# 1. Presentación

*En la presente XXVI edición del Congreso de Marketing de AEMARK se pueden destacar cuatro cuestiones interesantes. La primera es su consolidación como congreso internacional. Los Encuentros de Profesores Universitarios de Marketing se transformaron en congreso nacional y desde hace pocos años se ha dado un salto cualitativo: hay una creciente colaboración de académicos procedentes de diferentes países. En menos de cinco ediciones se ha pasado de una presencia casi testimonial de autores internacionales a una presencia significativa. Así, en la presente edición hay autores españoles, de América Latina, europeos y asiáticos, lo que hace de él un congreso auténticamente internacionalizado. Esto es un magnífico síntoma de colaboración que seguro que irá creciendo en los próximos años.*

*La segunda cuestión es que se ha reducido de forma significativa el número de ponencias presentadas. Así, de las 177 presentadas al XXV Congreso realizado en Barcelona hemos pasado a 132, incluyendo comunicaciones, trabajos en curso y tesis. Sin embargo, se ha incrementado de forma muy importante la calidad de los trabajos, como lo demuestra el porcentaje de ponencias aceptadas (tras un proceso de doble revisión ciega) pasando de un 69 a casi un 83 por ciento.*

*En tercer lugar, cabe destacar que en la presente edición se abandona el formato en papel y el soporte CD y se opta por la edición digital. El acceso a las ponencias a través de la Red es más sencillo y facilita la posibilidad de recibir consultas y citas. Los investigadores usamos principalmente los documentos accesibles vía Internet como input para nuestras investigaciones. Como sabemos, las nuevas tecnologías no sólo suponen una mayor y más rápida obtención y difusión de*

*la información sino también una nueva forma de trabajar, en la que el nuevo formato digital puede resultar más útil.*

*La cuarta y última cuestión es que el XXVI Congreso está pensado, al igual que los que le han precedido, como un punto de encuentro para la reflexión y puesta en común de los avances en nuestras respectivas áreas de trabajo. Ya no sólo se trata de realizar nuevos hallazgos sino aflore su verdadero valor para la academia, para las empresas y para la sociedad.*

*Desde el punto académico un vistazo a las ponencias presentadas muestra la especialización progresiva de los contenidos y un mayor empuje de los enfoques multidisciplinares bajo un trabajo grupal (que se ha hecho imprescindible). Desde el punto de vista empresarial, muchas de las comunicaciones presentadas se centran en aspectos que aportan valor directo a las empresas. Finalmente, hay una mayor preocupación de los investigadores por los aspectos no directamente lucrativos y de responsabilidad social.*

*El documento que el lector tiene en su mano es el resumen del esfuerzo de cientos de investigadores, de sus ideas y de ese triple enfoque académico, empresarial y social. Sin embargo, no es suficiente. Como científicos sociales, todos pensamos ya en mejorar nuestros trabajos y en dar respuestas a los retos y cuestiones que la sociedad demanda.*

FRANCISCO J. SARABIA-SÁNCHEZ  
Presidente del Comité Organizador  
del XXVI Congreso de Marketing AEMARK 2014

## 2. Comité Organizador

Ha estado formado por profesores del Área de Comercialización e Investigación de Mercados del Departamento de Estudios Económicos y Financieros de la Universidad Miguel Hernández. Su composición ha sido:

*Tabla 2.1. Comité Organizador de AEMARK 2014*

<b>CARGO</b>	<b>NOMBRE Y APELLIDOS</b>	<b>EMAIL</b>
<b>Presidente</b>	Francisco J. Sarabia Sánchez	fransarabia@umh.es
<b>Vocales</b>	María Elena González Gascón	elena.gonzalez@umh.es
	Andreas Kanther	kanther@umh.es
	Liudmila Ostrovsкая	lostrovsкая@umh.es
	José Francisco Parra Azor	jofra.parra@goumh.umh.es
	Carla Rodríguez Sánchez	c.rodiguez@umh.es

### 3. Comité Científico

Como en las anteriores ediciones, se ha realizado una evaluación de las comunicaciones (sean ponencias o trabajos en curso) presentados por los investigadores basándose en un *proceso de revisión ciega por pares y a una única evaluación*. Este sistema está garantizado por la existencia de un Comité Científico estructurado de la siguiente forma:

- a) Responsables de Área, que asignan revisores en función del área temática de la que sean especialistas. Por tanto, son Responsables de Área investigadores de reconocida trayectoria investigadora (Titulares y Catedráticos con al menos un sexenio de investigación).
- b) Presidencia del Congreso, que actúa como ‘Responsable de Área’ para las comunicaciones firmadas por otros responsables de área.
- c) Revisores, que son profesores especialistas en una o varias temáticas elegidos por los Jefes de Área entre los socios de AEMARK. De forma previa tienen que inscribirse como revisores y demostrar con publicaciones de calidad que tienen experiencia investigadora acreditada.

El proceso de evaluación que realiza el Comité Científico es el siguiente:

1. Los autores introducen en la aplicación Web del congreso una copia anónima de su trabajo. También eligen el área temática en la que desean ser evaluados.
2. Una vez pasado el plazo para introducir los trabajos, la aplicación Web los asigna en función del Área Temática elegida por el/los autor/es de cada trabajo.
3. Cada Responsable de Área asigna dos revisores anónimos por trabajo. La evaluación sigue un proceso estándar e igual para todos los trabajos asignados. La evaluación final es motivada.
4. Los trabajos se aceptan o rechazan por los dos evaluadores anónimos. Sólo en caso de discrepancia es el Responsable de Área quien decide sobre la aceptación o rechazo.

5. Una vez concluido el plazo de evaluación, se informa a los autores del resultado de la misma, indicándoseles los motivos por los que se acepta o rechaza el trabajo para su presentación en sesiones paralelas durante el congreso.

A este proceso hay que añadirle el filtro previo que imponen los propios autores sobre sus expectativas en relación al nivel de calidad de su trabajo (tanto en sí mismo como comparado con otros presentados en años anteriores).

Más información sobre las normas del proceso de evaluación de trabajos pueden verse en <http://www.aemarkcongresos.com/congreso2014/callforpapers.php#evaluacion>.

### 3.1. Responsables de las Áreas Temáticas

RESPONSABLE	UNIVERSIDAD	ÁREA TEMÁTICA
BARRUTIA LEGARRETA, JOSÉ MARÍA	Universidad del País Vasco	Marketing de Servicios
CERVERA TAULET, AMPARO	Universidad de Valencia	Marketing no Lucrativo y Responsabilidad Social
CERVIÑO FERNÁNDEZ, JULIO	Universidad Carlos III	Marketing Internacional
DEL BARRIO GARCÍA, SALVADOR	Universidad de Granada	Comunicación Comercial
DELGADO BALLESTER, ELENA	Universidad de Murcia	Dirección de Marca
FLAVIÁN BLANCO, CARLOS	Universidad de Zaragoza	Nuevas Tecnologías y e-Marketing
FRÍAS JAMILENA, M. DOLORES	Universidad de Granada	Marketing Turístico

### 3.3. Resultados del proceso de evaluación

Al XXVI Congreso de Marketing AEMARK 2014 se han presentado un total de 132 trabajos entre ponencias, trabajos en curso y tesis doctorales. El índice de aceptación ha alcanzado el 82,6 por ciento, lo que mejora el índice de la anterior edición (del 68,9 por ciento). Esto nos habla de un incremento de la calidad de los trabajos. La siguiente tabla muestra los indicadores básicos por Área Temática.

ÁREA TEMÁTICA	RECIBIDOS	ACEPTADOS	% DE ACEPTACIÓN
01. Comportamiento del Consumidor	14	11	79
02. Marketing Estratégico	11	8	73
03. Dirección de Marcas	5	4	80
04. Comunicación Comercial	7	5	71
05. Nuevas tecnologías y e-marketing	14	14	100
06. Marketing Internacional	3	2	67
07. Marketing Turístico	18	14	78
08. Marketing no lucrativo y Responsabilidad social	11	8	73
09. Dirección de Ventas y Equipos	2	2	100
10. Distribución Comercial y Gestión Minorista	8	7	88
11. Innovación, creación de valor y nuevos productos	5	4	80
12. Decisiones de Precios	0	0	–
13. Docencia en Marketing e Innovación Educativa	8	7	88
14. Marketing de Servicios	6	6	100
15. Investigación de Mercados y Modelización	2	2	100
16. Marketing Industrial, Agroalimentario y otras Aplicaciones Sectoriales del Marketing	7	5	71
17. Marketing Relacional	1	1	100
18. Presidencia	10	9	90
<b>TOTAL DE TRABAJOS</b>	<b>132</b>	<b>109</b>	<b>83</b>

### *3.4. Premios que AEMARK concede durante el congreso*

En cada congreso anual, AEMARK concede cuatro premios en colaboración con distintas organizaciones: a la mejor Tesis Doctoral de Marketing, al Mejor Artículo de Investigación, al Mejor Artículo Publicado en la REIM y Trayectoria de Profesor de Marketing (ver en <http://aemark.es/premios.php>). Igualmente AEMARK da ayudas a autores latinoamericanos que presenten comunicaciones al congreso y cumplan las condiciones que se señalan en las bases de dichas ayudas.

En la Website de AEMARK se actualiza la información y las bases y normativas pueden cambiar de año en año. Se recomienda a quienes deseen optar a estos premios o ayudas en futuras ediciones, que sigan la Website de AEMARK para disponer de información actualizada.

## 4. Índice alfabético de trabajos seleccionados

### COMPORTAMIENTO DEL CONSUMIDOR

#### *Ponencias*

**Análisis transcultural de los estilos de compra del consumidor: el caso de España y Finlandia.** ANA R. PERTEJO, ANA M. GONZÁLEZ-FERNÁNDEZ, CARMEN R. SANTOS (Universidad de León), JENNIINA HALKOAHO y PIRJO LAAKSONEN.

**Antecedents of attitudes toward the website: a crosscultural analysis.** JUAN MIGUEL ALCÁNTARA-PILAR y SALVADOR DEL BARRIO-GARCÍA (Universidad de Granada).

**Diferencias en el recuerdo de la marca entre la publicidad online con descuentos y con regalos.** ESMERALDA CRESPO ALMENDROS y SALVADOR DEL BARRIO GARCÍA (Universidad de Granada).

**Does the smart labelling add value to the product?** DOMINGO CALVO DOPICO (Universidad de A Coruña).

**Environmental arousal and shoppers' moods: effects on shopping behavior.** LAURA LUCIA PALACIOS, RAÚL PÉREZ LÓPEZ y YOLANDA POLO REDONDO (Universidad de Zaragoza).

**La influencia parental en los niveles de etnocentrismo regional de los jóvenes extremeños: un análisis exploratorio.** M. PILAR FERNÁNDEZ FERRÍN (Universidad del País Vasco), BELÉN BANDE VILELA (Universidad de Santiago de Compostela) y M. MERCEDES GALÁN LADERO (Universidad de Extremadura).

**Satisfaction and trust: the main determinants of older consumers' loyalty in times of crisis.** MIGUEL ANGEL MOLINER, JUAN CARLOS FANDOS, DIEGO MONFERRER, MARTA ESTRADA, JAVIER SÁNCHEZ y SANDRA TENA (Universidad Jaume I de Castellón).

**Segmentando clientes por su lealtad: una aproximación experiencial en el comercio minorista de ropa.** IRENE GIL SAURA, MARTINA G. GALLARZA y María Eugenia Ruiz Molina (Universidad de València).

**The impact of external recommendations on the consumer's multichannel search experience and decision: the moderating role of motivation to touch.** CARLOS FLAVIÁN BLANCO, RAQUEL GURREA SARASA y CARLOS ORÚS SANCLEMENTE (Universidad de Zaragoza).

**The moderating effects of consumer's characteristics in the relationships between privacy, security and online trust.** M.<sup>a</sup> ISABEL PASCUAL DEL RIQUELME MARTÍNEZ (Universidad Jorge Tadeo Lozano) y SERGIO ROMÁN NICOLÁS (Universidad de Murcia).

**What's up in smartphone services: analysis of switching costs, customer satisfaction and loyalty in the spanish market.** CRISTINA CALVO PORRAL (Universidad de A Coruña) y JEAN-PIERRE LÉVY-MANGIN (Universidad du Québec In Outaouais).

### *Trabajos en curso*

**S-O-R model proposal for online travel purchasing.** JANA PRODANOVA y SONIA SAN MARTÍN GUTIÉRREZ (Universidad de Burgos).

**What are generative consumers looking for?** MIGUEL GIMÉNEZ GARCÍA-CONDE, LONGINOS MARÍN RIVES y SALVADOR RUIZ DE MAYA (Universidad de Murcia).

**What if the share sensations after trasting new products?** SALVADOR RUIZ DE MAYA, INÉS LÓPEZ LÓPEZ (Universidad de Murcia) y SARAH MOORE (Universidad of Alberta, Canadá).

## MARKETING ESTRATÉGICO

### *Ponencias*

**Gestión del conocimiento sobre el cliente y co-innovación: efectos sobre los resultados de marketing.** PILAR FIDEL, AMPARO CERVERA, WALESSKA SCHLESINGER, M. ÁNGELES INIESTA (Universidad de Almería) y RAQUEL SÁNCHEZ (Universidad de Almería).

**La transferencia entre un gran evento deportivo y la marca patrocinadora: la visión del visitante deportivo.** CRISTINA ARAGONÉS JERICÓ (Florida Universitaria), INÉS KUSTER BOLUDA y NATALIA VILA LOPEZ (Universidad de València).

**Possible success factors in a CRM strategy: a study in the spanish banking sector.** JESÚS J. CAMBRA FIERRO, ANA OLAVARRÍA JARABA, ROSARIO VÁZQUEZ CARRASCO (Universidad Pablo de Olavide) y EDGAR CENTENO (Itesm Monterrey).

**Reacción publicitaria de las empresas establecidas ante la entrada al mercado: análisis de los costes de cambio en el sector aéreo español.** FRANCO MANUEL SANCHO ESPER y FRANCISCO JOSÉ MAS RUIZ (Universidad de Alicante).

*Trabajos en curso*

**Efectos de la normalización del sistema de reclamaciones y quejas.** CHANTHALY SPHABMIXAY SPHABMIXAY, ANA ISABEL RODRÍGUEZ ESCUDERO y JAVIER RODRÍGUEZ PINTO (Universidad de Valladolid).

**Managing customer initiated contacts: the impact on customer profitability.** JESÚS CAMBRA FIERRO (Universidad Pablo de Olavide), IGUÁCEL MELERO POLO y F. JAVIER SESE (Universidad de Zaragoza).

**Multimarket rivalry: how strategic groups act withing and across markets?** FRANCISCO JOSÉ MAS RUIZ y FELIPE RUIZ MORENO (Universidad de Alicante).

## DIRECCIÓN DE MARCAS

*Ponencias*

**¿Cómo construir una enseña con personalidad auténtica a través del marketing experiencial?** NATALIA VILA-LOPEZ, CARMEN TORRECILLA-MORENO, INÉS KUSTER-BOLUDA, PEDRO CANALES-RONDA y ASUNCIÓN HERNÁNDEZ-FERNÁNDEZ (Universidad de València).

**La influencia de las gratificaciones derivadas del uso de la red social Qzone en el grado de interacción con las marcas de los adolescentes chinos.** VANESSA APAOLAZA IBÁÑEZ, PATRICK HARTMANN, CRISTINA LÓPEZ CARO (Universidad del País Vasco) y JIAXUN HE (East China Normal University, Shanghai).

**The impact of collective brands on the economic efficiency of experience goods producers.** RICARDO SELLERS RUBIO y FRANCISCO MAS RUIZ (Universidad de Alicante).

## COMUNICACIÓN COMERCIAL

*Ponencias*

**Does integrated corporate communication really enhance business performance? Insights from the spanish hospitality industry.** LUCÍA PORCU y SALVADOR DEL BARRIO-GARCÍA (Universidad de Granada).

**Duración de los spots y recuerdo publicitario: optimización en función de las variables de planificación del medio televisión.** JOSEFA D. MARTÍN-SANTANA

(Universidad de Las Palmas), PEDRO REINARES-LARA y EVA REINARES-LARA (Universidad Rey Juan Carlos).

**Efecto de los reclamos en los envases de alimentos orgánicos sobre las percepciones del consumidor. Grado de explicitud y temática del mensaje.** MARÍA HIDALGO-BAZ, MERCEDES MARTOS-PARTAL y ÓSCAR GONZÁLEZ-BENITO (Universidad de Salamanca).

### *Trabajos en curso*

**Eficiencia de la actividad ferial en España: análisis longitudinal.** MARÍA CORDENTE RODRÍGUEZ (Universidad San Pablo C.E. Universidad), JUAN ANTONIO MONDÉJAR JIMÉNEZ (Universidad de Castilla-La Mancha) y JUAN CARLOS GÁZQUEZ ABAD (Universidad de Almería).

**El impacto del mix de medios en el valor de la empresa.** PABLO JOSÉ LÓPEZ TENORIO (Esic Business&Marketing School) y JAIME ROMERO (Universidad Autónoma de Madrid).

## NUEVAS TECNOLOGÍAS Y E-MARKETING

### *Ponencias*

**Análisis comparativo de la adopción de sistemas de pago móvil SMS, NFC y QR.** FRANCISCO LIÉBANA-CABANILLAS, IVIANE RAMOS DE LUNA, JUAN SÁNCHEZ FERNÁNDEZ, FRANCISCO MUÑOZ-LEIVA y FRANCISCO MONTORO RÍOS (Universidad de Granada).

**Branding in interactive media: brand connection platforms and their influence on customer engagement and brand image.** LORENA BLASCO-ARCAS, BLANCA HERNÁNDEZ-ORTEGA y JULIO JIMÉNEZ-MARTÍNEZ (Universidad de Zaragoza).

**¿Influye la lealtad del cliente bancario y el cross-buying en la adopción de la banca online?** ANTONIA M. ESTRELLA-RAMÓN y MANUEL SÁNCHEZ-PÉREZ (Universidad de Almería).

**Mobile social commerce acceptance model: factors and influences on intention to use s-commerce.** FRANCISCO J. LIÉBANA-CABANILLAS (Universidad de Granada), ÁNGEL F. VILLAREJO-RAMOS y MANUEL J. SÁNCHEZ-FRANCO (Universidad de Sevilla).

**Smart cards consolidation from a citizen oriented perspectiva: an empirical study.** DANIEL BELANCHE GRACIA y LUIS VICENTE CASALÓ ARIÑO (Universidad de Zaragoza).

**Website design as moderating factor of online user behavior.** JUAN MIGUEL ALCÁNTARA-PILAR y SALVADOR DEL BARRIO-GARCÍA (Universidad de Granada).

*Trabajos en curso*

- Comercio social vs comercio electrónico: ¿Influyen los estímulos sociales en el comportamiento del individuo?** LORENA BLASCO ARCAS, BLANCA ISABEL HERNÁNDEZ ORTEGA y BEATRIZ VELILLA BLASCO (Universidad de Zaragoza).
- Identificación de líderes de opinión a través de Twitter: cómo saber si son leales a la marca.** MANUELA LÓPEZ PÉREZ (Universidad Católica del Norte, Chile) y MARÍA SICILIA PIÑERO (Universidad de Murcia).
- La búsqueda del estado de flow en entornos social commerce.** CAROLINA HERRANDO SORIA, JULIO JIMÉNEZ MARTÍNEZ y MARÍA JOSÉ MARTÍN DE HOYOS (Universidad de Zaragoza).
- Las características del boca-oído electrónico y su influencia en la intención de recompra online: una propuesta de investigación.** JORGE MATUTE VALLEJO, YOLANDA POLO REDONDO y ANA UTRILLAS ACERETE (Universidad de Zaragoza).
- «My posts cannot be bought». Strategies to encourage bloggers to spread the word.** MANUELA LÓPEZ PÉREZ (Universidad Católica del Norte, Chile), MARÍA SICILIA PIÑERO (Universidad de Murcia) y PEEETER VERLEGH (Universidad of Amsterdam).
- The application of the signalling theory to mobile shopping. The gender effect.** SONIA SAN MARTÍN GUTIÉRREZ y JANA PRODANOVA (Universidad de Burgos).
- Why do marketers really need to work with digital engineers?** ANTONIO HYDER (Universidad Cardenal Herrera-Ceu).

**MARKETING INTERNACIONAL***Ponencias*

- Influencia de los valores de los directivos de Pymes internacionalizadas en los resultados exportadores.** F. JAVIER RONDÁN CATALUÑA, ANTONIO NAVARRO GARCÍA y JORGE ARENAS GAITÁN (Universidad de Sevilla).

*Trabajos en curso*

- Factores que afectan la dinámica de las empresas internacionales: un análisis empírico en Colombia.** DIANA ESCANDÓN (Universidad Javeriana), MIGUEL HERNÁNDEZ ESPALLARDO (Universidad de Murcia) y AUGUSTO RODRÍGUEZ (Universidad del Valle).

## MARKETING TURÍSTICO

### *Ponencias*

**A comparison of the antecedents of satisfaction in city break travelling.** JON CHARTERINA ABANDO y M<sup>a</sup> GLORIA APARICIO DE CASTRO (Universidad del País Vasco).

**Análisis de la influencia del medio de compra en la evaluación de un servicio turístico: un análisis multipaís.** CARMEN M. SABIOTE ORTIZ, DOLORES M. FRÍAS JAMILENA y JOSÉ ALBERTO CASTAÑEDA GARCÍA (Universidad de Granada).

**Antecedentes del valor de marca en la industria hotelera.** MAJA \_ERI\_, IRENE GIL-SAURA y ALEJANDRO MOLLÁ-DESCALS (Universidad de València).

**Crisis económica y actitud de los residentes hacia el turismo en destinos turísticos maduros. Un enfoque longitudinal.** DESIDERIO GUTIÉRREZ TAÑO (Universidad de La Laguna), JOAN B. GARAU VADELL (Universidad de Illes Balears), RICARDO J. DÍAZ ARMAS (Universidad de La Laguna) y MARÍA D. DE JUAN VIGARAY (Universidad de Alicante).

**El impacto de la motivación en la imagen percibida, la satisfacción y la lealtad del visitante.** MARTA LAGUNA GARCÍA y ANDRÉS PALACIOS PICOS (Universidad de Valladolid).

**Examining the hierarchy of destination brands and the effects between the dimensions of brand equity of a regional destination.** ÁNGEL HERRERO CRESPO, MARÍA DEL MAR GARCÍA DE LOS SALMONES SÁNCHEZ, HÉCTOR SAN MARTÍN GUTIÉRREZ y JESÚS COLLADO AGUDO (Universidad de Cantabria).

**Fuentes de información e imagen del destino: análisis de la valoración atendiendo al segmento.** ISABEL LLODRA RIERA, ANA ISABEL JIMÉNEZ ZARCO (Universidad Oberta de Catalunya) y MARÍA PILAR MARTÍNEZ RUIZ (Universidad D. Castilla-La Mancha).

**La relación entre satisfacción y lealtad en el turismo rural.** ANA MARÍA CAMPÓN CERRO, JOSÉ MANUEL HERNÁNDEZ MOGOLLÓN (Universidad de Extremadura) y HELENA MARÍA BAPTISTA ALVES (Universidade da Beira Interior, Portugal).

**The effects of assurance on trust antecedents in tourism product and service online purchase intention.** ENRIQUE BONSON PONTE, ELENA CARVAJAL TRUJILLO y TOMÁS ESCOBAR RODRÍGUEZ (Universidad de Huelva).

### *Trabajos en curso*

**El astroturismo como atractivo primario de un destino rural.** BELÉN ROYO NAVARRO, CARMINA FANDOS HERRERA (Universidad de Zaragoza) y JAVIER SANCHEZ GARCÍA (Universidad Jaime I de Castellón).

**¿Existe algo más allá f g Hofstede? Influencia de los cambios culturales en la creación de segmentos turísticos.** ANA M. GONZÁLEZ FERNÁNDEZ (Universidad de León).

**La calidad del servicio online y de su recuperación a través de dispositivos fijos y móviles: una comparación entre Portugal y España.** MYRIAM MARTÍ SÁNCHEZ, VANESSA ROGER MONZÓ, MARÍA GUIJARRO GARCÍA y ANTONIO NATURIL ALONSO (Esic Business & Marketing School).

**User-generated content and tourism destination image throught emotions and cognitions.** MARÍA DEL CARMEN HIDALGO ALCÁZAR (Universidad Católica del Norte, Chile), MARÍA SICILIA PIÑERO y SALVADOR RUIZ DE MAYA (Universidad de Murcia).

## MARKETING NO LUCRATIVO Y RESPONSABILIDAD SOCIAL

### *Ponencias*

**Análisis de la interacción entre reporting a grupos de interés e industria para explicar la reputación corporativa en España.** ANDREA PÉREZ RUIZ, MARÍA DEL MAR GARCÍA DE LOS SALMONES SÁNCHEZ y CARLOS LÓPEZ GUTIÉRREZ (Universidad de Cantabria).

**La compleja conceptualización del voluntario y la riqueza de la dimensionalidad de su experiencia: una aplicación en el ámbito de los eventos.** MARTINA G. GALLARZA, TERESA FAYOS (Universidad de València) y FRANCISCO ARTEAGA (Universidad Católica de Valencia).

**La innovación social como resultado de los acuerdos de cooperación empresa-organización no lucrativa.** M.<sup>a</sup> JOSÉ SANZO PÉREZ, LUIS IGNACIO ÁLVAREZ GONZÁLEZ (Universidad de Oviedo) y MARTA REY GARCÍA (Universidad de A Coruña).

**¿Qué es un consumidor responsable y sustentable? Reflexiones y consideraciones para como medirlo.** ENRIQUE BIANCHI (Universidad Nacional de Córdoba).

### *Trabajos en curso*

**Expectativas y percepciones del consumidor español respecto a la responsabilidad social: diferencias sociodemográficas.** RAFAEL CURRÁS PÉREZ, CONSUELO DOLZ DOLZ y MARÍA JOSÉ MIQUEL ROMERO (Universidad de València).

**Media effects on environmental activism: the moderating role of optimistic bias.** DAVID JIMÉNEZ CASTILLO y JOSÉ MANUEL ORTEGA EGEA (Universidad de Almería).

**Responsabilidad social del consumidor: desarrollo de una escala.** SYLVIA LÓPEZ DAVIS, LONGINOS MARÍN RIVES y SALVADOR RUIZ DE MAYA (Universidad de Murcia).

**The intersection between anti-consumption, organizations and environmental sustainability: a literature review.** NIEVES GARCÍA DE FRUTOS, JOSÉ MANUEL ORTEGA EGEA y JAVIER MARTÍNEZ DEL RÍO (Universidad de Almería).

## DIRECCIÓN DE VENTAS Y EQUIPOS

### *Ponencias*

**El estilo de liderazgo como factor moderador en la generación de confianza en equipos de trabajo virtuales.** MIGUEL GUINALIU BLASCO y PAU JORDAN BLASCO (Universidad de Zaragoza).

**Examining the impact of emotional intelligence on salesperson adaptive and proactive performance.** BELÉN BANDE VILELA (Universidad de Santiago de Compostela) y PILAR FERNÁNDEZ FERRÍN (Universidad del País Vasco).

**The influence of adaptive selling on customer satisfaction.** PEDRO JUAN MARTIN CASTEJÓN y SERGIO ROMAN NICOLÁS (Universidad de Murcia).

## DISTRIBUCIÓN COMERCIAL Y GESTIÓN MINORISTA

### *Ponencias*

**Aceptación de surtidos sin marcas nacionales: ¿Qué papel juega la actitud del consumidor hacia la situación económica?** JUAN CARLOS GÁZQUEZ ABAD (Universidad de Almería), FRANCISCO J. MARTÍNEZ LÓPEZ (Universidad de Granada), IRENE ESTEBAN MILLAT (Universidad Oberta de Catalunya) y JUAN ANTONIO MONDÉJAR JIMÉNEZ (Universidad Castilla-La Mancha).

**Efectividad de las técnicas de merchandising para categorías hedónicas y utilitarias.** ÁLVARO GARRIDO MORGADO, ÓSCAR GONZÁLEZ BENITO y MERCEDES MARTOS PARTAL (Universidad de Salamanca).

**Efecto de la crisis sobre el sector comercial español.** EVA TOMASETI SOLANO, JOSÉ HORACIO GARCÍA MARÍ y NOELIA SÁNCHEZ CASADO (Universidad Politécnica de Cartagena).

**El conocimiento de los distribuidores y su influencia en la estrategia de innovación de los fabricantes.** MANUEL SÁNCHEZ PÉREZ, MARÍA BELÉN MARÍN CARRILLO (Universidad de Almería) y CRISTINA SEGOVIA LÓPEZ.

**Estimación de los efectos del tamaño del surtido sobre las ventas de la categoría: análisis empírico en el formato hipermercado a partir de elasticidades.** JUAN CARLOS GÁZQUEZ ABAD (Universidad de Almería), FRANCISCO J. MARTÍNEZ LÓPEZ (Universidad de Granada), JUAN ANTONIO MONDÉJAR JIMÉNEZ (Universidad D. Castilla-La Mancha) y IRENE ESTEBAN MILLAT (Universidad Oberta de Catalunya).

**La satisfacción con la recuperación del servicio: efecto moderador de la edad en el boca-oído posterior.** BEATRIZ MOLINER VELÁZQUEZ, MARÍA EUGENIA RUIZ MOLINA y TERESA FAYOS GARDÓ (Universidad de València).

**Relación entre el capital de marca de la tienda y la lealtad: propuesta de dos modelos causales alternativos.** IRENE GIL SAURA, MAJA \_ERI\_, MARÍA EUGENIA RUIZ MOLINA y GLORIA BERENGUER CONTRI (Universidad de València).

**Private label brands: measuring the role of image, loyalty and manufacturer identification.** CRISTINA CALVO PORRAL (Universidad de A Coruña) y MARK LANG (St. Joseph University, Philadelphia, USA).

## INNOVACIÓN, CREACIÓN DE VALOR Y NUEVOS PRODUCTOS

### *Ponencias*

**Be creative but not so much. Decreasing benefits of creativity in firms.** VÍCTOR DEL-CORTE-LORA, TERESA M. VALLET-BELLMUNT y F. XAVIER MOLINA-MORALES (Universidad Jaume I de Castellón).

**La influencia de la innovación sobre los beneficios de la relación y la lealtad hacia la tienda.** MARÍA EUGENIA RUIZ MOLINA, IRENE GIL SAURA (Universidad de València) y DAVID SERVERA FRANCÉS (Universidad Católica de Valencia).

### *Trabajos en curso*

**Creatividad, innovación y gestión de la experiencia del visitante en industrias creativas.** CARMEN CAMARERO IZQUIERDO, MARÍA JOSÉ GARRIDO SAMANIEGO y EVA VICENTE HERNÁNDEZ (Universidad de Valladolid).

**The effects of predevelopment activities on new product performance.** MARÍA MORENO MOYA y JOSÉ LUIS MUNUERA ALEMÁN (Universidad de Murcia).

## DOCENCIA EN MARKETING E INNOVACIÓN EDUCATIVA

### *Ponencias*

**Cómo optimizar el trabajo cooperativo: una experiencia docente.** MARTA ESTRADA GUILLÉN, DIEGO MONFERRER TIRADO, MERCEDES SEGARRA CIPRÉS y MIGUEL ÁNGEL MOLINER TENA (Universidad Jaume I de Castellón).

**Competencias transversales y su influencia en la satisfacción de los estudiantes de marketing. Un estudio internacional.** ELENA GONZÁLEZ-GASCÓN (Universidad Miguel Hernández de Elche), MARÍA D. DE-JUAN-VIGARAY (Universidad de Alicante) y BEYZA GÜLTEKIN (Hacettepe University).

**Consecuencias afectivas y objetivas del uso de un canal de YouTube de apoyo a la docencia en marketing.** CARLOS ORÚS SANCLEMENTE, MARÍA JOSE BARLÉS ARIZÓN, DANIEL BELANCHE GRACIA, LUIS VICENTE CASALÓ ARIÑO, ELENA FRAJ ANDRÉS y RAQUEL GURREA SARASA (Universidad de Zaragoza).

**Estilos de aprendizaje y tecnología: perfil del estudiante y herramientas docentes de web social.** CARLOTA LORENZO ROMERO (Universidad D. Castilla-La Mancha) y MARÍA DEL MAR BUENDÍA NAVARRO (Ies Julián Zarco, Mota del Cuervo, Cuenca).

**Modelización del valor percibido en la educación superior y su efecto en la satisfacción.** LUIS DOÑA TOLEDO, TEODORO LUQUE MARTÍNEZ, SALVADOR DEL BARRIO GARCÍA (Universidad de Granada) y CLAUDIO RUY PORTELA DE VASCONCELOS (Universidad Federal da Paraíba).

### *Trabajos en curso*

**¿Cómo dinamizar el aula a través de competencias transversales en marketing?: el papel del relator.** CARMINA FANDOS HERRERA y MARIAN PELIGERO DOMEQUE (Universidad de Zaragoza).

**Los sistemas de evaluación según las guías docentes publicadas desde la introducción del EEES.** SONIA SAN MARTÍN GUTIÉRREZ (Universidad de Burgos), MARCOS SANTAMARÍA MARISCAL (Universidad de Burgos), REBECA SAN JOSÉ CABEZUDO (Universidad de Valladolid), ESTEFANÍA JERÓNIMO BEATO (Universidad Europea Miguel de Cervantes), BLANCA LÓPEZ CATALÁN (Universidad Pablo de Olavide), NADIA JIMÉNEZ TORRES (Universidad Autónoma de San Luis Potosí) y ELENA ROMERO MERINO.

## MARKETING DE SERVICIOS

### *Ponencias*

**¿De quién es la culpa? Atribución y gravedad del fallo en servicios prestados por más de un proveedor. Aplicación a la compra por Internet.** ÓSCAR AGUILAR ROJAS (Universidad de Costa Rica) y CARMINA FANDOS HERRERA (Universidad de Zaragoza).

**La estructura de preferencias de los clientes de entidades financieras: análisis del efecto región de origen.** ANTONIO CHAMORRO MERA y JOSÉ MANUEL GARCÍA GALLEGO (Universidad de Extremadura).

**La orientación al mercado interno y su influencia en los empleados y clientes: análisis comparativo según la experiencia laboral.** VICENT TORTOSA EDO, JAUME LLORENS MONZONÍS, MIGUEL ÁNGEL MOLINER TENA y JAVIER SÁNCHEZ GARCÍA (Universidad Jaume I de Castellón).

**La repetición de compra en el comercio minorista: efecto moderador del tipo de producto.** BEATRIZ MOLINER VELÁZQUEZ, IRENE GIL SAURA (Universidad de València) y MARÍA FUENTES BLASCO (Universidad Pablo de Olavide).

### *Trabajos en curso*

**Examining an economic value-based model and unobserved heterogeneity for university services.** RAQUEL SÁNCHEZ FERNÁNDEZ, M.<sup>a</sup> ÁNGELES INIESTA BONILLO, DAVID JIMÉNEZ CASTILLO (Universidad de Almería), AMPARO CERVERA TAULET y WALESSKA SCHLESINGER (Universidad de València).

**Improving call centers experience: the key role of fluency.** ESTELA FERNÁNDEZ SABIOTE e INÉS LÓPEZ LÓPEZ (Universidad de Murcia).

## INVESTIGACIÓN DE MERCADOS Y MODELIZACIÓN

### *Ponencias*

**Análisis de los factores que influyen en la unidimensionalidad de Cetscale: un enfoque meta-analítico.** JOSÉ FELIPE JIMÉNEZ GUERRERO y JUAN CARLOS GÁZQUEZ ABAD (Universidad de Almería).

**Modelos de gestión de inventarios para varios artículos, considerando demanda determinista dependiente del tiempo.** MANUEL GONZÁLEZ DE LA ROSA, ISABEL MONTERO MURADAS, JAIME FEBLES ACOSTA y JOAQUÍN SICILIA RODRÍGUEZ (Universidad de La Laguna).

## MARKETING INDUSTRIAL, AGROALIMENTARIO Y OTRAS APLICACIONES SECTORIALES DEL MARKETING

### *Ponencias*

**El efecto región de origen en la compra de vino.** JOSÉ MANUEL GARCÍA GALLEGO, ANTONIO CHAMORRO MERA y MARÍA DEL MAR GARCÍA GALÁN (Universidad de Extremadura).

**¿Es eficaz en términos de transmisión de imagen patrocinar a un equipo de fútbol con poco éxito deportivo?** MANUEL ALONSO DOS SANTOS, STEVE BAEZA (Universidad Católica Santísima Concepción), LEANDRO POBLETE, JOSÉ VÁZQUEZ y DANIELA HIDALGO (Universidad de Concepción).

**The mediation effects of trust and contracts on know-ledge exchange and innovation. Evidence from the european machine tool industry.** JON CHARTERINA ABANDO, JON LANDETA RODRÍGUEZ e IMANOL BASTERRETxea MARKAIDA (Universidad del País Vasco).

**Transferencia de conocimiento entre empresas y centros de investigación: contribución de la capacidad de absorción al desempeño de la investigación.** MANUEL SÁNCHEZ PÉREZ, CRISTINA SEGOVIA LÓPEZ y MARÍA BELÉN MARÍN CARRILLO.

*Trabajos en curso*

**Factores comportamentales que influyen en la elección de la cartera de productos del cliente bancario.** ANTONIA M. ESTRELLA-RAMÓN y MANUEL SÁNCHEZ-PÉREZ (Universidad de Almería).

## MARKETING RELACIONAL

*Ponencia*

**El uso de las redes sociales en el proceso de toma de decisiones.** NOELIA SÁNCHEZ CASADO, EVA TOMASETI SOLANO y JUAN GABRIEL CEGARRA NAVARRO (Universidad Politécnica de Cartagena).

## RESUMEN

*Las diferencias culturales entre los mercados de consumo existentes continúan siendo un reto, especialmente para las compañías internacionales. Se hace necesario comprender los diferentes estilos de toma de decisión del consumidor, su comportamiento de compra, así como los factores contextuales que les afectan, puesto que juegan un papel fundamental en sus preferencias, tanto hacia el producto como hacia el medio de compra. En este sentido, esta investigación pretende analizar las diferencias entre el consumidor español y finlandés de acuerdo a sus estilos de compra. Los datos se han obtenido gracias a la encuesta internacional llevada a cabo por la COConsumer BehaviouR Erasmus Network (COBEREN). La presente investigación señala y discute las diferencias culturales entre los estilos de compra del consumidor español y finlandés, proporcionando información relevante para las compañías interesadas en estos mercados, al permitirles concentrar sus esfuerzos de manera efectiva. También es útil como punto de partida para llevar a cabo futuras investigaciones transculturales sobre la orientación a la compra, gracias a la revisión de la literatura realizada y a las conclusiones obtenidas.*

## Palabras clave:

Estilos de compra, tipologías de comprador, orientación a la compra, comportamiento transcultural, COBEREN, España, Finlandia

---

<sup>1</sup> Esta investigación ha sido realizada gracias al proyecto COConsumer BehaviouR Erasmus Network (COBEREN), financiado por la Comisión Europea (1560-LLP-1-2009-1-ES-ERASMUS-ENWA1).

## 1. Introducción

La evolución constante del consumidor y de las tecnologías obliga a las empresas a estar continuamente pendientes de las tendencias del mercado. Los mercados multiculturales, la compra por internet y la preocupación por el consumo ético han ido incrementándose durante los últimos años, acompañados por significativos cambios en el comportamiento de compra de los consumidores. Varios estudios sugieren que muchos aspectos del comportamiento del consumidor están ligados a la cultura, lo que significa que al menos parte de la variación en los comportamientos del consumidor se debe a diferentes influencias culturales (De Mooij, 2014; De Mooij y Hofstede, 2011). Con el fin de tener éxito en este entorno cambiante, parece necesario que las compañías se centren en definir los requisitos que los consumidores buscan a la hora de comprar.

Investigaciones previas han utilizado diferentes marcos teóricos y perspectivas para comprender las tendencias existentes en la compra. Los procesos mentales del consumidor relativos a la compra han sido abordados a través de conceptos como la orientación a la compra (Stone, 1954), la motivación de compra (Westbrook y Black, 1985) y los estilos de toma de decisión (Sproles y Kendall, 1986), mientras los procesos comportamentales incluyen lealtad a la marca/tienda (Cunningham, 1961) y estilos de vida de compra (Mason, Durand y Taylor, 1983).

En lo referente a las diferencias culturales, dentro de la propia Unión Europea se pueden encontrar importantes contrastes comportamentales. Un ejemplo es el existente entre los países nórdicos y los países mediterráneos. España y Finlandia muestran fuertes choques en su cultura. Uno nórdico, otro del mediterráneo, contrastan en geografía y clima, así como en su economía, población, infraestructuras y desarrollo. Por ello, los patrones de consumo de los consumidores finlandeses y españoles también difieren marcadamente en términos de gasto de consumo, compra de alimentos, tipos de establecimientos a las que se acude, etc. (EMDS, 2014). Esto indica diferencias fundamentales entre España y Finlandia, justificando así el interés de la presente investigación.

Por todo ello, se pretenden lograr tres objetivos: conceptualizar los estilos de compra como una característica de la cultura de consumo, analizar y comparar las diferentes dimensiones de los estilos de compra entre Finlandia y España y analizar los segmentos de compradores en estos dos países, vislumbrando si las diferencias encontradas son mayores dentro del país que entre países.

## 2. Revisión de la Literatura

### 2.1. Orientación a la compra

El constructo de orientación a la compra es útil cuando se trata de comprender y describir a los consumidores y su comportamiento (Moye y Kincade, 2003; Shim y Kotsiopoulos, 1993). De acuerdo a Rigopoulou, Tsiotsou y Kehagias (2008) la orientación a la compra representa uno de los más valiosos enfoques de segmentación, puesto que refleja la categorización de los consumidores basándose en varios estilos de compra actuales (Shim y Kotsiopoulos, 1992). Por lo que una mejor comprensión de la orientación a la compra ayudará a los minoristas a refinar su *merchandising*, el ambiente de sus tiendas y sus programas de marketing, satisfaciendo así los gustos y deseos de sus compradores (Domina y Koch, 1998).

En la revisión de la literatura se han encontrado numerosas definiciones para explicar el constructo de orientación a la compra. En términos generales, Li, Kuo y Russell (1999) definen la orientación a la compra como la predisposición general hacia la tarea de compra. De forma similar, Shim y Gehrt (1996) explican que la orientación a la compra representa un aspecto cognitivo del comportamiento del consumidor, ya que se relaciona con una predisposición general hacia el acto de ir de compras y caracteriza el enfoque mental de un consumidor a la hora de tomar decisiones en el punto de venta. Mientras Visser y Du Preez (2001) subrayan que el concepto de orientación a la compra se compone de una dimensión personal (actividades, intereses, opiniones, motivos, necesidades y preferencias) y una dimensión de comportamiento

en el mercado, la cual refleja la dimensión personal e indica necesidades específicas y preferencias para la compra. Laaksonen (1993) ve la orientación a la compra como un elemento actitudinal que revela hasta qué punto un atributo es valorado por el comprador. En relación con esto, Marjanen, Pitkääho y Uusitalo (2005) definen la orientación hacia la elección como la tendencia del consumidor para seleccionar un lugar donde comprar, que se corresponde con su evaluación de la importancia de varias características del punto de venta.

Según Moschis (1992), la orientación a la compra es el resultado de varios patrones generales de compra, que incluyen las actividades, intereses y opiniones del consumidor en el proceso de compra. En este sentido, la orientación a la compra puede utilizarse para representar al consumidor con motivaciones económicas, recreativas, ambientales o sociales en la compra. En otras palabras, los compradores con diferentes orientaciones tienen diferentes características de consumo y comportamientos en el punto de venta, incluyendo, por ejemplo, diferentes necesidades y preferencias para las fuentes de información consultadas (Moschis, 1976), las formas de compra (Gutman y Mills, 1982; Domina y Koch, 1998; Lumpkin, Hawes y Darden, 1986) y los atributos buscados en el punto de venta (Swinyard y Rinne, 1995).

Por otra parte, en la literatura se puede encontrar orientación a la compra como sinónimo del estilo de compra (Hawks y Ackerman, 1990; Shim y Kotsiopoulos, 1993; Papatla y Bhatnagar, 2002), que es la forma en que los consumidores realizan la tarea de compra (Sinha, 2003). Es decir, la orientación a la compra es conceptualizada como una dimensión específica del estilo de vida. Lo que sugiere que el concepto de orientación a la compra abarca los intereses, opiniones, actitudes, necesidades y preferencias de los consumidores hacia las actividades de compra, pudiendo referirse a ello como estilos de compra o comprador.

## **2.2. Tipologías de compradores**

Durante al menos los últimos 60 años, se puede encontrar una gran variedad de tipologías de compra/comprador en la literatura. Los numerosos enfoques, contextos y técnicas de análisis dan lugar a una amplia variedad de tipologías de compradores, dificultando su comparación y generalización (Westbrook y Black, 1985; Ganesh, Reynolds y Luckett, 2007).

La literatura sobre el consumidor sugiere que hay tres tipos de enfoques para caracterizar los estilos del consumidor: el enfoque de la tipología del consumidor (Stone, 1954), el enfoque psicográfico/estilo de vida (Valencia, 1982; Ownbey, 1991; Tai, 2008) y el enfoque de características del consumidor (Sproles y Kendall, 1986; Scott y Bruce, 1995; Bauer *et al.*, 2006).

Numerosos estudios, así como el presente, han utilizado el enfoque de tipología del consumidor para identificar la orientación a la compra que guía al consumidor en su toma de decisiones y/o en su patrón de comportamiento, proporcionando diferentes tipologías de comprador (ver Tabla 1). Estas tipologías se basan fundamentalmente en los motivos del consumidor para ir de compras (Tauber, 1972; Bellenger y Korgaonkar, 1980; Westbrook y Black, 1985). Se sugiere que los consumidores compren por una variedad de motivos, definiendo los motivos de compra como los “conductores del comportamiento que llevan al consumidor al punto de venta para satisfacer sus necesidades internas” (Jim y Kim, 2003, p. 399).

Los motivos de compra son clasificados de manera amplia en dos categorías: utilitaria/funcional frente a hedónica/emocional/recreacional (Laaksonen, 2010; Yue-Teng et al., 2011). Sin embargo, varios motivos han sido utilizados en la literatura para clasificar al comprador: el deseo de posesión inmediata, la búsqueda de información, búsqueda de variedad, el disfrute o experiencia recreacional, conveniencia (incluyendo ahorro de tiempo), interacción social, etc. De acuerdo a estas diferentes motivaciones para comprar, se pueden identificar diferentes perfiles de compradores: apático (Brown, Pope y Voges, 2003; Ganesh, Reynolds y Luckett, 2007; Stone, 1954; Westbrook y Black, 1985; Williams et al., 1978), recreacional (Bellenger y Korgaonkar, 1980; Brown, Pope y Voges, 2003), implicado en el proceso (Westbrook y Black, 1985), entusiasta (Arnold y Reynolds, 2003; Ganesh, Reynolds y Luckett, 2007), consciente de la marca (Korgaonkar, 1984), económico/conveniencia (Bellenger y Korgaonkar, 1980; Brown,

Pope y Voges, 2003; Ganesh, Reynolds y Luckett, 2007; Korgaonkar, 1984; Rohm y Swaminathan, 2004; Stone, 1954; Westbrook y Black, 1985; Williams et al., 1978), optimización de la elección (Westbrook y Black, 1985), orientado al precio (Korgaonkar, 1984), proveedores (Arnold y Reynolds, 2003), buscador de ofertas (Ganesh, Reynolds y Luckett, 2007), buscador de variedad (Ganesh, Reynolds y Luckett, 2007; Rohm y Swaminathan, 2004)...

TABLA 1  
Algunas de las tipologías de comprador más recientes (últimos 5 años)

Autor/Año	País	Población	Muestra	Técnica	Tipologías (N)
Angell et al. (2014)	Reino Unido	Compradores de 60 años o más en tiendas de comestibles	524 Hombres (38%) Mujeres (62%)	Entrevista en profundidad y encuesta autorealizada por vía postal; análisis clúster	(1) Neutrales prudentes (152) (2) Exigentes en todos los aspectos (120) (3) Reacios casuales (98) (4) Sociables Exigentes (84) (5) Utilitaristas pudientes (70)
Jayasankaraprasad y Kathyayani (2014)		Compradores en tiendas de comestibles	1040	Encuesta personal en centro comercial; análisis clúster	(1) Económico (2) De conveniencia (3) De promociones-precio (4) Hedónico (5) Social
Angell et al. (2012)	Reino Unido	Comprador mayor en tienda de comestibles	36 individuos: Hombres (16.7%) Mujeres (83.3%)	Entrevista; análisis cualitativo	(1) Orientado al producto (2) Prudente (3) Selectivo-Conveniencia (4) Restrictivo-Conveniencia (5) Orientado a la tienda (6) Personalista
Mortimer (2011)	Australia	Comprador en tienda de comestibles	Hombres (140)	Cuestionario; análisis clúster	(1) Consciente del presupuesto (2) Controlado (3) Egocéntrico (4) Equitativo (5) Conveniencia
Yue-Teng et al. (2011)	Malasia	Estudiantes	Hombres (100) Mujeres (100)	Cuestionario auto-administrado; análisis factorial exploratorio	(1) Económico (2) Adicto (3) Conveniencia
Ganesh et al. (2010)	Estados Unidos	Mayores de 18 años	3059 Mujeres (67%) Hombres (33%)	Cuestionario online enviado a un panel; análisis clúster	Según motivaciones de compra: (1) interactivo (2) destino (3) apático (4) comprador e-window (5) básico (6) buscador de ofertas y (7) entusiasta de las compras

					Según atributos de la tienda online: (1) básico (2) aversión al riesgo (3) apático (4) entusiasta de las compras (5) buscador de ofertas
Ruiz y Lassala (2010)	España	Comprador online	380 compradores online	Entrevistas asistidas por ordenador; CHAID	Convenienciam-orientado a lo nuevo (96) Convenienciam-orientado a la experiencia (47) Implicado (60) Dual (26) Orientado al precio (85) Recreacional (66)
			1605 no compradores online		On-off (88) Amantes de la era tecnológica (68) Navegadores frecuentes (115) Tradicionales (296) Miedo a ser robados (163) Rezagados online (652) Compradores de moda (223)
Takkinen (2009)	Finlandia	Residentes en Helsinki de 18 a 74 años	446 mujeres	Cuestionario postal; análisis clúster	(1) Sin prisa (2) Buscador de servicios tradicional (3) Recreacional (4) Exigente y competente

### 3. Metodología

#### 3.1. Población y muestra objeto de estudio

Para llevar a cabo esta investigación se han analizado los datos obtenidos por la *CONsumer BEhaviour ERasmus Network* (COBEREN). COBEREN es una red internacional, subvencionada por la Comisión Europea, en la que colaboran expertos de 38 universidades pertenecientes a 30 países europeos. Su principal objetivo es proveer, al mundo académico y empresarial, con una amplia base de conocimiento sobre cultura y comportamiento del consumidor, así como una base de datos actualizada en cultura.

La recopilación de datos se llevó a cabo mediante el envío de un cuestionario online, traducido en los diferentes idiomas, a consumidores de los 30 países europeos. En la presente investigación se muestran parte de los resultados, los referentes al mercado español y finlandés.

Con carácter previo al análisis de la información recogida, los datos fueron sometidos a un proceso de depuración y validación para velar por la buena gestión de la información. Al centrarse en el consumidor español y finlandés, como ya se ha mencionado, el análisis se ha limitado al grupo de encuestados que señalaron que su país de origen era España o Finlandia y su nacionalidad, la española o la finlandesa. Los encuestados que no respondieron a estas preguntas, fueron eliminados de la muestra. Finalmente, la muestra seleccionada es de 968

españoles y 580 finlandeses, mayores de 18 años. La muestra está equilibrada en función del sexo y la edad. En la Tabla 2 se recogen las características sociodemográficas de la muestra.

TABLA 2  
Perfil de la muestra (%)

	ES	FI		ES	FI
<b>Sexo</b>			<b>Situación laboral</b>		
Hombre	52,4	47,9	Desempleado	14,1	6,3
Mujer	47,6	52,1	Empleado	64,8	64,9
<b>Edad</b>			Estudiante	5,2	8,7
Jóvenes (18-37 años)	33,6	28,9	Jubilado	15,9	20,1
Adultos (38-57 años)	38,0	37,5	<b>Ingresos netos mensuales del hogar</b>		
Mayores (58 ó más)	28,4	33,5	Menos de 200 Euros	1,5	0,2
<b>Nivel educativo</b>			200 – 499 Euros	1,7	1,8
Primaria	6,0	8,3	500 – 999 Euros	7,9	5,3
Secundaria	14,1	37,7	1000 – 1999 Euros	28,8	13,7
FP	15,1	22,4	2000 – 2999 Euros	23,7	24,7
Grado Universitario	38,8	8,2	3000 – 4999 Euros	27,2	40,9
Máster o Doctorado	26,0	23,4	5000 Euros o más	9,3	13,3

### 3.2. Dimensiones y análisis

El cuestionario elaborado por COBEREN se estructura en seis apartados: (1) significado de beber, (2) bebidas preferidas y consumo, (3) circunstancias, motivos de consumo y gasto en bebidas, (4) comportamiento de consumo en general, (5) cultura del consumidor y (6) descripción del perfil sociodemográfico.

Para esta investigación se utilizan los apartados 4 y 6, es decir, se analizan las variables *estilos de toma de decisión* y *perfil sociodemográfico*. El *perfil sociodemográfico* abarca las características que se observan en la tabla 2, mientras los *estilos de toma de decisión* aparecen recogidos en 44 ítems, 24 de los cuales utilizan una escala likert de 5 puntos y dos cuestiones dónde se pide seleccionar las 5 afirmaciones que mejor describen el comportamiento del encuestado. Estos ítems, procedentes principalmente del Inventario de Estilos de Consumidor de Sproles y Kendall (1986), han sido contrastados por el conjunto de expertos que forman la red COBEREN y, posteriormente, con la realización de un test piloto.

Las once dimensiones de estilos de compra (ver Tabla 3) se obtienen a partir de estas afirmaciones, basándose en la revisión de la literatura, así como en un análisis de componentes principales de las afirmaciones medidas en escala likert de 5 puntos y un análisis de correspondencias múltiples sobre el resto.

Antes de llevar a cabo el análisis empírico, los datos han sido recodificados con objeto de facilitar el análisis e integrar los diferentes tipos de escalas. La escala likert de 5 puntos ha sido recodificada en una escala de 3 puntos (Totalmente desacuerdo y En desacuerdo = -1, No sabe = 0, Totalmente de acuerdo y De acuerdo = +1), mientras las afirmaciones seleccionados se codificaron con +1 y las no seleccionadas con -1. Esta recodificación también varía dependiendo de la relación de la afirmación con la dimensión, siendo modificadas en nueve casos (ver Tabla 3).

Se utiliza un análisis de medias, porcentajes y la varianza para detectar las diferencias claves entre los estilos de compra de ambos países. Y posteriormente, se ha llevado a cabo un análisis clúster para cada uno de los países, a partir de las dimensiones de estilos de compra, con objeto de identificar y comparar las tipologías de compradores en España y Finlandia.

## 4. Resultados

### 4.1. Estilos de compra del consumidor español y finlandés

Se observan significativas diferencias estadísticas entre los estilos de compra de los consumidores españoles y finlandeses (ver Tabla 3). En particular, se encuentran importantes diferencias en dos dimensiones muy ligadas, la *social-recreacional* y la *independiente*. Si bien, la dimensión social-recreacional muestra una media negativa en ambos casos, existe una gran diferencia entre las medias y los porcentajes de cada país. Así, mientras los españoles son compradores más dependientes y recreativos, a los que les gusta ir de compras sólo por diversión, acompañados de amigos y a los que consultar qué comprar, los finlandeses deciden independientemente qué comprar y son compradores poco recreativos.

Otras dos dimensiones que también parecen estar ligadas y presentan diferencias significativas son las de *planificador* y *consciente de la calidad-marca*. Mientras los españoles dedican más tiempo a buscar información, comprar cuidadosamente (buscando calidad y prestando atención a las marcas) y reclamar cuando no están satisfechos, los finlandeses no dedican tanto tiempo a las compras, prefiriendo realizar compras rápidas de productos o marcas que les parecen suficientemente buenos.

Al analizar la *dimensión búsqueda de variedad-desleal*, se observa como los españoles muestran una media muy negativa, siendo por tanto compradores que no buscan variedad y leales, frente a los finlandeses que muestran una media próxima al cero, pero positiva. Son principalmente significativas aquellas sentencias referentes a la lealtad como: “cuando encuentro un producto o marca que me gusta, me mantengo fiel” o “tengo marcas favoritas que compro una y otra vez”. Sin embargo, resulta interesante que los españoles se sientan en mayor medida atraídos por las cosas nuevas que salen al mercado, que los finlandeses.

En la *dimensión ética*, ambos presentan medias positivas, pero los consumidores españoles parecen comprar productos de comercio justo o respetuosos con el medio ambiente en mayor proporción que los finlandeses. Ocurrendo algo similar en la *dimensión local*, donde ambos parecen preferir las tiendas pequeñas y los productos locales, mostrando una mayor diferencia en lo que se refiere a acudir al mercado municipal, donde los españoles muestran un porcentaje más elevado.

FIGURA 1  
Diferencias entre los estilos de compra del consumidor español y finlandés

Tanto españoles como finlandeses son compradores *conscientes del precio* (dimensión significativa estadísticamente con medias positivas), aunque los finlandeses se muestran algo más preocupados por el precio que los españoles.

La *dimensión descuidado* en ambos casos presenta medias negativas, considerándose por tanto compradores cuidadosos. Si bien la única afirmación significativa estadísticamente es la de “a veces compro sin pensar”, donde los compradores finlandeses muestran un mayor porcentaje que los españoles.

Respecto a la *dimensión de compra a distancia*, aunque no presenta diferencias estadísticas significativas, parece que ninguno de los países se siente atraído por este tipo de compra, mostrando ambos medias negativas. Los españoles señalan en mayor proporción comprar por internet o catálogo, aunque también son los más desconfiados en sus compras por internet.

En resumen, se puede decir que las diferencias más importantes entre España y Finlandia se encuentran en las dimensiones social-recreacional, consciente de la calidad-marca, buscador de variedad-desleal, planificador e independiente. Es decir, el comprador español se caracteriza por ser más social, dependiente, leal y perfeccionista que el finlandés, al dedicar más tiempo a la compra en sí, compartiéndola con amigos, así como a planificarla, además de estar más preocupado por la calidad, marca y procedencia de los productos que compra. Mientras el comprador finlandés es más independiente y descuidado, gustándole realizar sus compras más rápido, aunque trata de comprar productos suficientemente buenos.

#### 4.2. Segmentos de consumidores españoles basados en sus estilos de compra

A partir de las dimensiones de estilos de compra anteriores, se ha llevado a cabo un Análisis Clúster en dos pasos, para obtener los diferentes segmentos de compradores en España. Primero, se realizó un Análisis Clúster Jerárquico, utilizando el método de Ward, con el objetivo de identificar a través del histograma el número apropiado de segmentos. Posteriormente, se realizó un Análisis Clúster de K-medias para perfeccionar la identificación de dichos segmentos. Así, la mejor solución corresponde a la de tres clúster, que según muestra la prueba de Scheffé, que rechaza la igualdad de medias para todos los casos ( $p < 0,05$ ), pueden ser diferenciados a través de las diez dimensiones de estilos de compra. La Tabla 4 muestra la solución final basada en las dimensiones de estilos de compra y los porcentajes para cada uno de los clúster, así como sus características socio-demográficas.

Por tanto, los 968 encuestados españoles pueden ser clasificados en tres segmentos de compradores, los cuales son denominados:

Los *racionales*, que caracterizan a la mayor parte de la muestra (39,26%), son compradores muy éticos y planificadores, que prestan especial atención a la calidad y al precio. Son muy independientes, no yendo a comprar con amigos y no gustándoles las tiendas llenas de gente o comprar a distancia. Son consumidores localistas y leales a las tiendas, productos o marcas. En cuanto a sus características socio-demográficas, no existen diferencias significativas, aunque se puede apreciar que se trata de consumidores algo más mayores que los compradores de los otros segmentos.

Los *irracionales*, los cuales constituyen el 31,61% de la muestra, se caracterizan por ser los compradores menos conscientes de la calidad-marca y del precio, siendo los más descuidados y no planificadores. Sin embargo, se trata de los compradores más leales, no interesados en la variedad o en las cosas nuevas que salen al mercado. Este grupo también se caracteriza por su independencia, no gustándoles comprar con amigos, por diversión o a distancia. Tampoco son éticos, ni localistas. Respecto a sus características socio-demográficas, se aprecia un porcentaje algo superior de hombres (57,8%) que de mujeres (42,2%) en este segmento.

Los *sociales* representan el 29,13% de la muestra. Se diferencian principalmente de los otros dos segmentos por ser los más sociales-recreacionales y dependientes, además de ser los más desleales y buscadores de variedad y novedad. Compran a distancia, aunque desconfían de los productos online y se trata de consumidores éticos, localistas y marquistas. No son descuidados, planifican sus compras y compran tanto como pueden en rebajas. En cuanto a sus características socio-demográficas, no existen diferencias significativas, aunque se puede apreciar que se trata de consumidores algo más jóvenes que los compradores de los otros segmentos.

### 4.3. Segmentos de consumidores finlandeses basados en sus estilos de compra

Del mismo modo que en el caso español, a partir de un Análisis Clúster Jerárquico y un Análisis Clúster K-medias posterior, se han obtenido tres clúster. En este caso, la prueba de Scheffé no encuentra diferencias estadísticamente significativas entre los clúster a través de todas las dimensiones de estilos de compra. Así, las dimensiones de *compra a distancia*, *consciente del precio* e *independencia* no permiten diferenciar los tres segmentos obtenidos a partir de los 580 encuestados.

De acuerdo a la Tabla 5 se ha denominado al primer segmento *apático*. Este representa a la mayor parte de la muestra (56,03%) y se caracteriza principalmente por aburrirle las compras y no gustarle ir a comprar acompañado. No planifica sus compras y es un poco descuidado, acudiendo siempre a las mismas tiendas y comprando las mismas marcas. Sin embargo, se trata de un comprador ético, localista y que busca calidad en lo que compra. En cuanto a sus características socio-demográficas, este grupo es el que localiza un mayor porcentaje de hombres, adultos-mayores, con estudios de máster o doctorado y con los mayores ingresos.

El segmento *irracional* (28,45%) se diferencia de los otros segmentos por estar formado por aquellos compradores menos éticos, localistas, conscientes de la calidad-marca, planificadores y cuidadosos. Al igual que en el caso de los apáticos, aunque en menor medida, no se trata de un comprador social-recreacional y se muestra como un consumidor leal a las tiendas. Se caracteriza por estar formado en un porcentaje algo superior por mujeres, adultos y jubilados.

El *social-racional* representa un pequeño porcentaje de la muestra (15,52%) caracterizado significativamente por ser es el más social y al que más le gusta ir a comprar. Es un comprador muy ético y muy localista, así como muy consciente tanto de la calidad como de la marca, buscador de variedad-novedad, planificador y muy cuidadoso. Está formado principalmente por mujeres, jóvenes y estudiantes.

(-) Voy a las mismas tiendas, siempre que puedo	40,9	30,0	42,4
(-) Ir a muchas tiendas es una pérdida de tiempo	18,2	5,6	18,8
Siempre me atraen las cosas nuevas que salen al mercado	17,5	25,6	15,2
Para variar, compro en tiendas diferentes y elijo marcas distintas	13,8	28,9	18,2
<b>CONSCIENTE DEL PRECIO</b>	<b>1,09</b>	<b>1,08</b>	<b>1,16</b>
(-) No presto mucha atención al precio de lo que compro	15,1	21,1	14,5
Compro tanto como puedo en rebajas	69,8	75,6	72,7
<b>PLANIFICADOR</b>	<b>-0,19</b>	<b>0,60</b>	<b>-1,57</b>
Me gusta planificar antes de ir a comprar	66,2	60,0	51,5
Me gusta tomarme mi tiempo y comprar cuidadosamente	32,3	58,9	18,8
Trato de obtener tanta información como puedo antes de comprar algo	39,4	50,0	26,1
Me gusta comparar ofertas antes de elegir qué comprar	75,7	77,8	69,1
Intento asegurarme mucho de que siempre compro lo mejor	27,1	33,3	6,1
<b>DESCUIDADO</b>	<b>-1,72</b>	<b>-2,62</b>	<b>-0,85</b>
Con frecuencia realizo compras sin control de las que me arrepiento	5,8	5,6	12,7
A veces compro cosas sin pensar	52,0	50,0	69,1
A menudo compro sin pensar demasiado	12,6	6,7	34,5
Mis salidas de compras son tan rápidas como puedo	43,4	6,7	41,2
<b>INDEPENDIENTE</b>	<b>1,83</b>	<b>1,38</b>	<b>1,79</b>
Me considero un comprador independiente	70,8	62,2	66,7
Decido independientemente qué comprar y qué no	86,8	82,2	84,8
(-) Me gusta saber la opinión de los demás antes de comprar	16,0	25,6	12,1

#### 4.4. Comparación segmentos de consumidores españoles y finlandeses

Tanto en el caso de los españoles, como en el de los finlandeses se han obtenido tres segmentos diferenciados de compradores basados en sus estilos de compra. Sin embargo, sus características no son exactamente las mismas.

La principal diferencia que se encuentra entre los segmentos hallados en ambos países es que las dimensiones de *compra a distancia*, *consciente del precio* e *independencia* no permiten diferenciar los tres segmentos finlandeses. Es decir, estas dimensiones no son buenas diferenciadoras para el mercado finlandés, pero sí para el mercado español. Así, en todos los casos, el comprador finlandés se va a caracterizar por ser un comprador al que no le gusta comprar a distancia, muy consciente del precio y muy independiente. Sin embargo, en el caso del mercado español, sí que se encuentran diferencias respecto a estas dimensiones entre los segmentos descubiertos.

Si se analizan las diferencias entre los tres segmentos encontrados para cada país, se observa que dos de los tres segmentos obtenidos, *irracional* y *social*, a pesar de no mostrar unas características completamente idénticas, son compradores bastante parecidos, cuyas demandas son similares. Sin embargo, el tercer segmento es distinto para el caso de España y Finlandia. Mientras en España se ha identificado un segmento de compradores *racionales*, en Finlandia se ha encontrado un segmento de compradores *apáticos*.

Así, mientras los *racionales* se caracterizan por ser compradores muy planificadores, que prestan especial atención a lo que compran, los *apáticos* no planifican sus compras y son un poco descuidados. Sin embargo, ambos se caracterizan por ser compradores adultos, éticos, localistas, a los que no les gusta ir a tiendas llenas de gente o comprar acompañados, aunque la intensidad de estas dimensiones varía de unos a otros.

Como se hacía mención anteriormente, en ambos países se identifica un segmento de compradores *irracionales*, con porcentajes similares en ambas muestras (España con 31,61% y Finlandia con 28,45%) y características también afines. Se trata de compradores poco éticos y poco localistas, no preocupados por la calidad o la marca, siendo además descuidados y no planificando sus compras. Si bien, el comprador finlandés busca variedad y está compuesto principalmente por mujeres, frente al español que no está interesado en la variedad y está principalmente compuesto por hombres.

También se encuentra en ambos países el segmento de compradores *sociales*, con características similares. Se diferencia especialmente de los otros segmentos por tratarse de los compradores más sociales-recreacionales, además de ser muy éticos y muy localistas, así como muy consciente tanto de la calidad como de la marca, buscadores de variedad-novedad, planificadores y muy cuidadosos. Ambos segmentos están formados mayoritariamente por jóvenes.

## 5. Conclusiones

Durante los últimos cincuenta años, tanto académicos como profesionales del marketing, han utilizado las tipologías de compradores como una herramienta eficaz que permite identificar y satisfacer adecuadamente las necesidades de los consumidores (Angell *et al.*, 2012). Estos estudios habitualmente se han basado en los motivos de compra y las características del consumidor para construir taxonomías de comprador en diferentes contextos. Sin embargo, a pesar de aparecer de manera constante la necesidad de replicar y contrastar estas clasificaciones en diferentes países, hasta la fecha, muy pocas investigaciones se han centrado en las variaciones de los tipos de comprador en base a su cultura nacional. Además, debido al auge de internet, los últimos estudios realizados se enfocan en el análisis del comprador online, dejando olvidado al comprador tradicional, que representa aún hoy un gran porcentaje del mercado. Por todo ello, el objetivo de la presente investigación ha consistido en estudiar en profundidad las tipologías de compradores en España y Finlandia, permitiendo percibir las diferencias tanto entre países como dentro de cada uno de los países.

Para lograr estos objetivos, y tomando como referencia las diferentes tipologías de compra de la literatura, se han identificado diez características en el comprador, que son: social-recreacional, ético, local, a distancia, consciente de la marca-calidad, buscador de variedad-desleal, consciente del precio, planificador, descuidado e independiente. Al analizar las diferencias entre España y Finlandia, se ha encontrado que mientras el comprador español se caracteriza por ser

más social-recreativo, dependiente, planificador y leal, el comprador finlandés es más independiente y descuidado, gustándole realizar sus compras más rápidamente y sin planificarlas.

Sin embargo, el encuentro clave de esta investigación reside en los tres segmentos de mercado hallados en cada uno de los mercados, español y finlandés. Si se analizan las diferencias entre los segmentos, se observa que dos de los tres segmentos obtenidos en cada país (irracional y social) muestra características casi idénticas. Sin embargo, el tercer segmento es diferente. Así, mientras para España se ha identificado un segmento de compradores racionales, para Finlandia se ha encontrado un segmento de compradores apáticos.

Por tanto, de este estudio emerge que a pesar de existir claras diferencias culturales en las tipologías y segmentos de compradores, también se encuentran importantes semejanzas. Estos resultados son de gran relevancia para el mundo empresarial (ver apartado 6), aunque también lo son para el mundo académico y para aquellas instituciones preocupadas por el consumidor. Además, estudios futuros podrán hacer uso de las diez dimensiones obtenidas, así como de los segmentos que emergen a partir de ellas, y replicarlos en otros países y contextos.

## **6. Implicaciones empresariales**

El mercado de consumo es un mercado en constante evolución, que cada vez se presenta más diversificado. Como resultado de ello, existe una amplia variedad de productos y servicios disponibles para el consumidor medio, lo que implica que el proceso de toma de decisión del consumidor español es cada vez más complejo, emergiendo nuevos segmentos en el mercado. Así, uno de los aspectos más importantes del comportamiento del consumidor para las empresas es comprender cómo los consumidores realizan sus compras.

La información sobre los estilos de comprador, será particularmente útil para los minoristas y anunciantes. Perfilar a los consumidores mediante la combinación de sus estilos de toma de decisión proporciona información de gran utilidad para los minoristas en su lucha por atraer un gran número de compradores, así como en sus esfuerzos para prevenir la pérdida de sus clientes actuales.

Por otra parte, el consumidor medio está expuesto a cientos de anuncios al día, la mayoría de los cuales reciben una baja atención y comprensión por parte del consumidor. Desarrollar mensajes que capturen la atención del consumidor y generen una comprensión apropiada se convierte en uno de los mayores retos de los anunciantes. Los estilos de comprador proveen una forma más eficaz para identificar y comprender los diversos segmentos de decisores y orientar estrategias más adaptadas a sus gustos y necesidades, puesto que los anuncios en los que el consumidor se siente identificado, hacen que presten más atención, los comprenden mejor y crean una actitud positiva hacia la marca y hacia la intención de compra.

## **7. Limitaciones y futuras líneas de investigación**

Existen varias limitaciones que justifican las posibles líneas de investigación futuras.

En primer lugar, hay otros factores que pueden influir en las tipologías de comprador y que no se han tenido en cuenta, como el estilo de vida o el tipo de producto o servicio sobre el que se realiza la compra.

También hay que tener en cuenta que los datos utilizados en este estudio han sido obtenidos de COBEREN, por lo que los autores de este estudio han tenido un control parcial sobre las cuestiones realizadas.

Además, como en cualquier encuesta, se debe señalar la dependencia de los resultados de los datos aportados por los encuestados. Es importante reconocer que los participantes pueden no haber respondido con sinceridad a todas las preguntas, más al tratarse de una encuesta online donde no se sabe exactamente quién está respondiendo el cuestionario. Los encuestados pueden haber respondido de una manera socialmente aceptable o de la manera que ellos creen que coincide con las expectativas del investigador.

Algunas posibles líneas de investigación que surgen de las limitaciones del presente estudio, podrían dirigirse a responder las siguientes cuestiones:

- Cómo las tipologías de compradores pueden variar en función del tipo de producto o servicio que se vaya a adquirir
- Cómo las tipologías de comprador pueden variar dependiendo de si la compra es presencial u online
- Y si se ven las tipologías de comprador afectados por la situación y el contexto en el que se encuentra el consumidor

## ABSTRACT

*This present research analyzes the moderating role of the cultural dimensions of long-term orientation and individualism on the relationships between satisfaction online during the browsing, message involvement and perceived usefulness of the website on attitude toward the website. The sample comprised 491 users from Spain and United Kingdom. The findings indicate that the long-term orientation dimension moderates the relationship between satisfaction online and perceived usefulness and attitudes toward the website. However, the relationships between message involvement and attitudes toward the website, moderated by the individualism dimension, could not be confirmed as the scores were very similar for both samples.*

## KEYWORDS

*Attitudes toward the website, perceived usefulness, satisfaction online, message involvement, long-term orientation, individualism*

## 1. Introduction

The Internet, as a medium registering over 2,400 million users world-wide by the end of 2012 (Internet World Stats, 2013), has transformed the purchasing environment (Varadarajan & Yadav, 2002). Customers will browse a website only if they perceive it to be entertaining, informative and useful as they do not want to waste their time. The main mission of website designers is therefore to develop sites where customers can easily find the information they are looking for while also being entertained (Mazaheri, Richard & Laroche, 2013).

Users create their attitudes toward the website they are browsing depending on how useful they perceive it to be (Castañeda, Muñoz & Luque, 2007), the relevance of the information they find (Chen & Tsai, 2008; Yoon & Joo-Ho, 2001) and the satisfaction they feel during their browsing experience (McKinney, 2004; Szymanski & Hise, 2000).

Within this context, it is vital to take into account the cultural differences that exist in the different markets. As suggested by certain authors, the Internet may be considered to be the greatest contributor to the globalization of markets and to the sophistication and growing power of the consumer (Constantinides, Lorenzo-Romero & Gómez, 2010), thanks to its capacity to give users of different cultural profiles the opportunity to interact with firms located anywhere in the world. Given the wide reach of the Internet and the fact that culture impacts in consumers behavior (Davis, Wang & Lindridge, 2008), it is crucial to explore the role of culture in the reactions of online users when developing attitudes toward different websites.

The present research examines these two questions in some depth. The first goal is to analyze how satisfaction online during browsing, the degree of message involvement, and the perceived usefulness of the site all influence in the developing of attitude toward the website. The second goal is to study how the behavioral and emotional responses reflected in the attitude toward a website vary between users from different cultures (and thus with different value systems): (1) collectivism *vs.* individualism; and (2) long-term orientation *vs.* short-term orientation (Hofstede, 2001). To fulfill these objectives a promotional website was built, representing a fictitious tourist destination, and users from two countries with markedly different cultures were invited to browse the site with a view to putting together a tourism package. More specifically, the participants selected for the study were British Internet users (belonging to an individualist culture with a short-term orientation) and Spanish users (more collectivist and with a long-term orientation). The rationale for using a tourist destination as the sector for the study was that the websites of such destinations are visited by users from many different countries and cultures, who tend to have to browse standardized sites that are not adapted to their particular culture values and that are often presented in a language that is not their mother tongue.

## 2. Conceptual framework

### 2.1. *The influence of site features on attitudes toward a website.*

Many studies have focused on examining the influence of site features on online consumer behavior. Among the features that have been addressed are the global search function, humor, language options, the extent to which the layout is well or badly organized, the quality of the display, ordering policy, and customer feedback (Eroglu *et al.*, 2003; Hausman & Seikpe, 2009; Mazaheri *et al.*, 2013). These are divided into two categories. First, the interface features, such as text, font size and color or background music (Davis *et al.*, 2008) and a second category that contains items such as information and site effectiveness. The perception and the effect of the former on consumers, through message involvement (MI) or perceived usefulness (PU) are very important for firms. Mazaheri *et al.* (2013), following Eroglu *et al.* (2001), divided this category into two groups: high and low task-relevant cues. First, high task-relevant cues are related to the features that facilitate the acquisition target with the font used, font size, etc. And the latter, low task-relevant cues, are inconsequential to the completion

of the shopping task, such as those additional features of the design that would ensure visitors enjoy themselves while browsing the site (Eroglu *et al.*, 2001).

For this work, we selected website informativeness, related to message involvement, and website effectiveness, related to perceived usefulness, as high task-relevant cues. For the low task-relevant cue we chose the site's entertainment value, measured in terms of satisfaction online during browsing. Eighmey (1997) defines the Internet as an "Infotainment" medium, since information and entertainment are two essential elements of websites.

These three elements can be considered as antecedents of attitude toward the website. On the one hand, with regard to the involvement of users with the information contained on the site, if it is accurate, up-to-date and relevant, customers perceive the site to be more informative, and thus develop a positive attitude toward it (Chen & Tsai, 2008; Hausman & Siekpe, 2009; Yoon & Joo-Hoo, 2001). On the other hand, there is expected to be a positive and direct relationship between perceived usefulness and attitude toward the website, because the more useful a user perceives a website to be, the more positive their attitude toward it (Castañeda *et al.*, 2007). Finally, as several studies have shown, the subject's level of satisfaction online during browsing will positively affect their attitude toward the site (Bigné *et al.*, 2005; Castañeda *et al.*, 2009; Szymanski & Hise, 2000).

## 2.2. The moderating role of culture

Culture, from the point of view of many authors, may be considered one of the most abstract and difficult elements to measure that influences human behavior (Liu, Furrer & Sudharshan, 2001; Voss, Roth & Rosenzweig, 2004). The majority of cross-cultural studies in the field of management draw on the cultural framework developed by Hofstede (2001), as identified in various different works (Craig & Douglas, 2011; Engelen & Brettel, 2011; Taras, Steel & Kirkman, 2011). The model classifies cultures into five dimensions: a) *power distance* (POD), *uncertainty avoidance*, *individualism* (IND), *masculinity* (MAS) and *long-term orientation* (LTO). In light of this classification, it is to be expected that purchasing behavior on the Internet should be moderated by the country – and therefore the culture – to which the subject belongs.

The LTO dimension is the extent to which members of a society place great significance on values of thrift, persistence, and long-term alliances. It is also related to the importance the individual attaches to his/her time when seeking benefits from personal projects. An individual with a short-term orientation seeks immediate benefits and enjoys the moment, while one who has long-term orientation will make sacrifices in the present in order to secure future benefits. For this reason, satisfaction online, as an antecedent of attitude toward the website, will be more important for those subjects with a short-term orientation than for those with a long-term orientation (Sabiote, Frias & Castañeda, 2012a).

On the other hand, subjects who belong to cultures that focus on the long term prefer useful web sites, and they are prepared to spend time getting to know how a website is used so as to obtain benefits in the future (Alcántara-Pilar, Del Barrio & Porcu-García, 2013).

In light of these factors we submit the following research hypotheses:

*H<sub>1</sub>: There is a positive and direct relationship between satisfaction online and attitudes toward the website which will be greater for users belonging to short-term orientation cultures than for those belonging to long-term orientation cultures.*

*H<sub>2</sub>: There is a positive and direct relationship between the perceived usefulness of a website and attitudes toward the website which will be greater for users belonging to long-term orientation cultures than for those belonging to short-term orientation cultures.*

Meanwhile, the IND dimension is the extent to which the members of a society pursue primarily their own interests rather than that of others. In collectivism societies individuals look after the interest of their group before themselves. Collectivism is a high context culture and emphasizes causal reasoning and forming perceptions about social contexts and situational constraints (Davis *et al.*, 2008). Individualist and collectivist values create different symbolic-subjective cultures. On the one hand, individualist societies tend to place less importance on general information, emphasizing instead individual demands as a reflection of a low-context culture. On the other hand, collectivist cultures

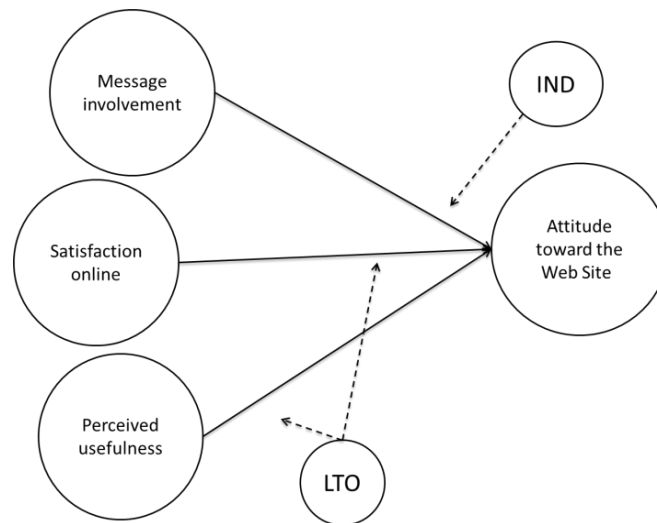

tend to promote group wellbeing, and place more emphasis on the social rather than the individual context; hence, they pay more attention to all of the information on offer via the website, not only the aspects that interest them individually (Oyserman, Coon & Kimmelmeier, 2002). For this reason, when comparing the two collectives, the individualist user will be more involved in all of the information presented on the website and will not solely focus on what they are looking for personally. Bu, Kim and Son (2013) compared users from the USA (individualists) with those from China and Japan (both collectivist cultures), and found that subjects' level of involvement with the product was directly related to this dimension, such that US users were less involved than the Chinese and Japanese users.

As a result, the positive relationships between message involvement and attitude toward the website, demonstrated by Chen and Tsi (2008) and Yoon and Joo-Hoo (2001), are likely to be higher for individuals from a collectivist culture because they value more highly than their individualist counterparts those websites that offer a high volume of content that can supplement the basic information, such as pictures, music, or reviews from other users. We therefore propose the following hypothesis:

*H<sub>3</sub>: There is a positive and direct relationship between user message involvement and attitudes toward the website, which will be greater for users belonging to collectivist cultures than for those who belong to individualistic cultures.*

The hypotheses can be summarized in the theoretical model in Figure 1.

FIGURE 1.  
Proposed theoretical model

### 3. Experimental design, data collection and measures

#### 3.1. Independent variable

In order to test the proposed hypotheses, a between-subjects experimental design was chosen, using one independent variable with two levels, namely: culture (Spanish vs. British). The choice of cultures for the experiment was based on cultural differences distinguished by using Hofstede's indices (Hofstede, 2001). Spain and Great Britain were selected due to their differences in the LTO and IND dimensions (LTO: Spain, 19 vs. Great Britain, 35; IND: Spain, 51 vs. Great Britain, 85).

#### 3.2. Experimental website design and sample selection

The experiment required a professional website to be purpose-built, with its own domain name, providing information on a fictitious tourist destination called Buyuada ([www.buyuada.org](http://www.buyuada.org)). A

fictitious location was devised with a view to avoiding a scenario in which subjects' previous awareness of, or attitudes toward, the destination might affect the results. The site was hosted via a domain pertaining to the researchers, enabling them to simulate natural browsing conditions at all times for the subjects. Two versions of the site were created – one written in Spanish and the other in English (see Figures 2 and 3).

The subjects were selected by an external company commissioned to establish an online survey panel for the experiment. Internet users from Great Britain and Spain were invited to participate. The external company made email contact with each panel member and were sent a link to the appropriate version of the website, together with instructions. The users were to browse through the website and put together their own tourism package based on an outward flight, a return flight, hotel accommodation, and a restaurant, from the multiple options on offer. The instructions explained to the users that they should complete the task of creating their package as if they really were going to undertake a trip to Buyuada, and that they should therefore process all the information on the website. This approach ensured that participants would have to read about the features of the different services on offer, which would oblige them to process the information to a significant depth of detail – an important condition when subsequently measuring the variables of perceived usefulness, satisfaction online, message involvement and attitudes toward the website.

FIGURE 2.  
Example of the home page of the website

FIGURE 3.  
Example of the Restaurants section of the website

Once browsing was complete, subjects were redirected to a questionnaire. The final sample was distributed by treatment, as follows: Spanish sample (228 subjects) and British sample (263 subjects). The sample was well balanced in gender terms, comprising 53% men (258) and 47% women (233). Finally, the sample represented an average age of 38.66 years (see Table 1).

TABLE 1.  
Sample by gender, age and culture

Spanish			
	Men	Women	N
18-24	11 (4.82%)	4 (1.75%)	15 (6.58%)
25-34	93 (40.78%)	42 (18.42%)	135(59.21%)
35+	51 (22.38%)	27 (11.85%)	78 (34.21%)
N	155 (67.98%)	73 (32.02%)	228 (100%)
British			
	Men	Women	N
18-24	11 (4.18%)	25 (9.50%)	36 (13.69%)
25-34	20 (7.60%)	55 (20.91%)	75 (28.52%)
35+	72 (27.38%)	80 (30.43%)	152 (57.79%)
N	103(39.16%)	160 (60.84%)	263 (100%)
Total sample			
	Men	Women	N
18-24	22 (4.48%)	29 (5.9%)	51 (10.39%)
25-34	113 (23.01%)	97 (19.75%)	210 (42.77%)
35+	123 (25.06%)	107(21.8%)	230 (46.84%)
N	258 (52.55%)	233 (47.45%)	491 (100%)

As regards educational level, the sample was divided into three sub-groups: primary-level education, secondary-level education, and university-level education. The highest percentage was for Higher Education (56.01% of the sample), followed by secondary-education qualifications (40.73%) and no qualifications (3.26%). In the case of both Spain and the UK, over 95% of users had secondary-level qualifications or a university education (AIMC, 2010; Office for National Statistics, 2010). These percentages were similar for both cultures (see Table 2).

TABLE 2.  
Sample distribution by educational level and culture

Culture	Primary-level education	Secondary-level education	University-level education
Spanish	7 (3.07%)	92 (40.35%)	129 (56.58%)
British	9 (3.42%)	108 (41.06%)	146 (55.51%)

To ensure that users came from Spain and the UK, Google Analytics was used during the data-collection phase (see Figure 4). To minimize the risk of contamination a strict criterion for participation was applied, in that any users who accessed the experimental website from outside the UK or Spain would automatically be excluded from the study.

### 3.3. Measures

All the measurement scales were adapted from validated instruments used in the literature. To measure satisfaction online during the browsing, a 7-point semantic differential scale was employed - as used by Szymanski and Hise (2001).

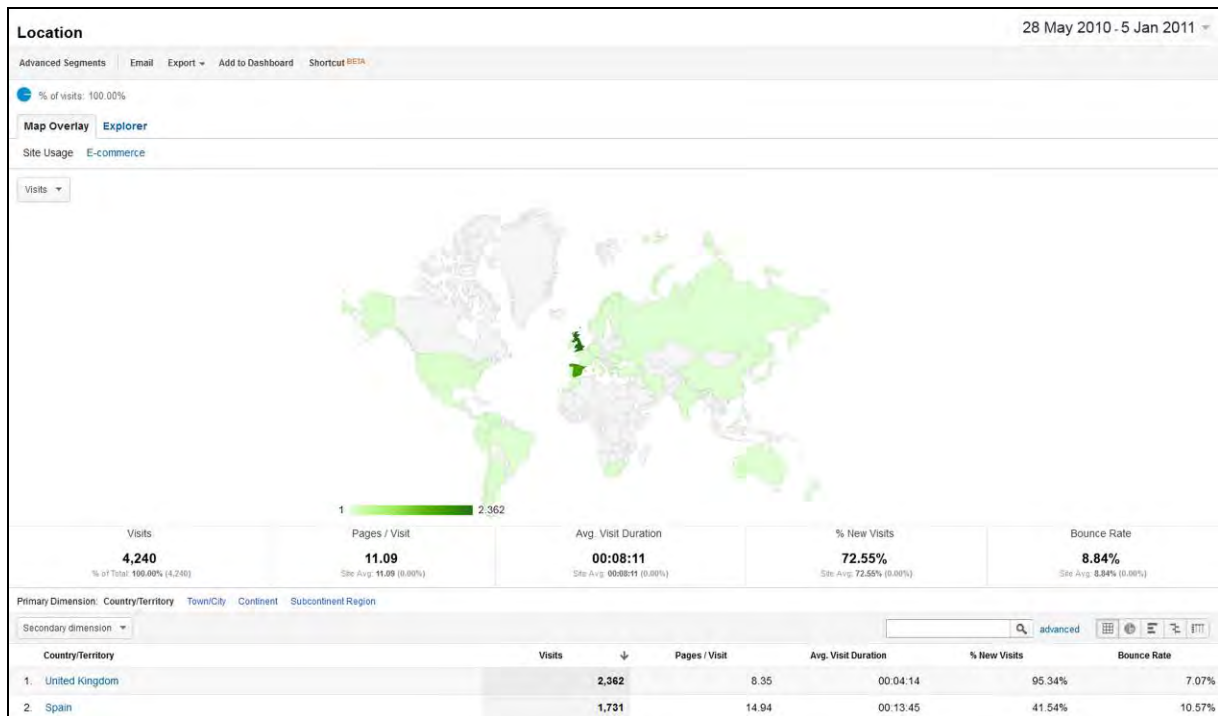

With regard to measurement of message involvement, perceived usefulness and attitudes toward website, 7-point Likert scales were used, on which 1 equaled *totally disagree* and 7 equaled *totally agree*. Message involvement was measured by a scale adapted from previous works (Malär, Krohmer, Hoyer & Nyffenegger, 2001; Schmitt, Zarantonello & Brakus, 2009; Zaichkowsky, 1985).

Attitude toward website was measured using the scale adapted from Chen, Clifford and Wells (2002). Finally, perceived usefulness was measured using the scale employed by Davis, Bagozzi and Warshaw (1989) in its scaled-down version by Koufaris, Kambil and Labarbera (2002) (see Annex 1).

The study also measured variables of a socio-demographic nature such as gender and age, together with the cultural dimensions using the VSM94 scale developed by Hofstede (2001)<sup>2</sup>.

<sup>2</sup> The complete questionnaire (VSM94) can be found on Professor Hofstede's website, together with the formulas for calculating cultural scores (<http://www.geerthofstede.nl/research--vsm>).

FIGURE 4.  
Google Analytics statistics during data-collection.

## 4. Findings

### 4.1. Standardization of cross-cultural studies and manipulation check for the cultural factor

When working with samples from different cultures it is important to address any issues arising from equivalence and deviation and take into account whether the scores obtained are comparable (Van de Vijver and Leung, 1997). The method proposed by Cheung & Resvold (2000) was applied, using factorial invariance analysis, examining whether members of both cultures gave equal weight to the different indicators used to measure the theoretical constructs. The results obtained revealed the existence of cultural response bias. In light of the most widely-used models proposed in the literature, it was decided that the 'standardization among cultures method' should be applied, which involves subtracting all values of each culture from the mean of the culture in question and then dividing it by the standard deviation (Fischer, 2004).

### 4.2. Manipulation check

Before testing the hypotheses we undertook a manipulation test for the experimental factor 'culture'. The cultural scores obtained for the sample Spanish sample were 88.37 (IND) and 58.25 (LTO). The British sample obtained 89 (IND) and 24.67 (LTO). These results allowed us to conclude the existence of cultural differences between the two subsamples for the case of the LTO dimension, although not for IND dimension whose scores were very similar.

### 4.3. Results

Testing the proposed hypotheses required us to estimate the proposed causal model by means of a multigroup SEM analysis (Spanish vs. British). To this end, we used the LISREL 8.8 program. The measurement model was found to be satisfactory, with all the items presenting individual reliability ( $R^2$ ) above 0.50, and composite reliability and average variance extracted values for the three scales being above recommended values (0.7 and 0.50, respectively). The overall goodness-of-fit indices revealed that the estimated multigroup model was quite acceptable (see Annex 2) (Hair & Anderson, 2010).

Likewise, the discriminant validity of the four constructs in each group was tested following the procedure proposed by Fornell and Larcker (1981), according to which the square root of the extracted variances must be greater than the correlations between constructs (see Table 3).

TABLE 3.  
Discriminant Validity

	Spanish					British				
	AVE	Perc. useful.	Satisf.	Mess. involv.	Att. toward the website	AVE	Perc. useful.	Satisf.	Mess. involv.	Att. toward the website
Perc. useful.	0.88	<b>0.94</b>				0.88	<b>0.94</b>			
Satisf.	0.77	0.69	<b>0.86</b>			0.79	0.72	<b>0.89</b>		
Message involv.	0.84	0.56	0.56	<b>0.92</b>		0.84	0.56	0.56	<b>0.92</b>	
Att. toward the website	0.78	0.88	0.69	0.58	<b>0.88</b>	0.79	0.76	0.72	0.55	<b>0.89</b>

\* Square root of AVE on the diagonal in bold. Correlations on the off-diagonal

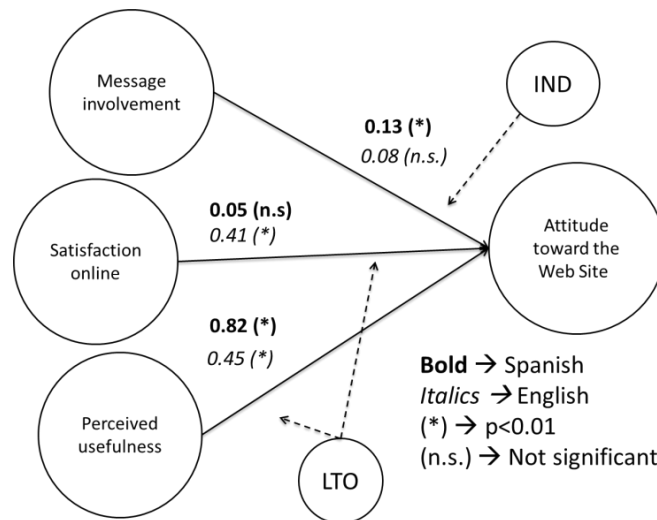

To test the proposed hypothesis we carried out an analysis of invariance between the parameters of the model in order to compare them between groups, using the Chi-squared differences test for this purpose (see Table 4).

The testing of H<sub>1</sub> and H<sub>2</sub> required us to compare the estimated parameters for group with high LTO and group with low LTO. H<sub>1</sub> proposed a positive effect of satisfaction online on attitude toward website, this being greater for British sample than for Spanish one. As can be seen in Table 4 and Figure 5, the coefficients were positive, significantly different between both groups and in the expected direction ( $\beta_{1\text{-Spanish}} = 0.05$ ;  $\beta_{1\text{-English}} = 0.45$ ), being this effect greater for British than for Spanish ( $p < 0.01$ ); hence H<sub>1</sub> is confirmed.

TABLE 4.  
Multigroup invariance analysis results (non-standardized parameters)

Relations	Spanish sample		English sample		Δ Chi-square (p-value)
	Parameter	t-value	Parameter	t-value	
Satisfaction online → Attitude toward website	0.05	0.77	0.45	4.92	14.0842 (p<0.01)
Perceived usefulness → Attitude toward website	0.82	11.05	0.44	5.01	8.3127 (p<0.01)
Message involvement → Attitude toward website	0.15	2.09	0.10	1.16	0.3284 (p>0.10)

**FIGURE 5.**  
**Estimated structural model (Common Metric Completely Standardized Solution)**

With regard to the relationship between perceived usefulness and attitude toward website, H<sub>2</sub> proposed that the relationship is positive and greater for Spanish sample compared to British one. The results showed coefficients in the expected direction ( $\beta_{2\text{-Spanish}} = 0.82$ ;  $\beta_{2\text{-English}} = 0.44$ ), being the parameter for Spanish significantly higher than for the UK shows ( $p < 0.01$ ), confirming H<sub>2</sub>. Confirmation of both hypotheses was due to the fact that the Spanish sample registers a higher score for LTO than British one.

Meanwhile H<sub>3</sub> propose basically the relationship between message involvement and attitude toward website, this being greater for British sample than for Spanish one. H<sub>3</sub> is not confirmed as no significant differences were observed between the coefficients of the relationship between message involvement and attitude toward website ( $\beta_{3\text{-Spanish}} = 0.15$ ;  $\beta_{1\text{-English}} = 0.10$ ;  $p > 0.10$ ). It is due to the fact that Spanish sample and British one register similar score in IND.

## 5. Discussion

### 5.1. Conclusions

The main objective of the present work was to examine the extent to which cultural differences between Spain and UK are able to moderate the influence of some of the key antecedent variables of attitude-formation and change of attitude toward a website (for a tourist destination, in this case). To date several works have addressed the antecedent effect of perceived usefulness (Lee et al., 2003), satisfaction (Sabiote, Frias & Castañeda, 2012a) and message involvement (Chen & Tsai, 2008; Hausman & Siekpe, 2009; Yoon & Joo-Hoo, 2001) on the formation of attitudes toward a website. However, no other works have examined the combined effect of the three variables moderated by the cultural dimensions of IND and LTO. We believe it is of both theoretical and practical interest to adopt a holistic approach to examining the degree to which users from cultures with different levels of IND and LTO also differ when forming their attitudes toward the website they are browsing.

Analysis of the results reveals that the user's culture moderates attitude-formation. Using Hofstede's cultural dimensions as a reference point, we can conclude that the differences in LTO partly explain the formation of user attitudes toward the website. Users belonging to cultures such as that of Spain, with a high LTO, attach more importance to perceived usefulness than users with a lower LTO score, such as the British culture. British users attach more importance to variables such as satisfaction online, which develops positive attitudes toward the website, than Spanish users. Furthermore,

regarding the relationship between message involvement and attitude toward the website, conclusions could not be drawn as both samples presented very similar scores for IND.

One original feature of our work compared to earlier studies is that we did not simply assume that Spanish and British users have different IND and LTO values, as per the seminal work of Hofstede (2001). Rather, we endeavored to examine via the sample to what extent those original cultural scores remain true today. By contrast, other studies have used the original values obtained by Hofstede (2001) as their cultural reference framework, without confirming their validity in the samples they use (Karahanna, Williams, Polites, Liu & Seligman, 2013; Lim, Yeow & Yuen, 2010); indeed this is one of key criticisms typically leveled at cross-cultural studies. In the present work, however, before users were submitted to the experimental treatment they were given a questionnaire designed to capture their cultural values, in line with the VSM94 scale proposed by Hofstede (2001). This step made it possible to detect similarities between the British and Spanish in the IND dimension, contrasting with the original values obtained by Hofstede which were markedly different. This enabled us to test that in the sample of Internet users that we selected there were no major differences in the IND dimension, which undoubtedly affected the results obtained for the relationship between website message involvement and attitudes toward the site. These results demonstrate, in cross-cultural studies, the importance of testing the cultural values present in the samples used rather than simply relying on the original scores ascertained by Hofstede (2001), so as to avoid erroneous conclusions being drawn from the data analysis.

A further contribution of the present work is the fact that it was based on an experiment using a website promoting a fictitious tourist destination presented in two versions (depending on the mother tongue of the sample user group) and designed to encourage users to browse freely while putting together a tourism package. This approach sought to create a task in which information-processing during the experiment would be as similar as possible to a real-life browsing scenario and contracting process for tourists. By contrast, other works in the cross-cultural sphere have focused only on inviting subjects to complete a questionnaire, without previously having undertaken a complete and detailed browsing process (Li & Huang, 2009; Noh, Lee, Kim & Garrison, 2013).

Similarly, there are few works to date that have examined the moderating role placed by the LTO cultural dimension in online information-processing and attitude-formation. The present study demonstrates that this dimension affects the antecedent relationships of attitude and thus is worthy of greater attention in academic cross-cultural research. In this regard we hope these findings will serve as a foundation on which future research can build.

### *5.2. Managerial implications*

The findings derived from the present study have important implications for both web designers and marketing managers, particularly in the tourism sector. National culture has been found to be of major importance in the formation of attitudes in the online context. This is of particular interest for this sector as the potential tourists who visit destination or hotel websites come from many different countries and cultures. If marketers and website designers can better understand how cultural factors affect tourist attitudes, this will enable them to market their destinations and services more effectively. For example, for users belonging to a culture very similar to that of Spain, it is essential to develop useful websites to generate positive attitudes toward the sites. These users do not care so much about enjoyment during their browsing time as do those from cultures similar to that of the UK.

Meanwhile, users from cultures similar to that of the UK (who therefore have less of a short-term orientation) look to achieve results as quickly as possible. This explains why, for them, the effect of satisfaction with the browsing experience on the ultimate formation of attitudes toward the website is greater than for Spanish users. By contrast, the Spanish are more concerned with finding usefulness over the long-term during their browsing and are more willing to invest time in processing information, with a view to securing greater usefulness in the future.

Previous studies (Alcántara-Pilar and Del Barrio-García, 2013) have identified that LTO has a moderating effect on the formation of loyalty toward websites. Our work indirectly corroborates this finding, to the extent that attitude is one of the key determinants of user behavior, as asserted by many

other works from the last few decades (Vakratsas and Ambler, 1999). This finding shows how important it is that firms marketing their products over the Internet, and more specifically managers of accommodation or tourist destination websites, create positive browsing experiences that lead to a high level of satisfaction and perceptions of usefulness. This is particularly important in the case of users from cultures with a high LTO due to the benefit of this approach in terms of attitude and, in turn, loyalty.

In light of our findings, it is important to note that many firms mistakenly believe that adapting the website to the user simply involves translating the content, when the academic literature has shown that this is insufficient (Okazaki, 2004a, 2004b, 2005; Okazaki & Alonso, 2002; Okazaki & Skapa, 2008). It is a common mistake among many firms operating in international markets to think that simply translating website content or even the information they convey via their social network profiles is an adequate means of adapting their offer to an international audience. Marketers and advertisers need to be aware of the importance of cross-cultural differences when designing their online presence, as the Internet is a place well suited to creating a rich product experience (Evans & Wurster, 1999; Okazaki, 2004b). An in-depth study of the differentiating elements between cultures, and its application to the website, would enable firms to achieve the so-called ‘come&stop’ effect (Coyle & Thirson, 2001) whereby consumers enter the website and stop, satisfied that their search is over. Therefore, in addition to a simple translation it is important to adapt the entire structure of the website and its content according to the culture of those users the site needs to appeal to (Alcántara *et al.*, 2013).

### 5.1. Limitations and future research

The main limitation of this study is the comparison of only two cultures, Spain vs. the UK. However, this limitation is justified by the complexity of the experimental design and the cost of extending the study to other cultures. Importantly, much of the cross-cultural research of the last few years has been based on comparing two cultures presenting different cultural dimensions (Benet-Martínez, V., Lee, F. & Leu, J., 2006; Chai & Pavlou, 2001; Jin, Park & Ki, 2008; Mazaheri *et al.*, 2011; Noriega & Blair, 2008; Sabiote, Frías & Castañeda, 2012a, 2012b; Singh, 2006 ; Sun, 2006). In this sense, a possible line of research for the future could be to extend the comparison to users from cultures with different values in the IND and LTO dimensions.

Another limitation is the fact that the sample we analyzed showed similar values for the IND dimension. It is not clear whether this is due to the characteristics of the final sample or if it is a genuine result of the growth in IND that is being witnessed among Internet users due to the globalization process indicated by Hofstede *et al.* (2010). Therefore, future research could focus on solving the above limitations.

Universidad de Granada

## RESUMEN

*Esta investigación pretende analizar el impacto de los descuentos y regalos online sobre el recuerdo de la marca, así como explorar la influencia del perfil sociodemográfico del internauta sobre dicho nivel de impacto. Los resultados obtenidos indican que los descuentos favorecen el recuerdo del producto frente a los regalos online que favorecen el recuerdo de la marca y el producto simultáneamente. A su vez, los individuos que más recuerdan la marca tras visualizar un descuento son jóvenes, estudiantes o trabajadores por cuenta propia y con ingresos bajos. Sin embargo, los que más recuerdan la marca tras visualizar un regalo online son de edad media, preferentemente hombres con un nivel de formación alto, trabajadores por cuenta ajena e ingresos medio-altos. Esta investigación ayuda a profundizar en el perfil del internauta más adecuado para cada acción promocional online.*

## Palabras clave:

Promoción de ventas online, Recuerdo del Internauta, Recuerdo de producto, Recuerdo de marca, Perfil sociodemográfico.

## 1. Introducción

Según los últimos datos proporcionados por ZenithOptimedia, la publicidad online creció en torno al 16,2% durante 2013 y se prevé un crecimiento medio anual para el periodo 2014-2016 del 16% (ZenithOptimedia, 2014). Cada minuto, en la Red, estamos expuestos a miles de impactos publicitarios cuya finalidad va desde darnos a conocer una determinada marca o producto hasta persuadirnos para que nos hagamos amigos de su página en Facebook. Ante esta situación, distintos informes y estudios basados en métricas como el Click Through Rate –CTR parecen indicar que la publicidad online en la actualidad comienza a sufrir los mismos síntomas que la tradicional, esto es la pérdida de eficacia como consecuencia de su alta saturación con valores de CTR inferiores al 0,3% en toda Europa (IAB, 2011).

Para tratar de solventar este problema, las empresas innovan cada vez más en el uso de herramientas y formatos de comunicación distintos y creativos que llamen la atención del usuario y lo inciten a procesar el mensaje emitido. Muchas de ellas han optado por utilizar la promoción de ventas online como forma de incrementar su visibilidad convirtiéndola en una de las herramientas más utilizadas online (emarketer.com, 2011). Alrededor de 7,7 millones de internautas españoles han utilizado alguna vez los cupones proporcionados por sitios de compra colectiva y un 25% de ellos buscan expresamente este tipo de incentivos promocionales (Nielsen, 2011). Entre las ventajas que aporta esta herramienta de comunicación a los anunciantes se encuentran el ofrecimiento de un valor añadido que lleva al internauta a procesar más profundamente el mensaje contenido en ella. Esto ayuda a la marca a diferenciarse de la competencia y a incrementar la eficacia de sus comunicaciones online.

Este incremento en la atención que proporciona la promoción de ventas online influirá en el recuerdo del mensaje, la marca y el producto (Crespo-Almendros y Del Barrio-García, 2014). La generación de recuerdo de marca es un elemento esencial en la construcción de notoriedad e imagen de marca, además de ser considerado como uno de los mayores predictores del comportamiento de compra online (Lim et al., 2011). Así pues, el estudio del impacto de las acciones de promoción de ventas online sobre el recuerdo del internauta se constituye como un objetivo principal y primordial de los responsables de comunicación, sobre todo por su impacto sobre la notoriedad e imagen de marca y, por ende, sobre el valor de marca.

Aunque existen algunas investigaciones acerca del impacto de la publicidad online sobre el recuerdo y el reconocimiento de los propios anuncios (Danaher y Mullarkey, 2003; Dahlen, 2002; Gong y Maddox, 2003; Lee y Thorson, 2009; Van Steenburg, 2012; Yoo, 2007), son pocos los estudios existentes que aborden el impacto que este tipo de mensajes publicitarios centrados en incentivos promocionales online generan sobre el recuerdo de la marca, el mensaje o el producto (Crespo-Almendros y Del Barrio-García, 2014,; Hupfer y Grey, 2005).

Al margen del posible gap existente en la literatura acerca del impacto de este tipo de publicidad en el recuerdo, también se conoce poco sobre qué tipo de moderadores pueden estar afectando dicha relación. Revisando la literatura sobre promoción de ventas, parece claro que uno de los principales moderadores del impacto de la promoción de ventas online es el tipo de incentivo utilizado. Cada tipo de promoción de ventas online (descuentos vs regalos) provocará un procesamiento distinto del mensaje (Buil et al., 2013; Nunes y Park, 2003) y, por tanto, deberá afectar al recuerdo del mismo de forma diferente.

De otro lado, es posible considerar como otras variables moderadoras las relacionadas con el perfil sociodemográfico del destinatario. Investigaciones previas han demostrado que el perfil sociodemográfico de los usuarios afecta a su respuesta ante la promoción de ventas tanto en Internet como fuera de ella (Huff y Alden, 1998; Kang et al., 2006; Chiou-Wei e Inman, 2008).

Así pues, el presente estudio pretende profundizar en el análisis del impacto de los mensajes publicitarios sobre descuentos y regalos online en el recuerdo de la marca, así como analizar y explorar la influencia que tienen distintas variables sociodemográficas del internauta sobre dicho nivel de impacto. Se pretende analizar cuál es el perfil del internauta que mejor recuerda la marca, el producto y el mensaje online y si existen diferencias en dicho perfil en función de si se ha visualizado una publicidad sobre un descuento o un regalo online. Esta investigación aporta una contribución

adicional a la literatura existente sobre promoción de ventas online dado que, a día de hoy, no se conocen otros trabajos que analicen el perfil del internauta que presenta un mayor nivel de recuerdo frente a los descuentos y los regalos online.

## **2. Revisión de la literatura**

### ***2.1. Importancia de la medición del recuerdo online***

Diversos estudios sobre el estado actual de la eficacia publicitaria online parecen arrojar síntomas de sobresaturación y, por tanto, de pérdida de eficacia del medio. De ser así, cabe preguntarse ¿por qué las empresas y sus gestores siguen invirtiendo en publicidad y promoción de ventas en este medio e incluso incrementando la inversión destinada a este medio cada año? Muchos autores responden a esta pregunta trasladándonos a las medidas clásicas de eficacia publicitaria. Según los mismos, la publicidad online tiene una serie de fines distintos y complementarios al cambio de comportamientos del internauta tales como la generación de notoriedad, imagen de marca, etc. Por tanto, su eficacia publicitaria no puede ser medida únicamente con variables comportamentales sino que habrá que utilizar métricas tradicionales de medición de eficacia publicitaria (Beerli y Martin, 2010; Machanda et al., 2006). A este respecto, la medición del recuerdo es clave como elemento constructor de imagen de marca y ventas a corto plazo. Buena prueba de ello es que los responsables de marketing incluyen la generación de notoriedad y reconocimiento de marca como dos de los objetivos primordiales para su plan de marketing online (Hollis, 2005).

El primer paso para que una marca se instale en la mente del consumidor y termine influyendo sobre su proceso de toma de decisiones es que dicho consumidor sea capaz de reconocer y recordar la marca como proveedora de un servicio o producto concreto (Vakratsas y Ambler, 1999). En el caso de la publicidad online sobre un descuento o regalo una vez que el estímulo ha sido capaz de captar la atención del internauta y generarle un cierto interés para que procese la información contenida en el banner se accionarán los mecanismos de almacenamiento de la información vista generando o influyendo sobre el recuerdo. Los autores demuestran que la simple exposición al mensaje online tiene efectos sobre la memoria del consumidor en términos de recuerdo y reconocimiento de la marca, el producto y el mensaje (Dahlén et al., 2003; Hollis, 2005; Moore et al., 2005; Shamdasani et al., 2001).

### ***2.2. El efecto de la promoción de ventas online sobre el recuerdo del internauta***

A pesar de la importancia del recuerdo como medida de la eficacia promocional online, son pocas las investigaciones existente hasta fecha (Chen, 2004; Hupfer y Grey, 2005). La mayoría de estudios encontrados sobre promoción de ventas online se limitan al análisis de su eficacia en términos de redención de cupones (Cheng y Dogan, 2008; Chiou-Wei y Inman, 2008; Chtourou et al., 2002; Kang et al., 2006). Para los medios tradicionales, los estudios concluyen que los anuncios que incluyen información sobre una promoción de ventas incrementan la probabilidad de que el consumidor recuerde el anuncio (Gati y Tversky, 1987).

A nivel publicitario, Shankar y Hollinger (2007) argumentan que solamente un pequeño porcentaje de los individuos que son expuestos a un anuncio Web son capaces de recordar su contenido (incluyendo la marca) y de interactuar con él. Más de la mitad de los internautas no prestan atención a los anuncios Web, al menos atención consciente (Dreze y Hussherr, 2003). Navegan por el site en el que se ubica el banner sin percibir de forma consciente su existencia. Sin embargo, es posible que el efecto de la publicidad online sobre el recuerdo no siempre sea el mismo, la literatura se ha centrado en analizar las distintas variables que moderan el efecto sobre el recuerdo del mensaje publicitario online (Lim et al., 2011; Lohtia et al., 2007). Los autores consideran que entre los factores que pueden afectar al recuerdo publicitario se encuentran el tipo de atención prestada (Chandon et al., 2003; Lim et al., 2011), la experiencia de uso Web (Dahlen, 2002), el tipo de publicidad y las necesidades de cognición (Van Steenburg, 2012) o la actitud hacia el Website (Danaher y Mullarkey, 2003; Menon y Soman, 2002). De otro lado, las propias características del banner también influyen sobre la habilidad del individuo para recordar el anuncio. El mensaje, la información sobre la promoción y la actitud hacia el mensaje comunicado a través del banner influirán directamente sobre el recuerdo del anuncio y sobre la notoriedad de marca alcanzada (Dreze y Hussherr, 2003; Goldsmith y Lafferty, 2002). Por tanto, la

promoción de ventas online afecta al recuerdo de la marca, el producto y el mensaje. El interés despertado por el banner promocional se traducirá en un procesamiento o decodificación de la información contenida en el mensaje, que será traducida y almacenada en forma de asociaciones o adjetivos de marca (Chtourou et al., 2005), favoreciendo así el recuerdo. Chen (2004) concluye que los individuos expuestos a una promoción de ventas recuerdan un mayor número de ítems que aquellos no expuestos y, por tanto, que la promoción de ventas incrementa el recuerdo. Además, puntualiza que entre las variables que influyen sobre el recuerdo de la promoción de ventas se encuentra la incertidumbre. En aquellas situaciones en las que la promoción es incierta se recuerdan un mayor número de características que en aquellas otras en las que la promoción es cierta. También, cuanto más difícil es la elección por parte de consumidor se recuerdan un mayor número de características.

A su vez, tal y como se ha demostrado, las experiencias emocionales son más recordadas por los individuos (Coyle y Thorson, 2001; Hoffman y Novak, 1996), por tanto, aquellas promociones de ventas online capaces de generar experiencias gratificantes para el consumidor incrementarán el recuerdo sobre aquellas que no lo hacen. Según Gilbert y Jackaria (2002) y Ndubisi (2005) no todas las promociones de ventas servirán para incrementar la notoriedad y el recuerdo de marca previo a la compra. Consideran que si la promoción es lo suficientemente perceptible facilitará el reconocimiento y el recuerdo de marca para compras futuras. A este respecto, Crespo-Almendros y Del Barrio-García (2014) concluyen que los descuentos en precio y, en general, las promociones monetarias online son especialmente buenas para centrar la atención del internauta en el producto promocionado incrementando el nivel de recuerdo de éste frente a sus homólogas no monetarias. Sin embargo, las promociones hedónicas serán especialmente buenas para conseguir altos niveles de recuerdo de producto y marca conjuntamente. Otra variable que afecta al nivel de recuerdo alcanzado con la promoción es la congruencia entre el Web site anfitrión y el producto ofrecido en la promoción online. Moore et al. (2005) demuestran que la incongruencia entre el sitio Web anfitrión y el producto ofrecido en un banner online provoca un mayor nivel de recuerdo y reconocimiento del mismo aunque su efecto sobre las actitudes hacia el sitio y el banner es menor que en el caso de existir congruencia.

Así pues, la promoción de ventas online parece afectar al recuerdo de la marca, al producto y a la oferta promocional, dependiendo dicho efecto del tipo de promoción de ventas empleado (descuentos vs regalos), entre otras variables.

A partir de lo anteriormente expuesto proponemos la siguiente hipótesis de trabajo:

*H1: La publicidad online sobre descuentos genera un nivel de recuerdo de marca inferior que la publicidad online sobre regalos*

### **2.3. Influencia del perfil del internauta sobre el recuerdo generado por los descuentos y los regalos online**

Si tal y como se ha comentado la eficacia de la promoción de ventas online en términos de recuerdo depende de su capacidad para generar experiencias gratificantes y de su nivel de congruencia con los objetivos buscados por el internauta, cabe preguntarse: ¿qué perfil sociodemográfico tendrán los individuos que mejor recuerden los elementos contenidos en la publicidad de un descuento o regalo online?

El estudio “NetRadar” realizado por ZenithOptimedia (2012) pone de manifiesto que no todos los internautas presentan los mismos niveles de recuerdo. Las características del internauta afectan de forma significativa a su recuerdo de las informaciones comerciales vistas online. Durante décadas, los científicos han analizado como los estilos de procesamiento de la información difieren en función de una serie de variables demográficas tales como el género. La mayoría de las diferencias encontradas se han atribuido a fuentes biológicas o sociológicas (Darley y Smith, 1995). Según estas investigaciones los hombres procesan de una forma más analítica y lógica mientras que las mujeres son más subjetivas e intuitivas (Broverman et al., 1968; Poole, 1977). Además, las investigaciones aseguran que los hombres tienen un estilo de atención distinto llevándolos a ser más selectivos o a utilizar “efficiency-striving heuristics information”. Por tanto, es de esperar que el nivel de recuerdo por tipo de género sea distinto ante una acción de comunicación online. Autores como Banerjee et al. (2011) demostraron que el género es una variable moderadora del efecto de las promociones de ventas sobre el recuerdo.

Con respecto al nivel de ingresos, el estado laboral y el nivel de estudios no se han encontrado investigaciones que analicen su influencia sobre el recuerdo de la promoción de ventas online. Sin embargo, la literatura tradicional sobre promoción de ventas ha venido asegurando que dichas variables afectan de forma significativa al efecto de la promoción de ventas sobre las variables cognitivas, actitudinales y comportamentales del consumidor. La percepción de los beneficios y de los costes asociados con la adquisición de productos en promoción dependerá de las características personales del individuo (Mittal, 1994; Ailawadi et al., 2001). Teel et al. (1980) hallaron que los usuarios de promociones de ventas y, en concreto de cupones, son más jóvenes, pertenecen a familias más numerosas y poseen mayores ingresos que los no usuarios.

Dotson y Hyatt (2000) analizaron si diferentes características demográficas influyen en la actitud hacia la promoción de ventas y en el uso de la misma, en función del tipo de promoción utilizada. Obtuvieron que los individuos con una mayor probabilidad de utilizar la promoción de ventas eran aquellos que no estaban casados, eran jóvenes y de raza negra. Los individuos casados y más mayores parecen presentar una conciencia del descuento menor y, quizás, son más propensos a comprar al precio acostumbrado, probablemente, porque poseen una menor presión financiera.

Lee y Brown (1985) encontraron que a mayores ingresos más probabilidad de utilizar cupones. Sin embargo, Bawa y Shoemaker (1987) encontraron que el efecto de esta variable no era significativo. Mittal (1994) destaca que el estado laboral de la persona puede reducir la probabilidad de utilizar cupones, debido, sobre todo, al efecto que dicha variable puede tener sobre el tiempo disponible para realizar actividades promocionales. Strober y Weinberg (1980) hallaron que para las mujeres trabajadoras la probabilidad de utilizar cupones era menor que para las no trabajadoras.

Finalmente, el nivel de educación también ha sido analizado como posible determinante del uso de cupones. Los consumidores con un nivel de educación mayor buscan más variedad, tiene menores costes de sustitución y podrían utilizar más cupones. Según Bawa y Shoemaker (1987) los consumidores con niveles de educación más altos son de media más usuarios de cupones. De acuerdo a la revisión de la literatura anterior proponemos las siguientes hipótesis de investigación:

*H2: Existen diferencias en el perfil sociodemográfico de los usuarios que recuerdan la publicidad según el tipo de incentivo promocional online en el que se basen (descuentos vs regalos)*

### **3. Estudio Empírico**

#### ***3.1. Variable independiente***

Para contrastar las hipótesis se llevó a cabo un diseño experimental basado en la observación del comportamiento del individuo y completado con una encuesta asistida por ordenador. La variable independiente fue el tipo de incentivo promocional utilizado en el mensaje publicitario: descuento vs regalo.

#### ***3.2. Selección del producto, diseño de los incentivos y pretest***

El producto seleccionado fue un billete de avión. Esta decisión estuvo avalada por el hecho de que según el estudio “Comercio electrónico B2C” (ONTSI, 2011) el 52,4% de los artículos comprados online durante 2010 fueron billetes de transporte.

Para el diseño de los dos tratamientos experimentales se optó por simular las condiciones más habituales de exposición de los sujetos durante la navegación Web, utilizando como vehículo de comunicación de los incentivos promocionales un banner alojado en la página Web de un Diario digital nacional. La selección de los incentivos promocionales (descuento vs regalo) para cada banner se realizó tratando que fueran concordantes con los beneficios buscados por el internauta (disfrute, diversión, etc.), percibidos como del mismo valor monetario y congruentes o complementarios con el producto ofrecido como forma de incrementar su capacidad para captar la atención del consumidor.

Para ello se llevó a cabo un pretest con 90 estudiantes para comprobar a priori que los dos incentivos eran percibidos como del mismo valor monetario (en torno a 120€). Los incentivos finalmente escogidos fueron un descuento de 120 € y el regalo de dos noches en un hotel nacional (véanse figuras

1 y 2). Asimismo, dicho pretest permitió comprobar que el producto elegido, un billete de avión, era percibido principalmente como utilitario o hedónico, utilizando para ello el procedimiento propuesto por Batra y Ahtola (1990). El análisis de datos mostró que el producto billete de avión obtuvo un índice de -0,1271 en una escala de -7 a 7 pudiendo concluir que tanto la componente utilitaria como la hedónica estaban presentes en ese producto, si bien la componente hedónica parecía ser la dominante.

Publicidad promocional sobre un descuento

FIGURA 2  
Publicidad promocional sobre un regalo

### 3.3. Desarrollo del experimento y composición de la muestra

El experimento se llevó a cabo en dos provincias españolas diferentes, ya que como consecuencia del tipo de producto elegido era posible que existieran diferencias en la respuesta entre los sujetos pertenecientes a provincias con aeropuertos grandes y aquellas con aeropuertos pequeños o sin aeropuertos. Teniendo en cuenta el número de pasajeros registrados en los aeropuertos se seleccionaron como ciudades para llevar a cabo el trabajo de campo la ciudad del principal aeropuerto nacional y otra ciudad con uno de los aeropuertos que ocupan el último lugar del ranking según el informe anual de 2010 de AENA (AENA, 2012). Con el fin de evitar los problemas derivados de la selección de los sujetos en el medio Internet y tratar de extrapolar en la medida de lo posible los resultados obtenidos se decidió seleccionar a los integrantes de la muestra, internautas en todo caso, de forma aleatoria en la calle y no a través de la Red, manteniendo cuotas de sexo y edad proporcionales a la población española.

Concretamente, el experimento consistió en mostrar al individuo la página Web del diario El Mundo.es en la que debía navegar de forma natural durante un tiempo máximo de 10 minutos. En ese tiempo el internauta podía ver el banner promocional asignado que estaba alojado en dicha página Web. Ante la imposibilidad de poder ubicar en realidad los tratamientos experimentales en la página de ese Diario digital, se recurrió a la ayuda de un experto ingeniero informático que creó una aplicación Web capaz de capturar en tiempo real la página Web y llevarla a una URL propia ubicada en un servidor y sobre la que sí se tenía plena autonomía para hacer aparecer los tratamientos. La aplicación Web consistió en 2 *frames*, en uno se cargaba la Web de El Mundo.es en tiempo real y en el otro aparecía el tratamiento promocional. Mediante la combinación de ambos se conseguía que aparecieran los tratamientos sobre la Web del diario en cuestión. El usuario expuesto al experimento era incapaz de percibir que estaba fuera del sitio Web del diario digital ya que lo que visualizaba era el contenido real existente en dicho instante, sólo que copiado y ubicado en otra URL distinta que el sujeto no veía. En el caso de que los usuarios cliquearan en el banner les saltaba el cuestionario. En el caso de que no cliquearan transcurridos los 10 minutos se le pedía que rellenase dicho cuestionario.

La muestra final estuvo compuesta por 445 individuos, de los que el 57,5% fueron hombres y el 42,5% mujeres, con edades comprendidas entre los 19-34 años (73,3%) y más de 34 años (26,7%). La mayoría tenía ingresos mensuales inferiores a 1,500€, y utilizaban el e-mail, e Internet varias veces a la semana, todos los días o varias veces al día (véase tabla 1).

TABLA 1

**Descripción de la muestra**

Género	Hombre	57,5%
	Mujer	42,5%
Edad	de 18 a 24	49,7%
	de 25 a 34	23,6%
	de 35 a 44	7,9%
	Más de 44	18,9%
Ingresos mensuales	hasta €499	57,3%
	€500-€999	10,6%
	€1,000-€1,499	15,5%
	€1,500-€1,999	8,1%
	€2,000-€2,499	4,3%
	Más de €2,500	4,2%

**3.4. Medidas**

El **recuerdo del internauta** acerca de la publicidad del descuento o del regalo online fue medido utilizando el tipo de recuerdo registrado. Para ello, se codificó el recuerdo espontáneo del individuo en 4 categorías denominadas: (0) No recuerda nada, cuando el individuo decía no recordar ningún anuncio visualizado durante su navegación; (1) Recuerdo de producto, cuando el individuo recordaba haber visto un anuncio de billetes de avión; (2) Recuerdo de marca y producto, cuando el individuo decía haber visto un anuncio de billetes de avión de Iberia; (3) Recuerdo de marca, producto y mensaje (3) cuando el individuo recordaba el descuento o el regalo visto para volar con Iberia.

Son diversos los estudios que demuestran que la familiaridad con la marca y la propensión a la promoción son dos de los principales moderadores de la respuesta del consumidor a la promoción de ventas (Bagozzi, 1981; DelVecchio et al, 2006; Palazón y Delgado, 2009; Yi y Yoo, 2011). Por este motivo, se decidió controlar ambas variables para garantizar que los distintos grupos experimentales no presentaran diferencias con respecto a estas variables. Con este fin, la **familiaridad con la marca** se midió utilizando una versión adaptada de la escala propuesta por Gefen (2000), consistente en un ítem tipo Likert de 1 a 7: “¿Cómo de familiar considera la compra de billetes de avión de la marca Iberia? Para medir la **propensión a la promoción de ventas** se utilizó la escala propuesta por Lichtenstein et al. (1993) y aplicada por Palazón and Delgado (2011) al mismo área geográfica: (1) Tengo marcas favoritas pero la mayor parte de las veces compro la marca que está en promoción; (2) Debería comprar la marca que está en promoción; (3) Es más probable que compre esta marca que está en promoción; (4) Comparado con mis familiares y amigos, es más probable que compre la marca que está en promoción.

Por último, se midieron variables sociodemográficas tales como el género, la edad, la situación laboral, el nivel de estudios y el nivel de ingresos. Para ello se utilizaron las escalas utilizadas en la encuesta Navegantes en la Red realizada por la AIMC (AIMC, 2010).

**4. Resultados****4.1. Chequeo de manipulación**

Para comprobar que los incentivos utilizados eran percibidos como de igual valor monetario se utilizó el procedimiento establecido por Nunes y Park (2003) y utilizado más tarde por Palazón y Delgado (2005). El test t llevado a cabo corroboró la inexistencia de diferencias significativas en el valor percibido de los distintos incentivos, lo que nos permitió confirmar que el incentivo basado en el regalo se percibía en torno a 120 ( $p > 0.05$ ) correspondiente al valor del incentivo monetario (véase tabla 2).

TABLA 2  
**Resultados del test t para una muestra**

	Valor = 120			
	t	gl	Sig. (2-colas)	Diferencia de medias
Precio percibido de las 2 noches de hotel	-1,81	675	0,07	-3,35

Finalmente se comprobó que los grupos experimentales estaban igualmente distribuidos en términos de edad, género, familiaridad con la marca y propensión a la promoción. Asimismo, ambos grupos estuvieron distribuidos homogéneamente en términos de composición y tamaño (descuento, 230; regalo, 220). Utilizando un test de Kolmogorov-Smirnov se comprobó que no había diferencias significativas en ambos grupos ( $p > 0,05$ ).

Para comprobar las diferencias entre los grupos con respecto a la propensión a la promoción, previamente se validó la escala multi-item mediante un AFC y cuyos resultados no se presentan por limitaciones de espacio. Dado que la escala multiitem era adecuada se creó una variable que reflejaba la media de las puntuaciones obtenidas en los distintos items que la componen. El test de diferencia de medias para cada grupo experimental reveló que no existían diferencias significativas en relación a la propensión a la promoción y la familiaridad con la marca ( $p > 0,05$ ).

#### 4.2. Contraste de hipótesis

Para contrastar las hipótesis propuestas se llevó a cabo una segmentación jerárquica mediante el algoritmo de segmentación C&RT, por ser el más adecuado para este caso. Dicho algoritmo no realiza suposición alguna sobre el tipo de variables dependientes e independientes (pueden ser continuas, categóricas o nominales), no se basa en la hipótesis de normalidad de las variables, sus resultados no tienen por qué ser dicotómicos y permite que un mismo predictor aparezca en diferentes niveles del árbol (Breiman et al., 1984). Calcula una medida de impureza (variabilidad de los datos dentro del nodo) y elige las variables que aportan una mayor reducción de la misma.

En concreto, se llevaron a cabo dos segmentaciones jerárquicas, una para cada tratamiento (descuento vs regalo) con el fin de analizar las posibles diferencias obtenidas en cuanto al perfil del internauta. En ambos casos, como variable dependiente se utilizó el nivel de recuerdo del internauta y como variables independientes se utilizaron el género, la edad, la situación laboral, el nivel de estudios y el nivel de ingresos. De esta manera, para el caso del descuento online se obtuvo un árbol de segmentación con un poder predictivo del 51,8%, mientras que para el caso del regalo online el árbol obtenido tuvo un poder predictivo del 52,1%. Las figuras 3 y 4 muestran los árboles resultantes en cada caso.

Los resultados indican que a nivel general, el anuncio que incluye el descuento online consigue un mayor nivel de recuerdo de producto (12,4%) que el que incluye como reclamo el regalo (4,6%). Sin embargo, este último genera un mayor nivel de recuerdo de marca (50,2%) que el anuncio con el descuento (45%). Estos niveles de recuerdo se ven afectados por distintas variables sociodemográficas, tal y como muestran los resultados. La situación laboral del usuario y su edad son las variables que más influyen en el nivel de recuerdo del internauta acerca de la publicidad online del descuento. Sin embargo, para la publicidad online del regalo el nivel de recuerdo del internauta queda determinado, en primer lugar, por su nivel de estudios, seguido de su situación laboral. Estos resultados ponen de manifiesto la existencia de diferencias en cuanto al nivel de recuerdo alcanzado por los regalos y los descuentos online, dependiendo este de determinadas variables sociodemográficas del usuario. Así pues, se confirman H1 y H2.

Al objeto de explicar mejor los perfiles encontrados se presenta una tabla para cada tipo de incentivo promocional utilizado, en la que se muestran los perfiles encontrados junto con las principales características sociodemográficas estudiadas (véanse tablas 3 y 4).

Los usuarios que visualizaron el **anuncio con el descuento** pueden clasificarse en 3 grupos o perfiles:

- Grupo 1: MUY INTERESADOS EN EL PRODUCTO. Formado por 66 individuos (29,2% de la muestra) estudiantes o trabajadores por cuenta propia. Su edad suele estar comprendida entre los 20 a 24 años y los 45 a 54. Está compuesto igualmente por hombres (51,5%) y mujeres (48,5%), con estudios de grado medio o superior y con ingresos principalmente

inferiores a 499€ (90%). Este grupo posee un porcentaje superior de personas con estudios a nivel de diplomatura que el resto de los grupos. Ante un descuento ofrecido en la Red, la mayoría de ellos son capaces de recordar la marca y el producto promocionado asociadamente (54,5%). Este porcentaje es el más alto de los tres grupos. Por tanto, si se desea conseguir un recuerdo conjunto de marca y producto este es el perfil más indicado. A su vez, un 15,2% de los usuarios de Internet es capaz de recordar sólo el producto pero no la marca. Para este grupo, la publicidad online con el descuento consigue un nivel de recuerdo de marca del 62,1% siendo, por tanto, el grupo que mayor nivel de recuerdo alcanza de los tres. Poseen un nivel de no recuerdo del 22,7%.

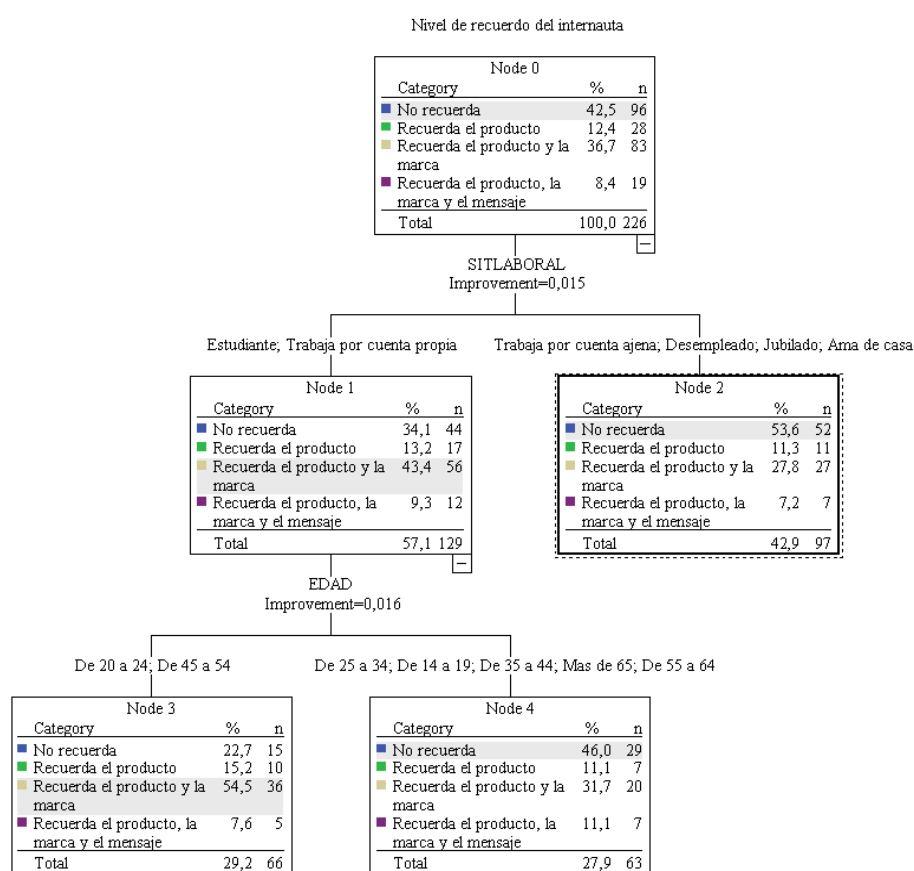

TABLA 3  
Perfil de cada grupo que visualizó el anuncio online con descuento

		Grupo 1	Grupo 2	Grupo 3
GÉNERO	Hombre	52,4%	51,5%	62,9%
	Mujer	47,6%	48,5%	37,1%
ESTUDIOS	Sin estudios	1,6%	1,5%	0,0%
	Estudios primarios/Certificado escolar	11,1%	3,0%	4,1%
	Secundaria/Bachiller/FP	54,0%	40,9%	44,3%
	Diplomatura/Título de grado medio	15,9%	24,2%	16,5%
	Licenciatura/Título superior	17,5%	30,3%	33,0%
	Otros	0,0%	0,0%	2,1%
INGRESOS MENSUALES	Hasta 499€	84,1%	90,9%	24,7%
	Entre 500-999€	6,3%	3,0%	16,5%
	Entre 1000-1499€	3,2%	3,0%	29,9%
	Entre 1500-1999€	4,8%	3,0%	15,5%
	Entre 2000-2499€	0,0%	0,0%	6,2%
	Entre 2500-2999€	0,0%	0,0%	4,1%
	Entre 3000-4999€	0,0%	0,0%	3,1%
	Más de 5000€	1,6%	0,0%	0,0%

- Grupo 2: PREOCUPADOS POR EL PRECIO. Formado por 63 individuos (27,9% de la muestra). Su edad está comprendida principalmente entre los 14 a 19 años, los 25 a 44 y más de 55. De nuevo, al igual que en el caso anterior son estudiantes o trabajadores por cuenta propia. Está compuesto por un porcentaje de hombres (52,4%) ligeramente superior al de mujeres (47,6%), con estudios sobre todo medios (secundaria o similar) a nivel de diplomatura y con unos ingresos inferiores a 499€ (84,1%). Ante un descuento ofrecido en la Red, la mayoría de ellos no son capaces de recordar nada (46%). Poseen un nivel de recuerdo de producto del 11% y conjunto de marca y producto del 31,7%. Este grupo destaca por ser el que presenta un mayor nivel de recuerdo conjunto de marca, producto y mensaje (11%) de los tres. Por este motivo, se considera que este grupo es el más preocupado o al que más le interesan los descuentos online. El 42,7% de ellos recuerda la marca tras la exposición a la publicidad sobre el descuento online.
- Grupo 3: POCO INTERESADOS EN EL PRODUCTO O EL DESCUENTO. Formado por 97 individuos (42,9% de la muestra) es el grupo más numeroso de los tres. En este caso la única variable que afecta a su nivel de recuerdo es la situación laboral, no afectando la edad de los internautas. Son trabajadores por cuenta ajena o que no trabajan en la actualidad. Está compuesto principalmente por hombres (63%) con estudios de grado medio o superiores y con unos ingresos inferiores a 2000 €. Ante un descuento ofrecido en la Red, la mayoría de ellos no recuerdan nada (53,6%), siendo este el grupo que presenta un mayor nivel de no recuerdo de los tres considerados. El 27,8% son capaces de recordar la marca y el producto promocionado, mientras que poseen un nivel de recuerdo conjunto de la marca, producto y el mensaje de solo el 7,2%. El 35% de ellos recuerda la marca tras la exposición a la publicidad sobre el descuento online registrando el porcentaje más bajo de los 3 grupos.

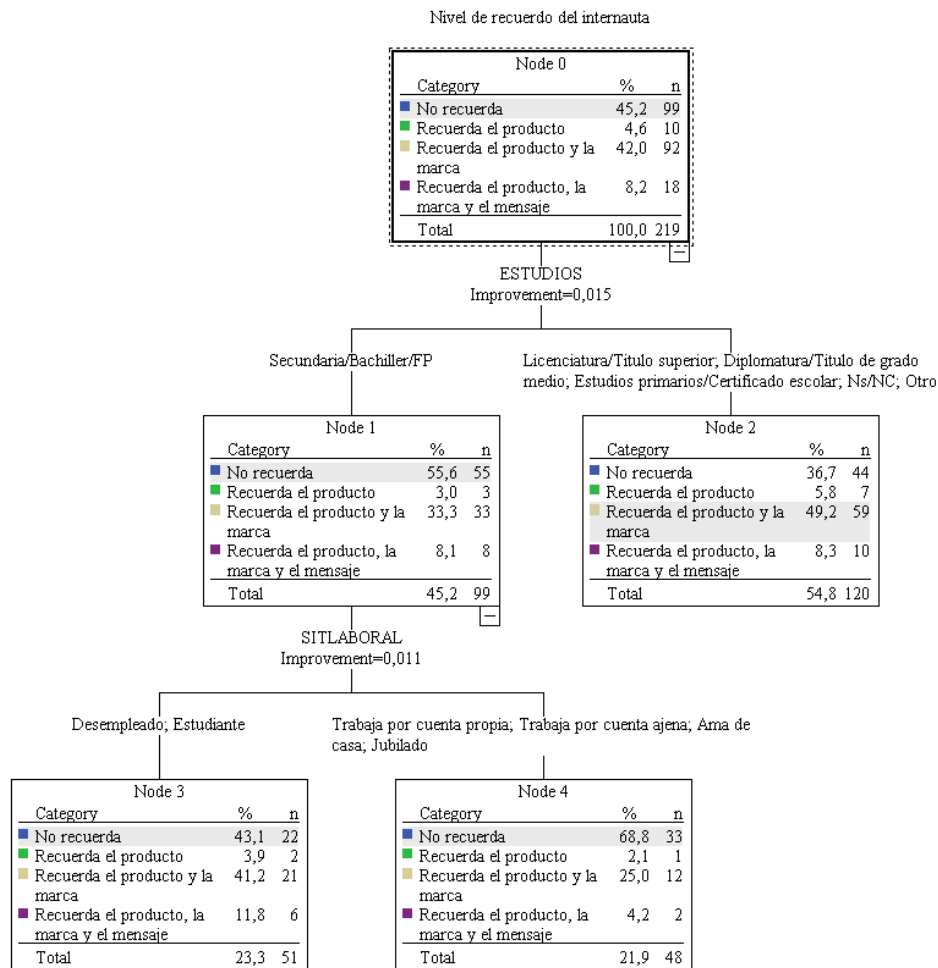

**FIGURA 3**  
**Perfil del internauta según su nivel de recuerdo del descuento online**

Por otra parte, los usuarios que **visualizaron el anuncio online con el regalo** quedan clasificados en otros 3 grupos como se muestra a continuación:

- Grupo 1: MUY INTERESADOS EN EL REGALO. Formado por 51 individuos (23,3% de la muestra) con estudios secundarios, bachillerato o equivalente, y cuya situación laboral actual es estudiantes o desempleados. Está formado por un porcentaje ligeramente superior de hombres (52,9%) que de mujeres (47,1%), con edades comprendidas mayoritariamente entre los 14 y los 24 años (82,3%) y con unos ingresos inferiores a 499 € (92,2%). Ante un regalo ofrecido en la Red, el 43% no recuerda nada y el 41% recuerda la marca y el producto conjuntamente. Destacan principalmente por ser el grupo que más porcentaje de recuerdo de marca, producto y mensaje de forma conjunta presenta (11,8%). El 63% de ellos son capaces de recordar la marca tras la exposición al regalo promocional. Por tanto, la comunicación del regalo online es más eficaz para este perfil de usuario junto con el grupo 3. Así pues, puede decirse que es el mejor perfil para generar recuerdo de marca y producto conjuntamente con un regalo online. Sin embargo, es posible que este no sea el perfil idóneo para considerarlo como target. Es posible que de forma inmediata no cierren la compra del producto al no tener ingresos, sin embargo puede que cuando dicha situación cambie se conviertan en público potencial. Al contar con menos ingresos, son más susceptibles a los regalos promocionales que el resto de internautas que visualizaron este estímulo, lo que los lleva a procesar más la información sobre el regalo ofrecido en la Red y, por tanto, a recordarlo más.

**FIGURA 4**  
**Perfil del internauta según su nivel de recuerdo del regalo online**

- Grupo 2: POCO INTERESADOS EN EL PRODUCTO. Formado por 48 individuos (21,9% de la muestra). De nuevo, al igual que en el caso anterior tienen estudios secundarios. Su situación laboral es trabajador, ama de casa o jubilado. Está formado principalmente por hombres (58,3%), con edades superiores a los 20 años (95,8%) y con unos ingresos inferiores a 1500 € (83,4%). Este grupo destaca por tener el mayor porcentaje de personas con edades superiores a 35 años (45,8%). Ante un regalo ofrecido en la Red, la mayoría de ellos no son capaces de recordar nada (68,8%). Poseen un nivel de recuerdo de producto del 2% y de recuerdo conjunto de marca y producto del 25%. Este grupo destaca por ser el que presenta un menor nivel de recuerdo conjunto de marca y producto y, en general, recuerdo de marca (29,2%). Por tanto, este tipo de instrumento de comunicación parece ser poco eficaz en este segmento.
- Grupo 3: MUY INTERESADOS EN EL PRODUCTO. Formado por 120 individuos (54,8% de la muestra) es el grupo más numeroso de los tres. En este caso la única variable que afecta a su nivel de recuerdo es el nivel de estudios, no afectando para este caso la situación laboral de los internautas. Poseen estudios primarios o universitarios. Está formado principalmente por hombres (60,8%), con edades comprendidas entre los 20 y los 35 años (61,7%) y con unos ingresos inferiores a 2000€ (89,2%). Cuando visualizan un anuncio sobre un regalo en la Red la mayoría recuerdan la marca y el producto (49,2%), siendo este el grupo que presenta un mayor nivel de este tipo de recuerdo de los tres considerados. A su vez, son el grupo que menor nivel de no recuerdo presenta (36,7%). El 8,3% son capaces de recordar la marca, el producto y el mensaje. El 57,5% de ellos recuerdan la marca tras visualizar el estímulo promocional online. Probablemente, dado su nivel de estudios, este grupo sea el más implicado con los viajes lo que lo lleva a prestar más atención a este tipo de informaciones

online. Al igual que en el caso del grupo 1, estos individuos parecen ser el perfil adecuado de este tipo de incentivo online, incrementando la eficacia de la comunicación del regalo online.

TABLA 4  
**Perfil de cada grupo que visualizó el anuncio online con regalo**

		Grupo 1	Grupo 2	Grupo 3
GÉNERO	Hombre	52,9%	60,8%	58,3%

	Entre 2500-2999€	0,0%	5,8%	0,0%
	Entre 3000-4999€	0,0%	1,7%	2,1%
	Más de 5000€	0,0%	0,8%	0,0%

## 5. Conclusiones y recomendaciones

Con este trabajo se ha pretendido analizar si los anuncios online que incluyen incentivos promocionales, ya sean descuentos o regalos, son eficaces en términos de generación de recuerdo de la marca y en qué medida el perfil sociodemográfico del internauta afecta a su capacidad para generar recuerdo. Este trabajo profundiza y contribuye a la literatura de marketing online ya que es el primero en analizar cómo el recuerdo registrado por los descuentos y los regalos online depende del perfil del internauta. De los resultados obtenidos puede concluirse que los anuncios online sobre descuentos son especialmente eficaces para generar recuerdo de producto mientras que los anuncios online sobre regalos lo son para generar recuerdo de marca.

A su vez, como novedad del trabajo, se obtiene que estos niveles de recuerdo dependen de distintas variables sociodemográficas tales como la situación laboral y la edad del internauta, que son las variables más explicativas del recuerdo registrado tras la visualización de la publicidad con descuento online. En cambio, el recuerdo en la publicidad con regalos queda explicado en mayor medida por el nivel de estudios y la situación laboral del internauta. Este resultado está en línea de lo establecido en los medios tradicionales por Bawa y Shoemaker (1987) ya que según sus investigaciones el nivel de educación afecta a la respuesta frente a la promoción de ventas. También está en concordancia con lo obtenido por Mittal (1994) y Strober y Weinberg (1980), ya que estos autores obtuvieron que la respuesta del consumidor depende de su estado laboral.

En función del recuerdo alcanzado tras ver un anuncio de descuento se han clasificado a los internautas en 3 grupos: Muy interesados en el producto, preocupados por el precio y poco interesados en el producto o el descuento. El primer grupo, los interesados en el producto, son personas de edad media con pocos ingresos aunque con formación, esta característica los lleva a recordar más el mensaje del descuento online identificando la marca y el producto. El segundo grupo, los preocupados por el precio, son personas sobre todo jóvenes o mayores con unos ingresos muy bajos y estudiantes o trabajadores por cuenta propia. Este grupo cuando le interesa el producto es el que más recuerda de forma conjunta el mensaje del descuento online demostrando que quizás son de los individuos más propensos a los descuentos. Por último, el tercer grupo, los poco interesados en el producto o el descuento, son principalmente hombres formados, trabajadores por cuenta ajena o que no trabajan y con ingresos moderadamente altos. Este grupo es el que presenta un mayor nivel de no recuerdo de los tres. Este resultado es posible que se deba a que dado su perfil sean más expertos en la navegación web que los otros grupos siendo más capaces de evitar los mensajes publicitarios promocionales que en ella aparecen. Es decir, es posible que naveguen de una forma más guiada por objetivos tratando de

evitar todos los mensajes que no tengan que ver con sus objetivos de navegación (Hammond et al., 1997; Novak et al., 2000). A este respecto, Dahlen (2002) establece que cuanto mayor es la experiencia del internauta con el medio menos impacto a nivel de recuerdo tendrá sobre el la publicidad online. Otra posible explicación, es que dado su poder adquisitivo y su situación laboral, es posible que los descuentos no sean de los incentivos que más se adaptan a sus gustos y preferencias haciendo que capten menos su atención. Así pues, para este grupo de usuarios habrá que buscar formas alternativas de comunicar para lograr niveles de recuerdo de marca aceptables.

Por otro lado, los usuarios que visualizaron el anuncio online con el regalo pueden clasificarse también en 3 grupos según su nivel de recuerdo: muy interesados en los regalos, poco interesados en el producto y muy interesados en el producto. El primer grupo son jóvenes poco formados y sin ingresos. Este tipo de internauta recuerda más el contenido conjunto del mensaje promocional que el resto de grupos probablemente debido a esa escasez de ingresos. El segundo grupo son personas poco formadas y en un porcentaje bastante alto de edad elevada. Estas características los hacen ser el perfil menos adecuado para este tipo de producto por lo que son el que presentar un nivel de no recuerdo más elevado. El tercer grupo son personas de edad media, formados y con ingresos altos, esto los lleva ser el perfil más adecuado para este tipo de producto y por tanto a presentar los mejores niveles de recuerdo de todos.

Dada la importancia puesta de manifiesto en la gestión de la promoción de ventas online por su capacidad para afectar al recuerdo de la marca, es necesario conocer cuáles son las acciones más eficientes y sobre qué público deben lanzarse en aras a realizar un buen targeting online. Es decir, es primordial que los gestores de marketing conozcan cómo la promoción de ventas online puede ayudar a conseguir recuerdo de marca y por ende, notoriedad de marca.

Obviamente los banner a través de los que se comunique la promoción de ventas deben facilitar el recuerdo del internauta. Para ello, es recomendable conocer el perfil del usuario de la información promocional como forma de adaptar perfectamente el mensaje promocional en sí.

Para alcanzar mayores niveles de recuerdo de la acción promocional se recomienda alojarlo en web sites congruentes con los beneficios buscados por el cliente y aportados por el producto promocionado como forma de mejorar la capacidad del mismo para captar la atención del usuario y que éste lo procese.

Así pues, se recomienda tanto para diseñar como para decidir donde alojar la publicidad sobre los descuentos online teniendo en cuenta que el target son personas medianamente formadas, jóvenes y con unos ingresos no muy elevados. Por el contrario, para el diseño y elección de la estrategia de difusión de la publicidad online sobre los regalos habrá que tener en cuenta que sus usuarios serán sobre todo hombres, de edad media, muy formados y con unos ingresos bastante altos.

# DOES THE SMART LABELLING ADD VALUE TO THE PRODUCT?

---

DOMINGO CALVO DOPICO

*Universidad de A Coruña*

## ABSTRACT

*The globalisation of markets has enabled consumers to have far more possibilities and alternatives when it comes to picking and choosing. However, the huge number of fraudulent cases is a common occurrence. The consumers therefore not only have to tackle the problem of correctly inferring the quality, but also the probability of making a mistake or having to process information with which they are often unfamiliar (e.g. barcode). One of the solutions to this problem is smart labelling. The aim of this work is to investigate whether or not smart labelling provides value to the consumer. We have conducted a market research using a category of products in which this problem is highly representative: fish products. We selected a sample of 300 homes that were potential consumers of fish products and asked them about the value or importance that smart labelling could have on the purchase process. The results show that the clarity of the labelling, as an informative cue, and by way of credibility, improves the perception of quality, reduces the perceived risk or likelihood of making a mistake and saves the consumer costs when it comes to seeking information. In addition, the usability of labelling also improves the clarity of the signal as it allows the consumer to check and recognise certain intrinsic attributes or characteristics that imbue the product with authenticity.*

**KEY WORDS:** *Labelling, Consumer behavior, Traceability, Signaling Theory.*

## **1. INTRODUCTION AND OBJECTIVES**

Companies are facing an ever-more globalised and competitive environment, with growing demand from consumers for better guarantees of quality. Unlike experts, consumers cannot easily know which properties are intrinsic to products and which are those that give them their perceived quality. There is thus a problem of uncertainty regarding the quality of products (Akerlof, 1970), also known as imperfect information on product quality. This problem becomes more complex when consumers are faced with many alternatives of a similar perceived quality, which makes them have to decide on one without being completely sure. Consumers do not have a clear understanding of the multitude of alternatives that exist, which leads to a problem with managing the information and, therefore, the risk associated with the purchase.

To sum up, we faced with two problems: one the one hand, how to infer quality and, on the other hand, how to solve the problem of making the right choice from so many alternatives, the so-called perceived risk (Mitchell and Greated, 1988a). The signalling theory (Erdem and Swait, 1998, 2004; Ye and Van Raaij, 2004) has provided a solution to the problem of information asymmetries, looking into the properties that informative signals must have. Among these variables are price, labelling, guarantees, brand (manufacturer or distributor) origin, advertising and packaging design. From the consumer point of view, one the most reliable signal is the one that commits the firm to fulfil quality promises. Concretely, we need to come up with clear and credible indicators (Erdem et al., 2006) that allow consumers to infer the quality. This fact reveals the need to design useful informative signs both from the standpoint of information processing as well as to ensure the product's intrinsic properties. Use of such indicators could appreciably help the consumer to infer product quality, minimize the risk in the purchase process and reduce information-processing costs in the purchase process.

However, there are attributes that cannot be assessed by the consumer, even once the product has been consumed. These are the so-called credence attributes. It is therefore necessary to equip the consumer with new mechanisms that enable him to not only verify product quality but also make sure that those properties are true and authentic. This problem has become even more acute with the globalisation phenomenon, where there are many occasions of fraud. In fact, firms can sell the product in one country but the raw material comes from another region. In other cases, confusing information is provided (e.g. made in the PRC). To respond to this problem, literature has stressed the need to introduce mechanisms that allow the consumer not only to be aware of what intrinsic properties the product has, but also to guarantee these. One of the tools that help firms to track the trajectory or path of a product throughout the chain is traceability. However, most of consumers do not recognise what the term traceability means (Giraud and Halawany, 2006). By the same token, there are few studies that have performed research, from the consumer behaviour standpoint, the importance of traceability for consumers (Chrisochoidis et al, 2006; Van Riswijk and Frewer, 2008, 2012; Vervecke and Ward, 2006) However, still no empirical studies simultaneously research the signalling of quality and the importance of traceability. From the signalling theory, this problem may be tackled through the introduction of smart labelling, which would enable us to assess whether the consumer can clearly recognise the intrinsic properties of a product -to infer the product quality- as well as distinguish one product from another -risk reduction-. For this reason, we will investigate whether smart labelling can add value to the product. First, we need to assess whether the consumer is interested in introducing a system of traceability and how this is to show on the quality labelling. At the same time, discovering the hierarchy of quality attributes also enables us to design a better system of traceability. Lastly, and this is the leading contribution of the work, it would enable us to know whether smart labelling adds value to the product. We have based our work on fish products.

To respond to this objective, we have divided this work into five sections. First of all, we will explain in detail the theoretical framework on which the principles of brand as a signal are based. Next, based on these foundations, we will build the model. We will then explain the methodology and, finally, the analysis of results from which we will extract the main conclusions.

## **2. THEORETICAL FRAMEWORK: SIGNALLING THEORY AND IMPERFECT MARKETS**

As we explained at the start of this work, we are thus faced with a problem of imperfect market information. Literature on the information economy (Stigler, 1961; Akerlof, 1970) has contributed to the solution of

signals to this problem of asymmetric and imperfect information. To be able to infer those properties and, as a result, perceive the quality that the product possesses, consumers make use of signals or indicators. For the case of fish, the signals that have been researched the most are region of origin (Ericsson et al., 1984; Bertozzi, 1995); brand, price and label; and intrinsic characteristics –texture, appearance, taste-. From the point of view of the Information Economy, and considering markets that are imperfect and have major asymmetry of information which prevents consumers from evaluating the product quality at the time of purchase, we investigate the characteristics of the signal that allow the consumer to infer product quality. Erdem and Swait (1998) explain that the clarity and credibility placed in the signal increases utility, improving their perception on product quality and reducing the risk and costs of searching for information associated with the purchase. This is what we will explain in more detail.

### **Smart Labelling, Traceability and Perceived Quality**

As has already been indicated, there is considerable uncertainty about product quality. Fish and a seafood product is a very good example. The signals into which there has been the most research have been price, guarantees (Boulding and Kirmani, 1993; Erelles et al., 1999); manufacturer or distributor's brand (Yoo et al, 2000); umbrella branding (Wernerfelt, 1988; Erdem, 1998); origin (Bertozzi, 1995; Biljana et al., 1996; Papadopoulos and Heslop, 1993); advertising (Kirmani, 1990) and packaging design. Although the signal that stands out from all of them is brand, since it is presented as the most reliable and credible signal for end consumers (Erdem et al., 2006); the labelling is becoming more and more important because of the value of attributes such as nutritional information, energy value or attributes related to the manufacture or production. Labelling can therefore act as a signal from which consumers infer a specific level of objective quality, since consumers confer a confidence value on it (Cox, 1967). It is obvious and justified that it is a credible signal because it is exposed to market approval and because it is closely linked with the intrinsic properties of the product. Since it is so closely linked to these properties, it also transmits other benefits that are directly connected with these intrinsic properties, such as the positive associations and images evoked by these attributes.

### **Smart Labelling and Perceived Risk**

Perceived risk was defined by Bauer (1967) as a subjective belief in the probability of something bad happening or unfavourable consequences arising after buying the product (for example, incorrect assessment of its quality, other members of the household not liking it, or simply the product in question not being the right one). Marketing literature subsequently began to develop the concept (Cox, 1967; Bettman, 1973; Dowling, 1986). Since the level of uncertainty about the quality or quality attributes is considerable, good signalling of them is a determining factor in the selection process. It is obvious that since they cannot process these attributes or properties, consumers are going to base their opinion on the signal that allows them to recognise these attributes, i.e., on the informative signal that allows them to recognise many of these quality attributes. On the other hand, as well as recognising these quality attributes, consumers need to make sure that these attributes correspond to what would objectively be a quality product. It is logical and immediate to check how the smart labelling reduces the search for all of this information because it is presented as a highly credible signal.

### **Smart Labelling and Utility**

This approach is based on the idea that consumers make use of labelling to infer the characteristics of products due to the existence of imperfect and asymmetric information in markets. For this reason, and due to the existence of the problems of adverse selection, smart labelling may constitute, for the company, a very effective signal to infer quality and to reduce the information-processing costs. Thus, smart labelling is a credible signal that can help consumers to infer the level of objective quality and to reduce the perceived risk associated with the purchase, i.e., the risk of not knowing what the result of the product may be. It therefore allows for the reduction of information costs and an increase in the utility of the product.

Based on these principles, we are going to develop a theoretical model that we intend to prove. This is explained below.

### **3. MODELLING THE RELATIONSHIPS BETWEEN CLARITY, USABILITY, CREDIBILITY, PERCEIVED QUALITY, RISK, AND COSTS OF SEARCH OF INFORMATION**

As indicated in the introduction, we are presented with two problems: on the one hand, how to infer quality and, on the other hand, how to solve the problem of making the right choice from so many alternatives, the so-called perceived risk. To solve this problem, we should make use of the Signalling Theory. Based on this theory, the hypotheses will be built. This is explained in detail below.

#### **Clarity, Usability and Credibility**

As explained by Erdem and Swait (2004), the clarity of the informative signal is vital in achieving markets that are more transparent. Clarity of the informative signal has a notable influence on credibility. However, even if that information is visible for the consumer, in many cases the consumer is unable to understand it, process it or interpret it properly. We therefore need to provide the consumer with a mechanism that enables him to do a reliable check of the information given by that signal. In this case, we need to improve the usability of the signal (Venkatesh et al., 2003). Both clarity and usability will therefore appreciably improve signal credibility.

#### **Credibility and Perceived Quality**

There are some intrinsic attributes that imbue the product with quality (e.g. the origin of a raw material; the texture and origin of a fish product (Acebrón and Dopico, 2000)). However, consumers may not recognise those features of the product. What consumers are therefore seeking is for the signal to be credible. As we have mentioned, to be able to infer those properties and, as a result, perceive the quality that the product possesses, consumers are searching for credible signals or indicators. Given the fact that quality labelling is subject to a check by independent organisations, this is why we are now looking into the importance of the labelling. The logic that endorses the signalling properties of the labelling is the credibility. Credibility of smart labelling has been based on two basic elements. On the one hand, there are independent agencies that control quality and that can ensure a certain level of quality. Thus, this objectivisation is responsible for credibility, which is the basis for recognising quality. On the other hand, the signalling of traceability would allow the consumer to recognise those intrinsic properties, as they could examine those product properties (the origin, the method of capture, etc.). Smart labelling is therefore set to give an appreciable improvement to the overall quality perceived in the product.

#### **Credibility and Perceived Risk**

The diversity of alternatives, -e.g. the wide variety of fish caught-, generates a lot of uncertainty and confusion in consumers (Mitchell and Grottel, 1988b). This fact arose - as we explained previously - because of the globalisation phenomenon, where consumers are faced with numerous alternatives that in many cases are not identified or they do not know. In this context, application of the smart labelling reduces perceived risk. The smart labelling serves to reduce risk of the probability of error, since it provides a credible indication of its attributes such as specie, region of origin, method of capture, etc. Furthermore, the role of the smart labelling as a reliable signal is reflected in the guarantee of non-variability of quality. Therefore, the objectivity of the attributes guaranteed by the smart labelling, together with the subsequent learning derived from the experience of consumption, increases reliability regarding the levels of the attributes and therefore reduces the risk associated with the purchase.

#### **Credibility and the Search for Information**

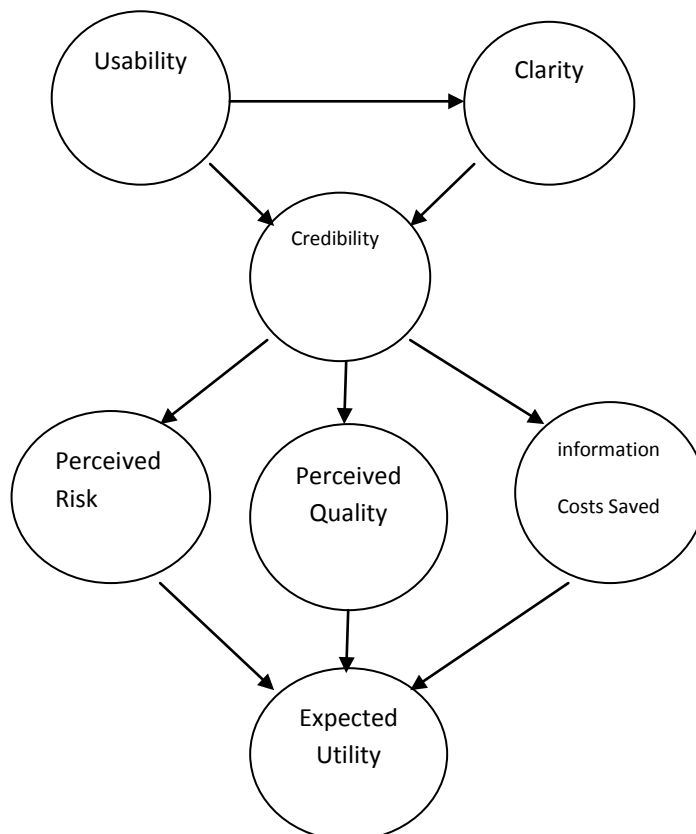

Consumers who buy products incur multiple costs when they gather and process information to reduce uncertainty and perceived risk. To solve this, consumers will look for a signal that allows them to reduce the effort involved in searching for information and to reduce the costs of processing this information, while ensuring that the properties that this product possesses are real. We understand that the smart labelling fulfils this purpose. To a certain extent, the labelling provides consumers with information for which is also very reliable. The smart labelling reduces both the costs of collecting information and the costs of processing it

(processing and abstraction). This happens because smart labelling reduces the effort that consumers have to make to recognise the attributes that the product possesses (origin, method of capture, specie, etc). Furthermore, as it is a credible signal, it guarantees that these attributes that give the product quality are certain. Thus, the credibility of the signal allows maximum reduction of the costs of searching for and processing that information. While the costs of information on the product generally increase –since they depend directly on the asymmetry and informative imperfection of the market (Erdem and Swait, 1998)-, these same costs will be reduced based on the credibility of the smart labelling.

**Perceived Quality, Risk, Costs of search for Information and Expected Utility**

We have already seen that labelling is a good indicator of quality. In addition, the labelling not only guarantees a certain quality status but it also transmits and evokes symbolic elements generating better perception of those attributes (Del Rio et al., 2001). Thus, a higher perceived quality of the product, -based on the credibility of the smart labelling-, increases expected utility. At the same time, as the theoretical and empirical evidence suggests, the aversion to risk in product markets also has an influence on expected utility (Anand, 1993). The explanation is based on the fact that the perceived risk causes confusion about the perceived attributes and the consumer's low level of self-confidence reduces the probability of objective assessment of the product attribute. Consequently, at the time of purchase the costs of the search for information required to convert the visible attributes into perceptible quality signals will remain constant or will even increase. Compared to this, today's consumers, always aiming for as few efforts as possible, will find a lot of utility in labelling as information signal that is necessary for its assessment. Therefore, it is expected that the effects of labelling on perceived risk and the search for information indirectly have a positive impact on its expected utility. This would ratify the value of the labelling as a credible quality signal for consumers. After establishing the cause and effect of relationships existing between the Credibility of the smart labelling, the Perceived Quality, the Perceived Risk and the Information Costs involved, we can express the structural model proposed as a graph with respect to the effects of Credibility on the Utility Expected by consumers (See Figure 1).

**FIGURE1.** Relationships between Clarity, Credibility, Usability and Perceived Quality, Perceived Risk and Information Costs Saved

### **3. METHODOLOGY**

To perform this work we compiled a questionnaire entitled “*Questionnaire on purchase habits and the importance of labelling and traceability of fish products*”. The questionnaire is divided into five blocks. The first block focuses on analysing fish-product purchase habits. The second block deals with signs of quality and the influence these have on purchases. The third section deals with traceability. More specifically, it analyses i) spontaneous awareness of traceability; ii) the importance of introducing a system of traceability, and iii) the willingness to pay a premium for the introduction of this traceability system. The fourth block covers the relationships between clarity, credibility, perceived quality, risk and costs of searching for information. We asked to the interviewee to give their level of agreement or disagreement with each item. Lastly, the final section analyses the socio-demographic profile of the person who makes the purchases. This therefore analyses the type of home, age, gender and level of education.

#### **3.1 Sampling: size of the sample and sampling procedure**

The sampling unit of this study is the person responsible for household purchases. To select each one, a market research company called AGORA performed a random sampling of households, which allowed us to obtain a representative sample of the target population. The sampling size was 300 and there was a sampling error of 5,66%. The sampling error was calculated in accordance with an infinite population (population that exceeds 100,000 inhabitants) and with a confidence interval of 95%, whereby  $p=q=0,5$ . The selection of sampling homes followed the methodology proposed by Ministry of Agriculture, Fishing and Environment (2013), also called MAGRAMA (2013); which involves selecting locations from different geographical areas of Spain. A total of 300 questionnaires were conducted throughout Spain. The fieldwork was performed by the company AGORA Market Studies. The questionnaire was carried out personally and directly at the home, and any possible doubts or concerns of the interviewee were clarified using a more colloquial example or explanation. We performed a pre-test to identify any aspect that required improvement. The conclusions of this pre-test have been used to define the subsequent briefing. The aim of the briefing was to perform a training and instruction session with the interviewers to reveal the aims of the survey and the meaning to be given to each question. This enabled effective collection of the answers from the interviewees. Data were collected between 21 October and 4 November 2013, both inclusive. Once the data had been collected, we debugged the database making sure that all data were properly entered and have been correctly recorded. We also coded the open questions in accordance with the table of codes created in the pre-test stage. There were 295 valid questionnaires (N=295). The characteristics of the sample are shown below, in the following table (see table 1).

**TABLE 1.**Socio-demographic Structure of the Sample (N=295)

SOCIO-DEMOGRAPHIC VARIABLE	RESPONSE CATEGORIES	RELATIVE FREQUENCY (Cod)	SOCIO-DEMOGRAPHIC VARIABLE	RESPONSE CATEGORIES	RELATIVE FREQUENCY (Cod)
<b>Typology of household</b>	Independent young person	8,1%	<b>Gender</b>	Male	28,8%
	Retirees	10,5%		Female	71,2%
	Independent adult	10,2%		<b>Total</b>	<b>100.0%</b>
	Single-parent homes	7,1%	<b>Age</b>	18 – 28	9,7%
	Family unit with young children	21,0%		29 – 38	26,6%
	Family unit with teenagers	9,5%		39 – 48	25%
	Family unit with grown-up children	13,2%		49 – 58	22,4%
	Family unit with children, but not under their charge	9,2%		59 – 68	10%
	Family unit (young couple) no children	4,4%		69 – 78	4,6%
	Family unit (adult couple) no children	6,8%		>78	1,7%

### 3.2 Measurement of variables

The consumers were asked to show their degree of agreement or disagreement with different propositions related to clarity, credibility, usability, perceived quality, perceived risk and utility. The items assessed by interviewees and representing the latent variables were elaborated on the basis of a review of the literature and traditional scales. They also were asked for other questions related to consumption of fish products (frequency of buying/consumption, willingness to buy), consumption motives, hierarchy of quality cues, the introduction of a traceability programme as well as the willingness to pay for the implicit quality guarantees in said traceability programme. The final part of the questionnaire collected socio-demographic data of the respondents.

**TABLE 2.** Latent variables and reflective indicators used to measure the importance of Smart Labelling

<b>Latent variables</b>	<b>Indicators</b>
<b>Credibility</b> (based on Erdem and Swait, 1998)	Credi1: The smart label that guarantees the properties of the product is a signal in which information can be trusted Credi2: Buying a product with a smart labeling that tells you about the whole process of production that has followed the product is very reliable Credi3: A smart labeling that guarantees the product has followed a quality control is very reliable Credi4: I can trust in the smart labeling because provides information on the authentic properties of product
<b>Clarity</b> (based on Erdem and Swait, 1998)	Clarity1: I think that the smart labeling offers the consumer very clear information. Clarity2: I have no trouble in understanding the information contained in the smart labeling Clarity3: An smart label intend to offer a very clear information for the consumer
<b>Usability</b> (based on Davis et al., 1989)	Use1: Use this smart labeling can help me know the path followed by the product since caught until it reaches the point of sale Use2: Use this labeling would allow me to get the information in relation to the origin, and know the route from the origin to the point of sale Use3: Use this smart labeling makes it easier to buy
<b>Perceived Quality</b> (based on Zeithmal, 1988)	Calper1: I consider that a product with a labeling that guarantees their intrinsic properties (species, origin, date of capture) is of very good quality Calper2: A product with a smart label reflects a very high quality Calper3: I think that a product that contains a smart labeling which specifies all its main features is of very good quality
<b>Perceived Risk*</b> (Based on MiErdem and Swait, 1998)	Risk1: If the product I want to buy does not have a label that tells about the main features, the probability that suits what I want is very low Risk2: If I buy a product without labeling that ensures quality, increase my confusion at the time of purchase Risk3: Buying a product without labeling which tells you about the whole process that has followed the product increases the possibility of fraud
<b>Information costs Saved</b> (based on Erdem and Swait, 1998, 2004)	Infocost1: I have to search for information (e.g. check the labelling) before deciding on the product I'll buy Infocost2: If the product has a smart labeling saving time and effort in buying process Infocost3: I know that a very clear labeling saves me having to spend much time in the buying process
<b>Expected Utility</b>	Utility1: I consider that the smart labeling incorporates added value to the product Utility2: The smart labeling provides a more valuable product Utility3: In general, I find useful smart labeling

\* The perceived risk has been measured considering that the existence of a latent risk. That is, when consumers buy the products, feel that, in their choices, there is a latent risk in making the correct choice.

## 4. RESULTS

### 4.1 Demand of guarantees, Quality signalling and Traceability in the Smart Labelling

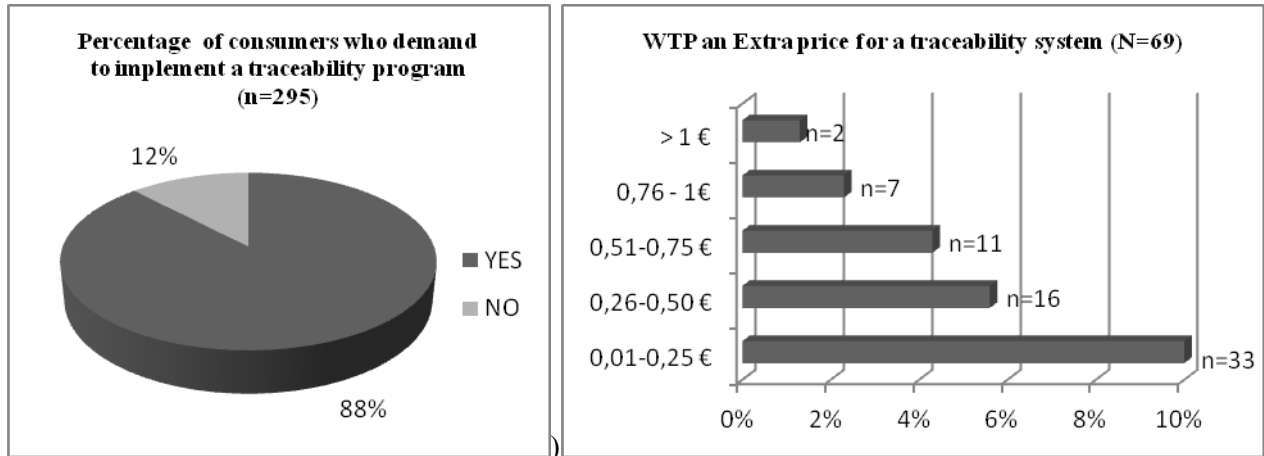

In this section we analyse the consumer's demand vis-à-vis the introduction of a traceability programme as well as the willingness to pay for the implicit quality guarantees in said traceability programme. We also assess whether the consumer is able to understand the codes or signals that can help him recognise product traceability.

#### 4.1.1 Demand of quality guarantees

As figure 2 shows, most consumers are demanding the introduction of traceability systems. However, consumers are not willing to pay a price premium. In fact, they believe that the excess price payable should be assumed by the producers. Only a small percentage (27,9%) would pay it. In most cases, this extra price would

not exceed €0,50 (see figure 2). A similar price premium can be seen in the study conducted by Zheng et al., (2012). Apart from there being few consumers willing to pay that extra price, the price premiums are low (Wang et al., 2009). This data reveals a challenge for the sector, viz., the need to collaborate and to share information.

**FIGURE 2.**The demand to introduce a Traceability Programme of fish products (N=295) and Extra price per kilo that the consumer would be willing to pay for the introduction of a traceability system (N=69)

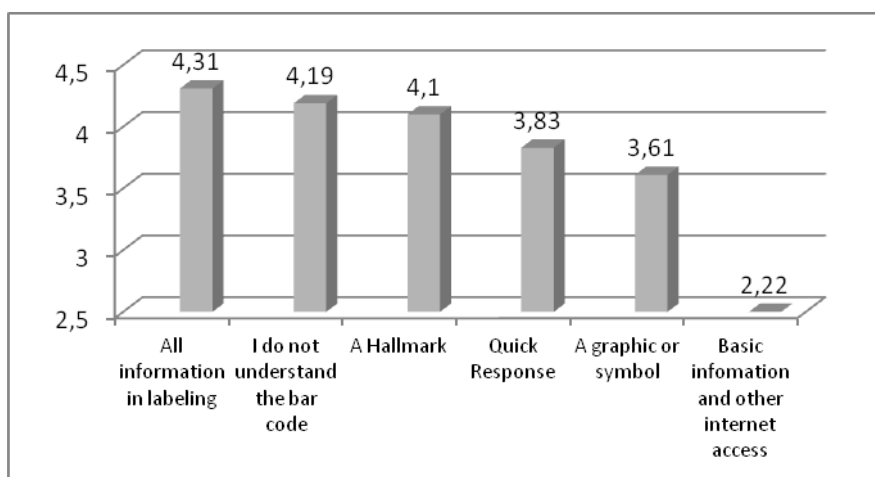

Source: Own elaboration

#### 4.1.2 Signalling traceability in the Smart labelling

As it can be seen in figure 3, consumers agree that all relevant information -understood as any relevant information that helps determine quality - should be on the label. That information refers to the relevant intrinsic properties that determine quality. The quick response codes (3,63) and Internet use (2,22) score relatively low. Similarly, these consumers do not understand what the barcode means (4,19). Therefore, it would be necessary to improve the signalling and understanding of those codes or signals, and also to educate or guide the consumer and facilitate the use of new technologies. Of primary importance is to improve the usability of both the quick response (QR) codes and understanding of the barcodes.

**FIGURE 3.**Ranking of indicators to signal Traceability in the Smart Labelling (Average scores of traceability on 1-5 Likert Scale (N=295))

#### 4.2 Usefulness of smart labelling. Quality signaling, perceived risk and information processing

*Analysis of the measurement model*

Prior to analysing the relations we will briefly examine the measurement model. This required a confirmatory factor analysis for the purpose of corroborating both reliability and statistical validity. The first analysis revealed the need to remove several items from the proposed scales in order to measure credibility (credibility4;  $\lambda_{14}=-0,162$  and credibility3;  $\lambda_{13}=-0,270$ ) as well as one indicator of perceived quality (Calper2;  $\lambda_{22}=0,425$ ) and one indicator of Information Costs ( $\lambda_{61}=0,377$ ) as they had loadings with a value below the minimum required ( $t < 1,96$ ). Similarly the GFI = 0,876 (below 0,90) and the RMSEA = 0,133 (above 0,08) offer values that do not comply with the necessary requirements. Having removed these indicators, the results showed an appropriate specification of the proposed factorial structure (table3). In fact, Chi-square  $\chi^2$  improves significantly given that the value decreases ( $\chi^2=595,1$ ;  $df= 142$ ;  $p\text{-value}=0.000$ ) and the goodness of fit indicators improves - GFI =0,92 and CFI=0,92-. Finally, the RMSEA (0,078) also improves as it decreases. Besides that, all of the indicators presented significant standardised lambda coefficients in excess of 0,50, which verifies the convergent validity of the scales. By the same token, the coefficients presented a good ratio with each of the underlying factors ( $R^2 > 0,3$ ). With regard to the analyses concerning reliability, the composite reliability coefficients and analysis of the variance extracted exceeded the suggested values of 0,6 (Anderson and Gerbin, 1988) and 0,5, respectively (Hair *et al.*, 2006). Similarly, the discriminating validity of the measurement model was also ratified by checking that none of the confidence intervals of the estimated correlations between each pair of dimensions contained the value 1. Finally, the quality indicators of the goodness of fit exceeded the established limits (Bagozzi and Yi, 1988; Hair *et al.*, 2006).

**TABLE 3.** Reliability and Validity of the constructs

<b>Construct</b>	<b>Reflective indicators (label)</b>	<b>Lambda</b>	<b>CR Composite Reliability (&gt;0,60)</b>	<b>AVE Average Variance Extracted (&gt; 0,5)</b>
<b>Credibility</b>	Credi1	0,573	0,66	0,504
	Credi2	0,824

As shown in table 4, the clarity of the signal ( $\beta_{23}=0,994$ ) is a fundamental variable as it has a notable influence on credibility. This reveals the importance of transparency in both reducing informative asymmetries as well as improving the consumer's perception. In fact, traceability can allow the transparency of markets (Van Riswijk and Frewer, 2012). As can be seen, in accordance with the signalling theory, the credibility of labelling improves the perception of quality ( $\beta_{34}=0,284$ ), reduces the perceived risk or likelihood of making a mistake in the purchase ( $\beta_{35}= -0,152$ ) and saves costs in seeking and processing information ( $\beta_{36}=0,521$ ).

In addition, the usability of the informative signal improves clarity ( $\beta_{12}=0,585$ ) of the signal. This is a very interesting finding, as in many cases the consumer does not fully understand that information (Giraud and Halawany, 2006) -e.g. barcode digits-. By improving the usability of the informative signal, the consumer is able to have a clear perception of attributes that are difficult to comprehend and to process (e.g. origin of the product or method of production). However, it has not been demonstrated that usability directly improve the credibility of the signal ( $\beta_{13} = 0,004$ ), but there is an indirect and positive effect between usability and credibility because credibility is enhanced by the clarity. The consumer, on being able to check the information of certain intrinsic attributes (e.g. product origin), feels more reliable and trustworthy (Vervecke and Ward, 2006). We can therefore state that the information provided is very reliable and credible.

Lastly, reducing the perceived risk ( $\beta_{57}= -0,120$ ), improving the perceived quality ( $\beta_{47}= 0,396$ ) and saving costs in seeking or processing information ( $\beta_{67}= 0,739$ ), provides utility to the consumer.

**TABLE 4.** Relationships between Clarity, Credibility, Usability and Perceived Quality, Perceived Risk and Saved information Costs

## 5. MANAGERIAL IMPLICATIONS

Below we set out the main implications obtained through the performance of this study.

### 5.1 Improve the signage through the labelling of relevant intrinsic properties

We need to improve the signage of the relevant intrinsic properties, especially those which the end consumer finds difficult to perceive (Van Riswijk and Frewer, 2008) -i.e. specific origin, family or specie, level of freshness, method of capture, etc. -. The aim is to favour and simplify the end-consumer's task of looking for

and processing information. This can be achieved through the design of codes or well-known symbols that the end consumer can easily remember.

## **5.2 Guaranteeing those intrinsic properties: Control and monitoring throughout the chain**

It is essential to control the quality of products to ensure that those intrinsic properties satisfy the quality standards set by experts. Viz., we must ensure that the origin, species, freshness, etc. to satisfy the standards established by experts. As we could see, most consumers are demanding the introduction of traceability systems. However, they are not willing to pay a price premium. In fact, they believe that the extra price payable should be assumed by the food chain agents. Only a small percentage of consumers (27,9%) would pay it. In most cases, this extra price would not exceed €0,50. In addition to there being few consumers willing to pay the extra price, the price premiums are low (Wang et al., 2009). This data reveals a challenge for the sector, viz., the need to collaborate and to share information.

By the same token, majority of consumers are unfamiliar with what the barcode or the rapid response code (QR code) means. Therefore, it would be necessary to educate the consumer and facilitate the use of new technologies. This fact reveals that it would be advisable to give information on the meaning of such codes or indicators. A further implication that we have seen, and which is also consistent with the results already remarked upon, is that many consumers favour a distinctive symbol that guarantees the validity of the label information. This same result is backed by prior research (Giraud and Halawany, 2006).

## **6. CONCLUSIONS**

The most relevant informative signals the consumer uses in the purchase process may be intrinsic or extrinsic. In the purchase process, smart labelling is an informative signal that is acquiring huge relevance and interest. However, use of this is still incipient because of insufficient transparency, the difficulty in understanding this information and the reduced usability. As we have already seen, most of these issues would enable the utility for the end consumer to improve notably. We set out the main conclusions of the study below.

### *Demand for greater quality guarantees*

Most consumers are demanding greater quality guarantees. However, they are not willing to pay a premium price. In fact, they believe that the extra price payable should be assumed by the food chain agents. Only a small percentage of consumers would pay it. In most cases, this extra price would not exceed €0.50. Similar results could be demonstrated by other studies (Wang et al., 2009).

### *Greater informative transparency*

The clarity of the informative signal improves the consumer's perception and helps make the entire information processing more credible. We need to improve the signalling of the relevant intrinsic properties that are difficult to the end consumer to perceive (e.g. specific origin, family or species, health claim or level of freshness). The aim is to favour and simplify the end-consumer's task of looking for and processing information. We can achieve this through the design of codes or well-known signs that the end consumer can easily remember.

### *Monitoring of the supply chain through a quick and efficient control mechanism*

As well as improving the clarity of the informative signal, this signal has to be credible. It is therefore essential to control the quality of products to ensure that those intrinsic properties satisfy the quality standards set by experts. Viz., we must ensure that the origin, species, freshness, etc., satisfy the standards established by experts. Independent agencies must carry out this control through quick and efficient control mechanisms. In fact, a quick response must be provided that enables verification -at the time of the check- of whether those informative signals are correct.

## **7. FURTHER RESEARCH**

The conclusions drawn by the study are interesting, as they reveal how we can improve the understanding of informative signals to enhance the perception of quality and reduce the risk and the cost of processing information in imperfect markets. The next step would involve experimentally testing how to improve the usability of smart labelling (e.g. to stimulate the use of quick response codes) and of the information available to the user in a real setting.

## ABSTRACT

*This paper aims to demonstrate how both valence and arousal of incidental moods can moderate the relationship between the level of excitement triggered by a mall environment and shopping behavior. We follow the mood regulation theory together with Mano's (1999) cautions to establish our theoretical framework. Our method is based on a 4x2 between subjects experiment with a sample of 377 Spanish undergraduates. Our findings support the mood regulation theory for positive low-arousal individuals, while reject this theory for negative low-arousal shoppers. Additionally, Mano's (1999) cautions are confirmed for high-arousal shoppers. We suggest that mall managers should include relaxing atmospheric zones in order to improve customers' welfare and shopping behavior, as well as reduce the number of exciting elements.*

## Keywords:

*Shopping behavior, atmospherics, incidental moods, shopping malls, mood regulation theory.*

## 1. Introduction.

Shopping is an activity where people do not only take into account utilitarian aspects of products or services, but also they want to be entertained, stimulated and emotionally affected (Hirschman and Holbrook, 1982; Nicolao et al. 2009). In response to this fact, mall managers are centered on managing customers' feelings, emotions and affective states (Naylor et al. 2008). They have often created exciting environments to encourage shopping behavior. However, the assumption that an exciting environment encourages shopping at malls might not be stable, and might depend on customer's characteristics and situational variables.

Academicicians have widely demonstrated the effect of mood during the retail experience on strategic variables such as monetary spending (Furnham and Milner, 2013), time perceptions (Ursavas and Hesapci-Sanaktekin, 2013), memory (Arnold and Reynolds, 2009), unplanned purchases (Atalay and Meloy, 2011), variety seeking (Chien-Huang and Hung-Chou), and product choice (Fedorikhin and Patrick, 2010). Furthermore, previous research has analyzed the effect of store atmospheric characteristics on shoppers' affective responses and subsequent behaviors (Bitner, 1992; Lin and Mattila, 2010; Baker and Wakefield, 2012; Yim et al. 2012), and consider situational and consumer-related characteristics that can moderate the effects of store characteristics on shopping behavior (Kaltcheva and Wirtz, 2006; Massara et al. 2010). Among these situational variables, consumers' incidental pre-existing moods can play a significant role. This paper focuses on two dimensions of moods, valence and arousal that have been proved to have the most important effect on consumer behavior. Thus, although mall managers have focused on creating exciting environments, this excitement may not always have the same effect on shopping behavior, as this relationship might be moderated by incidental moods (Mano, 1999; Mattila and Wirtz, 2001). So, how can differences in incidental mood lead to different perceptions, and subsequently different behaviors?

To address this question, our research seeks to demonstrate how both valence and arousal of incidental moods can moderate the relationship between the level of excitement triggered by a mall environment and shopping outcomes. Our methodology is based on an experiment carried out in a laboratory setting, where 446 students from a North-eastern Spanish university participated. To do so, we induced four discrete affective states that differed in valence and arousal. Afterwards, respondents were exposed to one of two laboratory mall environmental sceneries (low vs. high arousing atmospheres), and finally, asked to report their shopping behavior.

The contribution of this paper to marketing literature is twofold. First, we demonstrate that both valence and arousal of incidental moods moderate the relationship between the level of excitement triggered by a mall environment and shopping behavior. Second, we extend the mood regulation theory to explain shopping behavior in an exciting (vs. non-exciting) mall environment for shoppers in low-arousal moods.

The rest of the paper is organized as follows. The next section reviews the theoretical background existent in the literature about environment and shopping behavior, as well as incidental moods. The third section presents our hypotheses to be tested. Afterwards, we will explain the experiment that will serve to test these hypotheses. In the fourth section our results will be presented. Finally, we will discuss our results highlighting our main conclusions, as well as pointing out interesting managerial implications, and possible future lines of research.

## 2. Theoretical background.

### 2.1. *Atmospherics and shopping behavior.*

A vast body of research has demonstrated that store environmental factors play a critical role on shopping behavior, through both cognitive and affective processes. Specifically, affective states have acquired an important role in the path by which these environmental cues affect consumer behavior. Most research has treated these feeling states as consequences of atmospheric factors or mediators between environment and behavioral outcomes, such as propensity to buy (Turley and Milliman, 2000), time spent on the visit (Spies et al. 1997), money spent (Sherman et al. 1997), patronage intentions (Baker et al. 2002; Wakefield and Baker, 1998), satisfaction (Babin et al. 2003), store

attitude (Yoo et al. 1998), and loyalty (Bigné et al. 2008). This previous research has focused on the effects of pleasant environments on shopping behavior. Differences among them are based on the number of atmospheric variables analyzed. While some articles have focused on one or a few atmospheric variables, others have collected the general effects of an environmental setting on consumer behavior. For example, Spies, Hesse and Loesch (1997) chose two different store layouts with different levels of pleasantness. Their results confirmed that pleasant environments led to more satisfaction and more money spent in the store. In contrast, Bigné, Andreu, Chumpitaz, and Swaen (2005) studied the shopping experience at a mall. They found that ambience factors, such as illumination, decor, accessibility cleanness and temperature affected satisfaction through positive emotions.

Whilst the effects of pleasant environments are stable in the literature, the effects of exciting atmospheric variables are less consistent (Massara et al. 2010; Morrison et al. 2011). Sherman, Mathur and Smith (1997) found that an exciting environment increased money and time spent, and the number of items purchased. Donovan and Rossiter (1982) found that arousal triggered by the environment had a positive influence on shopping behavior only in pleasant retail environments. Chebat and Michon (2003) reported that a light and pleasant ambient scent arouses (or excites) consumers. These contradictions made Kaltcheva and Weitz (2006) include motivational orientations in the relationship between the excitement triggered by the mall atmosphere and shoppers' pleasure, finding a moderating effect. Thus, an exciting environment had a positive effect on shopping behavior for those with a task-oriented goal, but a negative impact for those with a recreational-oriented objective. Additionally, Massara, Liu, and Melara (2010) found that the level of excitement elicited by a virtual store environment led to a better shopping behavior only if it matched the consumer's expectations. Our study tries to demonstrate how moods can play a moderating role between the mall atmospheric excitement and shopping behavior (SB). To do so, we will differentiate between a high arousing atmosphere (HAA) and a low arousing atmosphere (LAA) in terms of light, colors and crowding density. This categorization has been used in previous research (Pan and Siemens, 2012; Wansik and Van Ittersum, 2012).

## ***2.2. Incidental moods and shopping behavior.***

Gardner and Vandersteel (1984, advances in consumer research) defined mood as "*a mild, transient, pervasive feeling state*". As this research delves into the feeling state that a person can live previously to the purchase experience and with relative stability over time, we focus on pre-existing moods (Luong, 2005; Pollai et al. 2010), and specifically on incidental mood, that it is originated from external factors unrelated to the shopping experience with no specifiable causes (Garg et al. 2005; Pocheptsova and Novemsky, 2010).

The most common argument that is present in previous research on retailing is that positive incidental moods lead to approach behaviors, such as propensity to buy, time spent at the store or intentions to return, and negative incidental mood entails avoidance behaviors and more negative evaluations of environmental cues (Andrade, 2005; Donovan and Rossiter, 1982; Donovan et al. 1994; Keltner et al. 1993). Accordingly, Forgas (1991) recognizes that positive moods lead people to make decisions more quickly, to use less information, to be more confident of their decisions and to be more heuristic-systematic evaluators. Clore, Wyer, Dienes, Gasper, Gohm, and Isbell (2001) suggested that those in a bad mood are more flexible and more easily adaptable to the environment. This circumstance enhanced approach behaviors.

Marketing literature has often distinguished several types of incidental moods depending on two dimensions: valence and arousal. The traditional view of mood has focused on valence differentiation, positive versus negative mood (Watson et al. 1988; Maier et al. 2012). However, Tellegen (1985) argued that mood is also characterized by intensity. Intensity of affective states is a function of arousal and the control that a person can execute on his or her feelings (Bagozzi, 1999). Mehrabian and Russell (1974) defined arousal as "*the subjective experience of energy mobilization, which can be conceptualized as an affective dimension ranging from sleepy to frantic excitement*". Mano (1999) stated that differences in arousal in shoppers' negative emotions can lead to different evaluations of environmental cues in a retail setting. More recent research has demonstrated that two different

affective states with the same valence can drive different judgments and decisions (Raghunathan et al. 2006; Kim et al. 2010; Di Muro and Murray, 2012). For example, Kim et al. (2010) demonstrated that consumers in a positive mood but with different level of arousal (excitement vs. peacefulness) made different choices between two vacational options. Excited consumers evaluated more favorably an adventurous vacation, while peaceful individuals preferred the serene vacation. Raghunathan et al. (2006) achieved similar conclusions with participants in two negative moods, anxiety and sadness.

As a consequence, this paper will distinguish among four types of incidental pre-existing mood as a function of two dimensions, valence and arousal. Individuals will be able to feel positive high-arousal mood (PHA), which is related to enthusiasm, elation and excitement; positive low-arousal mood (PLA), characterized by feelings of calmness and peacefulness; negative high-arousal mood (NHA), which reflects a state of distress and nervousness; and negative low-arousal mood (NLA), which is related to sadness and boredom.

### **3. Hypothesis development.**

Incidental moods can influence perceptions of environmental cues and act as moderators of the shopping experience (Swinyard, 1993; De Rojas and Camarero, 2008; Morrison et al. 2011). Thus, we propose that incidental pre-existing moods moderate the relationship between an exciting (or arousing) atmosphere and approach behaviors. The development of our hypotheses puts down its roots into the mood regulation theory.

Mood regulation theory posits two basic assumptions: (1) people are motivated to maintain positive moods, and (2) people are motivated to mitigate negative affective states (Isen, 1987; Andrade, 2005; Kim et al. 2010; Di Muro and Murray, 2012). Prior research applied this theory to study the role of mood valence on shopping behavior (Arnold and Reynolds, 2009; Meloy, 2000; Zillman et al. 1980). For example, Meloy (2000) demonstrated that consumers in a pleasant mood preferred to maintain their good mood even though the option taken lead them to a poor choice. Additionally, Zillman et al. (1980) among others found that consumers preferred a TV show that offered them relief from negative affective experiences. Kim et al. (2010) and Raghunathan et al. (2006) suggested, and Di Muro and Murray (2012) demonstrated that the same mechanism may underlie the effects of mood arousal on decision making. The later authors showed that consumers misattributed the affect they were feeling toward products that they perceived as representative of those feelings. Thus, if consumers are in a positive high-arousal mood (e.g. enthusiasm) they will prefer arousing products, as they are encouraged to maintain their positive high-arousal feeling state. Equally, when a consumer is experiencing a positive low-arousal mood (e.g. relaxation), he or she will find that a low level of arousal is pleasant and, therefore, prefer a product that offers low arousal. However, consumers in a negative mood will want to change their actual state of arousal according to mood regulation theory. Those with an unpleasant low-arousal mood (e.g. boredom) will perceive this feeling state as unpleasant and they will prefer high-arousing products that could help them to change their affective state. The same but inverse reasoning can be applied to consumers in a negative high-arousal affective state.

We can extrapolate this argumentation to the retail setting. However, we must be cautious and only apply this theory to low-arousal shoppers, since high-arousal shoppers' behavior seems to be guided by other reasoning. For shoppers in a positive low-arousal mood, an arousing environment will trigger a state of discomfort and will make them show a less favorable behavior. On the other hand, shoppers in a negative low-arousal mood will be more comfortable and pleased in an environment that could help them to change this feeling state, what subsequently will lead them to approach behaviors. So that, we state the following hypotheses:

H1: The level of atmospheric arousal will have a positive effect on shopping behavior for shoppers in a negative low-arousal mood.

H2: The level of atmospheric arousal will have a negative effect on shopping behavior for shoppers in a positive low-arousal mood.

Regarding high-arousal shoppers, our reasoning disentangles the mood regulation theory and follows the argument of Mano's (1999) work. According to this work, affective states characterized by higher arousal restrict attentional capacity. Additionally, more previously aroused individuals tend to simplify their decisions by focusing on fewer and more remarkable attributes, and exhibit reduced ad recall (Griskevicius et al. 2010). This reduced cognitive elaboration could prevent high-arousal consumers from being able to accurately evaluate shopping experience. Since both negative and positive high arousal shoppers will show a lower discrimination between the two retail settings (high vs. low arousing environments), both of them will not present differences between these two environments. As a consequence, our third hypothesis states as follows:

H3: The level of atmospheric arousal will have no effect on shopping behavior for a) shoppers in a positive high-arousal mood and b) shoppers in a negative high-arousal mood.

Additionally, we have included gender and frequency of visit as control variables. According to previous research, a better shopping behavior is expected within women compared to men due to cultural reasons, since women are considered the principal agents involved in shopping in our society (Grewal et al. 2003; Kuruvilla et al. 2009). Additionally, more frequent shoppers will show a better behavior, since the more they go shopping, the more they like it (Johnson and Mathews, 1997).

## 4. Method.

### 4.1. Participants, design, and procedure.

We conducted a 4 (incidental mood: PHA, PLA, NHA, vs. NLA) x 2 (HAA vs. LAA) between-subjects experiment during November 2013. 446 undergraduate students from a North-eastern Spanish University participated in the study. After a depuration process, 380 questionnaires were valid. The 61.6 % were women and the medium age was 21.05. The 82.9% of them goes to the shopping center at least once a month. As an incentive, they took part in a raffle of a 60 Euros coupon to spend in a well-known Spanish department store.

Respondents were randomly assigned to one of the four mood conditions. The experiment had two different stages: mood induction and manipulation of arousal. The experimenter informed participants that they would be asked to complete several unrelated tasks. The tasks were presented in a document consisted of three different pages. Participants were given instructions of doing each task separately and were informed about the impossibility of going back once they had completed each one.

#### - Mood induction.

Participants were first asked to put a set of 10 words in alphabetical order with the aim to remove any mood differences due to extraneous factors (Wegener et al. 1995). Mood induction was achieved through two techniques, video exposure and descriptions of past life experiences. Both of them have been previously followed in marketing research (Kim et al. 2010; Puccinelli, 2007). First, they were exposed to a video that evoked the corresponding mood state. We based the choice of the induction videos on previous literature (Zwosta et al. 2013). In order to induce a positive high-arousal mood, participants were exposed to a video that displayed several sportspersons and athletes from the Olympic Games with the song "We are the champions". The positive low-arousal mood was induced by a video that showed several landscapes with a relaxing background music. The negative high-arousal condition was achieved by displaying a fragment of the film "Buried". Finally, a video with repetitive images of the ancient videogame "Pong" served to induce a negative low-arousal mood. All the videos had a last between 2.50 and 3.50 minutes.

After the video exposure, participants completed a manipulation task following Bless et al. (1996). They were asked to list three life experiences that had made them feel the correspondent mood state and then to provide a detailed written description of one of those experiences. In the positive high-arousal condition, we asked them to remember three life experiences that evoked feelings of enthusiasm, excitement, and joy, while we defined the positive low-arousal experience with the words calmness, serenity, and peacefulness. The negative high-arousal experience was defined by distress, affliction, and anxiety, and the negative low-arousal one by the feelings of boredom, laziness, and

apathy. We encouraged participants to describe the event in such a way that a person who read it might experience the same sensation. Once the participants had written their task, they were asked to indicate how they were feeling on a seven-point scale.

- *Manipulation of atmospheric arousal.*

After the induction task, the participants were randomly exposed to one of two pictures depicting an arousing or a non-arousing environment at a mall. The variables that can be relevant for differences in the level of arousal triggered by a mall atmosphere are three: lighting, perceived crowding and colors. Lighting has demonstrated to be one of the most important environmental variables that influence consumer behavior in shopping environments, and prior research has found that brighter compared to softer lights triggered more arousal (Summers and Herbert, 2001; Wansik and Van Ittersum, 2012). Retail crowding arises as a consequence of spatial, social and psychological factors related to the scarcity of space (Stokols, 1972; Van Rompay et al. 2012). Recent research has demonstrated that a moderate crowd ambient at the mall is arousing, whilst a non-arousing scenery is that in which a few people are present (Pan and Siemenes, 2011). Finally, colors have demonstrated to be a very important variable arising arousal that has interrelated effect with lighting level. Specifically, warmer colors and higher color saturation increase arousal (Valdez and Mehrabian, 1994; Kaltcheva and Weitz, 2006).

To sum up, bright lights, moderate crowding, and warmer and higher saturation colors are present in the arousing condition, whilst soft lights, minimum levels of crowding, and cooler and less saturations colors form the non-arousing environment in our study. After having seen the image, participants were asked about the level of arousal that the image triggered, and about their shopping behavior.

#### **4.2. Pre-test.**

In order to determine if the videos and the images effectively evoked the feelings they were supposed to trigger, we conducted a pre-test with 80 participants (53 were women and the medium age was 22.23) that evaluated the videos and the photographs. They rated the degree to which each video evoked the corresponding feeling states on a seven-point scale (1="I am not feeling this mood state at all", 7="I am definitely feeling this mood state"). Additionally, we asked them to rate the level of arousal that the two images transmitted in terms of lighting, colors and crowding perceptions in a seven-point semantic differential scale. In each mood condition, results of ANOVA showed that the induction was successful. Thus, in the PHA condition, participants punctuated higher on feelings of enthusiasm, excitement and activation ( $F_{3,79}=26.407$ ,  $p<0.01$ , with  $\mu=5.409$ ). The same happened in the rest of the mood conditions: PLA ( $F_{3,78}=42.684$ ,  $p<0.01$ , with  $\mu=5.741$ ), NHA ( $F_{3,79}=34.659$ ,  $p<0.01$ , with  $\mu=4.56$ ), and NLA ( $F_{3,79}=17.265$ ,  $p<0.01$ , with  $\mu=5.038$ ). As well as mood conditions, the level of atmospheric excitement was clearly different between the HAA and the LAA images ( $F_{1,77}=118.436$ ,  $p<0.01$ , with  $\mu=5.388$  and  $\mu=2.925$  respectively).

#### **4.3. Measures.**

All the variables were measured by applying scales previously used in marketing literature. We conducted a confirmatory factor analysis and obtained acceptable levels of the Cronbach's Alpha for all these measures. Mood states were measured with seven point scales that ranged from (1) "definitely I do not feel this mood" to (7) "definitely I do feel this mood". Positive moods measures were based on Kim et al. (2010), while negative moods were measured with the scale proposed by Mano (1999). Positive high-arousal mood was built with four adjectives: excited, enthusiast, active, and lively ( $\alpha=0.864$ ); while tranquil, peaceful, serene, and calmed ( $\alpha=0.939$ ) were used to measure positive low-arousal mood. Negative high-arousal mood was measured with five adjectives: distressed, upset, nervous, anxious and distraught ( $\alpha=0.899$ ); and negative low-arousal mood by bored, tired, drowsy, sluggish and sleepy ( $\alpha=0.907$ ). Atmospheric arousal was measured by a seven-point semantic differential scale adapted from Kaltcheva and Weitz (2006). Thus, participants had to indicate what feeling transmitted the mall image: relax versus stimulation, calmness versus excitement, laziness versus frenzy, dull versus jittery, sleep versus activation, and pessimism versus liveliness ( $\alpha=0.867$ ). Finally, measures of the shopping behavior were based on the study of Donovan and Rossiter (1982), also used by Kaltcheva and Weitz (2006). They had to score on a seven-point

Likert scale, anchored by “strongly disagree” and “strongly agree”. The items were the following: “I would enjoy shopping in this mall”, “I would return to this mall”, “I would spend more time at this mall looking around or exploring this environment”, “I would be willing to buy things at this mall”, “This is a place where I might try to avoid other people, and avoid having to talk to them” (reversed), “I would be willing to recommend this mall to my friends”. The reversed item was eliminated, since its load on the construct of shopping behavior was very low, which allows us to get an accepted value of Cronbach’s Alpha for this construct ( $\alpha=0.904$ ). Regarding control variables, gender was a dichotomous variable (0/1) and frequency was a categorical variable with four categories: “I go to shopping malls less than once a month”, “I go to shopping malls once a month”, “I go to shopping malls between 2 and 4 times a month”, and “I go to shopping malls 5 or more times a month”.

**4.4. Manipulation checks.**

First, as a check of the effectiveness of the mood induction, the adjective-scale ratings of mood were examined. Table 1 shows the means of every mood state experienced by participants in each mood condition. A multivariate analysis of variance (MANOVA) yielded at  $p=0.05$  that participants in the PHA condition reported significantly higher positive high-arousal mood states ( $F_{3,373}=142.21, p<0.01$ ) compared to participants in the other mood conditions. Individuals in the PLA condition punctuated higher in the adjectives corresponding to the positive low-arousal mood state ( $F_{3,375}=195.23, p<0.01$ ), as it is the case in the NHA condition ( $F_{3,369}=156.69, p<0.01$ ), and in the NLA condition ( $F_{3,372}=109.23, p<0.01$ ).

Second, the level of arousal that mall images effectively triggered was assessed. Those subjects that were assigned to the high-arousing environment condition reported that their image significantly evoked higher atmospheric arousal ( $F_{1,374}=322.83, p<0.01$ ) than those who were exposed to the low-arousing mall setting as it can be seen in Table 2.

**TABLE 1.**  
**Mean adjective-scale ratings of induced mood (scale from 1 to 7).**

Incidental mood conditions	Positive valence				Negative valence			
	High-arousal		Low-arousal		High-arousal		Low-arousal	
	Mean	(SD)	Mean	(SD)	Mean	(SD)	Mean	(SD)
PHA	<b>5.186</b>	0.893	3.053	1.032	2.582	1.188	2.082	0.924
PLA	3.114	1.105	<b>5.769</b>	0.928	2.327	1.037	4.193	1.373

NLA	2.033	1.004	3.142	1.389	2.882	1.223	<b>5.321</b>	1.111

**TABLE 2.**  
**Mean differential semantic scale ratings for arousal (scale from 1 to 7).**

Atmospheric arousal conditions	Mean	SD
High-arousing atmosphere (HAA)	5.332	1.058
Low-arousing atmosphere (LAA)	3.373	1.056

**4. Findings.**

The hypotheses were tested using ANOVA. Table 3 shows the main and interaction effects of exogenous and control variables on shopping behavior (SB). The main effect of mood on SB is not significant, while the main effect of atmospheric arousal is statistically relevant ( $F_{1,377}=5.177, p<0.01$ ). As expected, we find a significant two-way interaction between moods and atmospheric arousal on shopping behavior ( $F_{3,377}=5.971, p<0.01$ ). Means of shopping behavior by experimental condition and results of ANOVA by mood condition are displayed in Table 5. Differences in consumer behavior are only significant for PLA individuals. As a consequence, H1 is rejected, since the effect of atmospheric arousal on shopping behavior is not significant for NLA individuals. In contrast, H2 is confirmed as

shopping behavior arises when atmospheric arousal decreases. In the case of PHA and NHA individuals, atmospheric arousal has no effect on shopping behavior, confirming H3a) and H3b). Figure 1 depicts these effects.

**TABLE 3.**

\* PHA: positive high-arousal mood; PLA: positive low-arousal mood; NHA: negative high-arousal mood; NLA: negative low-arousal mood; HAA: High-arousing atmosphere; LAA: Low-arousing atmosphere; SB: shopping behavior.

**FIGURE 1.**

**Two-way interaction of moods and atmospheric arousal on shopping behavior.**

\* PHA: positive high-arousal mood; PLA: positive low-arousal mood; NHA: negative high-arousal mood; NLA: negative low-arousal mood; HAA: High-arousing atmosphere; LAA: Low-arousing atmosphere.

For control variables, only the main effect of frequency on shopping behavior is significant at 5% ( $F_{3,377}=5.234, p<0.05$ ). Particularly, those who visit the mall more than once a month (categories 3 and 4,  $\mu=4.649$  and  $\mu=4.662$  respectively) show a better behavior than the less frequent shoppers (categories 1, and 2,  $\mu=4.021$  and  $\mu=4.082$  respectively) as can be seen in Figure 2. Although the main effect of gender is not significant, the interaction between gender and frequency is significant at 10%. The results show that among those who visit shopping malls between 2 and 4 times a month, females have a better behavior than males ( $F_{1,141}=9.209, p<0.01, \mu=4.874$  and  $\mu=4.195$  respectively) as Figure 3 shows. Thus, for this group our expectations are fulfilled.

In relation to the rest of interaction effects, none of them are significant. No differences in shopping behavior are found in terms of gender or frequency for each incidental mood and any of these control variables moderate the relationship between mall atmospherics and shopping behavior.

**Two-way interaction of frequency (times a month) and gender on shopping behavior (mean).**

## 5. Discussion, managerial implications, and further research.

Our research aims to demonstrate that the effects of an exciting (or arousing) mall atmosphere on shopping behavior are moderated by valence and arousal of incidental moods. To achieve our goals we have carried out an experiment using a sample of 380 students. Our theoretical framework is based on mood regulation theory for low-arousal shoppers, while Mano's (1999) work is followed to conceptualize the effects of mall atmospherics on shopping behavior for high-arousal shoppers. Our analysis demonstrates that the excitement triggered by a mall atmosphere worsens shopping behavior for shoppers in a positive low-arousal mood. This finding is consistent with the mood regulation theory (Isen, 1987). Thus, relaxed, calmed or serene shoppers prefer a non-exciting atmosphere to maintain their quiet, peaceful and pleased mood state. The discomfort when approaching an arousing

environment leads them to a worse shopping behavior. In contrast, for shoppers in a negative-low arousal mood, our results show a positive relationship between the level of atmospheric arousal and shopping behavior. This is consistent with the idea supported by the mood regulation theory and confirms previous research (Korpela, 2003; Mano, 1999; Wirtz et al. 2001). However, although an improvement in the approach behavior is found in this kind of shoppers, this change is not significant.

Regarding positive and negative high-arousal shoppers, the direction of the effects is consistent with mood regulation theory. Positive high-arousal shoppers' behavior slightly improves in an exciting environment while the influence of this environment is negative for negative high-arousal shoppers. Nonetheless, since these effects are not significant, mood regulation theory is rejected for both groups, confirming our expectations. Enthusiastic and joyful people, as well as anxious or nervous shoppers, are not influenced by the level of atmospheric arousal.

Two control variables were included in the model: gender and frequency of visit. Our results suggest that shoppers show a better shopping behavior than infrequent shoppers. This finding supports previous research that argues that the more the frequency of executing an activity or purchasing a product, the more they like it (Johnson and Mathews, 1997). As frequency of visit to malls rises, shopping behavior improves. This result is consistent with the findings of previous research that relates frequency with motivations, as they found that more frequent shoppers are guided more by hedonic and social value what implies to stay longer at the mall or having a better experience, whilst infrequent shoppers are guided by utilitarian values (Reynolds et al., 2002; Roy, 1994). Our study not only analyzes the main effect of this variable on shopping behavior but also its interaction effect with other exogenous variables. Previous research has suggested that less frequent shoppers give less importance to mall atmospheric cues, while frequent shoppers tend to be more bothered by odors and decoration (Ruiz et al., 2004). However, our findings have not found a significant effect of the interaction effect between frequency and atmospheric arousal. A possible explanation for our finding may be that we have just provided an image of the mall, so odors and music are not taken into consideration. Therefore, further research is needed to better know the influence of frequency. In contrast to our expectations, the main effect of gender on shopping behavior is not significant. This contradicts previous studies that have found that women show a better shopping behavior than men (Grewal et al., 2003; Kuruvilla et al., 2009). This traditional point of view is only confirmed for medium frequent shoppers. Our results suggest that men require going shopping very frequently in order to show a significant positive shopping behavior.

Our paper contributes to the consumer behavior research and the retailing literature by analyzing the moderating role of both valence and arousal of incidental moods in the relationship between atmospheric arousal and shopping behavior. We expand the stream of research followed by Kaltcheva and Wirtz (2006) and Massara et al. (2010), since these authors identified shopping orientation and expectations as situational moderators. Our results for shoppers in negative moods are similar to Mano's (1999) conclusions. However he differentiated between a favorable and an unfavorable environment, while we differentiate between a high-arousing and a low-arousing mall environment. Additionally, we contribute by demonstrating that differences in arousal within shoppers in a negative mood do not lead to different behaviors. For shoppers in positive moods, differences in arousal have previously demonstrated that lead to different product choices (Di Muro and Murray, 2012; Kim et al. 2010), but have not been addressed in the context of the retail environment and its effects on shopping behavior. Thus, our paper shows that an exciting environment may have a negative effect on shopping behavior for shopper in positive low arousal moods, while the effects are not significant for shoppers in a positive high-arousal mood.

### ***5.1. Managerial implications.***

Important managerial implications can be provided from our findings. Firstly, mall managers should be careful with the level of excitement that they try to create by designing environmental cues. This excitement may worsen shopping behavior for relaxed, peaceful, and serene shoppers. So managers should differentiate some zones of the mall depending on the visitors' mood, making relaxing atmosphere zones inside of the mall. Secondly, if they are not able to modify the excitement level of the mall atmosphere, they should encourage positive high-arousal moods among shoppers that

are in a positive low-arousal mood previous to the shopping activity. That is, they should try to change relaxation, peacefulness and calmness into enthusiasm, joy and positive activism. Thus, the level of excitement would not worsen behavior for those shoppers. Thirdly, although according to our results, it is not necessary to worry about shoppers in negative moods, we should get positive feelings to improve their welfare.

### **5.2. Limitations and further research.**

We must acknowledge several limitations in our investigation that represent opportunities for further research. Firstly, our study has been carried out in a laboratory setting with a sample formed by students. So, field research could make our conclusions more reliable and generalizable. Secondly, we focus on mood states as moderators of the effect of atmospheric arousal on shopping behavior, but we do not consider the different sources of those moods. Further research should address this question and try to identify how to influence on shopping behavior taking into account mood states. Finally, our study looks into shopping activity at malls, but other retail settings could also be interesting and moods can differently moderate the effect of their environmental cues on shopping behavior.

## RESUMEN

*Este trabajo estudia la influencia de los padres en los niveles de etnocentrismo regional de sus hijos a través del planteamiento y contrastación de un modelo en el que la identidad regional y los niveles de etnocentrismo regional de los padres son considerados posibles antecedentes del etnocentrismo de los hijos, junto con otras variables como la percepción sobre la situación financiera particular y el estado de la economía o el sexo del individuo.*

*Los resultados, basados en 197 triadas formadas por consumidores jóvenes extremeños y sus padres, muestran que, a pesar de que los niveles de etnocentrismo de los jóvenes son relativamente bajos, la influencia de los padres es muy significativa y, en todo caso, muy superior al efecto de otras variables. El análisis exploratorio realizado apoya el supuesto de que el etnocentrismo del consumidor es una tendencia general adquirida durante la infancia, por medio del proceso de socialización.*

## Palabras clave:

Etnocentrismo regional del consumidor, consumidores extremeños, influencia parental, grupos de referencia

## 1. Introducción

Tanto en el ámbito empresarial como en el académico ha habido siempre un gran interés por conocer los factores relacionados con la elección de los consumidores entre productos de distinto origen, pero ese interés se ha centrado durante décadas en el estudio de los factores que determinaban la preferencia de los consumidores por los productos nacionales frente a los extranjeros. El estudio de la demanda de productos locales o regionales es mucho más reciente y los trabajos en el ámbito del marketing son muy escasos, especialmente en el ámbito español. Una manifestación de que el tema objeto de estudio está en una fase inicial es la falta de una definición clara en la literatura de lo que se entiende por producto local o por producto regional.

Estudios recientes revelan que la tendencia hacia la compra de productos de alimentación con un origen cercano al consumidor (productos producidos en la misma región del consumidor o en un entorno próximo) va en aumento (Campbell, 2011), en parte motivada por la aparición en todo el mundo de grupos de consumo local, que buscan apoyar las economías locales frente a la competencia de grandes empresas globales. Ya sea porque a los productos con un origen cercano se les atribuyen una serie de características deseables por parte del consumidor (mayor calidad/mayor frescura), porque son un medio para impulsar la economía local, partiendo del apoyo a las normalmente pequeñas explotaciones locales, o porque comprando productos que han sido producidos a una distancia menor el impacto sobre el medio ambiente de las actividades de transporte es menos lesivo, en algunos países la tasa de productos locales y regionales sobre el total de productos de alimentación consumidos va en aumento. En definitiva, las motivaciones de compra de productos locales son una combinación de atributos privados y públicos (Bond *et al.*, 2008; Thilmany *et al.*, 2008) que cada vez preocupan más a los distribuidores, que están viendo en los cambios en el comportamiento de compra del consumidor una oportunidad. Así, varias cadenas de distribución norteamericanas, entre ellas el líder de la distribución a nivel mundial, Wal-Mart, han mostrado un gran interés por este segmento de mercado. Responsables de la empresa Mercadona, líder de la distribución de alimentación en España, han manifestado recientemente (Zafra, 2013) su intención de cambiar su estrategia con respecto a los productos frescos de alimentación, buscando un mayor abastecimiento de proveedores locales y regionales, ante la constatación de que el consumidor prefiere consumir productos locales, aunque su consumo no se extienda todo el año, que otros productos con un origen más lejano, a los que atribuye una menor calidad.

Si la investigación sobre el tema en otros países es bastante limitada, en España el estudio del consumo local o regional desde la perspectiva del marketing es prácticamente inexistente. Es necesario, por tanto, avanzar en el conocimiento de la importancia del origen del producto en la elección del consumidor y contribuir a la literatura sobre el origen del producto. Algunos autores como Samiee (2011) y Usunier (2011), que representan la corriente crítica, sostienen que la mayoría de los consumidores desconocen el origen de los productos y tienen poco interés por averiguarlo, y sugieren que el efecto del origen del producto se ha exagerado en las investigaciones de las últimas décadas. Sin embargo, para otros autores, el origen del producto sigue siendo muy relevante, tanto para las empresas como para los investigadores (Diamantopoulos *et al.*, 2011; Magnusson *et al.*, 2011 a, b).

Aunque la literatura sobre antecedentes del etnocentrismo del consumidor es bastante amplia, se basa en estudios empíricos realizados en un número elevado de países y considera múltiples variables, de su revisión puede concluirse un cierto sesgo hacia variables sociodemográficas, que son las más comúnmente analizadas: edad, sexo, nivel de estudios y nivel de ingresos (Caruana, 1996; Erdogan y Uzkuurt, 2010; Good y Huddleston, 1995; Kottasz y Bennet, 2006; Watson y Wright, 2000). Además, no hay evidencias claras sobre el efecto de algunas de estas variables. Así, algunos estudios encuentran una relación positiva de la edad en el etnocentrismo del consumidor (Crysochoidis *et al.*, 2007; Marín y Miquel, 1997); pero otros no observan relación significativa (Nijssen y Douglas, 2004; Saffu y Walker, 2005) e incluso un mismo

estudio encuentra resultados dispares en Turquía (relación positiva) y República Checa (ausencia de relación) (Balabanis *et al.*, 2001).

Otros antecedentes del etnocentrismo del consumidor menos estudiados en la literatura son el estado civil o el lugar de residencia (Caruana, 1996), el patriotismo (Klein y Ettenson, 1999; Sharma *et al.*, 1995), la apertura cultural y el colectivismo (Kottasz y Bennet, 2006; Sharma *et al.*, 1995), o el estilo de vida (Spillan *et al.*, 2007).

Hasta donde llega nuestro conocimiento, no se ha contrastado hasta la fecha la posible influencia parental en los niveles de etnocentrismo de los hijos, a pesar de que en uno de los primeros trabajos sobre el tema Shimp (1984) afirmaba que las tendencias etnocéntricas de un consumidor se derivan principalmente de sus experiencias de socialización, siendo la familia y, en menor medida, los líderes de opinión, compañeros y medios de comunicación los que influyen en la orientación etnocéntrica de un individuo desde la infancia.

Este trabajo pretende cubrir estos dos huecos en la literatura: por una parte, considerar un nivel regional de análisis (productos regionales frente a no regionales), que complete el nivel habitual (productos nacionales frente a extranjeros); por otra, estudiar uno de los antecedentes del etnocentrismo del consumidor menos estudiados, concretamente, la influencia de un grupo de referencia: los padres de los consumidores jóvenes.

La teoría que sirve de base a este trabajo es la teoría de la identidad social, que sostiene que los individuos tienden a clasificarse en grupos (grupos propios) que se diferencian de otros grupos de individuos (grupos ajenos). En la literatura esta teoría ha servido para explicar la elección del consumidor entre productos nacionales y extranjeros, asimilando que el grupo propio es el formado por los ciudadanos de un país, mientras que los grupos ajenos son los formados por ciudadanos de otros países. Los productos fabricados en el país del consumidor son considerados productos del grupo, mientras que los productos extranjeros son considerados productos ajenos (Tajfel, 1981; Verlegh, 1999). La tendencia natural de cada grupo es apoyar todo lo relacionado con el propio grupo, en detrimento de otros grupos.

Este trabajo se estructura como sigue. En primer lugar, se revisan las definiciones de producto local, regional o con un origen cercano que se han propuesto en los últimos años en la literatura y se resalta la ausencia de una definición universalmente aceptada de estos conceptos. En segundo lugar, se estudia la evolución del concepto de etnocentrismo, desde su concepción original hasta llegar a la de etnocentrismo regional, pasando por la de etnocentrismo del consumidor. En tercer lugar, se exponen algunos de los fundamentos de la teoría de la identidad social, en la que se asienta este trabajo. En cuarto lugar, se plantean las hipótesis del estudio a partir de la revisión de la literatura sobre antecedentes del etnocentrismo del consumidor. En quinto lugar, se presenta la metodología del estudio. En sexto lugar, se exponen los principales resultados del análisis empírico realizado. Por último, se resumen las principales conclusiones de este trabajo.

## **2. Definición de producto local o regional**

Thilmany *et al.* (2008) consideran que una manifestación de la importancia del movimiento “local food” es la elección del término *Locavores* en 2007 como la palabra del año por el New Oxford American Dictionary, que lo define como un residente local que trata de consumir alimentos producidos en un radio de 100 millas.

Sneed *et al.* (2012) recogen que, según el Congreso Americano, para que un producto agrícola se considere local la distancia total recorrida entre el origen del producto y el mercado debe ser inferior a 400 millas o estar comprendida en el estado de producción. Para Hand y Martínez (2010), esta definición es una manifestación de la dificultad de delimitar lo que es un producto local mediante criterios geográficos, especialmente en un país (EE.UU.) en el que algunos condados de los estados de la costa Oeste son más grandes que los estados de la costa Este.

Chambers *et al.* (2007) consideran que un producto de alimentación local es aquel producido y vendido en un radio máximo de 20-50 millas de distancia con respecto a la residencia del consumidor, aunque consideran que en la literatura académica y gubernamental (Reino Unido)

los productos locales de alimentación han sido descritos como aquellos cultivados y vendidos dentro de la misma región o condado (Edward-Jones *et al.*, 2008).

Algunos autores empiezan a cuestionar que las definiciones de producto local con criterios geográficos recojan adecuadamente las percepciones de los consumidores. Han y Martínez (2010) plantean que a los consumidores que buscan productos locales les preocupa cómo se elaboran los productos y quién los produce y apuntan dos elementos que completan el concepto de producto local: por una parte, los consumidores parecen estar buscando una interacción personal con los productores y, por lo tanto, persiguen reducir la distancia social producción-consumo más que la distancia geográfica; por otra, a los consumidores les preocupa la sostenibilidad medioambiental y social asociada a los métodos de producción y empiezan a manifestar su apoyo a las pequeñas explotaciones y las prácticas asociadas con el bienestar animal (Martínez *et al.*, 2010).

La literatura no ofrece una definición universal de producto local que pueda aplicarse a distintas regiones, empresas o consumidores y, además, los conceptos de producto local y producto regional son muy próximos. Sin embargo, conocer la percepción de lo que los consumidores entienden por producto local o regional puede ser fundamental para las empresas que quieren destacar en sus estrategias el origen cercano de los productos (Darby *et al.*, 2008).

### **3. Distintos niveles de etnocentrismo**

#### **3.1. Etnocentrismo**

El concepto de etnocentrismo del consumidor parte del término más general de etnocentrismo, que Sumner (1906, p.13) definió como “la visión de las cosas en la que el propio grupo es el centro de todo y los demás son valorados y clasificados con referencia a él...cada grupo alimenta su propio orgullo y vanidad, se jacta de ser superior, exalta sus propias virtudes y mira con desprecio a los foráneos”. Definiciones posteriores siguieron la misma línea al considerar el etnocentrismo como parte de la naturaleza humana (Lynn, 1976), un fenómeno universal profundamente enraizado en muchas relaciones intergrupos (Lewis, 1976), que no sólo se inscribe a nivel de nación, sino que se manifiesta en multitud de grupos sociales dando lugar a orgullo familiar, prejuicios religiosos, discriminación racial o patriotismo (Murdock, 1931).

La causa principal de que el etnocentrismo exista en las sociedades actuales es la tendencia a simplificar y generalizar sobre otras culturas. El etnocentrismo lleva a analizar el entorno desde la perspectiva del grupo del que se es parte y a aceptar ciegamente a las personas afines culturalmente, a la vez que se rechaza a aquellas personas con distintas culturas (Booth, 1979; Worchel y Cooper, 1979).

Para Howard (1996) el etnocentrismo tiene un carácter dual. Por una parte, el etnocentrismo es una fuerza positiva en el sentido en que proporciona al individuo un sentimiento de orgullo, bienestar y seguridad. Despreciar a otras culturas puede contribuir a aumentar los sentimientos patrióticos del grupo y considerar que el estilo de vida propio es superior. Por otra parte, en sentido negativo, el etnocentrismo es el factor que más puede inhibir el conocimiento de otras culturas y en su forma más acusada puede conducir al chovinismo, la creencia de que las costumbres y normas propias son automática e incuestionablemente superiores a las de otros.

El etnocentrismo ayuda a asegurar la supervivencia de los grupos y aumenta sus lazos de solidaridad, cooperación y lealtad (Shimp y Sharma, 1987). Levine y Campbell (1972) especificaron las propiedades del etnocentrismo; en concreto, consideraron que este concepto consistía en la tendencia a: (1) distinguir varios grupos; (2) percibir los sucesos en términos de los intereses económicos, políticos o sociales del propio grupo; (3) ver al propio grupo como el centro del universo y considerar su forma de vida superior a las demás; (4) sospechar de otros grupos y despreciarlos; (5) ver al propio grupo como superior, fuerte y honesto; y (6) ver a otros grupos como inferiores, débiles y causantes de problemas. Para Brislin (1993), las personas

etnocéntricas consideran el grupo como algo central porque aporta estándares de comportamiento adecuados y protección frente a posibles amenazas de los ajenos al grupo.

La descripción de etnocentrismo que se recoge en estos últimos párrafos y que refleja la posición dominante en la literatura está plagada de expresiones como: “mira con desprecio a los foráneos”, “se rechaza a aquellas personas con distintas culturas”, “sospechar de otros grupos y despreciarlos” o “ver a otros grupos como causantes de problemas”. Sin embargo, Cahsdan (2001), tras un estudio basado en una muestra intercultural de 286 sociedades (Murdock y White, 1969), concluye que etnocentrismo y xenofobia no van de la mano y que la lealtad intra-étnica no implica necesariamente hostilidad inter-étnica.

De manera similar, Adams (1951) cuestiona también que la hostilidad con otros grupos sea una consecuencia inevitable del etnocentrismo, como dan a entender otros estudios. Este autor considera necesario aclarar en su artículo la aparente confusión en la literatura entre dos conceptos distintos: conciencia de grupo y etnocentrismo.

La conciencia de grupo es lo que Murdock (1949, p. 83), equivocadamente para Adams, denomina etnocentrismo y que se refiere a la “tendencia a exaltar el propio grupo y despreciar a otros grupos” que lleva a “sentimientos antagonistas y comportamientos hostiles” como una consecuencia “inevitable de la solidaridad intra-grupo”. Esta conciencia de grupo surgiría, a juicio de Adams, del contacto cara a cara, diario y cubre todo el espectro, desde “orgullo local” hasta “conflicto internacional”, pasando por “espíritu corporativo”, “intolerancia religiosa” o “prejuicio racial”.

Sin embargo, para Adams (1951) el etnocentrismo es más lo que Herskovits (1948, p.68) describe como “el punto de vista por el que el modo de vida propio es preferido al de otros” y que es una consecuencia lógica del proceso de “enculturización temprana”. Este sentimiento de superioridad respecto al estilo de vida propio o a su cultura hace que un estadounidense pueda pensar, por ejemplo, que hace las cosas mejor, y de una manera más correcta y eficiente que un japonés o que un brasileño. Adquirir la propia cultura y estar condicionado a hacer las cosas de una determinada forma supone creer que hacer las cosas de otra forma es incorrecto o de mala educación. Para Adams (1951), este es el origen fundamental del sentimiento de etnocentrismo. El etnocentrismo, pero no la conciencia de grupo, es una característica humana y, por lo tanto, cultural.

### **3.2. Etnocentrismo del consumidor**

El concepto de etnocentrismo del consumidor fue planteado inicialmente por Shimp (1984) para recoger las percepciones de los consumidores estadounidenses acerca de la oferta de productos procedentes de otros países. Posteriormente, Shimp y Sharma (1987) y Sharma *et al.* (1995) utilizaron este término para referirse a las creencias de los consumidores acerca de lo adecuado y moral de adquirir productos hechos en el extranjero.

Desde la perspectiva de los consumidores etnocéntricos, “comprar productos importados es inadecuado porque se daña la economía nacional, genera pérdidas de puestos de trabajo y es muy poco patriótico; los productos de otros países son objeto de desprecio para los consumidores muy etnocéntricos” (Shimp y Sharma, 1987, p.280).

Shimp (1984) considera que las tendencias etnocéntricas de un consumidor se derivan principalmente de sus experiencias de socialización. La familia y, en menor medida, los líderes de opinión, compañeros y medios de comunicación influyen en la orientación etnocéntrica de un individuo desde la infancia

La literatura señala una serie de propiedades específicas del etnocentrismo del consumidor (Shankarmahesh, 2006; Sharma *et al.*, 1995; Shimp y Sharma, 1987): (1) Es una tendencia general, más que una actitud específica; (2) es el resultado del “amor y preocupación por el propio país y el temor a perder control sobre los propios intereses como resultado de los efectos perjudiciales de las importaciones sobre uno mismo y sobre los compatriotas” (Sharma *et al.*, 1995, p.27); (3) incluye una intención y disposición a no adquirir productos de otros países; (4) se refiere a un nivel personal (individual) de prejuicio negativo hacia las importaciones, si bien

el nivel global de etnocentrismo del consumidor en un determinado sistema social sería la agregación de los niveles individuales de tendencias etnocéntricas; (5) tiene una dimensión ética que indica que comprar productos importados es poco patriótico y una desconsideración con respecto a los compatriotas en paro; (6) es inelástico con respecto al precio y otros atributos del producto; (7) se supone que es adquirido desde la infancia por medio del proceso de socialización; (8) no afecta únicamente a productos de consumo, sino también a productos industriales.

### **3.3. Etnocentrismo regional del consumidor**

Aunque la investigación sobre etnocentrismo del consumidor se ha ceñido casi en exclusiva a la elección entre productos nacionales y extranjeros, también es posible encontrar en la literatura apoyos a la necesidad de considerar un nivel subnacional de análisis. Burger y Harris (1999) se basan en el estudio de catorce identidades sociales en Sudáfrica y encuentran una relación entre la identidad social del consumidor y la elección de productos propios. Para estos autores es fundamental considerar distintas identidades sociales en la investigación sobre los efectos país de origen, especialmente en mercados emergentes y economías en transición. Oullet (2007) plantea el concepto de etnocentrismo étnico, con antecedentes y consecuencias similares al etnocentrismo del consumidor introducido por Shimp y Sharma (1987) y medido mediante la CETSCALE. En este caso, el país es sustituido por el grupo étnico, de tal manera que el consumidor con etnocentrismo étnico valorará positivamente y mostrará una mayor disposición a comprar los productos de su grupo étnico frente a los productos de grupos ajenos. Sus resultados, basados en las respuestas de 954 consumidores estadounidenses, canadienses y franceses apoyan esta suposición. Otros estudios sobre etnocentrismo inter-étnico son los realizados por Vida *et al.* (2008) en Bosnia-Herzegovina y Poon *et al.* (2010) en Australia, que utilizan una versión reducida de la CETSCALE. En el primer caso, la identidad Bosnia, Serbia o Croata del consumidor tenía una influencia clara en los niveles de etnocentrismo y en la predisposición a adquirir productos nacionales. En el segundo, en el que se distinguieron tres grupos étnicos (australianos, inmigrantes occidentales e inmigrantes orientales), se observó que los inmigrantes orientales eran los menos etnocéntricos de los tres grupos considerados, que cuanto más tiempo llevasen en el país los inmigrantes, mayor era su nivel de etnocentrismo y que sólo en el caso de los inmigrantes occidentales el nivel de etnocentrismo de los hombres era significativamente mayor que el de las mujeres.

Otros niveles de análisis subnacional han sido más descuidados y podemos considerar que la investigación sobre la presencia de etnocentrismo regional es prácticamente inexistente, con la excepción de las aportaciones de Siemieniako *et al.* (2011) y Fernández-Ferrín y Bande-Vilela (2013). Siemieniako *et al.* (2011) sostienen que es importante considerar un nivel regional en el estudio del etnocentrismo del consumidor. Llevan a cabo un estudio preliminar, a partir de un análisis focal con 9 estudiantes polacos, en el que entre otros aspectos estudian si los estudiantes sienten una obligación moral de adquirir marcas locales de cervezas. Este trabajo reveló fuertes niveles de identidad regional y de etnocentrismo regional, así como una mayor preferencia por marcas locales.

A su vez, el análisis cuantitativo realizado por Fernández-Ferrín y Bande-Vilela (2013) basado en una muestra de 138 consumidores gallegos, obtenida a través de un muestreo bietápico (hogares e individuos) aleatorio, permitió comprobar que la escala de tendencias etnocéntricas del consumidor (CETSCALE), desarrollada por Shimp y Sharma (1987), tiene buenas propiedades psicométricas cuando se aplica a un nivel regional de análisis y que las tendencias etnocéntricas del consumidor influyen de manera significativa en sus intenciones de compra con respecto a los productos regionales y no regionales.

## **4. Teoría de la identidad social**

Según recogen Lantz y Loeb (1996), el “auto-concepto” se compone de dos aspectos: (1) la identidad personal, que se refiere a atributos específicos de un individuo como la competencia, el talento o la sociabilidad; y (2) la identidad social, que se deriva del conocimiento de

pertenencia al grupo, junto con el valor e importancia emocional de dicha pertenencia. Para los teóricos sociales la necesidad de mantener una autoestima positiva incluye una identidad personal y varias identidades sociales (Luhtenan y Crocker, 1992; Turner, 1982; Tajfel, 1981). Parece ser que existe una propensión a crear una identidad positiva a través de la identificación con varios grupos sociales, entre los cuales estarían la familia, la etnia o raza, los amigos o el propio país.

Un individuo puede mantener varias identidades sociales simultáneamente y para que una destaque sobre el resto la combinación de sus características personales y de la situación debe propiciar la “despersonalización” de la identidad personal. Según Lantz y Loeb (1998), esto ocurre cuando las diferencias entre individuos de un grupo social se minimizan y las diferencias entre grupos sociales se maximizan. La despersonalización está relacionada con el proceso de “auto-estereotipo”, en el que el individuo se ve a sí mismo como un elemento intercambiable de una determinada categoría social, más que alguien con una personalidad única. Es la identificación con el grupo la que provoca que el individuo haga continuamente comparaciones entre el grupo propio y los ajenos, especialmente en aquellos aspectos en los que el propio grupo sale bien parado (Shimp *et al.*, 2004).

Según Shimp *et al.* (2004) el autoconcepto de un individuo se basa en diferencias reales o percibidas (estereotipos) entre el propio grupo y los ajenos, que pueden influir en sus evaluaciones y comportamientos. Por ejemplo, un gallego podría compararse con un individuo de otra región y considerarse especialmente amante de su tierra, hospitalario u honrado. De acuerdo con la investigación sobre auto-categorización, el etnocentrismo es una de las posibles consecuencias de la despersonalización.

Dentro de las múltiples identidades sociales que puede presentar un individuo, Lantz y Loeb (1998) se centran en la identidad local y estudian su impacto en las tendencias etnocéntricas del consumidor y en su preferencia por la compra de productos locales. Para estos autores, la identidad local no tiene por qué desarrollarse de la misma forma que la identidad nacional. Gran parte de la investigación sobre identidad nacional tiene que ver con las tendencias etnocéntricas de los consumidores y, según Sumner (1906), el etnocentrismo se debe muchas veces a la existencia de una percepción de amenaza de otros grupos sociales y suele ser mayor en individuos con un patriotismo elevado. Sin embargo, no está claro que lo mismo ocurra cuando hablamos de identidad local y es que “es mucho más fácil sentirse amenazado por otro país que por otra ciudad dentro del mismo país” (Lantz y Loeb, 1998).

Estos autores sostienen que la percepción de una amenaza no es un elemento necesario para que se desarrolle una identidad local. Aunque la percepción de una amenaza procedente de otros municipios reforzaría esa identidad, sería suficiente con que un individuo manifestase sentimientos positivos que le impulsasen a distinguirse de individuos de otras localidades para que esa identidad local aflorase: “En términos de la teoría de la identidad social podría decirse que los consumidores tienen una identidad nacional. La identidad nacional puede ser fuerte en algunos consumidores y débil en otros. La CETSCALE, que se centra en la compra de productos, mide la manifestación económica de la identidad nacional” (Lantz y Loeb, 1996, p. 375).

Sin embargo, para Lantz y Loeb (1998), identidad local y etnocentrismo local son dos conceptos distintos, siendo el primero antecedente del segundo. La identidad local no necesita un incentivo económico para activarse, pero cuando ésta es fuerte, seguramente lleve a expresiones de apoyo a la economía local, particularmente por parte de los consumidores.

La teoría de la autocategorización sostiene que los individuos desean considerarse parte de grupos de los que tienen una imagen positiva. Por eso es de esperar que cuando un consumidor tenga una fuerte identidad local perciba los productos locales como de mayor calidad, incluso en ausencia de información objetiva que sustente esa valoración.

## **5. Antecedentes del etnocentrismo regional: la influencia parental**

Un nivel elevado de identidad con una categoría social lleva a tendencias etnocéntricas elevadas con esa categoría social (Lantz y Loeb, 1998). Dentro de las múltiples categorías sociales posibles, estos autores estudiaron la identidad local y su influencia en el comportamiento del consumidor, concretamente en las tendencias etnocéntricas y sus preferencias por los productos locales. Encontraron que la identificación de un individuo en su entorno local era un claro antecedente de su nivel de etnocentrismo y éste a su vez predecía su preferencia por los productos locales. Resultados similares fueron encontrados al estudiar consumidores turcos (Kaynak y Kara, 2000) y guatemaltecos (Spillan *et al.*, 2007). A nivel regional, Fernández-Ferrín y Bande-Vilela encontraron una relación positiva y significativa entre la identidad regional de una muestra de consumidores gallegos y sus niveles de etnocentrismo regional. Cabe esperar, basándose en las evidencias previas las siguientes hipótesis:

**H1a: La identidad regional de los padres influirá positivamente en sus niveles de etnocentrismo regional.**

**H1b: La identidad regional de las madres influirá positivamente en sus niveles de etnocentrismo regional.**

**H1c: La identidad regional de los hijos/as influirá positivamente en sus niveles de etnocentrismo regional.**

Según la teoría de la identidad social, la identidad personal y la identidad social de un individuo forman el auto-concepto y ambas son necesarias para que el individuo tenga una autoestima positiva. Además, es habitual que éste tenga varias identidades sociales (Luhtenan y Crocker, 1992; Turner, 1982; Tajfel, 1981), que no tienen por qué ser excluyentes (Lantz y Loeb, 1998).

La literatura señala que los comportamientos de jóvenes se ven afectados claramente por otras personas con las que entran en contacto, directa o indirectamente, y que actúan como modelos de referencia (Bandura, 1977). Algunos autores consideran que la familia y especialmente los padres actúan como modelos a seguir por los hijos, siendo su influencia sobre los actitudes y patrones de consumo muy superior a la de otros modelos de referencia, como profesores o compañeros (Moschis, 1985), especialmente durante la adolescencia (Martin y Bush, 2000)

Además, según recogen de Run *et al.* (2010), siguiendo a Feltman (1998) y Gunter y Furnham (1998) los padres desempeñan un papel muy importante en la formación de las actitudes y comportamiento de sus hijos al actuar como agentes de valores, proporcionando reglas, perspectivas y principios mediante la interacción y comunicación con ellos.

Ante la falta de conocimiento sobre el proceso de formación de la identidad regional de un individuo, en este trabajo exploratorio planteamos que los padres contribuirán de manera significativa a formar la identidad regional de sus hijos:

**H2a: La identidad regional de los padres influirá positivamente en la identidad regional de sus hijos/as.**

**H2b: La identidad regional de las madres influirá positivamente en la identidad regional de sus hijos/as.**

Asimismo y basándonos en los primeros trabajos sobre etnocentrismo del consumidor (Shimp, 1984) que apuntan a la familia como uno de los elementos más determinantes del proceso de socialización de un individuo y de sus orientaciones etnocéntricas, por encima de otros grupos de referencia, planteamos que los niveles de etnocentrismo regional de los padres y madres influirán de manera positiva en las tendencias etnocéntricas de sus hijos/as.

**H3a: El nivel de etnocentrismo regional de los padres influirá positivamente en los niveles de etnocentrismo regional de sus hijos/as**

**H3b: El nivel de etnocentrismo regional de las madres influirá positivamente en los niveles de etnocentrismo regional de sus hijos/as**

Las tendencias etnocéntricas del consumidor son especialmente prominentes entre los individuos cuya calidad de vida y situación económica se ve amenazada por la competencia extranjera (Shimp y Sharma, 1987) y tienen un efecto más fuerte en las actitudes hacia los productos extranjeros cuando esos productos amenazaban de una manera más clara la economía individual (Sharma *et al.*, 1995). En un estudio de consumidores estadounidenses y su actitud hacia los productos japoneses, Klein y Ettenson (1999) encontraron que la percepción de que la economía personal había mejorado en el último año estaba relacionada negativamente con los niveles de etnocentrismo, es decir, que aquellos consumidores que creían que sus finanzas personales habían mejorado, manifestaban menores niveles de etnocentrismo. Basándonos en evidencias previas planteamos que:

**H4: La percepción de mejora en la economía particular influirá negativamente en el etnocentrismo regional de los consumidores jóvenes.**

**H5: La percepción de mejora de la economía extremeña influirá negativamente en el etnocentrismo regional de los consumidores jóvenes.**

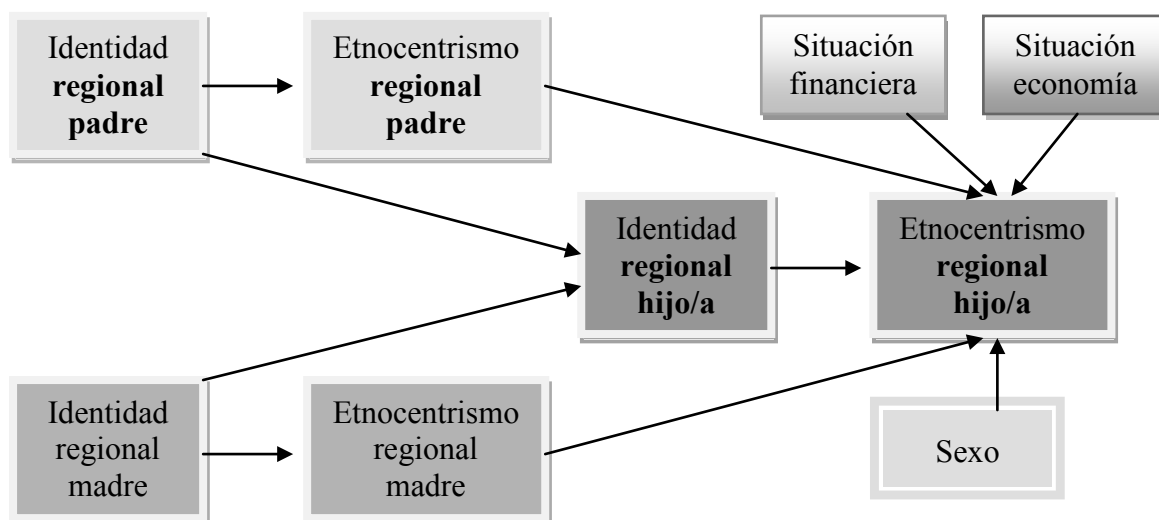

Algunos autores encuentran que los niveles de etnocentrismo del consumidor son mayores en las mujeres que en los hombres. Es el caso de Good y Huddleston (1995) en su análisis de consumidores polacos, Sharma *et al.* (1995) al estudiar las tendencias etnocéntricas en Corea del Sur, Ibáñez (2001) en su estudio de consumidores españoles, Klein y Ettenson (1999) con su trabajo basado en una muestra de consumidores estadounidenses, o Balabanis *et al.* (2001) y Erdogan y Uzkuurt (2004) al estudiar el etnocentrismo de los consumidores turcos. Sin embargo, estudios basados en muestras de consumidores rusos (Good y Huddleston, 1995; Saffu y Walker, 2005), españoles (Marín y Miquel, 1997), checos (Balabanis *et al.*, 2001), holandeses (Nijssen y Douglas, 2004), canadienses (Saffu y Walker, 2005), húngaros y británicos (Kottasz y Bennet, 2006), griegos (Chrysochoidis *et al.*, 2007) o malteses (Caruana, 1996) concluyen con una ausencia de relación entre el sexo del individuo y sus tendencias etnocéntricas.

Ante las evidencias encontradas en la literatura en general y en particular para España, la variable sexo será introducida en el análisis como una variable control. No obstante, dado que de existir una relación entre sexo y nivel de etnocentrismo es más probable que sean las mujeres las que presenten mayores niveles de etnocentrismo regional, proponemos lo siguiente:

**H6: La variable sexo estará relacionada significativamente con los niveles de etnocentrismo regional siendo éstos mayores en el caso de las mujeres.**

Las relaciones propuestas aparecen recogidas en la Figura 1.

FIGURA 1  
Modelo teórico planteado

## **6. Metodología**

### **6.1. Muestra**

Para lograr los objetivos de la investigación y estudiar si los niveles de identidad regional y etnocentrismo regional de los padres influyen significativamente en los valores observados en los hijos consideramos oportuno fijar dos condiciones que deben reunir los consumidores jóvenes para formar parte de la muestra: primero, que sean adultos, es decir, que hayan cumplido los 18 años y tengan cierta capacidad de decisión y, segundo, que padres e hijos formen una misma unidad familiar. Estos dos requisitos son habitualmente satisfechos en el caso de los estudiantes universitarios.

Aunque la recogida de datos entre estudiantes es a veces criticada en la literatura, en algunos trabajos se defiende la idoneidad de las muestras de “adultos jóvenes con niveles de estudios elevados” (Martin y Bush, 2000; Vermeir y Verbeke, 2008) al considerar que éstos: (1) son los consumidores del futuro; (2) están en la etapa de formación de su identidad personal y de su sistema de creencias y valores; (3) tienen poder de compra creciente e influencia en las decisiones de compra de su familia; y (4) actúan como marcadores de tendencias de consumo. Para Strizhakova et al. (2012) los consumidores jóvenes son un segmento atractivo para las empresas multinacionales, especialmente en mercados emergentes, al ser muy innovadores, mostrarse favorables a la prueba de nuevos productos, ser muy conscientes de su identidad y estar muy expuestos a los medios de comunicación globales.

Los estudiantes seleccionados para formar parte de la muestra cursan estudios en el Grado en Administración y Dirección de Empresas (GADE) en el Campus de Badajoz, de la Universidad de Extremadura. Es de esperar que, siendo Extremadura una Comunidad Autónoma caracterizada por sus niveles de nacionalismo inferiores a los de otras CC.AA. como Cataluña o el País Vasco, los niveles de etnocentrismo regional del consumidor no serán muy elevados y, además, al tratarse de consumidores jóvenes, también cabe esperar niveles bajos de etnocentrismo. De confirmarse la influencia parental en el etnocentrismo de los consumidores jóvenes extremeños, es razonable esperar una influencia mayor en otras CC.AA. con mayores niveles de etnocentrismo.

A los estudiantes se les pidió que completasen un cuestionario que recogía escalas de medida de etnocentrismo del consumidor a nivel regional y alguno de los antecedentes analizados en la literatura, que son considerados en el modelo teórico planteado: identidad regional, percepción de la situación financiera personal y la situación de la economía y sexo del individuo. Además, para completar la recogida de datos y poder medir las tendencias etnocéntricas regionales de sus padres y sus niveles de identidad regional, se pidió a los estudiantes que actuasen como encuestadores y llevasen a sus casas la parte del cuestionario referida a las puntuaciones de sus padres. Se les instruyó para que no influyesen en las respuestas de sus padres, pero que aclarasen las dudas que éstos pudiesen tener sobre el tema. Se acompañó el cuestionario de una carta explicativa con el propósito del estudio.

### **6.2. Medidas**

La medida de etnocentrismo regional del consumidor es una adaptación de la versión reducida de la CETSCALE, de seis indicadores, de Klein *et al.* (2005), testada previamente en seis países y con buenas propiedades psicométricas. Esta escala también resultó ser fiable y válida en el contexto de compra de productos regionales/no regionales de los consumidores gallegos (Fernández-Ferrín y Bande Vilela, 2013).

Para medir los dos antecedentes económicos del etnocentrismo regional del consumidor, la preocupación por la situación financiera familiar y la preocupación por la situación de la economía regional, se adaptaron dos medidas de Klein y Ettenson (1999): “Valore su situación financiera personal (familiar) con relación a un año atrás” y “Valore la situación de la economía extremeña con relación a un año atrás (1: mucho peor; 7: mucho mejor). La medida del antecedente psicosociológico considerado, la identidad con la Comunidad Autónoma o identidad regional, es una adaptación de la escala de Lanz y Loeb (1998). La variable sexo es

incluida en el cuestionario y posteriormente en el análisis como un posible antecedente demográfico del etnocentrismo regional.

## 7. Resultados

Los análisis descriptivos realizados permiten comprobar que los niveles de identidad regional son bastante altos, tanto en los hijos/as ( $m = 5.210$ ) como en los padres ( $m = 5.605$ ) y madres ( $m = 5.607$ ). Un test t de medias para muestras emparejadas confirma que la identidad regional de los padres y madres es significativamente distinta de la de los hijos/as ( $t = - 3.728$ ,  $p < .001$ ;  $t = - 4.016$ ,  $p < .001$ , respectivamente) y que no hay diferencias significativas entre las puntuaciones de los dos cónyuges. Los niveles de etnocentrismo regional de los hijos ( $m = 3.063$ ), como cabía esperar, son significativamente más bajos ( $t = - 6.634$ ,  $p < .001$ ,  $t = - 6.932$ ,  $p < .001$ , respectivamente) que los niveles observados en sus padres ( $m = 3.773$ ) y madres ( $m = 3.782$ ), que no difieren entre sí. Estos resultados son coherentes con los de otros estudios que señalan que los individuos jóvenes tienen menor probabilidad de ser etnocéntricos (Orth y Firbasová, 2003).

El análisis del alfa de Cronbach arroja unos niveles muy elevados de consistencia interna de las dos escalas de medida de la identidad regional y del etnocentrismo regional del consumidor, superiores a 0.9 en los tres colectivos analizados: padres, madres e hijos/as (ver Tabla 1).

TABLA 1  
Fiabilidad de las escalas de medida y estadísticos descriptivos

Constructos e indicadores	Media	Desviación típica	$\alpha$ de Cronbach
<b>Identidad regional hijo/a</b> Me siento fuertemente identificado con Extremadura Me gusta vivir en Extremadura Me siento comprometido con Extremadura Me gusta ser parte de mi Comunidad Autónoma Para mí el sentimiento de orgullo hacia Extremadura es importante	5.210	1.433	0.924
<b>Etnocentrismo regional hijo/a</b> Sólo deberían comprarse productos de fuera de Extremadura cuando aquí no estén disponibles Productos extremeños, por encima de todo Un verdadero extremeño debería comprar siempre productos fabricados en Extremadura Los extremeños no deberían comprar productos fuera de la Comunidad, ya que daña a las empresas extremeñas y causa desempleo Puede que me cueste a largo plazo, pero prefiero apoyar los productos extremeños Los consumidores extremeños que adquieren productos fabricados en otras regiones son responsables de la pérdida de empleo de sus paisanos	3.063	1.392	0.905
<b>Identidad regional padre*</b>	5.605	1.481	0.940
<b>Etnocentrismo regional padre**</b>	3.773	1.621	0.923
<b>Identidad regional madre*</b>	5.607	1.375	0.927
<b>Etnocentrismo regional madre**</b>	3.782	1.641	0.917
<b>Situación financiera personal</b>	4.041	1.216	---
<b>Situación economía extremeña</b>	3.396	1.266	---
<b>Sexo</b>	0.554	0.498	---

\*La escala de medida de la identidad regional de los padres es la misma que la de los hijos. \*\*La escala de medida del etnocentrismo regional de los padres es la misma que la de los hijos. Todas las variables están medidas en una escala Likert de siete puntos (1: en total desacuerdo; 7: totalmente de acuerdo), salvo la situación financiera personal y la situación financiera particular, que tienen los siguientes extremos (1: mucho peor; 7: mucho mejor). Sexo (0: hombre; 1: mujer)

Para contrastar las hipótesis planteadas se construye un modelo estructural con el etnocentrismo regional de los hijos como variable dependiente principal, que resulta afectada directamente por: (1) los niveles de etnocentrismo regional de sus padres, (2) los niveles de identidad regional propios; (3) la percepción sobre la situación financiera personal y la percepción sobre la situación de la economía extremeña; y (4) el sexo. Además se plantea un efecto indirecto de la identidad regional de los padres en el etnocentrismo regional de sus hijos a través de la identidad regional de éstos. Los análisis se realizaron con el programa AMOS 20.0 y las variables consideradas para medir los constructos son las medias de los indicadores originales.

El ajuste del modelo estructural es muy bueno ( $\chi^2$  (df = 23) = 29.355,  $p = .169$ ,  $\chi^2/df = 1.276$ , CFI = 0.986, GFI = 0.968, TLI = 0.978, RMSEA=0.038) y se confirman las hipótesis referidas a la influencia directa de los niveles de etnocentrismo regional de los padres en los niveles de etnocentrismo de los hijos/as, así como la influencia de los niveles de identidad regional de los padres en los niveles de identidad regional de los hijos/as y éstos a su vez en el etnocentrismo regional de los hijos/as. Los índices de modificación aconsejan introducir en el modelo la relación entre el nivel de etnocentrismo regional de los padres en el nivel de etnocentrismo de las madres, ya que ésta es significativa ( $b = 0.502$ ,  $p < .01$ ).

Los resultados obtenidos apoyan las hipótesis H1a, H1b y H1c y permiten comprobar la influencia positiva y significativa de la identidad regional en el etnocentrismo regional, en el caso de los padres ( $b = 0.530$ ,  $p < .01$ ), las madres ( $b = 0.251$ ,  $p < .01$ ) y los hijos/as ( $b = 0.177$ ,  $p < .01$ ). También resultan apoyadas las H2a, H2b, H3a y H3b, ya que se comprueba que la identidad regional de los padres ( $b = 0.209$ ,  $p < .01$ ) y de las madres ( $b = 0.355$ ,  $p < .01$ ) influye significativa y positivamente en la identidad regional de los hijos/as y que los niveles de etnocentrismo regional de los padres ( $b = 0.251$ ,  $p < .01$ ) y de las madres ( $b = 0.311$ ,  $p < .01$ ) afectan positiva y significativamente en el etnocentrismo regional de sus hijos/as.

Las hipótesis referidas a las restantes variables planteadas como posibles antecedentes del etnocentrismo regional no son aceptadas. Ni la percepción sobre la situación financiera particular (H4), ni la situación de la economía extremeña (H5), ni el sexo (H6) de los jóvenes consumidores parecen tener una influencia significativa en sus niveles de etnocentrismo regional cuando se considera la influencia de las percepciones de identidad regional y etnocentrismo regional de sus padres (ver Figura 2 y Tabla 2).

FIGURA 2  
Modelo estructural: coeficientes estandarizados

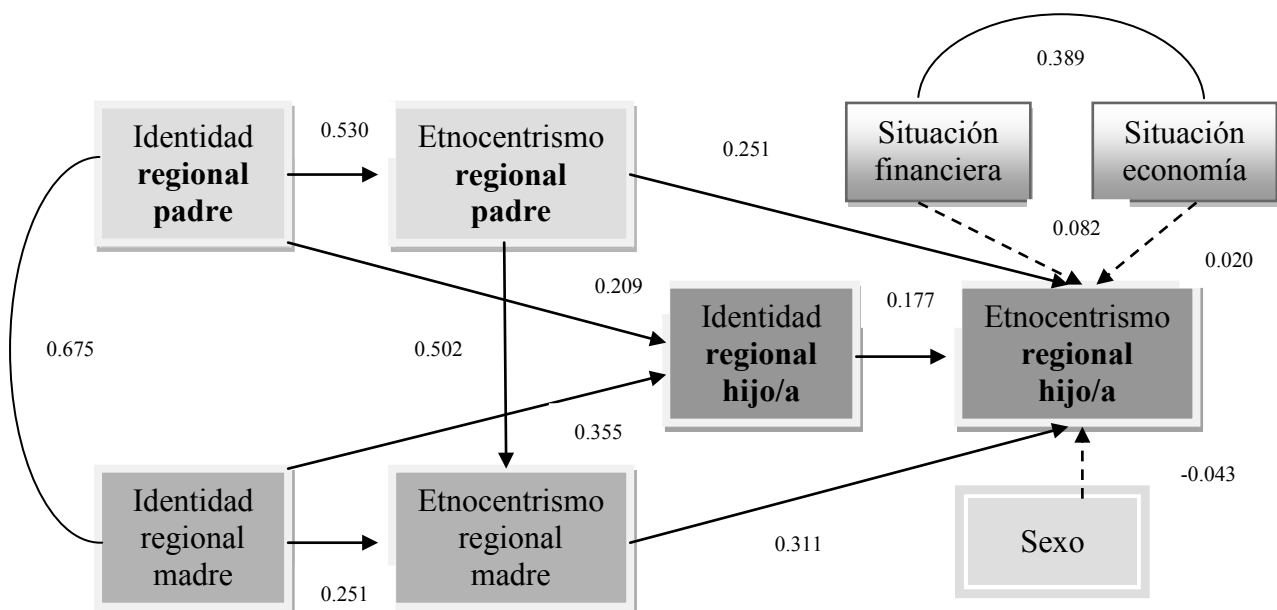

TABLA 2  
**Resultado del modelo de ecuaciones estructurales: parámetros estimados**

Hipótesis	Efectos	Coefficiente no estandarizado	S.E.	C.R.	Coefficiente estandarizado
H1a	Identidad regional padre → Etnocentrismo regional padre	0.582***	0.067	8.706	0.530
H1b	Identidad regional madre → Etnocentrismo regional madre	0.300***	0.071	4.233	0.251

H3b	Etnocentrismo regional madre → Etnocentrismo regional hijo/a	0.271***	0.064	4.257	0.311
H4	Situación financiera personal → Etnocentrismo regional hijo/a	0.094ns	0.072	1.304	0.082
H5	Situación economía extremeña → Etnocentrismo regional hijo/a	0.022ns	0.069	0.313	0.020
H6	Sexo → Etnocentrismo regional hijo/a	-0.018ns	0.160	-0.739	-0.043
	<b>Otros efectos</b>				
	Etnocentrismo regional padre → Etnocentrismo regional madre	0.519***	0.061	8.473	0.502
		<b>Covarianza</b>	<b>S.E</b>	<b>C.R.</b>	<b>Correlación</b>
	Identidad regional padre ↔ Identidad regional madre	1.223***	0.157	7.794	0.675
	Situación financiera personal ↔ Situación economía extremeña	0.587***	0.116	5.044	0.389

Indicadores de bondad del ajuste:  $\chi^2$  (df = 23) = 29.355, p = .169,  $\chi^2/df$  = 1.276, comparative fit index [CFI] = 0.986, goodness-of-fit index [GFI] = 0.968, root mean square error of approximation [RMSEA] = 0.038.

R<sup>2</sup>: Etnocentrismo regional hijo/a = 0.341; Etnocentrismo regional padre = 0.281; Etnocentrismo regional madre = 0.406; Identidad regional hijo/a = 0.270.

\*\*\*p < .01, ns = no significativo.

## 8. Conclusiones

El análisis exploratorio realizado, basado en las respuestas de 197 tríadas formadas por 197 jóvenes extremeños y sus padres, permite aumentar nuestro grado de conocimiento sobre varios aspectos que la literatura sobre etnocentrismo del consumidor ha ignorado hasta ahora. Por una parte, nuestros resultados indican que, a pesar de que los jóvenes extremeños no presentan niveles de etnocentrismo regional muy elevados, éstos se ven claramente influidos por los niveles de identidad regional de sus padres y madres, a través de dos efectos indirectos: uno a través del etnocentrismo regional de los progenitores y otro por medio de la identidad regional de sus hijos/as. Por otra parte, los antecedentes económicos (percepción de la situación financiera particular y percepción de la situación de la economía extremeña) y el antecedente demográfico (sexo) considerados no tienen ningún efecto sobre el etnocentrismo regional de los jóvenes. Estos resultados contradicen los de Klein y Ettenson (1999), quienes encuentran dichos efectos para una muestra de consumidores estadounidenses. Creemos que una de las principales contribuciones de este trabajo es la incorporación en el mismo modelo de antecedentes ya considerados previamente en la literatura, principalmente de naturaleza demográfica y económica, junto con dos variables asociadas con la influencia parental: la identidad regional y el etnocentrismo regional de los padres, reuniendo así las valoraciones de tres fuentes distintas. Además, creemos que la consideración de un nivel subnacional de análisis en el estudio del etnocentrismo del consumidor es otra aportación importante, dada la escasez de estudios a nivel regional.

## ABSTRACT

*This paper studies the formation of loyalty in older consumers in these times of deep economic crisis. Considering the increasing percentage of elderly people in our society, it's necessary to evaluate the characteristics and the different needs of this growing group in order to develop more appropriate strategies.*

*Testing a classic model of loyalty in a general crisis situation, it's confirmed that even in environments of instability, satisfaction and trust remain as the basic pillars of loyalty. In addition, it has been found that the information processing shows singularities in the elderly. The older consumer can be described as a more loyal, nostalgic and resistant to change type of consumer.*

## Key words:

Loyalty, Trust, Switching Costs, Older Consumers, Crisis

## **1. Introduction**

All developed societies are affected by the trend towards population ageing. In 2009, the median population age in EU-27 was 40.7 years and is projected to reach 47.9 years by 2060. One of the main demographic trends in EU-27 is that life expectancy continues to rise, especially from gains at older ages. But not only are people living longer lives; they may be living longer healthy lives. Populations that are currently the oldest, such as Germany's and Italy's, will age rapidly for the next twenty years, then stabilise. Of the 499,703,311 inhabitants of EU-27 in 2010, 17.4% were over 64, whereas in 1990 the percentage was 13.4% (Eurostat, 2011).

Differences in attitudes and behaviours between older and younger consumers have been well documented in the literature in relation to various factors: media habits, socialisation, adoption of technologies, complaining behaviour, shopping behaviour, general expenditure patterns, and information processing (Moschis and Nguyen, 2008). Traditionally, these differences have been justified by biological, psychological and socio-relational changes that occur during the ageing process (Carrigan and Szimigin, 1999; Reisenwitz et al, 2007; Lambert-Pandraud and Laurent, 2010). A new approach has been posited recently, the life-course paradigm, that represents a major change in how researchers think about and study consumer behaviour in later life, because it makes time, context, and process more salient dimensions of theory and analysis (Moschis, 2012; Lee et al, 2012).

The life-course paradigm posits that consumer thoughts and actions should differ according to the life circumstances people collectively experience. These circumstances include factors in the physical or social environment experienced for a relatively long time, known as period effects, such as periods of economic prosperity or crisis (Moschis, 2012). The world crisis that began in 2008, with a particular impact on the financial sector in the most developed countries has undoubtedly affected the attitudes and behaviours of consumers in general and older consumers in particular. The most evident consequence has been the loss of trust in financial institutions as pointed out by the Marketing Science Institute (MSI, 2011). One country that has suffered most from this crisis is Spain, where the banking sector has undergone radical transformation, with the almost complete disappearance of the savings banks that represented 50% of bank deposits. This situation meant that in June 2012 the European Union approved a financial bailout of a hundred billion Euros for the Spanish banking system. At microeconomic level, the crisis has had a negative effect on bank credibility and has eroded customers' trust in their banks. Thus the percentage of Spanish citizens who said they had little or no trust in banks went from 61% in October 2005, to 65.3% in December 2008 and to 76.7% in October 2010 (CIS, 2013). This loss of trust in banks can also be seen in other countries like the United States (Stevenson and Wolfers, 2011). However, although these macroeconomic data demonstrate the effects of the crisis, they do not enable identification of the changes that have occurred in consumer attitudes and behaviours (Deb and Chavali, 2010; Stevenson and Wolfers, 2011).

The aim of this work is to analyse older consumer's trust during a financial crisis, studying its antecedents and consequences. First of all the paper describes the conceptual framework for older consumers on which the study is based, the life-course paradigm. Then it analyses the variable older consumers' trust during a financial crisis, followed by a study of the consequences (loyalty and positive switching costs) and the antecedents (satisfaction, negative switching costs and brand image) of trust in these circumstances. The proposed hypotheses are tested on a sample of users of Spanish banks, a paradigmatic industry in the financial crisis that began in 2008.

## **2. Older consumer theoretical framework**

The life-course paradigm assumes that biological and psychological changes during a person's life and social demands across the life course define typical life events and social roles that serve as turning points and affect a person's life; they create physical, emotional and social demands and circumstances to which people must adapt by changing their thoughts and actions (Moschis, 2012; Lee et al, 2012). Therefore, study of older consumers' attitudes and behaviours

must not only take into account the biological and psychological effects of ageing but also personal events and the surrounding circumstances that condition those habits.

The biological and psychological effects of ageing are quite well known. Changes in bodily systems, such as declines in vision and hearing, and the onset of chronic conditions and disease occur at different ages and at different rates of psychological decline (Moschis, 2012; Lee et al, 2012). Ageing brings with it changes in the way the senses perceive information from the surrounding environment. In general, the senses become increasingly less sharp and limitations in distinguishing nuances appear. The ageing process also brings changes in the ability to concentrate and memorise.

Psychological models focus on changes in cognition, personality and self. Models of cognition have been used in the field of consumer behaviour to study the development and change in patterns of information processing and decision making in later life. The processing-resource framework, which conceptualizes age-related differences in cognition in terms of deficits in processing resources has been the most frequently (Lambert-Pandraud, et al, 2005; Yoon et al, 2009).

Particularly relevant in this regard is the work by Lambert-Pandraud and Laurent (2010) which established that three specific mechanisms intervene in the formation of preferences in older consumers: nostalgia, declining innovativeness and attachment. The first mechanism is the theory about nostalgia that posits that consumers develop preferences at an early age and maintain them for the rest of their lives (Holbrook and Schindler, 1991; Reisenwitz et al, 2007). Nostalgia is an emotional state in which an individual yearns for an idealized or sanitized version of an earlier time period (Stern, 1992). Some works supports the idea that nostalgia can influence the consumer's lifelong preferences in any product associated with a strong affective experience (Holbrook and Schindler, 1996; Schindler and Holbrook, 2003)

The second mechanism is declining innovativeness, an explanation that asserts that younger consumers have a greater propensity to adopt new products (Botwinick, 1978; Reisenwitz et al, 2007). Finally, the third mechanism is the attachment approach that argues that consumers develop affective links over time with objects or brands because of their personal history with and usage of these objects or brands (Thomson, MacInnis and Park, 2005; Price, Arnould and Curasi, 2000).

Additionally, the life-course paradigm posits that people also tend to experience various events at different ages that affect their behaviour in later life. These events affect a person's mind-sets, lifestyles, and consumption patterns for the rest of his or her life (Moschis, 2012; Lee et al, 2012). Together with personal events, the life-course paradigm highlights the importance of life circumstances. Consumer thoughts and actions also should differ according to the life circumstances people collectively experience. These circumstances include factors in the physical or social environment experienced for a relatively long time, known as period effects, such as periods of financial crisis; they also include cohort effects, which refer to influences shared by people growing up in a particular time period that persist as the individual ages (Moschis, 2012; Lee et al, 2012; Obal and Kunz, 2013).

In short, emotional, relational and experience-linked variables acquire greater importance as the individual gets older, in contrast to more cognitive evaluations. Furthermore, throughout their lives individuals encounter personal events and circumstances that modify their attitudes and behaviours.

### **3. Trust and financial crisis in older consumers**

#### ***3.1. Trust in older consumers***

El-Manstrly et al. (2011) defines trust as a function of the perceived reliability and integrity of a brand or service provider. The concept of trust is directly associated with perceived risk in terms of feelings of uncertainty and possible adverse consequences about some future event (Reisenwitz et al, 2007). Consumer trust implies consumer familiarity and comfort with a

service provider that should reduce the consumer's feelings of anxiety and risk (Aurier and N'Goala, 2010). Trust is a prevision consumers make on a company's ability to satisfy their expectations in the future (Guenzi, Johnson and Castaldo, 2009; Aurier and N'Goala, 2010). Trust can be based on cognition when individuals are looking for a rational reason to rely on the other party (McAllister, 1995). But trust can also be based on emotion when it involves emotional bonds between individuals. These two dimensions of trust can be linked together. A relationship between two parties may begin with an expression of cognitive trust, and after a while, based on accumulated experience, it may become affective trust (McAllister, 1995).

Therefore, in general terms, in younger consumers and in the initial stages of a relationship, trust has a high cognitive component, whereas in older consumers and advanced phases of a relationship, the emotional component predominates. This evolution is explained by some authors through Socioemotional Selectivity Theory (SST) that suggests that people's motivation changes as they grow older (Carstensen, 2006; Jahn et al, 2012). Adult development involves a shift from expansionist motives, like achievement or identity development, to motives involving security or threat avoidance (Helson and Soto, 2005). When the future is perceived as limited, people tend to be more present oriented and immediate needs, such as emotional states, become the most salient. The proportion of emotional to nonemotional information recalled from social narratives increases from an earlier age group (50-65) to a successive one (70-83 years) (Jahn et al, 2012). This emotional drift is also justified by three mechanisms that modulate the preferences of older consumers and lead them to prefer old brands for affective reasons: nostalgia, declining innovativeness and attachment (Lambert-Pandraud and Laurent, 2010).

The key question is, what effect has the irruption of a life circumstance of the magnitude of the 2008 financial crisis on consumer confidence? It seems logical to think that the effect will differ according to age. In younger consumers, where the cognitive vision of trust prevails, rational arguments will have a greater impact. In this segment of the population, trust has been eroded with negative news from each bank. In contrast, in older consumers with a longer relationship with banks and where the emotional dimension of trust predominates, negative information will have less effect, as the personal and affective links established with the financial institutions will be paramount. Jahn et al (2012), from the SST view, posits that the elderly are less likely to question items they have known for a long time. Instead of searching for evidence that a favoured brand might have trust deficits, older people focus on the positive aspects of a previously chosen option. Unless older people become really dissatisfied with a product, they do not look for alternatives. Laufer, Silvera and Meyer (2006) show that in a trust threatening product harm crisis, older consumers did not blame the company and did not react with reduced purchase.

### ***3.2. Trust, loyalty and financial crisis***

Consumer trust is a key element for the supplier to be able to maintain long term relationships (Morgan and Hunt, 1994; Kantsperger and Kunz, 2010; Aurier and N'Goala, 2010). Loyalty can be defined as a deep commitment to repurchase or repeat purchase behaviour for a consistently preferred product/ service in the future, which causes repeat purchase of the same brand or set of brands despite situational influences and marketing efforts which have the potential to bring about changes in behaviour (Oliver, 1999).

In short, loyalty is the customer's likelihood of generating positive word-of-mouth and repurchase intentions (Zeithaml et al 1996; Guenzi, Johnson and Castaldo, 2009; Dagger and David, 2012). It is important to emphasise that the focus must not be on repeat purchase behaviour alone because of the impact of situational factors which may hide consumers' true intentions (Oliver, 1999; Al-Hawari, Ward and Newby, 2009). Therefore, following Oliver (1999), loyalty must be considered mainly at the affective and intentional level.

In services industries, like retail banking, trust becomes crucial in many relational exchange situations and reduces the perceived risk of the service outcome (Dimitriadis, Kouremenos and Kyrezis, 2011). Many studies have found that customer trust determines customer behavioural and attitudinal loyalty (Chaudhuri and Holbrook, 2001; Chiou and Droge, 2006; Rauyruen et al,

2007; Guenzi, Johnson and Castaldo, 2009; Deb and Chavali, 2010; Kantsperger and Kunz, 2010; Aurier and N'Goala, 2010; Dimitriadis, Kouremenos and Kyrezis, 2011; Trif, 2013). In the absence of trust, customer loyalty would not be sustained in the medium to long-term (Bove and Johnson, 2006). In the case of older consumers, given the pre-eminence of the emotional dimension, trust plays a more significant role than it does in younger people. As McAllister (1995) points out, accumulated experience leads to the development of affective trust in consumers which represents a stronger link than the cognitive trust that develops at the start of a relationship in the younger segment. Thus it can be posited that the financial crisis has had less effect on this causal relation in older consumers because negative news has less impact.

*H1: During a financial crisis, trust has more of a direct positive influence on loyalty in older consumers than in younger consumers.*

### **3.3. Trust, satisfaction and financial crisis**

Customer satisfaction is defined as an emotional state arising from a cognitive process that implies a comparison between customer expectations and customer perceptions of service performance, and an emotional evaluation experienced during consumption (Westbrook and Oliver, 1991). Customer satisfaction can be generated by a discrete transaction, in which episodic satisfaction occurs, and by a long-term relationship between a customer and a supplier (Lam et al 2004). Overall satisfaction describes the consumer's cognitive and affective state resulting from a personal consumption experience (Chandrashekar et al, 2007).

The literature holds that customer satisfaction with a supplier is an antecedent of trust in the supplier (Johnson and Grayson, 2005; Kantsperger and Kunz, 2010; Trif, 2013). Satisfaction remains an evaluation of past service experiences, while trust is more concerned with the future service relationship (Aurier and N'Goala, 2010).

From the theoretical perspective, overall older customer satisfaction, where experience accumulates, is more important than episodic satisfaction, which takes situational events into account. Therefore negative news from the crisis will have a greater impact on younger consumers, who are more sensitive to episodic satisfaction, and their cognitive evaluation will have a great impact on their future expectations (trust). In contrast, episodic satisfaction is more important for older consumers than for younger ones, and so negative news will have less impact. Furthermore, in the formation of trust and satisfaction in older consumers, other emotional mechanisms intervene like nostalgia and attachment, and therefore during a financial crisis, the relationship between satisfaction and trust will be less important than in the younger segment. Hence:

*H2: During a financial crisis, satisfaction has less of a direct positive influence on trust in older consumers than in younger people.*

Customer satisfaction is considered a key driver of the long-term relationship between suppliers and buyers (Westbrook and Oliver, 1991). A satisfied customer's affection towards a service provider could motivate the customer to patronize the provider again and recommend the provider to other customers (Yu and Dean, 2001; Rauyruen et al, 2007; Trif, 2013). Satisfaction is often perceived as a factor that influences the likelihood of repurchase or reuse of the service provided by a supplier.

In this case, the impact of the financial crisis has made episodic satisfaction particularly relevant, and so the relationship between satisfaction and loyalty is stronger in younger people than in older consumers. Therefore we posit that satisfaction in older consumers will have less impact on loyalty than in the younger segment.

*H3: During a financial crisis, satisfaction has less of a direct positive influence on loyalty in older consumers than in younger people.*

### **3.4. Trust, switching costs, brand image and financial crisis**

To assume that satisfied customers are also loyal customers ignores the likelihood that customer and contextual factors moderate and thus alter this relationship (Dagger and David, 2012). A

variable that has deserved much attention in recent years is switching costs. Switching costs are the costs customers associate with the process of changing from one provider to another (El-Manstrly et al, 2011). The higher the perceived switching costs, the less likelihood there is of changing brand or provider (Fornell, 1992).

Dagger and David (2012) consider that high switching costs make customers feel locked into the relationship. This can wrongly lead the firm to assume that repeat purchasing reflects a loyal and satisfied customer base, when in fact many customers may be less than satisfied but perceive the costs of switching to another firm as being too high (Bell, Auh and Smalley, 2005).

In this regard it is interesting to categorise switching costs based on the underlying nature of the constraint: positive switching costs, those deriving primarily from positive sources of constraint, and negative switching costs, those deriving primarily from negative sources of constraint (Jones et al, 2007; Maicas, Polo and Sesé, 2006).

The key to this distinction is whether or not switching cost derive primarily from creating benefits and value for the customer. Positive switching costs (social and lost benefits costs) create such benefits and value, whereas negative switching costs (such as procedural and economic switching costs), deriving primarily from negative sources of constraint, do not.

Trust and positive switching costs have a significant influence on attitudinal and behavioural loyalty in bank branch customers in the UK (El-Manstrly et al, 2011). When customers perceive a service provider as trustworthy, they are more likely to develop a positive attitude towards that service provider and in turn a positive buying behaviour. The perceived risk associated with this particular service provider is more likely to be reduced as a result of perceived trust. De Matos et al. (2009) found that, in the Brazilian banking industry, switching costs are a significant antecedent of loyalty, and that they played a mediating role between satisfaction and loyalty, particularly on attitudinal loyalty.

Positive switching costs involve loyalty benefits that customers have to give up by when their relationship with the service provider ends. The enjoyment of these benefits may lead the customer to recommend the provider to other customers. As a result, a positive relationship between switching costs and the recommend dimension of loyalty may exist (Lam, et al., 2004; El-Manstrly et al, 2011; Tong, Wong and Lui, 2012). In fact, switching costs increase as relationships deepen and broaden (Kamakura et al, 2003; Bell, Auh and Smalley, 2005; Aurier and N'Goala, 2010). In the case of older consumers it should be remembered that they base their purchase decisions on accumulated experience and emotions whereas younger people are exposed to a broad range of cognitive influences. Nostalgia, declining innovativeness and attachment strengthen the importance of positive switching costs in older consumers, so that their influence on loyalty will be greater than among younger consumers. Moschis and Nguyen (2008) find that lower fees and discount programmes seem to be ineffective in attracting affluent older people to services. In line with Moschis et al (2003), marketers should not use price appeal to mature consumers to create competitive advantage. It can also be posited that positive switching costs will be more significant than negative ones for older people.

*H4: During a financial crisis, positive switching costs have more of a direct positive influence on loyalty in older consumers than in younger people.*

*H5: During a financial crisis, negative switching costs have less of a direct positive influence on loyalty in older consumers than positive switching costs.*

As regards switching costs in relation to the other variables, satisfaction and trust, Maicas, Polo and Sesé (2006) and El-Manstrly et al (2011) consider that trust reduces the perception of risk and increases the feeling of wanting to remain in the relationship, and so it can be posited that trust promotes positive switching costs. Customers decide to make durable and non-retrievable inputs in the exchange relationship because they trust their providers and can thus overcome the risks associated with higher dependence (Dwyer et al, 1987; Aurier and N'Goala, 2010). Older consumers will see this relationship promoted due to the three affective mechanisms that determine their preferences

*H6: During a financial crisis, trust has more of a direct positive influence on positive switching costs in older consumers than in younger people.*

However, negative switching costs can be perceived as opportunistic behaviours by suppliers in a position of power (De Matos et al., 2009). Therefore, reductive elements of freedom can adversely affect individual trust. Due to the above three major mechanisms, older consumers have greater emotional inertia due to duration of the relationship and they become less sensitive. We therefore propose:

*H7: During a financial crisis, negative switching costs have less of a direct negative influence on trust in the supplier in older consumers than in younger people.*

In the relationship between switching costs and satisfaction, it can also be established that satisfaction will favourably influence positive switching costs, promoting the sensation of wanting to remain in the relationship. The influence of the mechanisms of nostalgia, declining innovativeness and attachment reduce the influence of satisfaction in older consumers, while the greater importance of episodic satisfaction for younger consumers promotes the importance of satisfaction in that segment. Therefore we posit:

*H8: During a financial crisis, satisfaction has less of a direct positive influence on positive switching costs in older consumers than in younger people.*

Brand image is considered an important antecedent of satisfaction, trust and indirectly, loyalty (Fredericks and Salter, 1995; Bigné et al, 2001; Eskildsen et al, 2004; Faullant, Matzler and Füller, 2008). A good brand image leads to greater perception of affective satisfaction and trust in a service company and consequently becomes an important incentive for maintaining the relationship in the long term. In the case of older consumers Lambert-Pandraud and Laurent (2010) found that nostalgia, declining innovativeness and attachment induce this segment to prefer established national brands. Therefore, as consumers age the emotional links with their preferred brands intensify and so it can be posited that brand image is a more significant antecedent of satisfaction and trust than in the younger segment. Therefore:

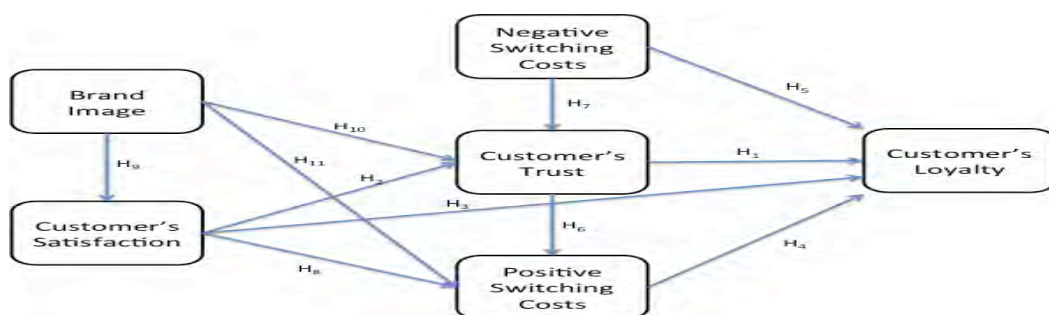

*H9: During a financial crisis, brand image has more of a direct, positive influence on satisfaction in older consumers than in younger people.*

*H10: During a financial crisis, brand image has more of a direct, positive influence on trust in older consumers than in younger people.*

The final question is whether there is a causal relation between brand image and switching costs. It seems evident that there is, as positive switching costs are barriers to leaving a relationship that make consumers want to remain in the relationship. Brand image is an important argument in favour of continuing the relationship because it implies an affective link which will also be more relevant for older consumers due to the emotional mechanisms that determine the formation of their preferences.

*H11: During a financial crisis, brand image has more of a direct, positive influence on positive switching costs in older consumers than younger people.*

FIGURE 1.  
Causal model

## 4. Method

This study focuses on the Spanish banking industry. The 2008 financial crisis hit the southern part of the European Union especially hard, and particularly the banks in Spain which in October 2011 received a bailout from the European Union for up to one billion euros. The enormous volume of negative news on this sector has severely eroded citizens' trust in banks since 2008.

The questionnaire was designed using scales from previous research, adapting some of the items to the specific characteristics of this study. The scales used to measure brand image, satisfaction and trust used the items proposed by Martínez et al. (2008), Bloemer and Odekerken-Schroeder (2002) and Ganesan (1994), respectively. The items for loyalty were based on the paper by Caruana (2004), and switching costs were measured using the scales by Burnham et al. (2003) and De Matos et al. (2009). The questionnaire contained closed questions and a 5-point Likert scale. A pre-test was carried out on 104 users of bank services with the aim of obtaining a final version of the questionnaire, making small changes in the drafting of the items for greater clarity and adapting them to the bank context.

The fieldwork was carried out in March and April 2011. Until that date the Spanish government had undertaken two restructurings of the banks, based on merging savings banks which at the time represented 50% of bank deposits. In March 2011 Moody's downgraded the long term debt for 30 Spanish banks and savings banks.

Because there has been no clear definition of when someone should be classified older or mature, in this paper we consider people aged 50 and over as mature consumers and sometimes use mature and older person interchangeably (Moschis and Nguyen, 2008). 634 valid surveys were conducted in Spain on customers of financial entities. There were 322 interviews with individuals under 49 years old and 312 older than 50 years old. A sampling error of  $\pm 3.97\%$  was assumed for a confidence level of 95.5%.

## 5. Analysis and results

### 5.1. Measure reliability and validity

The data were analyzed using structural equation models by means of multi-group analysis, following recommendations from earlier studies for moderating effects (Hombourg and Giering, 2001). The models were estimated from the matrices of variances and covariances by the maximum likelihood procedure with the EQS 6.1 statistical software application (Bentler, 1995).

In the first phase of the analysis we focused on studying the psychometric properties of the scales for the whole sample (Table 1). The probability associated with chi-squared is over 0.05, thus indicating an overall good fit of the scales (Jöreskog and Sörbom, 1996). Convergent validity is demonstrated in two ways.

TABLE 1.  
Analysis of scale dimensionality, reliability and validity (Fully standardized solution).

Items	Factor loading	t-Value
<i>Brand image</i> (CR=.80; AVE=.63)		
There are good reasons for using this bank rather than another	.75	6.59**
The company has personality	.66	6.61**
It doesn't disappoint its customers	.85	6.65**
<i>Satisfaction</i> (CR=.93; AVE=.80)		
I am satisfied with the quality/ price relationship	.80	17.45**
I am satisfied with the service they provide	.89	18.91**
I am satisfied with the company	.91	19.27**
Generally I am really satisfied	.93	19.59**
<i>Trust</i> (CR=.91; AVE=.74)		
I trust the good intentions of this bank/savings bank	.82	19.52**
I consider that the bank/saving bank behaves ethically	.78	18.42**
This bank is serious and fulfils its promises	.87	13.83**

At this bank they are concerned about making the customer happy <i>Loyalty</i> (CR=.84; AVE=.68)	.89	20.99**
I will try to continue with my usual bank/savings bank in the next few years	.82	10.38**
I will encourage my family and friends to become customers of my bank	.66	14.88**
If they continue to treat me like they are now, I doubt I will change financial institution	.89	19.61**
<i>Negative switching costs</i> (CR=.70; AVE=.60)		
Changing bank will probably have an economic cost	.67	10.04**
Changing will take quite a lot of time	.79	18.06**
<i>Positive switching costs</i> (CR=.79; AVE=.62)		
I already know the staff. Changing means starting from scratch	.62	13.57**
I am happy with the staff at my bank	.88	18.59**
My financial institution has a good reputation	.73	15.68**

Note: Fit of the model:  $\chi^2=146.4488$ ,  $df=130$ ,  $P=0.15364$ ;  $RMSEA=.014$ ;  $CFI=.997$ ;  $NFI=.973$ ;  $NNFI=.996$ . CR= composite reliability; AVE=average variance extracted

\*\*  $p<.01$

First because the factor loadings are significant and greater than 0.5 (Bagozzi, 1980; Bagozzi and Yi, 1988; Hair et al., 2006) and second because the average variance extracted (AVE) for each of the factors is higher than 0.5 (Fornell and Larcker, 1981). Scale reliability is demonstrated because the composite reliability indices for all the dimensions are above 0.6 (Bagozzi and Yi, 1988).

The discriminant validity of the constructs considered was evaluated through AVE (Fornell and Larcker, 1981). The square root of the AVE between each pair of factors was higher than the estimated correlation between those factors in all cases confirming the scale's discriminant validity.

## 5.2. Hypothesis testing

As recommended by Byrne (2001), multi-group analysis must begin with a suitably tested fit in each of the separate samples. This analysis is conducted prior to the verification of the differences in the parameters that are common to the study variables between the groups considered (Byrne, 2006; Hair et al., 2006). As Table 3 shows, separately the model fits well in the two samples, younger ( $\chi^2=607.934$ ;  $df=130$ ) and older ( $\chi^2=427.652$ ;  $df=130$ ). The second step is the simultaneous estimation of the model in both samples. Again the model also fits adequately ( $\chi^2=1035.586$ ;  $df=260$ ). The third step refers to the equality of the factor loadings in the two groups (metrical invariance). When this restriction is introduced into the model, the model fit is not significantly worse than that of the previous step, as deduced from comparison between the  $\chi^2$  of steps 2 and 3 ( $\Delta\chi^2=10.282$ ;  $\Delta df=19$ ;  $p=0.9456>0.05$ ), thereby confirming the invariance of the factor loadings.

TABLE 3.  
Invariance measurement test.

	$\chi^2$	$df$	$\Delta\chi^2$	$\Delta df$	$p$	RMSEA (90%CI)	SRMR	CFI	NNFI
<b>Individual groups:</b>									
Younger	607.93	130				.003 (.02-.03)	.048	.97	.96
Older	427.65	130				.04 (.03-.05)	.046	.97	.97
<b>Measurement of Invariance:</b>									
Simultaneous model	1035.59	260				.043 (.03-.05)	.047	.97	.97
Model with restricted factor loadings	1045.87	279	10.28	19	.94	.05 (.04-.06)	.052	.97	.96

To test hypotheses 1 to 11, the causal relationships are analysed for the total sample (Table 4). This approach is adequate because the probability of the chi-squared is higher than 0.05 (0.30), NFI (0.98) is close to unity and RMSEA is close to zero (0.01).

TABLE 4.  
Summary results of the structural model.

Hypothesis	Path	Parameter	t-Value	Results
H <sub>1</sub>	Trust → Loyalty	0.36	4.61**	Supported
H <sub>2</sub>	Satisfaction → Trust	0.66	8.62**	Supported
H <sub>3</sub>	Satisfaction → Loyalty	0.18	2.43*	Supported
H <sub>4</sub>	Positive switching costs → Loyalty	0.46	6.61**	Supported
H <sub>5</sub>	Negative switching costs → Loyalty	0.01	0.41	Not supported
H <sub>6</sub>	Trust → Positive switching costs	0.23	2.81**	Supported
H <sub>7</sub>	Negative switching costs → Trust	-0.07	-2.14**	Supported
H <sub>8</sub>	Satisfaction → Positive switching costs	0.24	2.35*	Supported
H <sub>9</sub>	Brand image → Satisfaction	0.85	18.74**	Supported
H <sub>10</sub>	Brand image → Trust	0.18	2.54*	Supported
H <sub>11</sub>	Brand image → Positive switching costs	0.42	2.81**	Supported

Note: Fit of the model:  $\chi^2=147.06$ ;  $df=139$ ,  $P=0.30$ ;  $RMSEA=0.01$ ;  $CFI=0.99$ ;  $NFI=0.98$ ;  $NNFI=0.99$ .

\*  $p<.05$ ; \*\*  $p<.01$

$R^2$  Satisfaction 0.72;  $R^2$  Trust 0.74;  $R^2$  Loyalty 0.75;  $R^2$  Positive switching costs 0.69

The result of the analysis shows that the majority of the relationships hypothesised in the model are supported for the sample as a whole in the direct and positive relationships between trust and loyalty (supporting H1), between satisfaction and trust (supporting H2), between satisfaction and loyalty (supporting H3), between positive switching costs and loyalty (supporting H4), between trust and positive switching costs (supporting H6), between negative switching costs and trust (supporting H7), between satisfaction and positive switching costs (supporting H8), between brand image and satisfaction (supporting H9), between brand image and trust (supporting H10) and between brand image and positive switching costs (supporting H11). The effect of negative switching costs on loyalty is not significant and so H5 is rejected. Furthermore, this result supports H4 which proposes that the effect of positive switching costs on loyalty (0.46) is greater than the effect of negative switching costs on loyalty (not significant).

Next, the existence of significant differences in the causal relationships is estimated (Table 6). The analysis carried out to establish the causal relationships between the variables being studied is adequate because the probability of the chi-squared is higher than 0.05 (0.32), NFI (0.98) is close to unity and RMSEA is close to zero (0.01). Thus age group (younger vs older) in financial services was found to partially moderate the model. Table 5 shows the significant differences between younger and older customers in some of the causal relationships considered in the model.

TABLE 5.  
Moderating effects of age in the proposed relationships.

Path	Younger		Older		$\Delta \chi^2$	$p$	Results
	Parameter	t-Value	Parameter	t-Value			
Trust → Loyalty	0.27	2.36*	0.44	5.16**	4.46	0.03*	Supported
Satisfaction → Trust	0.71	7.71**	0.64	3.90**	1.29	0.25*	Not Supported
Satisfaction → Loyalty	0.20	1.98*	0.24	2.39*	0.07	0.79*	Not Supported
Positive switching costs → Loyalty	0.43	5.25**	0.32	3.81**	5.75	0.02*	Supported
Negative switching costs → Loyalty	0.05	0.74	-0.01	-0.30	0.58	0.44	No supported
Trust → Positive switching costs	0.29	2.40*	0.13	1.44	5.17	0.02*	Supported
Negative switching costs → Trust	-0.14	-3.25	0.06	0.92	11.44	0.00**	Supported
Satisfaction → Positive switching costs	0.24	1.99*	0.19	1.06	4.13	0.04*	Supported
Brand image → Satisfaction	0.81	13.73**	0.89	14.12**	1.43	0.23	No supported
Brand image → Trust	0.19	2.31*	0.18	0.96	0.05	0.83	No supported
Brand image → Positive switching costs	0.33	2.74**	0.56	3.39**	3.95	0.04*	Supported

Note: Fit of the model:  $\chi^2=302.78$ ;  $df=292$ ;  $P=0.32$ ;  $RMSEA=0.01$ ;  $CFI=0.99$ ;  $NFI=0.98$ ;  $NNFI=0.99$ .

Simultaneously latent variables test:  $\Delta \chi^2=34.17$ ;  $\Delta df=11$ ;  $p=0.00033<.05$

\*  $p<.05$ ; \*\*  $p<.01$

In view of the results it can be said that six hypotheses are confirmed entirely (in both the proposed relationship and in the differences between groups): H1, H4, H6, H7, H8 and H11.

Four hypotheses are partially supported (the moderator effect of age has not been confirmed): H2, H3, H9 and H10. Only one hypothesis is completely rejected (in both the proposed relationship and the moderator effect of age): H5.

## 6. Discussion

The purpose of this present study has been to analyse trust in older consumers during a financial crisis. The study makes several contributions. Firstly, it studies the effects of the deep global financial crisis which began in 2008 on consumer trust, analysing an exceptional cycle that has not occurred in western economies for decades. Secondly, it applies the life-course paradigm, which enables the identification of differences between cohorts of age and the most significant variables surrounding trust in different segments in an exceptional period. Thirdly, this study underlines the central role of trust for older consumers and the shield it represents against negative news.

The serious financial crisis has affected the banking sector in particular and eroded consumer trust. Trust, however, continues to play a central role in loyalty among older consumers. The tested model shows that older consumers make decisions linearly, taking fewer variables into account. Thus older consumers' trust only has satisfaction as antecedent and loyalty as the only consequence. In contrast, in younger people, brand image, satisfaction and negative switching costs influence trust which in turn, determines positive switching costs and loyalty. As posited, trust has a greater effect on loyalty among older consumers, due to the predominance of the emotional dimension and the intervention of the three mechanisms that shape their preferences (nostalgia, declining innovativeness and attachment). Accumulated experience and cognitive deficiencies in older consumers leads them to place less trust in external stimuli and rely more on internal factors which makes them less vulnerable to negative news and persuasive campaigns. This finding explains the significantly higher measurements of trust among older consumers.

In a time of financial crisis the loyalty of older consumers is mainly determined by trust. Expectations that the bank will continue to satisfy their future needs and the perceived reliability and integrity of the service provider are essential for older consumers to continue the relationship. In a time of crisis, negative switching costs have no relevance for the loyalty of older consumers, confirming that marketers should not use price appeal to mature consumers to create competitive advantage (Moschis et al, 2003). As in younger people, positive switching costs generate loyalty among older consumers. The difference between the two segments is that the cornerstone of older consumers' loyalty is trust, whereas for younger people it is positive switching costs. Therefore following the life-course paradigm, in times of financial crisis, it appears that positive switching costs become more important for generating loyalty in younger consumers; in older people loyalty begins to depend on emotional variables linked to experience, to the detriment of positive switching costs. Satisfaction appears to be a necessary condition whose importance remains invariable with age. Negative switching costs do not generate loyalty at any age.

In contrast to the hypothesis, this study has found that in a period of crisis positive switching costs are less important for older consumers. Exploring the relations in the model in greater depth shows that in older consumers, the only antecedent of positive switching costs is brand image, and the influence of satisfaction disappears. It would seem that the poor image projected by banks has reduced the social costs of the decision to change thereby reducing the influence of satisfaction. This finding seems to be supported by the fact that brand image ceases to generate trust directly among older consumers (although it is maintained indirectly through satisfaction). This aspect is the first symptom of the shield that surrounds trust and hinders the effects of negative news and a deteriorated brand image.

Thus while switching costs play a very significant role in younger people, their influence is more limited in older consumers. The study has found that negative switching costs are not relevant for older consumers, but in younger people they generate mistrust and do not influence

loyalty. It seems that during a financial crisis the strategy of generating negative switching costs causes mistrust as younger people see them only as obstacles designed to retain them, associating this strategy with the bad banking practices that have come to light with the financial crisis. Negative switching costs can be perceived as opportunistic behaviours performed by suppliers in a position of power (De Matos et al., 2009). Therefore, reductive elements of freedom adversely affect individual trust. In contrast, positive switching costs act as an exit barrier and contribute to loyalty in younger people and older consumers.

In this line the identification of different levels of trust by Guenzi, Johnson and Castaldo (2009) in the retail store is of interest. If a consumer-centric perspective is adopted, customer-to-firm, customer-to-brand, customer-to-product/service, and customer-to-employee relationships can be identified. A model of customer relationship with a store should incorporate not only the focal construct of customer trust in the firm, but also the related constructs of customer trust in the store's salespeople and products. It is therefore possible that trust in the brand and products may have diminished in older consumers, whereas trust in salespeople may have been promoted.

Satisfaction continues to play a central role in the generation of consumer trust and loyalty. No significant differences between the two segments can be found in contrast to the hypothesis. The influence of negative news on episodic satisfaction does not lead to a greater influence on trust and loyalty in younger people. The only difference between the two models refers to the impact of satisfaction on positive switching costs, significant only among younger people, which appears to respond to a consequence of the crisis (episodic satisfaction) and the pre-eminence of the image projected by the banks.

Brand image plays a very relevant role in a time of crisis. It is not only a fundamental antecedent of satisfaction, it also generates positive switching costs (significantly higher among older consumers). In contrast to the hypothesis, brand image does not influence trust in older consumers. The justification may come from the emotional shield which appears to surround the attitudes of older consumers. Older consumers rely more on their experience and their emotions than on information from the surrounding environment. Given the large quantity of negative news, older consumers appear to hide behind an emotional shield full of experiences that protects their key variable, trust. In contrast, younger people are cognitively more sensitive and in a time of crisis their decisions are complex or at least more multivariate than in older consumers.

This work has significant managerial implications. The banks that have based their crisis strategy on generating or maintaining negative switching costs have made a mistake. The refusal to refinance loans with better terms and conditions and the policy of being strict with penalties has generated mistrust among younger people and indirectly, less loyalty. The correct strategy is a customer-friendly orientation used by banks who have looked after their brand image with a long term vision. In a time of crisis, older consumers need to reaffirm their trust in the company and so the service provider must continue to generate cognitive and affective satisfaction. In our opinion, contact staff play a fundamental role in this aspect, as they are the main generator of satisfaction and trust.

The pillars of trust in older consumers are solid as they are based on mechanisms like nostalgia, declining innovativeness and attachment. Older consumer loyalty is more difficult to break because of the conservative nature of their habits and values, but that does not mean that the service company can rest on its laurels thinking that the chain cannot be broken. There is less likelihood of losing an older consumer in a period of crisis than a younger consumer (Lambert-Pandraud and Laurent, 2010). Although the economic environment generates a negative state of opinion, older consumers are fairly impermeable to negative news and they are protected behind their emotional and experiential shield which leads them to continue trusting their traditional brands. Seeing the differences between younger and older consumers, service providers need to adopt a long term orientation with their customers (relationship marketing), given that in periods of financial crisis older consumers could be an important asset. In this regard, older

consumers become a strategic segment for service providers because their loyalty has a solid base.

Caution must be exercised when extending these conclusions to other service contexts. The peculiarities of the financial crisis in the western world and especially the southern countries of the European Union is a very specific context where the effects have been extreme and there has been a lot of negative news since 2008. It is difficult for this situation to occur in another type of services given the strategic nature of the financial sector.

The sample has a limited geographical scope. Spain is in the European Union where the situation in the financial sector is similar to that in other Euro zone countries like Ireland, Greece, Italy, Portugal and Cyprus. Although the crisis in the financial sector has affected all western countries, it has not been as intense as in these countries.

We would also point to a final limitation which is the way the sample has been segmented. The 50 years limit separating older consumers is not an agreed limit. In this regard, we think it would be very interesting to explore the segment of older consumers in greater depth and establish different subsegments. It would also be interesting to adopt the multilevel vision of trust proposed by Guenzi, Johnson and Castaldo (2009), in order to specify more accurately where the erosion of consumer trust has occurred

## RESUMEN

*Cualquier conceptualización de la noción valor es un buen prisma para segmentar mercados, pero los enfoques experienciales lo son aún más ya que de por sí el marketing de experiencias enfatiza la personal e intrínseca relatividad del comportamiento del consumidor. Este trabajo explora la existencia de diferentes segmentos de consumidores de servicios (compradores de moda) a través del conocimiento de qué dimensiones del valor experiencial (eficiencia, calidad, estatus, estima, entretenimiento, estética, ética y escape) influyen en mayor medida en la fidelidad del consumidor hacia el proveedor del servicio (minoristas de moda). Con la ayuda de análisis CHAID, hemos identificado tres segmentos diferentes: los valores emocionales (entretenimiento) y altruistas (ética) parecen ser los más relevantes para la segmentación de los consumidores basándonos en su fidelidad hacia la cadena de venta de ropa. Las conclusiones revelan la utilidad del enfoque de marketing experiencial para hallar segmentos leales en la compra minorista.*

## Palabras clave

*Dimensiones de valor, valor experiencial, lealtad, segmentación, CHAID, comercio minorista*

## 1. Introducción

De todos los cambios de paradigma del marketing, el enfoque experiencial del comportamiento del consumidor está entre los más frecuentemente revisitados (Gallarza, Gil-Saura y Holbrook, 2011; Woodward y Holbrook, 2013). Como se menciona en un estado del arte sobre el tema “*el marco conceptual del marketing experiencial... parece incorporar una serie de elementos derivados de un largo periodo relativo a su conceptualización del que resulta una vía potencialmente fructífera para aproximarse a los cambios actuales de mercado*” (Arnould, 2007: 185). De hecho, los aspectos experienciales del consumidor son un aspecto crucial para el proveedor tanto de servicios como de productos. En lo que respecta al *retailing*, los aspectos experienciales del comportamiento de compra son reconocidos como potentes conductores de nuestro entendimiento de dicho comportamiento, tanto en la compra *on-line* (e.g. Mathwick, Malhotra y Rigdon, 2001; 2002) como presencial (e.g. Babin, Dardem y Griffin, 1994; Arnold y Reynolds, 2003; Sullivan, Kang y Heitmeyer, 2012). Pero los dos ámbitos están también relacionados, puesto que las experiencias del consumidor en la tienda son cruciales para los vendedores al por menor en multicanal, ya que la lealtad a la tienda es el predictor más fuerte de las intenciones de compra *on-line* (Jones y Kim, 2010).

Como es sabido, el marketing experiencial subraya la relatividad del comportamiento del consumidor, de carácter altamente personal e intrínseco (Holbrook, 1999; Arnould 2007; Woodward y Holbrook, 2013). En consecuencia, la mayoría de enfoques experienciales, desde los pioneros (e.g. Holbrook y Hirschman 1982), hasta los más recientes (e.g. Sullivan, Kang y Heitmeyer, 2012) subrayan la importancia de los aspectos intrínsecos del consumo (personalidad, sentimientos, estados de ánimo) para entender en profundidad las motivaciones experienciales de los consumidores. De ello se desprende que el enfoque experiencial sea una herramienta idónea para la segmentación de mercados.

Con esta literatura como base, el objetivo principal de este trabajo es explorar la existencia de diferentes segmentos de consumidores de servicios (compradores de moda) en relación a su fidelidad hacia el proveedor del servicio (tiendas de ropa). Centrándonos en las relaciones de los consumidores con sus marcas de tiendas de moda, el presente escrito tiene por objetivo la evaluación de la utilidad de las dimensiones de valor experienciales como variables de segmentación de los consumidores (de moda). Basándonos en su fidelidad hacia sus proveedores, nos centramos en identificar las dimensiones de valor experienciales que influyen en mayor medida en la fidelidad del consumidor en una situación específica de servicio (venta al por menor). Lo que este trabajo ofrece como novedad es: a) la consideración de una conceptualización más amplia de valor experiencial multidimensional (a saber, el marco conceptual de Holbrook (1999)), que incluye ocho dimensiones de valor desde nuestro conocimiento nunca antes estudiadas juntas en una misma situación de compra minorista, y b) la búsqueda de relaciones entre estas ocho dimensiones de valor y un comportamiento de lealtad, ofreciendo así un enfoque del comportamiento de compra diferente de la clásica cadena calidad-satisfacción-valor-lealtad.

El trabajo se organiza de la siguiente manera: después de esta introducción, el marco conceptual expone el enfoque experiencial del consumo, la propuesta conceptual elegida para este trabajo (Holbrook, 1999), y la importancia de la fidelidad y del valor para la segmentación de mercados. Después, exponemos la metodología del análisis CHAID, y a continuación se exponen y describen los resultados del análisis. Por último se recapitulan las conclusiones más relevantes de este estudio y se señalan las limitaciones así como las futuras líneas de investigación.

## 2. Marco Conceptual

### 2.1. El enfoque experiencial en el estudio del comportamiento de consumo

El estudio del enfoque experiencial del consumo tiene su origen en los trabajos de los años 80 que defienden la existencia de una dicotomía de valores hedonistas vs. utilitaristas (Holbrook y Hirschman, 1982; Hirschman y Holbrook, 1982). Esta aproximación a la naturaleza conceptual del valor ha tenido, desde entonces, una amplia influencia en el posterior estudio del comportamiento del consumidor (Gallarza et al., 2011; Arnold y Reynolds, 2003). Esta aproximación surge como oposición al

paradigma del proceso de información por el que el comportamiento del consumidor es objetivo y racional. Por el contrario, en el enfoque experiencial, los consumidores se mueven por aspectos más subjetivos, emocionales y simbólicos. Así, no se debe entender el acto de compra y el de consumo como simples hechos funcionales, sino que poseen dimensiones emocionales que deben ser aprehendidas para comprender el fenómeno del consumo en su totalidad. Proponer esta dualidad introducida como decimos en los años 80, en los trabajos de Holbrook y colegas (Holbrook y Hirschman, 1982; Hirschman y Holbrook, 1982), supuso un hito en la historia de la investigación del comportamiento del consumidor: se pudo, con ello, despegar de las concepciones más utilitaristas del comportamiento humano en el mercado, aportando una perspectiva experiencial y fenomenológica del consumo en la que se incluyeron nuevos aspectos como los hedonistas, simbólicos y estéticos.

Lo cierto es que esta dicotomía del valor de consumo, tal y como reconocen Kivetz y Strahilevitz (2001), permite abarcar amplias y muy diversas experiencias. La consideración de una dimensión hedonista de la compra permite arrojar mayor luz sobre determinados consumos como la compra impulsiva y/o compulsiva que resultan difícilmente explicables desde una óptica funcional (Babin et al., 1994; Kivetz y Strahilevitz, 2001, Callarisa et al., 2002, Duman y Mattila, 2005). El debate relanzado en la actualidad sobre la dimensionalidad afectiva/cognitiva del valor plantea interesantes reformulaciones de esta tipología clásica de valor.

Inicialmente, la perspectiva experiencial del valor se percibe como más apropiada para entornos de servicios debido a la importancia de los aspectos psicológicos y sociales del consumo (Sheth, Newman y Gross, 1991; Zeithaml, 1988). Con posterioridad, la adopción de esta perspectiva es la que permite difuminar las diferencias entre las ofertas de productos y servicios, siendo relevante únicamente la noción de experiencia, en la medida en que el consumidor experimenta sensaciones, emociones y recuerdos en su consumo (Holbrook, 1999; Sánchez-Fernández, Iniesta-Bonilla y Holbrook, 2009; Gallarza, Gil-Saura y Holbrook, 2011). Así, la aplicabilidad de la dicotomía utilitarista vs. hedonista puede extenderse a todas las ofertas en el mercado (de servicios o de productos manufacturados). Y de entre todos estos contextos, en donde mayor sentido cobra la aproximación experiencial, es en los llamados híbridos (aquellas ofertas con igual proporción de elementos tangibles e intangibles) donde este juego de percepciones racionales y emocionales ha tenido mayor eco. Estos incluyen principalmente los servicios de ocio y restauración, y la distribución minorista. Entre los primeros, existen relevantes aportaciones empíricas de escalas multidimensionales de valor (e.g. Gallarza y Gil, 2006; Sánchez, Callarisa, Rodríguez y Moliner, 2006; Sánchez-Fernández e Iniesta-Bonilla, 2007), algunas de ellas incluso con vocación de ser válidas en cualquier ámbito de servicio, como los trabajos de Petrick (2002, 2003) que proponen una estructura multidimensional de valor que contempla aspectos sociales, funcionales y emocionales.

Entre los segundos, los entornos de distribución minorista, esta dicotomía de valores utilitaristas vs. hedonistas ha sido ampliamente investigada de manera empírica, con un continuo juego en la combinación de productos tangibles y servicios, que permite una interesante perspectiva del enfoque experiencial. De entre estas aproximaciones empíricas, la escala del valor de compra (*shopping value scale*) de Babin, Darden y Griffin (1994) ha sido una de las más replicadas en diferentes formatos de distribución minorista; a saber, en *centros comerciales* (e.g. Stoel, Wickliffe y Lee, 2004), *grandes almacenes* (e.g. Seo y Lee, 2008), o *tiendas de descuento* (e.g. Carpenter, 2008).

También la propuesta de Sheth et al. (1991) ha sido relevante por su posterior aplicabilidad a entornos minoristas; en ella se distingue un valor *funcional* (como utilidad, ejemplo la fiabilidad, la durabilidad o también el precio), *social* (como un valor simbólico derivado del sentimiento de identidad grupal), *emocional* (como un reconocimiento expreso de la naturaleza afectiva de las evaluaciones de valor), *epistémico* (como la utilidad percibida como forma alternativa de desvelar curiosidad y novedad, y *condicional* (como la utilidad percibida de una alternativa como resultado de circunstancias a las que se enfrenta el consumidor en su toma de decisión). Este trabajo teórico es el que da origen a la famosa escala PERVAL, propuesta por Sweeney y Soutar (2001) y testada inicialmente en *retailing* y utilizada posteriormente por la doctrina para estudiar múltiples formatos de distribución: por ejemplo para *grandes almacenes* (e.g. Grace y O'Cass, 2005), *tiendas de ropa deportiva* (e.g. Chi y Kilduff, 2011), y en su parte más utilitarista, en *supermercados* comparados con *grandes almacenes* (e.g. Wong y Dean, 2009).

De manera más precisa, en lo que respecta a la industria minorista de moda, se ha argumentado que el enfoque experiencial permite analizar beneficios a la vez utilitaristas y hedonistas en la compra física en la tienda (Sullivan y Heitmeyer, 2008). En este sentido, Mathwick et al. (2001) argumentan como los consumidores pueden percibir valor experiencial en la tienda derivado del mobiliario y las evidencias físicas de la disposición de los productos, incluso sin necesidad de ultimar una compra.

Esta dualidad de valores hedonistas vs. utilitaristas ha sido ampliamente utilizada como base para estudios enfocados al análisis de segmentación de mercados (e.g. Arnold y Reynolds, 2003; Seo y Lee, 2008; Wong y Dean, 2009). En realidad, el concepto de valor, en su raíz axiológica, está indefectiblemente unido a la noción de segmentación de mercados, estrategia clave para el marketing (Gallarza et al., 2011), puesto que los consumidores difieren unos de otros en sus percepciones de valor, que son por definición subjetivas. En palabras de Holbrook (1999: 7) “*la personal relatividad del valor de consumo rige nuestra atención como especialistas de marketing, da forma a la lógica de la segmentación de mercados y consecuentemente conduce a la clave para ser efectivos en ellos*”. Retomar la esencia de esta realidad, ontológica para la investigación de mercados, es una de las justificaciones de un trabajo como el presente.

### **2.2. La propuesta integral de Holbrook (1999) sobre la dicotomía utilitarista vs. hedonista**

Uno de los escasos consensos existentes en torno a la conceptualización del valor es su naturaleza multidimensional (Gallarza et al., 2011). Estas dimensiones son concebidas por muchos autores como tipologías de valor, como una consecuencia inmediata de la naturaleza relativa de la noción valor, que varía entre personas, entre productos y entre situaciones (Holbrook, 1999). Así, muchos autores abordan las definiciones de valor de forma conjunta con las tipologías: por ejemplo Woodruff (1997), Holbrook (1999), o Sweeney y Soutar (2001). Esto se debe a que la consideración de tipologías de valor está en la raíz misma de la noción: tan importante como una completa e inequívoca definición de valor es una completa e inequívoca tipología. Además, metodológicamente, el hecho de considerar diferentes dimensiones de valor en una misma experiencia de consumo permite una mejor adaptación a la idiosincrasia de cada individuo consumidor, en la medida que se conciben puntuaciones diferentes para diferentes dimensiones en diferentes individuos.

Como es sabido, por un lado, existe una amplia corriente que entiende el valor como concepto bidireccional, inspirada por el trabajo seminal de Zeithaml (1988) que reconoce el valor como un *trade-off*, es decir un balance personal que el consumidor realiza sobre los beneficios y costes de una opción de mercado. Son muy numerosos los trabajos en esta línea tanto conceptualmente (e.g. Zeithaml y Bitner, 1996) como empíricamente (e.g. Dodds et al., 1991). No obstante esta bidimensionalidad del valor es una aproximación inicial a las tipologías de valor, completada después con otros enfoques de la noción que dan lugar a otras tipologías de valor (emocionales, sociales,...), en un enfoque más multidimensional pero sin hacer necesariamente referencia a un *trade-off*. Entre todas ellas, señalamos por su relevancia la de Babin et al. (1994), y la ya citada escala PERVAL de Sweeney y Soutar (2001), que suponen una sofisticación de la dicotomía básica de valor hedonista y utilitarista, a la que se van añadiendo nuevas dimensiones. En la misma línea, las propuestas de Mathwick et al. (2001; 2002) y la de Yuan y Wu (2008) de corte experiencial pueden también considerarse nuevas formas, más depuradas y complejas, de valores clásicos como los utilitaristas y hedonistas. Todas ellas son una expresión de la contemporaneidad y continua renovación de la investigación del valor. Entre todas ellas, para los objetivos de este trabajo de perspectiva experiencial, y por su carácter pionero e integral, hemos decidido adoptar la propuesta de ocho dimensiones de valor de Holbrook (1999).

Esta propuesta es el resultado de casi dos décadas de investigación (Holbrook y Hirschman, 1982; Holbrook, 1994; 1996; 1999) y ha sido objeto de amplias y continuadas discusiones entre la doctrina (Rust y Oliver, 1996; Babin y Kim, 1996; Oliver, 1999b; Smith, 1999; Brown, 1999). Dada la profundidad y continuidad de esta contribución, podemos considerar el marco del profesor Holbrook como un paradigma, parafraseando el comentario de Smith (1999: 157): “*en definitiva, el marco puede incluso tener el potencial necesario para servir de paradigma para algunos investigadores sobre consumo*”.

La tipología de valor propuesta por Holbrook reconoce tres ejes o dimensiones que permiten clasificar los diferentes tipos de valor que pueden darse en la experiencia de consumo: *valor extrínseco* vs. *intrínseco*, *valor orientado hacia sí mismo* vs. *hacia otros*, y *valor activo* vs. *reactivo*. La combinación de los tres ejes en una matriz da lugar a ocho tipos de valor: eficiencia, excelencia, entretenimiento, estética, estatus, estima, ética y espiritualidad (cf. Cuadro 1).

- Valor extrínseco vs. valor intrínseco: el primero es aquél que se deriva de “*una relación medios-fin en el consumo*”, mientras que el segundo se da cuando la experiencia de consumo es apreciada “*como un fin en sí mismo*” (Holbrook, 1999: 10). Esta dicotomía tiene su raíz en la tipología clásica de valor hedonista vs. utilitarista, aunque supone una cierta sofisticación de ésta. En otros textos se reconocen los términos hedonista, emotivo e intrínseco como muy similares (Babin et al., 1994). En el caso del paradigma de Holbrook, creemos que la consideración de esta dimensión es una forma de refrendar la idea de que el valor es experiencial y de que el sujeto es soberano en el acto de consumo puesto que “*sólo una experiencia de consumo puede ofrecer valor intrínseco. El objeto que sirve como medio para esa experiencia, puede, en el mejor de los casos, poseer valor extrínseco como medio para un fin deseado en sí mismo*” (Holbrook, 1999: 10).
- Valor orientado hacia sí mismo vs. orientado hacia otros: esta dimensión procede de la axiología y es, según Holbrook, la de mayor consenso. Así, el valor es *orientado hacia sí mismo* cuando se valora un aspecto del consumo egoístamente, por el efecto que tiene sobre el sujeto consumidor; el *valor orientado hacia otros*, por el contrario, es aquél que es buscado por su efecto sobre los demás, desde un nivel *micro* (familia, amigos, compañeros) hasta un nivel intermedio (comunidad, país, mundo) e incluso un nivel *macro* (el Cosmos, la Madre Naturaleza). Pese al consenso axiológico, esta dimensión es la que resulta más controvertida, por su difícil aplicación a algunas situaciones de consumo (Oliver, 1999b; Smith, 1999; Leclerc y Schmitt, 1999).
- Valor activo vs. valor reactivo: esta tercera dicotomía corresponde a la actividad desempeñada por el sujeto en la experiencia de consumo; así “*el valor de consumo es reactivo cuando resulta de la aprehensión, de la apreciación, de la admiración o de cualquier otra respuesta hacia un objeto*”, mientras que el valor es *activo* “*cuando lleva consigo cosas hechas por un consumidor en o con un producto como parte de una experiencia de consumo*” (Holbrook, 1999: 11). En esta dicotomía el acento se pone en un eje parecido al de la pasividad/actividad, o el control y la dependencia.

CUADRO 1.  
Dimensiones de valor (Holbrook, 1999)

		<b>Extrínseco</b>	<b>Intrínseco</b>
<b>Orientado hacia sí mismo</b>	Activo	Eficiencia	Entretenimiento
	Reactivo	Excelencia	Estética
<b>Orientado hacia otros</b>	Activo	Estatus	Ética
	Reactivo	Estima	Espiritualidad

### 2.3. La lealtad y el valor percibido, conceptos de utilidad para la segmentación de mercados

Como anunciábamos en la introducción, la justificación y fundamento de este trabajo estriba en que los vínculos existentes entre los clientes leales y las empresas de distribución minorista pueden deberse a la percepción de una experiencia satisfactoria, y que esta experiencia procede de la combinación de valores racionales y emocionales que el proveedor del servicio pone a disposición de sus clientes en el entorno físico de la tienda. Esta forma de entender el comportamiento de *shopping* se espera pueda arrojar luz sobre cuáles son los determinantes de una lealtad a largo plazo de los consumidores de moda minorista.

El concepto de lealtad, desde los trabajos pioneros de Oliver (1980) y también en las décadas que siguieron, se ha definido como una combinación de una actitud positiva y una repetición en el comportamiento, con antecedentes de diferente naturaleza (Dick y Basu, 1994). En este sentido, se han identificado diferentes fases del comportamiento de lealtad, que contemplan cuatro estadios posibles (Oliver, 1999a): lealtad cognitiva, lealtad afectiva, lealtad conativa y lealtad de acción. Consecuentemente, existen diferentes formas de definición de la lealtad percibida del cliente. Entre las

más recientes, en la literatura minorista, destacamos las que se entroncan en la corriente que apuesta por procesos de co-creación de valor, en los que el consumidor se implica activamente en la experiencia. En estos procesos, el tipo de lealtad resultante como vínculo entre el detallista y el cliente es eminentemente afectivo, y adopta expresiones interesantes como “embededness<sup>2</sup>” (Landry, Arnold y Stark, 2005) o “consumer relationship proneness” (i.e. propensión a la relación con el consumidor) (Wong y Dean, 2009).

En lo que respecta a su operativización, la lealtad puede medirse desde dos perspectivas diferentes: la comportamental, que se centra en experiencias pasadas, y la actitudinal que lo hace en acciones futuras (Zins, 2001). Es la segunda la que mayor eco ha encontrado en la literatura de *retailing* (e.g. Omar y Musa, 2011; Zhao y Huddleston, 2012), y es por tanto la adoptada en este trabajo. Así, debido al carácter altamente competitivo de la industria investigada (minoristas de moda), la lealtad es entendida como un compromiso profundo de los clientes para con la recompra del producto o *servicio* “a pesar de los impactos situacionales o las actividades promocionales que obviamente tienen la potencialidad de provocar comportamientos de cambio” (Oliver, 1999a: 34). En este sentido, la medida de lealtad elegida para este trabajo es la de Arnett et al. (2003) porque: a) se concibió para estudiar entornos de *retailing* como es nuestro caso; b) ayuda a proponer medidas de lealtad que pueden usarse como medidas de *benchmarking* “como medio para evaluar el atractivo de los segmentos de mercado” (p. 161); esto es, se corresponde con nuestra aproximación experiencial (al ser una medida relativa: personal, comparativa y situacional).

La elección del valor y de su multidimensionalidad para predecir el comportamiento de lealtad tiene su lógica en el papel crucial que estas dos nociones poseen, situándose ambas en el centro de toda aproximación al comportamiento del consumidor, ya que “los dos (valor y lealtad) coexisten en el objetivo común de construir relaciones estrechas con clientes” (Chu y Shiu, 2009: 99). En consecuencia, tanto conceptual como metodológicamente, usar el valor para predecir la lealtad tiene un refrendo máximo en la literatura de servicios, en la que el valor percibido es muy ampliamente reconocido como un antecedente positivo de la lealtad (e.g. Oliver, 1999a; Grace y O’Cass, 2005; Gallarza et al., 2011).

### 3. Metodología

Para lograr los objetivos de este trabajo, se realiza una encuesta personal a clientes de tiendas de moda con el fin de evaluar sus percepciones de valor experiencial y su lealtad hacia la tienda que acaba de visitar. El cuestionario incluye ítems para medir las dimensiones de valor según la aproximación de Holbrook (1999). Hasta donde tenemos conocimiento, ningún trabajo anterior ha analizado simultáneamente las ocho dimensiones de valor; eficiencia, excelencia (calidad), estatus, estima, entretenimiento, estética, ética y espiritualidad. Así, hemos seleccionado dos indicadores para cada dimensión de las escalas de valor previamente validadas por la literatura con el fin de progresar en la propuesta de ocho dimensiones de Holbrook.

En primer lugar, la escala de *eficiencia* se ha adaptado de Mathwick, Malhotra y Rigdom (2001). Segundo, la dimensión de valor de *excelencia* es reactiva, extrínsecamente auto-orientada. Conceptualmente, se ha relacionado con calidad (Holbrook, 1999) y metodológicamente, para un contexto de servicios, debería reflejar calidad de servicio. La escala utilizada es una adaptación de la escala de calidad de servicio de Sweeney, Soutar y Johnson (1999). En tercer y cuarto lugar, las escalas de *estatus* y *estima* proceden de la escala PERVAL (Sweeney y Soutar, 2001). En quinto lugar, la escala de valor emocional en el PERVAL es la que la conforma la escala de *entretenimiento*. En sexto lugar, la dimensión *estética* se mide a través de una adaptación de la escala de atractivo visual de Mathwick, Malhotra y Rigdom (2001) a entornos minoristas físicos. En séptimo lugar, la dimensión *ética* se mide a través de un indicador sobre transparencia de precios adaptada de Román (2007) y un indicador relacionado con prácticas sostenibles medioambientalmente, con el fin de contemplar nuevas tendencias en el comercio minorista en España (Retail-Index, 2013). Por último, para la dimensión de

---

<sup>2</sup> El término “embededness” no tiene traducción directa: corresponde a la idea de total integración y asunción del consumidor en su relación con el detallista.

*espiritualidad*, a imagen de los trabajos anteriores de Mathwick, Malhotra y Rigdom (2001), se realiza una adaptación de dicha variable a entornos de consumo minorista, adoptando otra variable afin denominada *escape*, que recoge la idea de desconexión y de huida de la rutina, experimentada durante una compra de naturaleza intrínseca, hedonista y experiencial. Con respecto a la escala de lealtad, se ha utilizado la de Arnett et al. (2003). Todos los ítems han sido medidos en una escala Likert de 7 puntos y se presentan en la Tabla 1. Adicionalmente, se ha incluido una serie de variables de clasificación.

TABLA 1.  
Variables, indicadores y fuentes utilizadas

Variable y fuente	Indicadores
<b>EFICIENCIA</b>	
Mathwick, Malhotra y Rigdom, (2001). Eficiencia (ítems 1 y 2)	Comprar en esta tienda es una forma eficiente de gestionar mi tiempo
	Comprar en esta tienda hace la vida más fácil
<b>CALIDAD DE SERVICIO</b>	
Sweeney, Soutar y Johnson (1999). Calidad de servicio funcional (ítems 1 y 2)	Los empleados de esta tienda son corteses.
	Los empleados de esta tienda están deseosos de ayudar
<b>ESTATUS</b>	
Sweeney y Soutar (2001). PERVAL, Valor social (ítems 3 y 4)	Comprar en esta tienda da una buena impresión de mi a otras personas
	Comprar en esta tienda me aporta aprobación social
<b>ESTIMA</b>	
Sweeney y Soutar (2001). PERVAL, Valor Social (ítems 1 y 2)	Comprar en esta tienda me ayuda a sentirme aceptado
	Comprar en esta tienda mejora la forma en que me perciben
<b>ENTRETENIMIENTO</b>	
Sweeney y Soutar (2001). PERVAL, Valor emocional (ítems 1 y 4)	Disfruto comprando en esta tienda
	Comprar en esta tienda me hace sentir bien
<b>ESTÉTICA</b>	
Mathwick, Malhotra y Rigdom, (2001). Atractivo visual (ítems 1 y 3)	La forma en que esta tienda dispone sus productos es atractiva
	Me gusta la estética que tiene esta tienda
<b>ETICA</b>	
Román (2007). No engaño (ítem 1)	Esta tienda exagera los beneficios y características de sus ofertas (ítem invertido)
Ad hoc	Esta tienda con sus acciones protege el medioambiente
<b>ESCAPE</b>	
Mathwick, Malhotra y Rigdom, (2001). Escape (ítems 1 y 3)	Comprar en esta tienda me permite desconectarme de todo
	Me implico tanto cuando compro en esta tienda que me olvido de todo lo demás
<b>LEALTAD</b>	
Arnett, Laverie y Meiers (2003). Lealtad al minorista (escala completa)	Me considero un cliente leal a la tienda XYZ
	Cuando compro ropa, la tienda XYZ es mi primera elección
	No compraré en otras tiendas de ropa si puedo comprar lo mismo en la tienda XYZ
	Aunque encuentre productos similares en otras tiendas, suelo comprar en la tienda XYZ

Los clientes minoristas en la muestra han sido seleccionados aleatoriamente y entrevistados personalmente a la salida de la tienda. Se han considerado las tres cadenas de tiendas de ropa más populares en España (i.e. H&M, Zara y Mango), en función de su relevancia y posicionamiento diferenciador en el mercado español y europeo (Retail-Index, 2013). La muestra final consta de 180 cuestionarios válidos obtenidos en una región española durante febrero y marzo de 2013.

Para identificar los segmentos de clientes, se aplica una Detección Automática de Interacciones (*Automatic Interaction Detection* o AID) considerando la lealtad como la variable clave en el proceso de segmentación. El método AID es una técnica de análisis estadístico no paramétrica que estudia la relación de dependencia entre una variable dependiente y diversas variables explicativas que opera

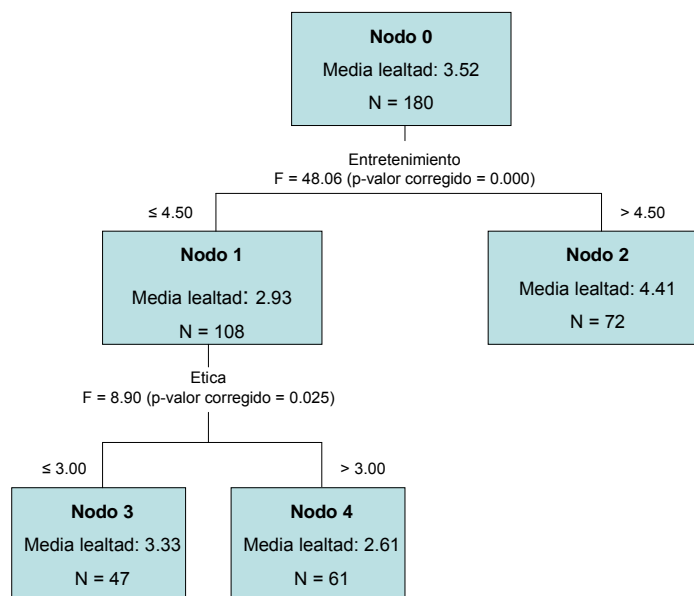

## SEGMENTANDO CLIENTES POR SU LEALTAD: UNA APROXIMACION EXPERIENCIAL...

secuencialmente a través de análisis de varianza, para detectar aquellas variables independientes que contribuyen en mayor medida a explicar la variabilidad en la variable dependiente (Kass, 1980). En particular, el procedimiento CHAID subdivide un conjuntos de datos en segmentos exclusivos y exhaustivos, comparado a través del estadístico *chi*-cuadrado (Magidson, 1993). En el presente estudio, el algoritmo CHAID ha sido utilizado para caracterizar la lealtad del cliente basándose en las dimensiones de valor. Adicionalmente, se utiliza el análisis de la varianza (ANOVA) para comparar los segmentos resultantes con respecto a otras variables.

### 4. Resultados

El algoritmo CHAID ha sido aplicado considerando la lealtad hacia el minorista como la variable dependiente, y las ocho dimensiones de valor (i.e. eficiencia, calidad de servicio, estatus, estima, entretenimiento, estética, ética y escape) como variables independientes. Los resultados se muestran en la Figura 1. A partir del algoritmo CHAID, se identifican tres segmentos finales de clientes de establecimientos minoristas de ropa. Para caracterizar cada segmento final, contrastamos la existencia de las diferencias entre los segmentos en cuanto a sus puntuaciones en lealtad y las dimensiones de valor (Tabla 2).

\* Para contrastar la significatividad de las diferencias entre los segmentos de consumidores, se calcula el test post-hoc de comparación múltiple de Tukey. Sólo se muestran las diferencias estadísticamente significativas entre los grupos con  $p < 0.05$ .

Respecto de la variable dependiente para el algoritmo CHAID (i.e. lealtad de cliente hacia el minorista de moda), se observa que segmento 1 (i.e. nodo 2 en la Figura 1) es el grupo más numeroso, representando 40% de la muestra total, mostrando una puntuación media significativamente más alta en comparación con el resto de grupos. En contraste, el segmento 3 (i.e. nodo 4) muestra un valor medio en la lealtad del cliente significativamente más bajo, mientras que el segmento 2 (i.e. nodo 3) se encuentra en una posición intermedia. En concreto, en este proceso de segmentación, el algoritmo CHAID identifica las dimensiones de entretenimiento y ética como las más pertinentes para diferenciar los segmentos de clientes. Como primer resultado, en el marco de la discusión entre valores hedonistas y utilitaristas como inductores del comportamiento de compra y de la lealtad (e.g. Mathwick et al., 2001; Seo y Lee, 2008), nuestros hallazgos muestran un predominio claro de los valores intrínsecos frente a los extrínsecos (i.e. destacan los aspectos afectivos y hedonistas de la experiencia de compra en el caso de ropa y complementos). Estos resultados se encuentran, en general, en línea con trabajos anteriores donde las emociones experimentadas en la tienda influyen sobre las preferencias del consumidor (Arnold y Reynolds, 2003). Sin embargo, nuestro estudio va más allá, al mostrar que la combinación de valores orientados hacia sí mismo (entretenimiento) y orientados hacia otros (ética) permite explicar el comportamiento de consumo y, de esta forma, definir diversos segmentos de consumidores, que se encuentran motivados por diferentes razones de índole hedonista (principalmente diversión y cuestiones morales).

Por lo que respecta a las dimensiones de valor como variables independientes, en general, los clientes que pertenecen al segmento 1 (i.e. el grupo con los niveles más altos de lealtad) muestran también puntuaciones más altas para el resto de dimensiones de valor en comparación con los otros dos segmentos de clientes, excepto para ética, para la que se encuentran en una posición intermedia. Por tanto, el segmento más leal muestra puntuaciones significativamente más altas en su valoración del servicio proporcionado por el detallista en términos de calidad de servicio, entretenimiento, estatus, estima, eficiencia, estética, y espiritualidad como vía de “escape”.

En cambio, los segmentos 2 y 3 sólo se diferencian entre sí y con respecto al segmento 1 gracias a la valoración de la dimensión ética por parte de sus clientes. En particular, el segmento 3, aquel que reúne los clientes menos leales, es el que muestra la puntuación más alta en ética, mientras que el segmento 2 ofrece las puntuaciones más bajas para ética, y el segmento 1 (clientes altamente leales) se sitúa en una posición intermedia. Los clientes del segmento 3, que representan un 33.9% de la muestra total, parecen ser más leales a sus propios principios, valores y concepciones acerca de qué prácticas son correctas o incorrectas en el comercio minorista de ropa en lugar de ser fieles a la enseña o marca comercial. Este grupo de consumidores probablemente se muestre altamente preocupado por el uso de

reclamos centrados en cuestiones medioambientales por parte del minorista (p.e. prácticas ecológicas sobre el uso de bolsas de plástico, uso de materiales orgánicos) así como por una política de precios justos. Por último, en un análisis adicional, se observa que las variables sociodemográficas (género, edad y nivel de educación) no muestran diferencias significativas. Como ha sido señalado en la literatura previa, las variables tradicionalmente consideradas para la segmentación ya no son tan útiles para identificar grupos diferenciados de clientes (Yoon y Kim, 2000; Story y Hess, 2006), como queda demostrado en el caso que nos ocupa. No obstante, esta cuestión se encuentra lejos de estar zanjada, en la medida en que otros trabajos que evalúan el efecto de las variables sociodemográficas en las percepciones de valor de compra encuentran efectos significativos; así, Seo y Lee (2008) encuentran que la clase social modera los valores de compra de manera diferente en función del formato comercial (en concreto, se observa un efecto moderador importante en grandes almacenes y no significativo en tiendas de descuento).

### 5. Conclusiones

La literatura en el ámbito del comercio minorista señala que la comprensión de los comportamientos basados en el valor constituye un desafío de creciente importancia para los gestores de establecimientos detallistas (Sullivan, Kang, y Heitmeyer, 2012). La experiencia de consumo descrita en este trabajo, y las particulares dimensiones de valor descritas en el mismo – el modelo de ocho dimensiones de valor de Holbrook (1999) – presentan resultados de interés tanto para académicos como para profesionales. Según nuestros hallazgos, hoy en día, los clientes de establecimientos minoristas de moda esperan, por la comparación permanente y siempre posible con los competidores, más y mejores servicios, experiencias, beneficios y por tanto más y mejores valores de la compañía. A partir de una aproximación experiencial como la nuestra, los clientes no buscan únicamente comprar un producto, sino que desean cubrir sus necesidades emocionales y altruistas con productos beneficiosos y valiosos así como experiencias lúdicas. Además, de los resultados obtenidos entendemos que la lealtad del cliente y el valor percibido derivado de la relación con el detallista son dos criterios válidos para la segmentación de clientes en el comercio minorista de moda, de manera que pueden facilitar las decisiones ejecutivas en cuanto a sus políticas de marketing.

En el presente trabajo se han identificado tres segmentos de clientes que difieren en su lealtad declarada al establecimiento detallista y su valoración de las distintas dimensiones de valor. En particular, la emoción (entretenimiento o “play” en inglés) y el altruismo (ética) parecen ser las variables más pertinentes para segmentar a los clientes de tiendas de moda en función de su lealtad a la cadena de tiendas. La caracterización de segmentos de clientes nos permite concluir que los clientes altamente leales muestran significativamente puntuaciones más altas para todos los tipos de valor, a excepción de la dimensión ética, en la que destacan los clientes menos leales. Por tanto, en primer lugar, los directores de tiendas deberían concentrar sus esfuerzos en crear una atmósfera que elicite emociones positivas en los visitantes de la tienda en conexión con su marca y surtido. Esto apoya la importancia de la aproximación experiencial en el proceso de compra en el sector del comercio minorista de moda. En segundo lugar, los detallistas deberían proporcionar a sus clientes evidencia acerca de la misión, valores y prácticas éticas de la compañía, y transformar aquellos clientes con nivel bajo de lealtad y altamente preocupados por cuestiones éticas en clientes leales.

Sin embargo, las variables sociodemográficas (i.e. género, edad, nivel educativo) no muestran diferencias significativas entre los distintos segmentos de clientes, mientras las variables relacionales como lealtad y valor permiten a los minoristas de moda definir grupos de clientes que difiere en la intensidad de sus percepciones del valor proporcionado por el detallista. La discusión referida a las semejanzas y discrepancias con otros trabajos acerca de los valores de compra experiencial (e.g. Seo y Lee, 2008) nos sugiere la necesidad de estudiar la combinación de criterios sociodemográficos y psicográficos, y sus efectos en los valores de compra y la lealtad del cliente hacia el establecimiento.

### 6. Limitaciones y futuras líneas de investigación

Cabe señalar diversas limitaciones relacionadas tanto con el marco teórico como con el estudio empírico. En primer lugar, como se destacó en nuestra introducción, la aproximación experiencial ha sido una de las áreas más fructíferas en la investigación del comportamiento del consumidor, siendo para algunos investigadores como la única perspectiva válida. Así, resulta conceptualmente muy difícil de aprehender, en un único esfuerzo de revisión de la literatura, una noción de experiencia del consumidor desarrollada en su integridad (Arnould, 2007).

Segundo, la elección del marco conceptual de Holbrook sobre el valor es un paso metodológico que asume que el valor es un beneficio completamente libre de coste, representado por una función de preferencia independiente del precio (Holbrook, 1999). El tiempo es el único coste no monetario (evaluado como parte de la eficiencia) que nuestro trabajo considera, si bien en la literatura en el ámbito de los servicios y del comportamiento del consumidor (e.g. Cronin, Brady y Hult, 2000) se viene señalando desde hace muchos años la existencia de una relación negativa entre sacrificios y lealtad (a través de valor y satisfacción). Estudios posteriores acerca de la capacidad de los valores de compra experiencial como criterios de segmentación para explicar la lealtad hacia el minorista deberían incluir otros costes monetarios y no monetarios, diferentes del tiempo (p.e. ruido u olores, que deberían ser considerados desde una aproximación experiencial, en la medida en que se relacionan con nuestros sentidos).

Tercero, la forma de hacer operativas las variables en escala contempla limitaciones en el número (sólo dos indicadores por dimensión) y en las fuentes, ya que cuatro de las ocho escalas de valor han sido adaptada de un contexto de compra on-line a entornos off-line (*eficiencia, estética, escape y ética*). Según nuestros resultados, la última de las dimensiones, i.e. ética, debería ser explorada en mayor medida, con escalas más comprehensivas procedentes de la literatura (implicando aspectos de cumplimiento y fiabilidad); aproximaciones adicionales más amplias, completadas con el examen de variables adicionales, podrían enriquecer la visión real proporcionada en este estudio. En particular, motivaciones de compra, variables psicográficas o rasgos de la personalidad del consumidor, como implicación, carácter innovador, autoexpresión e impulsividad, pueden jugar un papel importante en la segmentación de clientes en el comercio minorista de moda, en la línea de Cardoso et al. (2010).

Por último, la consideración conjunta de los conceptos de valor y lealtad sugieren vías aún no exploradas en el contexto del comercio minorista. La consideración de otros grupos de interés diferentes de los clientes, como empleados de contacto y/o líderes de opinión (personal shoppers, blogueros de moda...) puede alentar futuros estudios acerca del valor experiencial en contextos interpersonales, poniendo mayor interés en las dimensiones sociales de la compra. La inclusión de otros grupos de interés en esta industria de moda "stakeholders" puede ser contrastada con el valor percibido y la lealtad del cliente. Esta clase de estudio comparado nos debería proporcionar ideas adicionales sobre los procesos reales de co-creación de valor.

## ABSTRACT

*Searching for information online and then buying the product offline is the most extended shopping behavior among online users. With the advent of new technologies, consumers perceive an enhanced control and power during the purchase process. One of the main innovative elements that new technologies have incorporated into the purchase process is the ubiquitous access to information generated by other customers about the product. Nevertheless, at the physical store consumers face a new environment which may influence their behavior. The aim of this research is to analyze how online customer recommendations, and offline salesman recommendations, affect the consumer's search experience and decision in a multichannel setting based on an online-offline sequence. The moderating role of the motivation to touch the product is also examined. The results of two studies show that the combination of an online search and an offline purchase improves the consumers' purchase experience. Moreover, external recommendations can influence the outcomes of the search experience and decision to a great extent, although these effects depend on the motivation to touch the product.*

## Keywords:

Multichannel shopping, confidence, customer recommendations, salesman recommendations, motivation to touch

## 1. Introduction

The shopping environment is being affected by a dramatic proliferation of new channels through which customers can interact with retailers (Neslin et al., 2006). Consumers can easily combine different channels to search for the information about products, corroborate it and/or purchase them. Specifically, the most extended behavior among online users is based on an online information search and a subsequent visit to the physical store to purchase the product (Zhang et al. 2010; Hsiao, Yen and Li, 2012; Sevitt and Samuel, 2013). In this way, the advances in information technology and the new consumer information needs are driving the companies to implement new routes to interact with customers. One of the most beneficial innovations that new technologies have incorporated into the consumer's purchase process is the access to other consumers' opinions and evaluations in anytime and anywhere (Henning-Thurau et al., 2010). However, despite the great body of research analyzing the effects of traditional word of mouth, and of electronic word of mouth in e-commerce, there is a lack of research on how the opinions of other customers impact on consumer's purchase behavior at the physical outlet. With the aim of filling this gap, this research examines the consumer's purchase decision process based on the combination of the online and physical channels. Specifically, a new framework is proposed, namely the Multichannel Search Experience and Decision (MSED), in which the consumer first searches for information on the Internet and then goes to the store to confirm the information and make a decision with a high degree of confidence. Within this framework, we analyze how online customers' recommendations help the consumer to improve their multichannel shopping experience in terms of satisfaction and confidence, and how offline recommendations made by salespeople confronts with this initially generated impression of the product. Moreover, the moderating role of the motivation to touch the product is examined.

## 2. Conceptual Framework: The Multichannel Search Experience and Decision

Our demarcation of the multichannel behavior is in line with recent definitions developed by the literature, specifically the research shopper proposed by Scott Neslin and colleagues (e.g., Verhoef et al., 2007; Neslin and Shankar, 2009). These authors refer to this type of behavior as "the propensity of consumers to research the product in one channel (e.g., the Internet), and then purchase it through another channel (e.g., the store)" (Verhoef et al., 2007; p. 129). Although the definition does not treat the Internet as the exclusive channel to search for information, it could be considered as the most suitable medium to research products. The physical store is (still) the most preferred channel to carry out purchases (Chen, Jiang and Hsiao, 2008).

The Multichannel Search Experience and Decision (MSED henceforth) is defined as the combination of the online and offline channels in which the consumer firstly search for information online, and secondly confirm the information offline and makes the decision with a high degree of confidence. In this buying behavior, we analyze the stages prior to the consumer's choice (information search and evaluation of alternatives, i.e. purchase intentions), purchase decision, and post-purchase evaluation of the experience. Specifically, we focus the analysis on two key outcomes of the MSED: search-process satisfaction and choice confidence. Search-process satisfaction is defined as the satisfaction with the information search process (Creyer and Kozup, 2003). Consumers may perceive value of the purchase experience (Davis, Spohrer and Maglio, 2011; Zeithaml, 1988), and they experience satisfaction not only with the product but also with the shopping decision process itself. This affective evaluation may affect willingness to shop at a given store and/or channel (Zhang and Fitzsimons, 1999; Montoya-Weiss, Voss and Grewal, 2003). Confidence is a mental state of certainty with which a product, brand, or purchase situation is evaluated (Tormala, Rucker and Seger, 2008). For this research, achieving confidence represents an approaching goal (Heitmann et al., 2007) that motivates the MSED. The elimination in information asymmetries and the enhanced control over the purchase process allow consumers to use the online and the offline channels to arrive at a decision with a high degree of confidence. When consumers exert effort to systematically process the information and use more complete decision strategies, confidence in decision making arises

(Bettman, Luce and Payne, 1996). Thus, choice confidence is viewed as an important outcome of the multichannel shopping based on an online-offline search sequence, reflecting the extent to which the consumers may feel that they have performed the combination of media that allows them to arrive at the best decision.

We follow Dholakia et al.'s framework (2010) for studying the multichannel consumer behavior. Consumers bring several particularities with them that may affect their interaction with the physical store. In this research, consumers bring an initial impression of the product formed in a previous online interaction, which is confronted and/or confirmed through a physical experience at the store. In addition, consumers encounter new elements at the physical store that may influence their final evaluations and decisions (Dholakia et al., 2010). In this context, consumers may encounter a new alternative which can be compared to the previously considered for the purchase. Thus, we examine the differences in purchase intentions and choice at the physical store between a product initially considered in the online channel (target product) and a new product (rival) which has the potential to take part into the consideration set. The goal is to determine the stability of the initial preference and the outcomes of the experience. Moreover, this research analyzes how external recommendations, provided by other customers or the retailer's sales force, influence the MSED. We analyze whether the presence of online customer reviews help consumers to reinforce their impression about the product, improving their search experience and decision. On the other hand, we examine how the relative stability of the consumer's opinion about the product is affected when he or she receives a salesman's recommendation against it. Finally, the motivation to touch the product is examined as a possible moderator of the multichannel shopping behavior.

### 3. Hypotheses

In the multichannel context, several authors have analyzed the effects of different types of virtual experiences and direct experiences, as well as the differential impact of sequential combinations of online and offline experiences (Daugherty, Li and Biocca, 2008; Griffith and Chen, 2004; Ken, Liao and Yang, 2012; Li, Daugherty and Biocca, 2001, 2003; McCabe and Nowlis, 2001). Past research generally support the benefits derived from the combination of virtual and direct experiences in an online-offline sequence, compared to each one in isolation, in consumer's knowledge about the product, brand attitude and purchase intentions. If the individual establish a favorable impression of the product through an initial virtual experience, this evaluation may be enhanced once he/she obtains a direct experience with it (Daugherty et al., 2008). In the same way, given the lack of previous experiences with other products available in the physical store, it is expected that the purchase intentions toward a new, rival product will be less favourable than toward the target product. In this way, this research aims at replicating previous literature by showing a positive effect of the combination of online and offline experiences on the consumer's purchase intentions. Also, we try to extend previous research by analyzing the consumer's choice of the product. If the consumer combines the online and offline channels to reinforce the idea that the product considered is the best to match with their needs and goals, the choice of this product, compared to new alternatives, is expected to be higher.

*Hypothesis 1: Purchase intentions toward the product will be higher when the consumer searches for information online and then confirms the information offline than when the consumer has only (a) an online interaction, or (b) a physical inspection, with the product.*

*Hypothesis 2: The choice of a product will be higher when the consumer searches for information online and then confirms the information offline than when the consumer has only a physical inspection of a product.*

Following the same reasoning, we propose that the incorporation of the online channel to offline purchases allows the consumer to face the purchase-decision process with a high degree of information and power (Van Bruggen et al., 2010), thus improving the resulting outcomes of their experience. In this way, the consumer's search-process satisfaction may increase after having a physical interaction with a product previously considered on the online environment. The multichannel shopping behavior is a step-by-step process in which consumers evaluate the information in one channel and later updates it with information obtained in another channel

(McCabe and Nowlis, 2001). If the consumer visits the physical store in order to overcome the lack of physical interaction with products of the online medium, it may be expected that the satisfaction with the search process will increase once the direct experience takes place.

*Hypothesis 3: Search-process satisfaction will be higher when the consumer searches for information online and then confirms the information offline than when the consumer has only an online interaction with the product.*

In addition, the multichannel shopper defined within the MSED framework combines the virtual and physical channels to make choices with a high degree of confidence. Information processing literature establishes that consumers carry out exhaustive information searches and analyze every piece of information carefully with the goal of being confident in their judgments (Eagly and Chaiken, 1993; Petty, Briñol, and Tormala, 2002; Tormala et al., 2008). In multichannel shopping processes, consumers exert a certain degree of physical and cognitive effort to search for information in the online and physical channels. We expect that when consumers choose a product which has been researched through the combination of the online and offline channels, will be more confident in their choice than when consumers choose a product which is only evaluated at the physical store.

*Hypothesis 4: The level of choice confidence will be higher in a product for which the consumer searches for information online and then confirms the information offline than in a product whose search experience has been based only on the physical inspection.*

We focus on online product reviews as a particular form of electronic word-of-mouth (Chen and Xie, 2008; Lee, Park, and Han, 2006). Online product reviews are generated by other consumers who have acquired the product and used it, and communicate their experiences, evaluations, and opinions about it (Park et al., 2007). Specifically, and taking into account our research proposal, we focus on positive online product reviews, which are intended to favor and reinforce individuals' preferences towards it (Chevalier and Mayzlin, 2006). In this way, any persuasive attempt may have assimilation or contrast effects on consumers (Mason, Conrey and Smith, 2007). According to Janseen and Jager (2001), assimilation effects are likely to occur when the consumer's goal is to form an accurate judgment of the object. This research argues that the multichannel shopper combines the virtual and physical channel in order to form an accurate impression of the product so that it matches with their goals and needs. If the consumer is committed to accomplish with this objective, the positive information of an online product review tends to be consistent with this tendency (Khare, Labrecque, and Asare, 2011). Therefore, we expect that the presence of a positive product review posted by a customer online will have a positive impact on the consumer's MSED. The information generated by other consumers may be considered as more reliable and relevant than that from the company, because it comes from people who -a priori- do not respond to commercial interests (Park et al., 2007). Purchase intentions and the choice of the initially considered product should be higher in the presence of this type of external recommendations. Moreover, consumers may value the information obtained through customer reviews, experiencing increased levels of satisfaction with the search process. Finally, given the reinforcing effect that the customer review may have on the consumer's impression of the target product's adequacy, we propose a positive effect of this external recommendation on the confidence in the choice of target product.

*Hypothesis 5: The presence (versus absence) of a positive online customer recommendation in the MSED will have a positive influence on (a) purchase intentions, (b) choice, (c) search-process satisfaction, and (d) choice confidence.*

This research examines the effects of a salesman's recommendation which does not support but goes against the initial impression of the consumer. Taking into account that the combination of different media empowers consumers to obtain product knowledge and generate a stable impression of the product, it seems interesting to examine how persuasive attempts that consumers may encounter at the physical store affect the relative stability of their impression of the product formed in a previous online interaction. The influence of salespeople's recommendations may depend on the fact that the consumer has already formed an initial preference toward the product on the Internet. Individuals may implement different strategies when interacting with salespeople, with the goal of obtaining a high degree of confidence in the purchase of the product or defending themselves from their persuasive attempts (Kirmani and

Campbell, 2004). When consumers have established preferences toward a product, the reception of salespeople's recommendation against it may result in a rejection of the recommendation; furthermore, it may result in a reinforcement of the preferences toward the product initially considered. Fitzsimons and Lehmann (2004) demonstrated that an expert recommendation against a dominant option, or against a preliminary considered alternative, resulted in a "reactance-style" response. Rather than adjusting their decisions according to the expert recommendation or simply ignoring it, a backlash occurred such that an increase in the choice of the option that was recommended against was observed. This negative reaction is also consistent with the contrastive response of consumers to persuasive attempts (Khare et al., 2011). Furthermore, the recommendation against the initially considered alternative provoked an increased level of choice confidence of this alternative rejected by the recommendation. The authors showed that these effects are especially evidenced when the degree of involvement was high. Consumers in the MSED will experience reactance when receiving the salesman's recommendation. Purchase intentions, choice, and choice confidence in the target product are expected to be higher when the consumer receives a salesman's recommendation. However, one of the affective responses derived from reactance is reduced satisfaction with the decision process and increased difficulty in making a decision (Fitzsimons and Lehmann, 2004).

*Hypothesis 6: The presence (versus absence) of an offline salesman recommendation against the product initially considered in the MSED will have (a) a positive influence on purchase intentions toward the target product, (b) a positive influence on the choice of the target product, (c) a negative influence on the search-process satisfaction, and (d) and positive influence on choice confidence of the target product.*

Motivation to touch the product is considered a source of variation in consumer behavior (Citrin et al., 2003; Peck and Childers, 2003a; Dholakia et al. 2010). Consumers differ in their intrinsic motivation to touch the product (i.e. Need for Touch; Peck and Childers, 2003a) which may determine the evaluation obtained after a direct experience with the product differently. For example, consumers with a high motivation to touch the product obtain more confidence in their judgments after a direct experience with the product, whereas low motivated consumers had the same levels irrespective of touching the product (Grohmann, Spangenberg and Sprout, 2007).

When the motivation to touch the product is high, we may expect that consumers will pay special attention to the information obtained through the physical interaction. Tactile information is highly diagnostic under this circumstance (Grohmann et al., 2007). Consumers value it and may rely on it to a greater extent than other information sources to form a final decision. Therefore, when the motivation to touch the product is high, either stimulated internally by the consumer or externally by the situation, the influence of external recommendations will be rather low. However, when the motivation to touch the product is low, the consumer may rely on other information sources to achieve at the right decision. In this way, one of main advantages of the physical shopping environment is derived from the possibility of interacting with the sales team and receiving their recommendations (Frambach, Roest and Krishnan, 2007). In situations in which the physical interaction with the product does not provide with valuable information to consumers, receiving the salesman's recommendation could be viewed as a positive aspect of the shopping experience. Recommendations may serve to reduce the effort required and the uncertainty in the decision making process, increasing the satisfaction with the decision-making process and increasing the degree of confidence in it (Fitzsimons and Lehmann, 2004). We expect different effects of the salesman's recommendation on the resulting outcomes of the MSED, depending on the motivation to touch the product.

*Hypothesis 7: When the motivation to touch the product is high, the influence of a customer recommendation on the consumer's (a) purchase intentions, (b) choice, (c) search-process satisfaction, and (d) choice confidence, will be lower than when the motivation to touch the product is low.*

*Hypothesis 8: The motivation to touch the product will moderate the impact of a salesman recommendation on the consumer's (a) purchase intentions, (b) choice, (c) search-process satisfaction, and (d) choice confidence.*

## 4. Methodology

Two studies examine the relationships proposed. In the first study, we analyze how the presence of a customer recommendation in the online search episode, operationalized by means of a positive review of the product, influences the subsequent physical interaction with the product. At the physical encounter with the product, the differences with respect to a new alternative and the effects of a salesman's recommendation against the product initially considered are examined. In addition, the motivation to touch the product is included into the analyses by means of measuring the consumer's internal motivation. In this way, Need for Touch (NFT henceforth) is defined as the individual's "preference for the extraction and utilisation of information obtained through the haptic system" (Peck and Childers 2003a; p. 431). In the second study, the customer recommendation is received at the same moment as the physical interaction is taking place. Mobile technologies allow consumer to access this type of online recommendations at the physical store. The introduction of a rival product and the salesman's recommendation against the target product are also analyzed. Moreover, the motivation to touch the product is operationalized extrinsically by using different product types.

### 4.1. Study 1

The design of the experiment was full factorial, with 2 (online review: yes vs. no) x 2 (salesman recommendation: yes vs. no) between-subjects conditions. Participants were one hundred online users (44% male; between 18 and 35 years old) with a representative profile of the indices of Internet penetration and experience (e.g. Lin et al., 2011; ONTSI 2010). Participants were randomly assigned to one of the four conditions (cell sizes ranged from 22 to 27). Need for Touch was measured as a within-subjects factor. The context of the study was the purchase of a smartphone in a realistic shopping environment. The choice of smartphones was deemed as appropriate since this type of products is especially attractive to the demographic sample. In addition, both search and experience attributes are important for their evaluation (Gupta and Harris 2010). Thus, the combination of the online and the offline channels seems to be the ideal for consumers to obtain complete information about the product.

The experiment was developed in two parts. In the first part (T1), participants had an online information search episode in which they retrieved information about the product. The online presentation contained a small paragraph describing the product, a list of attributes, and a picture of the product. At this point, the manipulation of the online product review was introduced. Participants in the "review" condition additionally read a positive online review of the product. The review contained a text of 150 words approximately in which an anonymous consumer evaluated some of the product characteristics and related several use experiences<sup>1</sup>. After interacting for a few minutes, participants indicated their satisfaction with the search process (4 items adapted from Heitmann et al., 2007;  $\alpha = .89$ ) and the likelihood of buying the product to account for their purchase intentions. All the scales used 7-point Likert basis. In the second part of the experiment (T2), participants had a physical interaction with the product. The product presentation replicated the conventional presentations used in multichannel physical stores (e.g., FNAC). A new product (rival) was placed just beside the product previously considered in the online channel (target)<sup>2</sup>. The participants were instructed to touch and handle the products at their pace. At this point, participants in the "recommendation" condition received the salesman recommendation. The purpose of the recommendation was not to discredit the target product, but to persuade the participants that the rival product was the best for them. After interacting with both products, the participants completed the questionnaire (T2). In addition to the measures of satisfaction with the search process ( $\alpha = .92$ ) and purchase intentions towards the two products, participants were asked to choose between them. After that, they were asked about their degree of choice confidence (4 items adapted from Petty et al.,

---

<sup>1</sup>Suggestions from the specialized literature were followed in order to create an adequate online product review (McCabe and Nowlis, 2003; Park et al., 2007; Lin et al., 2011; Li and Zhan, 2011).

<sup>2</sup>The rival product was chosen because it presented similar characteristics with the target in terms of appearance and functionalities.

2002;  $\alpha = .91$ ). Finally, under the guise of a different study about youth personality, the participants completed the NFT scale (Peck and Childers 2003a;  $\alpha = .88$ ).

The analyses focused on the changes occurred from the online interaction to the physical inspection of the target product (T2-T1) as well as on the differences between the target and the rival products. The results of a repeated-measures ANOVA indicated that purchase intentions toward the target product in T2 ( $M = 4.36$ ,  $SD = 1.74$ ) was significantly higher than in T1 ( $M = 3.90$ ,  $SD = 1.61$ ;  $F(1, 96) = 10.813$ ,  $p < .01$ ). In support of H1a, the combination of the online and physical channels produced higher purchase intentions than the online channel exclusively. However, the presence of the customer review in the online interaction did not affect the change in purchase intentions ( $p = .52$ ), rejecting H5a. Moreover, and contrary to H6a, the presence of the salesman recommendation against the target product had a negative impact on the increase in purchase intentions ( $F(1, 96) = 6.079$ ,  $p < .05$ ). Purchase intentions increased more when the participants did not receive the recommendation ( $\Delta M = .83$ ,  $SD = 1.31$ ) than when they received it ( $\Delta M = .12$ ,  $SD = 1.56$ ). The interaction between the review and the recommendation was not significant ( $p = .86$ ).

Purchase intentions toward the target product was not significantly different from purchase intentions toward the rival product ( $M = 4.34$ ,  $SD = 1.57$ ;  $p = .83$ ). The fact of reading an online review previously did not affect this difference ( $p = .95$ ), but the salesman recommendation had a significant impact ( $F(1, 96) = 8.946$ ,  $p < .01$ ). Purchase intentions toward the target were higher than for the rival in the absence of recommendation ( $F(1, 48) = 5.765$ ,  $p < .05$ ); the opposite happened with the salesman recommendation, although the difference was marginally significant ( $F(1, 52) = 3.808$ ,  $p = .06$ ). The interaction term was not significant ( $p = .57$ ). Therefore, compliance with H1b is contingent on the existence of the salesman recommendation. If the participant did not receive the recommendation, the purchase intentions toward the product whose search experience was based on the combination of the online and offline channels was higher than for the product whose search experience consisted only of a physical inspection.

Regarding choice, the results of a three-way loglinear analysis with choice, review, and recommendation as factors revealed a significant two-way interaction between choice and salesman recommendation ( $\chi^2(1) = 6.979$ ,  $p < .01$ ). Without recommendation, 67% of participants chose the target product; when participants received the recommendation, only 34% chose the target. Support for H2 depends on the existence of the salesman recommendation, which had a negative effect on the choice of the target product (H6b is rejected). Also, participants' choice did not depend on the fact reading a customer review in the previous online interaction ( $p = .72$ ). H5b is thus rejected.

A repeated-measures ANOVA was carried out to examine whether the levels of search-process satisfaction increased after physically interacting with the product. Indeed, satisfaction in T2 ( $M = 5.52$ ,  $SD = 1.09$ ) was significantly higher than in T1 ( $M = 4.99$ ,  $SD = 1.10$ ;  $F(1, 96) = 36.085$ ,  $p < .001$ ), supporting H3. Contrary to H5c, the presence of an online review had a significant negative influence in this increase ( $F(1, 96) = 4.271$ ,  $p < .05$ ). The increase in satisfaction was higher when the participants did not read the online review ( $\Delta M = .71$ ,  $SD = .99$ ) than when they read it ( $\Delta M = .35$ ,  $SD = .75$ ). Nor the salesman recommendation ( $p = .47$ ) nor the interaction between the review and recommendation ( $p = .52$ ) affected the increase in search-process satisfaction. Thus, H6c must be rejected.

Finally, H4 which proposed that choice confidence should be higher for a product whose search experience is based on the combination of the online and the offline channels. The ANOVA showed no significant differences in choice confidence between the target ( $M = 6.13$ ,  $SD = .93$ ) and the rival product ( $M = 5.98$ ,  $SD = 1.07$ ;  $p = .22$ ). However, the interaction between the salesman recommendation and the product chosen was significant ( $F(1, 99) = 5.869$ ,  $p < .05$ ). Without recommendation, confidence in the choice of the target ( $M = 6.20$ ,  $SD = .78$ ) was significantly higher than confidence in the choice of the rival ( $M = 5.47$ ,  $SD = 1.35$ ;  $F(1, 47) = 5.576$ ,  $p < .05$ ). The opposite occurred in the presence of the salesman recommendation,

although the effect was not significant ( $p = .42$ ). Again, compliance with H4 was contingent on the existence of a salesman recommendation against the target product. Regarding the choice of the target product, choice confidence was not significantly different for participants who received the recommendation ( $M = 6.02$ ,  $SD = 1.13$ ) than for those who did not ( $p = .51$ ). H6d is rejected. Supporting H5d, the online review had a positive and significant effect ( $F(1, 99) = 4.207$ ,  $p < .05$ ). Choice confidence was higher if the participants read previously a review ( $M = 6.24$ ,  $SD = .92$ ) than if they did not ( $M = 5.85$ ,  $SD = 1.05$ ), regardless of the product chosen ( $p = .77$ ).

The PROCESS macro developed by Hayes (2013) was used to test for the moderating effects of participants' NFT. First, participants' level of NFT did not moderate the effect of the recommendation ( $p = .83$ ) and the review ( $p = .64$ ; the three-way interaction was not significant,  $p = .16$ ) on the increase in purchase intentions. However, the analysis yielded a significant interaction between NFT and the salesman recommendation on the differences in purchase intentions between the target and the rival product ( $\beta = .71$ ,  $se = .30$ ;  $t(92) = 2.364$ ,  $p < .05$ ). Following the Johnson-Neyman technique (Hayes, 2013), the data showed that the recommendation had a negative impact on this difference until the participants' NFT reached the point of 5.96 of the scale (60% of the sample). Therefore, H7a must be rejected, whereas support is found for H8a: the effect of the recommendation was evidenced when the motivation to touch the product was low, rather than high. In this line, participants' NFT moderated the impact of the salesman recommendation on choice ( $\beta = 1.21$ ,  $se = .51$ ;  $z = 2.370$ ,  $p < .05$ ). In support of H8b, the recommendation had an impact on choice for participants with a level of NFT below 5.88 of the scale (55% of the sample). NFT did not moderate the lack of effect of the online review on choice ( $p = .48$ ), thus rejecting H7b. Regarding search-process satisfaction, the interaction between NFT and the salesman recommendation was significant ( $\beta = -.51$ ,  $se = .15$ ;  $t(92) = -3.506$ ,  $p < .01$ ). The recommendation had a positive impact for participants with a NFT below 5.03 of the scale (31% of the individuals). H8c is supported. The negative impact of the review on the increase in satisfaction was not moderated by NFT ( $p = .53$ ; H7c is rejected). Finally, the analysis revealed a significant three-way interaction between the online review, the salesman recommendation, and the participant's NFT on choice confidence ( $\beta = -.81$ ,  $se = .35$ ;  $t(92) = -2.318$ ,  $p < .05$ ). When participants received no salesman recommendation, the positive effect of the online review on choice confidence was not affected by participants' level of NFT (non-significant interaction  $p = .22$ ). When participants received the salesman recommendation, the interaction between the online review and participants' NFT was significant ( $\beta = -.48$ ,  $se = .23$ ;  $t(48) = -2.113$ ,  $p < .05$ ), indicating that the review had a positive effect on choice confidence until NFT reached the level of 4.53 of the scale (25% of cases). Thus, some support is found for H7d. The positive effect of the online customer review was more evidenced for low NFT participants, but only when they received the salesman recommendation. However, H8d must be rejected, given that the salesman recommendation did not have significant effects on the confidence of the target product depending on NFT (non-significant interaction:  $p = .29$ ).

Overall, the results show that the consumer's search experience and decision improves when using a combination of the online and offline channels, compared to each one separately. The purchase intentions toward the product initially considered in the online environment increased after a physical interaction, and were higher than toward a new alternative. In addition, the previously considered product was chosen by more participants than the rival product, who held their choice with a higher degree of confidence. Furthermore, the search-process satisfaction increased significantly when the online interaction was subsequently accompanied by a physical inspection of the product.

However, the presence of external recommendations and the motivation to touch the product influenced significantly these effects. Contrary to our expectations, the presence of a salesman's recommendation did not reinforce the preferences toward the product initially considered. Indeed the reverse occurred, given the negative impact of the salesman's recommendation on the difference in purchase intentions between the target and the rival product, and on participants' choice of the target product. Thus, although consumers may be empowered due to

the incorporation of virtual experiences into their purchase decision process, they may be still sensitive to the persuasive attempts made by the retailer's sales force at the point of purchase. Nevertheless, the negative effects of the salesman's recommendation on purchase intentions and choice was significant for those participants with a low motivation to touch the merchandise. If low motivated consumers derived no valuable information from the direct experience with the product, they might rely on other elements that assist them in the physical store, such as the salesman's recommendation. When the motivation to obtain tactile information of the product was high, the fact of receiving a salesman's recommendation did not influence purchase intentions and choice. This notion was further confirmed in the outcomes of the MSED. Search-process satisfaction increased when the participants combined the online and offline channels. The presence of a salesman's recommendation had a positive impact on satisfaction for low NFT participants, whereas NFT participants appeared to ignore the recommendation. Furthermore, participants' confidence in the choice of the target product was higher than in the choice of the rival, but only for those who did not receive the salesman's recommendation. Again, the expected reactive response on choice confidence was not supported. Participants who received the salesman's recommendation and chose the target product did not show different levels of choice confidence than participants who did not receive the recommendation.

Regarding the effects for the presence of the customer recommendation, the analyses did not generally support our propositions. The online review did not affect purchase intentions and choice after touching the product. Moreover, the presence of an online review had a negative impact on the increase in satisfaction. This result may be due to the fact that participants had valued positively the customer recommendation in the online interaction and this effect was diluted in the physical encounter with the product. In fact, search-satisfaction after the physical interaction (T2) was not significantly different with ( $M = 5.43$ ,  $SD = 1.20$ ) or without ( $M = 5.51$ ,  $SD = .95$ ) the online review ( $p = 0.40$ ). As previously stated, the multichannel shopping behavior is a step-by-step process in which consumers evaluate the information in one channel and later updates it with information obtained in another channel (McCabe and Nowlis, 2001). Thus, consumers might have already discounted the positive effect of the online review when visiting the physical store. Nevertheless, the presence of an online customer review generally had a positive influence on participants' choice confidence, regardless of the product chosen or their level of NFT.

The next study seeks to extend and clarify some of the effects previously found regarding the presence of the customer recommendation. Specifically, with the goal of analyzing whether the lack of (or even the negative) effects of the customer review may be due to the consumers' discount of its value, participants in study 2 accessed user-generated content during the physical encounter with the product. These days, consumers can reach other consumers almost anywhere at any time through their mobile devices. They can easily read reviews of a product when shopping in a retail store (Henning-Thurau et al., 2010). Finally, motivation to touch the product was not measured but directly manipulated in study 2. Specifically, two product types differing in the relative importance of their material properties to evaluate and purchase them are included into the analysis. By including different product categories, we also aim at offering more generality to the results.

#### **4.2. Study 2**

Study 2 consisted of a full factorial design, with 3 (recommendation: no vs. customer vs. salesman) x 2 (product type: strap bag vs. usb memory stick) between-subjects conditions (cell sizes ranged from 21 to 27). Participants ( $N = 145$ ; 53% male; between 18 and 29 years old) were placed on a realistic purchase scenario. The participants were potential customers from a well-known multichannel retailer selling a wide variety of products. Participants were instructed to imagine that they had to buy a gift from the multichannel retailer for a person who was important to them. Participants had an online interaction with the product information and a subsequent physical experience with it, in which a new alternative was offered. The manipulation of the external recommendation was introduced at this point. On the one hand, participants who received customer recommendation were told that the university shop was

testing a new mobile application which allowed the consumer to access additional information about the product through scanning a QR code. In this way, participants were directed to the “customer reviews” option of the application and read a positive review of the target product. On the other hand, the salesman recommendation against the target product was developed in the same terms as in Study 1.

The selection of the products was made on the basis of the results of a pretest ( $n = 41$ ). The goal was to select two product categories differing on their material properties (Klatzky and Lederman, 1992; Peck and Childers, 2003b) to obtain an adequate manipulation of the motivation to touch the product. In addition, the pretest aimed at choosing two products, within each category, with similar levels of likeability to control for possible noise in the data. The results of the analyses showed a clear difference in favor of strap bags over usb memory sticks in the importance of touch and material properties for the evaluation and purchase. In addition, each pair of strap bags and usb memory sticks were equally rated in terms of likeability and similarity.

Measures of search-process satisfaction ( $\alpha = .88$  in T1;  $\alpha = .87$  in T2) and purchase intentions were collected in the first and second moments of the sequence, as well as for the rival product. Study 2 also included the actual choice of the participants and the measure of choice confidence ( $\alpha = .91$ ). For participants who received any of the recommendations, several measures about the recommendation’s source were gathered in order to ascertain what the effects may be due to. Specifically, participants rated on 7-point Likert scales the perceptions about the trustworthiness (5 items adapted from Ohanian, 1990;  $\alpha = .93$ ), familiarity with the product type (4 items adapted from Gefen, 2000;  $\alpha = .89$ ), and the expertise (4 items adapted from Ohanian, 1990;  $\alpha = .88$ ) of the person who did the recommendation.

Given the significant correlations between the variables (all  $r_s > .43$ ,  $p_s < .001$ ), a MANOVA was conducted with the three dependent measures and the type of recommendation as the independent factor. The analysis revealed a significant multivariate effect (Wilks’s  $\lambda = 0.622$ ,  $F(3, 87) = 17.647$ ,  $p < .001$ ). There were significant effects of the type of recommendation on perceived product familiarity ( $F(1, 90) = 12.070$ ,  $p < .01$ ). The customer recommendation was perceived as more familiar with the product type ( $M = 5.95$ ,  $SD = .81$ ) than the salesman recommendation ( $M = 5.29$ ,  $SD = .97$ ). In addition, the salesman recommendation was perceived with higher levels of expertise ( $M = 5.26$ ,  $SD = 1.22$ ) than the customer recommendation ( $M = 4.53$ ,  $SD = 1.28$ ;  $F(1, 90) = 7.607$ ,  $p < .01$ ). However, participants did not perceive higher trustworthiness in the customer recommendation ( $M = 5.06$ ,  $SD = 1.11$ ) or in the salesman recommendation ( $M = 5.16$ ,  $SD = .95$ ;  $p = .64$ ). Thus, we could expect that the effects of the customer recommendation may be due to the high familiarity of the customer with the product, whereas the effects of the salesman recommendation may be attributed to higher levels of expertise.

The results of the repeated-measures ANOVA revealed that purchase intentions toward the target product in T2 ( $M = 4.36$ ,  $SD = 1.57$ ) were significantly higher than in T1 ( $M = 4.15$ ,  $SD = 1.38$ ;  $F(1, 139) = 3.945$ ,  $p < .05$ ), supporting H1a. The effect of the recommendation was significant ( $F(2, 139) = 9.378$ ,  $p < .001$ ). Post-hoc Bonferroni tests showed that, compared to the control condition, the increase in purchase intentions with customer recommendation was higher, but marginally significant (mean diff. =  $.74$ ,  $p = 0.07$ ). H5a is marginally supported. Contrary to H6a, purchase intentions decreased in the presence of salesman’s recommendation (mean diff. =  $-.73$ ,  $p = 0.06$ ). However, the within-subjects interaction term was significant ( $F(2, 139) = 2.998$ ,  $p = .05$ ), revealing different patterns for each product (Figure 1). The positive effect of the customer recommendation and the negative effect of the salesman recommendation were significant for the usb memory stick ( $F(2, 73) = 12.759$ ,  $p < .001$ ) but not for the strap bag ( $p = .41$ ). So, support for H7a and 8a is found. The effects of the customer and the salesman recommendations are stronger when the motivation to touch the product is low, rather than high.

The difference in purchase intentions between the target and the rival product ( $M = 4.60$ ,  $SD = 1.63$ ) was not significant ( $p = .23$ ). However, the repeated-measures ANOVA yield a significant

direct effect of the type of product ( $F(1, 139) = 6.450, p < .05$ ), meaning that the difference in purchase intentions was favorable to the target strap bag (mean diff. = .23,  $SD = 1.87$ ) and favorable to the rival usb memory stick (mean diff. = -.69,  $SD = 2.36$ ). Thus, H1b is supported only for the strap bag. In addition, the recommendation had a significant effect on the difference in purchase intentions ( $F(2, 139) = 11.481, p < .001$ ), which was qualified by a significant recommendation x product interaction ( $F(2, 139) = 4.085, p < .05$ ; see Figure 1). Again, the effects of the recommendation on the difference in purchase intentions was significant for the usb memory stick ( $F(2, 73) = 13.249, p < .001$ ), and non-significant for the strap bag ( $p = .25$ ). Thus, H5a is supported but the effect of the customer recommendation was statistically significant only when the motivation to touch the product is low (H7a is confirmed). Although H6a is rejected, given the negative impact of the salesman recommendation, H8a is further confirmed due to the stronger effect on the usb memory stick than on the strap bag.

FIGURE 1  
**Recommendation x Product Interactions on Purchase Intentions (Study 2)**

Regarding the participants' choice between products, the results of the loglinear analysis (Field, 2009) revealed a significant interaction between the type of product and choice ( $\chi^2(1) = 8.678, p < .01$ ). Choice of the target product was higher for the strap bag (59% vs. 41%), whereas the contrary occurred for the usb memory stick (35% vs. 65%). Thus, support for H2 is found only for the strap bag. Also, the recommendation x choice interaction was significant ( $\chi^2(1) = 12.419, p < .01$ ). Taking into account the different choices of participants depending on the product type, separate analyses were run for the strap bag and the usb memory stick to examine the effects of the recommendations. The Figure 2 shows the choice percentages of the target and rival products for each type of recommendation. In this way, the target strap bag was chosen over the rival. Although the salesman recommendation had a negative effect on the choice of the target, the effect of the recommendation was not significant ( $p = .18$ ). However, the effect of the recommendation on the choice of the usb memory stick was significant ( $\chi^2(2) = 13.844, p < .01$ ). The rival was chosen over the target product, and the salesman recommendation significantly affected this difference ( $\chi^2(1) = 4.861, p < .05$ ). On the contrary, when the participants read the customer review, choices overturned ( $\chi^2(1) = 8.983, p < .01$ ; see Figure 2). Overall, support for H5b is found especially for the usb memory stick, which supports H7b. H6b is rejected, although the effect of the salesman recommendation was stronger for the usb memory stick than for the strap bag, thus supporting H8b.

FIGURE 2  
**Choice of Target and Rival Products (Study 2)**

The analyses of the outcomes of the search experience and decision revealed that search process satisfaction in T2 ( $M = 5.47, SD = 1.01$ ) was significantly higher than in T1 ( $M = 4.93, SD =$

1.08;  $F(1, 139) = 70.885, p < .001$ ). H3 is supported. However, the type of the recommendation affected this increase ( $F(2, 139) = 3.253, p < .05$ ), and type of product moderated this effect ( $F(2, 139) = 5.200, p < .01$ ). The salesman recommendation had a negative impact on the increase in satisfaction for the strap bag, although this effect was not significant ( $p = .22$ ). The positive effect of the customer recommendation was not significant ( $p = 1.00$ ). On the other hand, compared to the control condition, both the customer recommendation (mean diff. =  $-.63, p < .05$ ) and the salesman recommendation (mean diff. =  $.59, p < .05$ ) had positive effects on the increase of search-process satisfaction of the usb memory stick. Hypotheses 7c and 8c are supported. The effect of the customer recommendation was more evidenced when the motivation to touch the product was low rather than high, and the salesman recommendation had different influences depending on the type of product.

Finally, supporting H4, confidence in the choice of the target product ( $M = 6.27, SD = .56$ ) was significantly higher than in the rival product ( $M = 5.92, SD = .86; t(131.679) = 2.784, p = .05$ ). Taking into account that both products followed different patterns in the previous analyses (the target was apparently preferred over the rival strap bag, whereas the opposite occurred for the usb memory stick), separate analyses were conducted for each product. Figure 3 displays the means of choice confidence for the target and rival products, comparing the type of recommendation for each product. In this way, choice confidence was significantly higher for the target strap bag ( $M = 6.21, SD = .57$ ) than for the rival ( $M = 5.55, SD = .89; F(1, 70) = 17.509, p < .001$ ). Furthermore, the type of recommendation had a significant effect on the choice of the target strap bag ( $F(2, 41) = 6.190, p < .05$ ). Significant differences were found in the customer vs. no recommendation comparison ( $p < .01$ ), whereas the difference between the salesman recommendation and the control condition was not significant ( $p = .11$ ). On the other hand, the interaction effect of the type of recommendation and the choice of the usb memory stick was significant ( $F(2, 73) = 7.035, p < .01$ ). In this way, choice confidence in the target product was significantly higher with the customer recommendation than with no recommendation ( $p < .05$ ; see Figure 3). The effect of the salesman recommendation on the choice of the target usb memory stick was not significant ( $p = .94$ ). However, we found a significant effect of the recommendation on the choice confidence in the rival usb memory stick ( $F(2, 47) = 12.742, p < .001$ ). The salesman recommendation had a significant effect on choice confidence in this case, compared to the no-recommendation condition ( $p < .001$ ), whereas the customer recommendation had no effects ( $p = 1.00$ ). In sum, H5d may be generally supported, although the positive effect of the customer recommendation was stronger for the usb memory stick than for the strap bag (support to H7d). In this case, H8d must be rejected given that no different patterns were observed for each type of product.

These results showed that participants did not trust more in a recommendation made by an anonymous customer in a mobile application than in a recommendation made by the salesman at the store, regardless of the direction of the recommendation (in favor or against the target product). This result may be due to the fact that the customer recommendation was embedded into the retailer's own application. Thus, participants may have had suspicion about the authenticity of the customer recommendation. Nevertheless, participants perceived that the customer who made the review was more familiarized with the product, whereas they perceived higher expertise for the salesman.

Regarding the effects of the online-offline search sequence, the analyses generally supported the positive effect on the participants' MSED. After a physical interaction with the product previously considered online, an increase in purchase intentions and search-process satisfaction was observed. However, significant differences depending on the existence of external recommendations and on the type of product were identified. The customer recommendation had a positive influence on purchase intentions toward the target product, whereas the effect of the salesman recommendation was negative, but only for the usb memory stick. Confirming the results of the previous study, the effects of external opinions were stronger when the motivation to touch was low and thus the information derived from the direct experience was not especially valuable for participants. The difference in purchase intentions in favor of the target product

over the rival was supported only for the strap bag, whereas the opposite occurred for the usb memory stick. The same happened with regard to participants' choice. These results may be due to the manipulation of the type of product in the study. Products such as usb memory sticks may be low-involving for consumers due to its low cost. Thus, the attachment to the initially considered alternative may have been not so strong, making the preferences toward the target product less stable. In addition, the results of the pretest showed that both usb memory sticks were liked the same and were perceived as similar. However, the sample of the main study could have perceived a clear superiority for the rival product, thus contaminating the analyses. Nevertheless, external recommendations had stronger influences (positive for the customer, negative for the salesman) on this type of product than on the product whose motivation to touch was high. Furthermore, for the strap bag, the purchase intentions and choice of the target product were higher than for the rival.

FIGURE 3  
Choice Confidence of Target and Rival Products (Study 2)

The results supported the positive effect of the customer recommendation on the increase in satisfaction. It appears that consumers value the fact of accessing and receiving other customers' opinions at the physical store. Again, the motivation to touch the product moderated this effect, given that the customer recommendation had a significant impact only for the usb memory stick. In the same vein, the salesman recommendation had different effects on search-process satisfaction depending on the type of product. When the motivation to touch was low, participants perceived positively the fact of receiving the salesman recommendation. When touching the product did not provide with valuable information for the participant (just to see physically what was previously evaluated in the online environment), the presence of other informative cues, such as an expert recommendation, improved the satisfaction with the search experience. On the contrary, when touching the product offered new and diagnostic information, the effect of external recommendations is less relevant. In this way, although we found a directional "reactance-style" response to the salesman recommendation on the satisfaction with search experience of the strap bag (Fitzsimons and Lehmann, 2004), an "ignorance-style" response appears to fit better the data.

Finally, confidence in the choice of a product initially considered in the online environment was higher than confidence in the choice of a new product found at the physical store. Importantly, the customer recommendation had a positive influence on this outcome of the MSED. Customer recommendations may help consumers to make purchase decisions with a high degree of confidence. Regarding the effects of the salesman recommendation, the findings showed no effects on the choice confidence strap bag, which was higher for the target than for the rival product. For the usb memory stick, the salesman recommendation decreased the choice confidence in the target product and increased choice confidence in the rival product. These results may be consistent with our previous explanation regarding the superiority of the rival over the target product, and with the higher value that participants could have attached to the salesman recommendation when the motivation to touch the product was low. In this case, the salesman recommendation could be perceived as coherent with the participants' preferences, producing a significant increase in their choice confidence.

## 5. Summary and Implications

The Multichannel Search Experience and Decision developed in this research offers an adequate framework for studying this behavior. Overall, consumers who search for information online

and then go to the physical store to confirm the information and make decisions with a high degree of confidence, improve their purchase intentions and satisfaction with the experience along this path. In addition, they are more likely to choose the initially considered alternative instead of a new one, and are more confident in their decision when they chose this product. Thus, multichannel search experiences can be highly satisfactory for consumers.

Our findings show that consumers are still sensitive to external recommendations which may influence their MSED to a great extent. Companies must bear in mind the effects of the online reviews made by their customers on potentially new ones. In addition, both multichannel and traditional retailers could benefit from innovations in mobile technologies to incorporate applications which offer in situ recommendations from other customers of the store, which may influence the consumer's decision and experience to a great extent. In the same vein, although consumers may take the advantage of the ubiquitous access to other customers' recommendations, the presence of recommendations made by the sales force may have a strong influence on their behavior. All the effort that consumers exert to convince themselves about the suitability of a product to satisfy their needs could be worthless in the physical store, where the presence of multiple external attempts to persuade them could influence their behavior.

The motivation to touch the product has been proposed as a key moderator of the MSED and of the influence of external recommendations. External recommendations can have a special influence when the motivation to touch the product is low. When the motivation to touch is high, consumers rely on the information they obtain through the tactile input, thus reducing the effect of external recommendations or even ignoring them. Overall, retailers should allow consumers to access other customers' recommendations, especially when the motivation to touch the product is not high, given that touching the product may not provide with valuable information beyond confirming physically what has been seen online. In situations in which the motivation to touch is high (e.g. apparel stores) it seems less plausible that consumers rely on recommendations made by anonymous customers, given that they are obtaining highly diagnostic information by themselves. In the same way, salesman's recommendations may be positively perceived when the motivation to touch is low. When the motivation is high, it would be advisable for the sales force to let the consumer to freely handle and touch the merchandise, offering their assistance only when solicited. Otherwise, recommendations may be unwelcome or ignored.

## ABSTRACT

*The relationships between privacy, security and online trust have been the focus of numerous studies in previous research in online settings. Results from this literature, however, still present some confusion and inconsistent findings. In this study, we propose several reasons for these confusion and inconsistent findings, explaining how consumers' characteristics (gender, age, education and extraversion) can moderate the influence of both privacy and security in online trust. In doing so, this research expands previous literature by identifying the conditions under which perceived privacy and security are likely to have the greatest positive effects on consumer trust in the online retailer. Our results revealed that the influence of both privacy and security on online trust was stronger for male, younger, more educated and less extraverted consumers. Implications for theory and management are discussed.*

## Keywords:

Online trust, perceived privacy, perceived security, moderating effects, extraversion, demographics

## 1. Introducción

Since the birth of the Internet, privacy and security have been recognized as critical elements that online businesses have needed to address in order to build consumer online trust, and they are the most often cited antecedents of online trust (Bart et al. 2005; Urban et al. 2009). In spite of the general agreement among both practitioners and researchers that privacy and security are key determinants of online trust (Belanger et al. 2002; Gefen et al. 2003; Schoder and Haenlein, 2004; Kim et al. 2008) the academic literature still presents some confusion and inconsistent findings about the conceptualization of privacy and security and their effects on online trust. Among the empirical studies, a major problem includes the extent to which privacy and security issues are conceptualized as distinct variables, and the lack of understanding of how they are related to each other. To begin with this, although privacy and security represent two clearly distinct constructs (Miyazaki and Fernandez 2000; 2001; Belanger et al. 2002; Román 2007; Román and Cuestas 2008), many researchers tend to collapse them into one concept or dimension (Cheskin and SA 1999; Culnan 1999; Lee and Turban 2001; Wolfenbarger and Gilly 2002; Zeithaml et al. 2002; Corbitt et al. 2003; Flavián and Guinalíu 2006; Schlosser et al. 2006; Jin and Park 2008; San Martín and Camarero 2008; Chen and Dibb 2010). Yet, some important distinctions can and should be drawn between security and privacy, as we will explain further in this paper. According to this, some of the studies that have considered privacy and security as the same construct, do not take into account all aspects covering privacy and security issues, and hence their conceptualization and measurement is limited (Belanger et al. 2002; Davison et al. 2003).

In addition, research still presents a pattern of inconsistent findings with regard to the effects of privacy and security on online consumer trust. In some studies, researchers have found that both security and privacy have a significant and positive impact on online trust, usually being the effect of security stronger than the effect of privacy (e.g. Kim 2005; Kim et al. 2008; Dolatabadi and Ebrahimi 2010; Hu et al. 2010; Ganguly et al. 2011). Other studies, however, do not find a significant impact of security (Lee and Turban 2001; Belanger et al. 2002; Bart et al. 2005) or privacy (Cheung and Lee 2006; Gurung et al. 2007; Roca et al. 2009) in online trust. Accordingly, the first objective of this research is to analyze how perceived privacy and security, considered as distinct variables, influence consumers' trust in the online retailer.

Furthermore, beyond the problems related to the conceptualization of privacy and security argued earlier, another potential explanation for the inconsistent findings may be that most of the prior literature implicitly assumes that the impact of privacy and security on online trust are identical across customers. Yet, scholars have long argued that this assumption might be too simplistic, and recent evidence suggests that relationships among online trust and its antecedents may vary depending on the characteristics of consumers (e.g. Leonard and Riemenschneider 2008; San Martín and Camarero 2008; Hwang 2009; Chen and Dibb 2010; Ganguly et al. 2011; Liao et al. 2011; San Martín and Jiménez 2011). Accordingly, this research adds to the existing literature by analyzing the moderating role of consumer's level of extraversion and demographics (i.e., age, education and gender) in the influence of perceived privacy and security on trust. Consumer's extraversion includes characteristics such as talkativeness, sociability, and a high confidence in one's ability to social relations with others (Costa and McCrae 1992; Benet-Martínez and John, 1998). Importantly, consumer's extraversion along with the demographic variables have been found to play a key role when it comes to explain consumers' online attitudes and purchasing behavior (Kini and Chobineh, 1998; Tan and Sutherland, 2004; Junglas and Spitzmüller, 2006; Barnes et al., 2007; Chen and Lee, 2008; Román, 2010; Bae and Lee, 2011; San Martín and Jiménez, 2011; Ulbrich et al., 2011), yet their moderating influence in the privacy-security-trust link has been rarely studied and results are inconsistent, as shown in the Appendix.

In what follows, we present the theoretical framework in which our core variables (perceived privacy, security and trust) are defined. Hypotheses are then presented and tested. Finally, implications of the study are discussed.

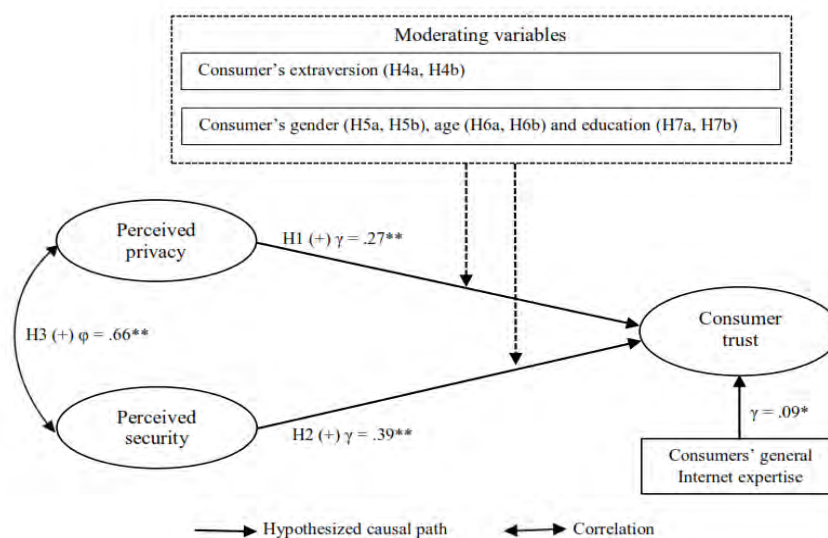

## 2. Research model and hypotheses development

Figure 1 represents our conceptual model. Following several scholars (e.g. Miyazaki and Fernandez 2000; 2001; Belanger et al. 2002; Román 2007; Román and Cuestas 2008), we see security and privacy as two different, yet related constructs. In particular, privacy issues refer to the uncertainty associated with providing personal information on a website and the risk of such information being exposed (Bart et al. 2005). Privacy issues on the Internet include “spam”, usage tracking and data collection, choice, and the sharing of information with third parties (Belanger et al. 2002). For instance, the practice of collecting consumer information for one purpose and then using that information to make unsolicited contacts represents a privacy issue (Román and Cuestas 2008). Another privacy concern is the degree to which consumer information is shared (i.e., rented or sold) to third parties that have marketing-related interests in such data (Miyazaki and Fernandez 2000). Accordingly, in this study perceived privacy refers to consumers’ perceptions about the protection of individually identifiable information on the Internet (Román 2007). Security, on the other hand, refers to the uncertainty of incurring monetary losses while interacting on a website (Román and Cuestas 2008). This may happen, for example, as a result of online credit card fraud (Miyazaki and Fernandez 2000). Perceived security, then, refers to consumers’ perceptions about the security of the online transaction (i.e., the safety of the payment methods) along with the protection of financial information from unauthorized access (Román 2007).

Consumer trust in the online retailer is conceptualized in this study as the consumer’s subjective belief that the selling party (online retailer) will fulfill its transactional obligations as the consumer understands them (Anderson and Srinivasan 2003; Kim et al. 2008). Perceived privacy and security are proposed as the two main antecedents of consumer trust (Hypothesis 1 and 2). We will also propose a positive relation between these two antecedents in Hypothesis 3. Furthermore, the direct effect of these two variables on online trust is proposed to be moderated by consumer’s level of extraversion (H4a-b) and demographics (H5a-b; H6a-b; H7a-b). Finally, Figure 1 also includes the effect of consumers’ general Internet expertise (in the box) on online trust as control variable. The rationale for each hypothesis follows.

FIGURA 1

### ***2.1. Privacy and security as antecedents of consumer trust in the online retailer***

Perceived privacy protection on the website helps to reduce consumers' perceptions of the risk that stems from online disclosure of personal information (Metzger, 2006), and thus encourage online transaction by increasing the perceived trustworthiness of the website (Kim et al. 2008). Numerous previous studies have already shown that perceived privacy positively influences consumer trust in online transactions (e.g. Friedman et al. 2000; Chellappa and Sin 2005; Bart et al. 2005; Román 2007; Van Dyke et al. 2007; Ganguly et al. 2011). Accordingly, we propose the following:

H1: Perceived privacy positively influences consumer trust in the online retailer.

Consumer perceptions of these security enforcement principles positively contribute to their trust perceptions regarding online transactions (Chellappa and Pavlou 2002). There is a significant body of research that has tested the positive influence of perceived security on consumer trust in online retailers (e.g. Belanger et al. 2002; Kim et al. 2004; Schoder and Haenlein 2004; Kim 2005; Cheung and Lee 2006; Mukherjee and Nath 2007; Román 2007; Kim et al. 2008; Roca et al. 2009; Hu et al. 2010; Kim et al. 2010). Accordingly, we propose that:

H2: Perceived security positively influences consumer trust in the online retailer.

### ***2.2. The relationship between privacy and security***

Although privacy and security are accepted to be two clearly distinct constructs (Miyazaki and Fernandez 2000; 2001; Belanger et al. 2002; Román 2007; Román and Cuestas 2008), there is strong evidence that they interactively influence each other (Belanger et al. 2002; Schlosser et al. 2006; Hu et al. 2010). For example, high concern for personal privacy would directly produce negative attitudes toward web security, and consumers who lack knowledge about online security and the third party security identification would worry about disclosing personal information during the process of online shopping. Accordingly, we propose that:

H3: Perceived privacy is positively correlated to perceived security.

### ***2.3. The moderating role of consumer characteristics***

Extraversion is a personality trait that relates to an individual's approach to dealing with their environment (Korzaan and Boswell 2008). Individuals high in extraversion are usually characterized as sociable, assertive and talkative, whereas individuals low in extraversion are more introverted, reserved and quiet (Costa and McCrae 1992). People high in extraversion are also excitement-seeking and have a higher need for stimulation and communication (McCrae and Costa 2003). In the online context, these characteristics of extravert consumers are reflected in a greater interest in the social or experiential aspects of online shopping (Cheung and Lee 2008; Huang and Yang 2010), such as the desire to be entertained, to socialize in the website and to enjoy with the shopping experience (Wolfenbarger and Gilly 2001; Huang and Yang 2010). Findings from Ganguly et al. (2011) reveal that this higher disposition toward hedonic or excitement value-seeking behavior (e.g., fun, playfulness) associated with extravert people positively moderates the influence of some interactivity website-related factors (e.g., communication exchange, social presence) on consumer trust in the website.

We believe that this personality trait will also moderate the influence of perceived privacy and security on trust in the online retailer. First, extant research has shown that the level of consumer extraversion is related to individual privacy concerns, risk and trust beliefs on the Internet (Tan and Sutherland 2004; Wang and Yang 2005; Junglas and Spitzmüller 2006; Barnes et al. 2007; Brunet and Schmidt 2007; Chen 2011). For example, some studies have found that, since extraverted individuals are more likely to make efforts to be actively involved and interested in opportunities to socialize and communicate with others (McCrae and Costa 2003; Chen 2011), they are less likely to voice strong online privacy concerns (Junglas and Spitzmüller 2006), and therefore they are also more willing to disclose personal information in the online environment, as compared to individuals who are less extraverted (Brunet and Schmidt 2007). Accordingly, consumers high in extraversion can be expected to be less concerned about disclosing personal information online, and hence privacy perceptions will not be as important to them as they could be for individuals low in extraversion. Other studies have

confirmed that the higher disposition toward excitement-seeking of extravert individuals is positively related to a more risk-taking propensity and a high disposition to trust online retailers (Tan and Sutherland 2004; Wang and Yang 2005; Chen 2011). Given that prior literature suggests that highly extraverted individuals tend to perceive fewer risks in online shopping than those less extraverted, we expect following:

H4a: The positive influence of perceived privacy on consumer trust in the online retailer will be stronger for less extraverted consumers than for more extraverted consumers.

H4b: The positive influence of perceived security on consumer trust in the online retailer will be stronger for less extraverted consumers than for more extraverted consumers.

A number of studies indicate that women tend to be more concerned about online privacy and security issues than men (Milberg et al. 1995; Sheehan 1999; Gauzente et al. 2004; San Martín and Jiménez 2011). At first sight, these findings seem to suggest that women might give more emphasis to privacy and security perceptions than men. However, the literature has also produced some contradictory findings. For example, several studies have not found significant differences between men and women on perceived privacy protection (Kolsaker and Payne 2002; Bart et al. 2005; Ulbrich et al. 2011) and perceptions about transaction security (Lightner 2003; Cyr and Bonanni 2005). Furthermore, prior research reveals that some women-related online behaviors are contradictory with their alleged high privacy concerns. For instance, results from Stern (2004) suggest that females are more likely to disclose personal information on the Internet. In line with this, scholars have argued that the relationship between consumers' privacy and security concerns and actual behavior neither is straightforward nor has any link been established incontrovertibly (Li and Sarathy 2006; Joinson et al. 2010). Accordingly, although several studies have shown that women may voice strong privacy or security concerns than men, we believe that these concern-based differences are insufficient or even inadequate to sustain the moderating effect of gender in our research model.

A plausible explanation for this privacy or security paradox found among women is that users' privacy and security concerns can be affected by other factors, such as consumers' shopping preferences or orientations (Kim and Benbasat 2003; Smith et al. 2011). In particular, researchers have found that some expected benefits, such as the desire of personalized service or social benefits, can override consumer's privacy concerns (Chellappa and Sin 2005). For example, prior evidence indicates that, unlike men, women tend to view online shopping as a social activity (Smith and Whitlark 2001; Van Slyke et al. 2002). Researchers have also showed that women give more importance than men to emotional appeals (such as community building activities in the online store) (Venkatesh and Agarwal 2006) or interactivity features (social presence and communication with the website) (Ganguly et al. 2011) to generate online trust. These findings suggest that, in spite of their claimed privacy or security concerns, when shopping online, women seem to focus more on these social or communicative aspects of shopping than in privacy or security related aspects. Accordingly, the proposed positive influence of both privacy and security perceptions on online trust is expected to be attenuated for female consumers.

On the other hand, men are more goal-directed and more motivated by functional factors (e.g., economy, efficiency, usefulness) than women in their online shopping attitudes and behaviors (Swaminathan et al. 1999; Dittmar et al. 2004; Doong and Wang 2011). Privacy and security issues on the website undoubtedly represent functional or utilitarian aspects of the online shopping process (Chen and Lee 2008), and previous research suggest that such functional website features receive more attention and are perceived as more valuable among functional-oriented consumers than among experiential-oriented ones (Dittmar et al. 2004; Chen and Lee 2008). Moreover, researchers have also argued that, while privacy and security concerns tend to be lessened as the consumer's experience and familiarity with online shopping increases (Miyazaki and Fernandez 2001; Corbitt et al. 2003), such greater familiarity also improves consumer knowledge and understanding of these privacy and security issues (Dutton and Shepherd 2003), which in turn, strengthen the role of perceived privacy and security website features on consumer's trust (Chen and Dibb 2010). Given the more functional shopping orientation and also the greater familiarity of men compared to women with online shopping related activities (Bae and Lee 2011), we expect the following:

H5a: The positive influence of perceived privacy on consumer trust in the online retailer will be stronger for male than for female consumers.

H5b: The positive influence of perceived security on consumer trust in the online retailer will be stronger male than for female consumers.

Several studies maintain that privacy and security concerns tend to be stronger as consumer's age increases (Gattiker and Kelly 1995; Gauzente et al. 2004; Reisenwitz et al. 2007; Wong et al. 2009). However, similarly to women-related findings, prior research has yielded some contradictory findings that suggest perceived privacy and security to be more important for younger than for older consumers (Dommeyer and Gross 2003; Lightner 2003). For example, Lightner (2003) found that, as age of consumers increased, their preference for security features against other website characteristics (such as navigation and buying speed) diminished. This evidence suggests a greater degree of awareness amongst younger users of the potential problems on the Internet. The older generation is also concerned about security and protection, but may be less aware of the operational issues (Dommeyer and Gross 2003). Accordingly, we propose that:

H6a: The positive influence of perceived privacy on consumer trust in the online retailer will be stronger for younger than for older consumers.

H6b: The positive influence of perceived security on consumer trust in the online retailer will be stronger younger than for older consumers.

To a lesser extent, previous research has analyzed the effect of consumers' level of education on their online privacy and security concerns (Dutton and Shepherd 2003; Lightner 2003; Bart et al. 2005; Yang et al. 2009). Again, this stream of research has also produced some inconsistent results. For instance, whereas findings from Lightner (2003) and Bart et al. (2005) suggest that the importance of perceived privacy and security tend to be weaker for more educated than for less educated consumers, results from Dutton and Shepherd (2003) and Yang et al. (2009) indicate the opposite. In line with these latter studies, we believe that a higher level of education can improve consumers' knowledge and understanding of privacy and security issues on the Internet. Furthermore, prior evidence indicates that more educated consumers place a higher value on perceived website ethical performance than less educated consumers (Yang et al., 2009; Román, 2010). Accordingly, we expect that:

H7a: The positive influence of perceived privacy on consumer trust in the online retailer will be stronger for more educated than for less educated consumers.

H7b: The positive influence of perceived security on consumer trust in the online retailer will be stronger more educated than for less educated consumers.

#### ***2.4. Control variable: Consumers' general Internet expertise***

Consumer's general Internet expertise refers to consumer's knowledge of, and experience with, the Internet (Montoya-Weiss et al. 2003). Several studies report that this general expertise positively contributes to consumer online trust (Miyazaki and Fernandez, 2001; Corbitt et al., 2003; Bart et al., 2005). Accordingly, including this construct as an additional predictor of consumers' trust in online shopping allows us to determine whether the hypothesized antecedents have a significant impact on online trust after accounting for the variance explained by consumer's Internet expertise.

### **3. Research method**

#### ***3.1. Data collection and sample***

A survey instrument was administered to a sample of 398 consumers. A marketing research firm was hired to assist with the data collection. Trained interviewers randomly approached respondents among individuals who passed the data collection point located on the pedestrian walkway in three major metropolitan cities. A similar procedure can be seen in previous research (e.g. Frambach et al. 2007). Screening questions were administered before the respondent was invited for an interview. An invitation only followed if the respondent proved to be eligible for the study (that is, he/she should have purchased a product online in the last 6 months). The latter condition was required in order to facilitate consumers' evaluations of the online retailer's website. Then, subjects were taken to the

company office (conveniently located in the metropolitan area) were they asked to complete the questionnaire.

The respondents were representative of online consumers across numerous e-retailers, having purchased a variety of items (e.g., travel, books, CDs, and computers). They were balanced in terms of gender (51% of them were male), relatively young (65% of them were between 20 and 35 years old), generally highly educated (68.2 of them had completed their university studies) and experienced with the Internet. Prior research has found that these characteristics are common among Internet shoppers (Girard et al. 2003; Swinyard and Smith 2003).

### **3.2. Measures**

Existing multi-item scales, adapted to suit the context of the study, were used for the measurement of the constructs (all items of the questionnaire are reported in Table 1). Three items from Anderson and Srinivasan (2003) were used to measure consumer trust in the online retailer. Both perceived privacy and security were measured with five items, respectively, developed by Román (2007). Consumer's extraversion was measured with three items from the BigFive scale (Benet-Martinez and John 1998). Shortened versions of such scale have been successfully used in other studies (Gosling et al. 2003; Chen and Lee 2008). Consumers' general Internet expertise was approached using two items adapted from Montoya-Weiss et al. (2003) and Belch et al. (2005). Consumers were asked to characterize their level of expertise with the Internet (ranging from "1 = no expertise" to "5 = high expertise"), and their knowledge about Internet in general (ranging from "1 = very poor" to "5 = excellent").

### **3.3. Confirmatory factor analyses: reliability, convergent, and discriminant validity**

A confirmatory factor analysis (CFA) by means of LISREL 8.80 was conducted to assess measurement reliability, convergent, and discriminant validity. The measurement model had a good fit ( $\chi^2(165) = 491.08$ ;  $p < 0.01$ ; GFI = 0.89; CFI = 0.96; RMSEA = 0.07; RMSR = 0.04; TLI (NNFI) = 0.94). Reliability of the measures was confirmed with composite reliability index higher than the recommended level of 0.60 (Bagozzi and Yi 1988) and average variance extracted was higher than the recommended level of 0.50 (Hair et al. 1998) as shown in Table 2. Following the procedures suggested by Fornell and Larcker (1981) and Bagozzi and Yi (1988), convergent validity was assessed by verifying the significance of the t values associated with the parameter estimates (Table 1). All t values were positive and significant ( $p < 0.01$ ).

Discriminant validity was tested by comparing the average variance extracted by each construct to the shared variance between the construct and all other variables. For each comparison, the explained variance exceeded all combinations of shared variance (see Table 2). The analysis also revealed that Internet expertise was significantly and positively correlated with consumer's education level ( $\sigma = 0.12$ ,  $p < 0.05$ ), and significantly and negatively correlated with gender ( $\sigma = -0.20$ ,  $p < 0.01$ ) and age ( $\sigma = -0.15$ ,  $p < 0.05$ ), which indicates that such Internet expertise is increased among male, younger and more educated consumers.

## **4. Results**

### **4.1. Direct effects**

The hypothesized relationships were estimated via LISREL 8.80. The results indicated a good fit between the model and the observed data ( $\chi^2(84) = 336.66$ ,  $p < 0.01$ ; GFI = 0.90; CFI = 0.97; RMSEA = 0.08; RMSR = 0.04; TLI (NNFI) = 0.96). The model explained 41% of the variance in consumer trust. Results of hypothesized relationships are reported in Figure 1.

After accounting for the variance explained by consumer's Internet expertise ( $\gamma = 0.09$ , t-value = 2.14), the analyses provided strong support for the direct positive influence of both perceived privacy ( $\gamma = 0.27$ , t-value = 4.34) and security ( $\gamma = 0.39$ , t-value = 6.40) on consumer trust. Thus, Hypotheses 1 and 2 were confirmed. In line with Hypothesis 3, perceived privacy and security were also found to be highly and positive correlated ( $\phi = 0.66$ ; t-value = 19.67).

TABLE 1  
**Construct measurement summary: Confirmatory factor analysis of multi-item measures**

Item description <sup>a</sup>	SD loading (t-value)
Consumer trust in the online retailer	
I can trust the performance of this website to be good	0.95 (25.25)
This site is reliable for online shopping	0.95 (25.26)
This site is trustworthy	0.92 (23.72)
Perceived privacy	
The site clearly explains how user information is used	0.81 (18.91)
It is easy to have access the privacy policy	0.78 (18.07)
The site shows that it complies with the rules and regulations governing online data protection	0.87 (21.13)
Only the personal information necessary for the transaction to be completed needs to be provided	0.77 (17.63)
Information regarding the privacy policy is clearly presented	0.80 (18.54)
Perceived security	
The site displays the terms and conditions of the online transaction before the purchase has taken place	0.73 (16.42)
The site appears to offer secure payment methods	0.91 (22.94)
The security policy is easy to understand	0.84 (20.48)
You can confirm the details of the transaction before paying	0.81 (19.21)
This site has adequate security features	0.84 (20.37)
Extraversion	
I am outgoing, sociable	0.86 (19.60)
I have an assertive personality	0.77 (17.19)
I feel comfortable around people	0.82 (18.63)
Consumer's general Internet expertise	
How would you characterize your level of expertise with the Internet?	0.99 (28.14)
How would you characterize your knowledge about Internet in general?	0.88 (22.44)
$\chi^2(165) = 491.08; p < 0.01; GFI = 0.89; CFI = 0.96; RMSEA = 0.07; RMSR = 0.04; TLI (NNFI) = 0.94$	

<sup>a</sup>All the remaining scales consisted of 5-point Likert questions, ranging from "1 = strongly disagree" to "5 = strongly agree."

#### 4.2. Moderating effects

Hypotheses 4a–b, 5a–b, 6a–b, and 7a–b examined the effects of the moderating variables. We tested moderating effects through multigroup LISREL analysis. The samples were splitted into subsamples according to whether consumers scored high or low on the moderating variables (as far as gender is concerned, males versus females was compared) to ensure within-group homogeneity and between-group heterogeneity (Stone and Hollenbeck 1989).

The results of the multi-group LISREL analyses are shown in Table 3. As anticipated, the positive influence of both perceived privacy and security on consumer's trust in the online retailer was stronger among: less extraverted ( $\gamma_{\text{privacy}} = 0.39, p < 0.01; \gamma_{\text{security}} = 0.49, p < 0.01$ ) versus more extraverted individuals ( $\gamma_{\text{privacy}} = 0.14, p < 0.1; \gamma_{\text{security}} = 0.22, p < 0.05$ ), males ( $\gamma_{\text{privacy}} = 0.35, p < 0.01; \gamma_{\text{security}} = 0.49, p < 0.01$ ) versus females ( $\gamma_{\text{privacy}} = 0.17, p < 0.05; \gamma_{\text{security}} = 0.25, p < 0.01$ ), more educated ( $\gamma_{\text{privacy}} = 0.43, p < 0.01; \gamma_{\text{security}} = 0.51, p < 0.01$ ) versus less educated consumers ( $\gamma_{\text{privacy}} = 0.19, p < 0.05; \gamma_{\text{security}} = 0.18, p < 0.05$ ), and younger ( $\gamma_{\text{privacy}} = 0.45, p < 0.01; \gamma_{\text{security}} = 0.50, p < 0.01$ ) versus older individuals ( $\gamma_{\text{privacy}} = 0.21, p < 0.05; \gamma_{\text{security}} = 0.28, p < 0.01$ ). In all these cases, as reported in Table 3, the decrease in chi-square when moving from the

restricted (equal) model to the more general model was significant, providing support for Hypothesis 4a–b, 5a–b, 6a–b, and 7a–b, respectively.

TABLE 2  
Mean, SD, scale reliability, AVE, and correlations

	Mean	SD	SCR	AVE	1	2	3	4	5	6	7	8
1. Consumer trust	3.98	0.83	0.96	0.88		0.30	0.35	0.08	0.07

## 5. Conclusions

The main objective of this study was to expand understanding of the effect of perceived privacy and security on trust in online retailers, and how consumer's level of extraversion and demographic variables moderate the effect of these factors on trust. Our findings revealed that both perceived privacy and security are positively related to consumer trust in the online retailer after accounting for

the variance explained by consumer's Internet expertise. Moreover, privacy and security were highly and positively correlated, which means that positive perceptions of one of them lead to positive perceptions of the other. Overall, these results highlight the importance of considering security and privacy as two distinct, yet related concepts which have their own contribution to trust.

The study of the moderating effects represents an initial effort in the process of identifying the conditions under which the influence of perceived privacy and security in consumer trust is stronger. Importantly, researchers have long argued that "hypothesizing direct effects may be somewhat redundant and obvious" (Dabholkar and Bagozzi 2002, p.185), and it is much more meaningful to investigate the moderating effects of consumer personal traits and demographics (e.g. Dabholkar 1996; Dabholkar and Bagozzi 2002; San Martín and Jiménez 2011). Our results revealed that the positive influence of both perceived privacy and security on consumer trust was stronger among individuals low in extraversion, males, younger and more educated consumers. These results contribute to prior literature in several ways.

The moderating role of personality traits in the relationships between online trust and its antecedents has received little attention in prior literature (Dabholkar and Bagozzi 2002; Chen and Lee 2008; Hwang 2009; Dolatabadi and Ebrahimi 2010; Ganguly et al. 2011). However, Dabholkar and Bagozzi (2002) argued that the variation in consumer differences arising from personality traits offers important contributions because such variation is at the heart of consumer attitude formation and behavioral intentions. Chen and Lee (2008) found that extraversion positively moderated the relationship between consumer beliefs about several peripheral route website contents (e.g., reputation, product quality) and consumer's online trust. Importantly, our findings extend Chen and Lee's (2008) study since we show that this personality trait also moderates the relationship of perceived privacy and security, which represent beliefs about central route website contents, on consumer trust.

Previous studies suggest that women are more concerned than men about privacy and security issues on the Internet (Milberg et al. 1995; Sheehan 1999; Gauzente et al. 2004; San Martín and Jiménez 2011). Interestingly, our results indicate that these higher concerns do not translate into a stronger influence of perceived privacy and security on trust, but rather the opposite takes place. This finding confirms previous contentions about the limited relationship that often exists between individuals' stated privacy and security concerns and their actual online behavior (Li and Sarathy 2006; Joinson et al. 2010). It also highlights the role that other consumer-related factors, such as their shopping preferences or orientations, may play in such context (Kim and Benbasat 2003; Smith et al. 2011). In particular, our results seem to suggest that the high preference of women for a personalized, engaging interaction with the Web site (Venkatesh and Agarwal 2006; Ganguly et al. 2011) may override their privacy or security concerns, and therefore such experiential or social value-seeking behavior can lead female consumers to rely more on the trusting beliefs that arise from the interactivity aspects of the website, than those which arise from the privacy or security policy features.

Finally, the influence of privacy and security on trust was stronger among younger and more educated consumers. This suggests that older consumers may be less aware than younger users of the potential problems on the Internet and the operational issues. It also implies that a higher level of education can improve consumers' knowledge and understanding of privacy and security issues on the Internet, and, hence, their potential positive role on the trusting perceptions of these consumers. Importantly, moderating effects of both age and education seem to indicate that the potential of websites' privacy and security policies to generate consumer trust may largely depend on the consumer-related abilities to fully understand such policies.

### ***5.1. Managerial implications***

There are a number of managerial implications derived from this study. Our results about the moderating role of consumer demographics provide online retailers a better understanding of how they can effectively communicate their trustworthiness to different consumers. In particular, for women, older and less educated consumers, who are usually concerned about privacy and security protection in online shopping, but also may be less aware of the operational issues or less motivated to understand them, we encourage online retailers to enhance or establish easy to access (and understand) privacy

and security policies. Importantly, the weaker influence of both privacy and security perceptions on trust by older and less educated consumers may be due to the lack of usability of privacy and security policies themselves, as most of them currently require greater than high school education or more than average online user's knowledge to be comprehended (Joinson et al. 2010). Therefore we encourage online retailers to expend more educational and promotional efforts to clearly explain their privacy and security policies and seals, as well as to adapt their language and information content so that statements can be easily recognizable and understood by all kind of consumers, regardless of their prior knowledge or experience. In addition, when targeting female customers, online retailers could provide more web-enabled communication along with their privacy and security policies to enhance trust by including features that facilitate the information exchange, such as virtual sales agents, online message boards or third party evaluations.

On the other hand, when targeting male, younger and more educated consumers, who are found in this study to be more experienced with the use of Internet in general than their counterparts (see Table 2), we suggest online retailers to provide more detailed or in-depth information about their privacy and security protection mechanisms. Moreover, given that younger and more educated consumers are more likely to be more aware of these issues (Dommeyer and Gross 2003; Yang et al. 2009), these segments may be willing to pay a premium for those websites that made readily available this kind of information (Joinson et al. 2010).

## **5.2. Limitations and future research**

This study represents an initial step into the analysis of the moderating effects of consumers' personality and demographic variables on the relationship between online trust and two of the most important antecedents, perceived privacy and security. Further research is needed to examine a more comprehensive set of online trust antecedents, such as the potential role that individuals' personal knowledge about privacy and security issues on the Internet would play in their trust beliefs. The role of other moderator variables, such as shopping orientations (e.g., goal-directed or utilitarian, social or experiential, etc.), could also be considered in further studies. For example, it would be interesting to analyze to what extent the different knowledge or shopping motivations of the various moderating groups (men versus women, younger versus older, high education versus low education) may be causing some of the differences found between these groups in our research.

## APPENDIX

### A summary of prior empirical studies examining privacy and/or security as antecedents of online trust which have included moderating effects

Authors	Moderators	Main findings
Kim et al. (2004)	Purchase experience with an Internet store	Structural assurance does not influence trust for potential and repeat customers. Reputation and information quality are the main antecedents of trust for potential customers, whereas that for repeat customers the main antecedents are the service quality and satisfaction.
Koufaris and Hampton-Sosa (2004)	Website categories	Perceived security control positively influences trust. Among the other antecedents, the effect of perceived security control on trust is stronger for websites of goods than for websites of services.
Bart et al. (2005)	Web site categories; Consumer demographics	The relative importance of privacy on online trust differs depending on: (1) the type of commercial Web site, being more important for travel websites, and (2) the level of education and income of consumers, being less important for highly educated, high-income consumers.
Kim (2005)	Individualism-Collectivism Cultural Dimension	For individualistic consumers privacy has a positive effect on trust, whereas this effect is not significant for collectivistic consumers. Security protection has a significant and positive effect on consumer's trust in e-vendor for both collectivistic and individualistic consumers
Schlosser et al. (2006)	Consumers' purpose for visiting the website; Perceived risk in online shopping.	Both the presence and strength of privacy/security statements positively influence trust: such beliefs are significantly higher for consumers who received a strong statement than for those who received weak or no statement.
Jin and Park (2006)	Online Purchase Experience	Online purchase experience does not significantly moderate the relationship between Security/Privacy and trust.
San Martin and Camarero (2008)	Attitudes toward online shopping	The motives and inhibitors the individuals perceive when buying online moderate the relationship between privacy/security policies and trust: whereas potential users are the group that more importance give to security and privacy policies as determinants for trust, for

		relational users such privacy and security policies are not significant determinants of trust.
Chen and Dobb (2010)	Familiarity with the site	Security and privacy assurances have a greater influence on trust when people are familiar with the site.
Dolatabadi and Ebrahimi (2010)	Propensity to trust	Respondents with high propensity to trust consider perceived risks and perceived reputation as the significant predictors of their trust in online shopping; while perceived risks, perceived security protection and perceived reputation were the factors considered by respondents with low propensity to trust.
Ganguly et al. (2011)	Enjoyment of online shopping; Trust Propensity; Age; Gender	Customers who are low on trust propensity give more stress on security of the website in order to generate trust with the travel portals. The relationship between privacy and trust is moderated by consumer gender, but age does not a significant moderate effect.
Liao et al. (2011)	Shopping experience	The effect of Internet literacy, social awareness and disposition to trust on privacy concern and trust was weaker for experienced shoppers.
San Martín and Jiménez (2011)	Gender	Privacy and security (measured as the same construct) positively influences online trust. Privacy and security concerns are more important for women than for men.

# WHAT'S UP IN SMARTPHONE SERVICES?: ANALYSIS OF SWITCHING COSTS, CUSTOMER SATISFACTION AND LOYALTY IN THE SPANISH MARKET

## ABSTRACT

**Introduction:** *With the rapid introduction of the smartphones in the marketplace, along with the increasing availability and demand of the Internet, the industry of mobile services is making great efforts in order to attract more customers and retain current ones.*

**Purpose:** *In this scenario, this study aims to analyze how the switching costs and perceived value influence customer satisfaction in the smartphone communication services. Additionally, the mediating role of customer loyalty is also examined.*

**Methodology:** *For this purpose, drawing on a sample of 370 customers, an analysis was developed through structural equation modeling.*

**Findings:** *Our findings suggest that customer satisfaction is determined by two variables –perceived value and corporate image-, while the switching costs exert a lower influence on customer satisfaction. Finally, our findings do not support the mediating role of customer loyalty on the relationship between customer satisfaction and switching intention.*

**Implications:** *Consequently, since our findings highlight low switching costs, smartphone services companies should focus their marketing efforts towards gaining new customers.*

**KEYWORDS:** *Smartphones, Switching costs, Satisfaction, Perceived value, Loyalty.*

## 1. INTRODUCTION

The mobile communication service industry is entering a new period. On one hand, fostered by the rapid development of information and communication technologies, the growing availability of internet services and the increasing demand from customers, the mobile communication services companies are currently shifting from voice-based communication to a combination of multimedia and data services (Kim et al., 2004). And on the other hand, the launching and popularization of the intelligent mobile phones - the so-called smartphones-, contribute to a transformation in the mobile

communication service market (Kim et al., 2004). The intelligent mobile phones or smartphones are not only a personal mobile device used to stay connected with family and friends, but also an extension of consumers' individuality and personality (Grant and O'Donohe, 2007), who adopt smartphones in order to enhance their private and social lives (Persaud and Azhar, 2012). Nowadays smartphones have become communication devices integrated into everyone's daily life (Kuo et al., 2009).

In this increasingly competitive market, the ability to provide a high level of customer satisfaction services is a key issue to providers in order to differentiate themselves from competitors (Deng et al., 2010). So, building strong and long-term relationships with customers and developing customers' loyalty is crucial for companies in gaining a sustainable competitive advantage (Nasir, 2005), since attracting new customers is considered more expensive than retaining current customers (Deng et al., 2010). Therefore, with smartphone penetration forecasted to increase substantially over the next years, managers need to understand smartphone consumers' behavior, in order to become more customer-oriented.

Despite the popularization of the smartphones, prior research has focused on mobile phones, and more specifically on their consumption, usage and motivations (Andrews et al., 2005; Hanley and Becker, 2008), experience and trust (Basheer and Ibrahim, 2010), or the cultural influence on mobile adoption (De Marez et al., 2007; Muk, 2007). Furthermore, previous literature on mobile services is based on consumers of the United States of America and Canada (Muk, 2007; Roach, 2009; Persaud and Azhar, 2012); whereas there is a lack of research focusing in the Southern European markets.

The purpose of this research is to provide and empirically test a conceptual model in order to deepen the understanding of the variables that motivate consumers' satisfaction, loyalty and switching intention of their smartphone services' companies, along with the examination of the their switching costs in a Southern European country. Considering the previous literature on the topic we develop a model of customer satisfaction in smartphone services including the following variables: perceived value, corporate image and switching costs –which include the attractiveness of alternatives, the search effort and service knowledge-. Additionally, our research analyzes the mediating role of customer loyalty. That is, customers' satisfaction and switching intention may depend on the mediating effects of customer loyalty. This article is structured as follows. The next section presents a brief review of the literature on smartphones and the mobile services market, followed by the conceptual framework and the research hypotheses development. We then describe the methodology, present the results and discuss the implications of our findings for managerial practice. Finally, we conclude by highlighting some research limitations and future research guidance.

## **2. CONCEPTUAL FRAMEWORK**

### **2.1. The Spanish smartphone services' market**

Classic mobile phones offer voice and text-messaging capabilities, with some other features, such as camera and calendar; while smartphones offer larger and higher resolution screens, a wide array of applications –apps-, web browsing, e-mail, picture messaging, GPS, popular networking sites, video camera, games or video and picture editing (Barnes, 2002; Persaud and Azhar, 2012). Additionally, smartphones comprise many technological capabilities over the traditional mobile phones (Persaud and Azhar, 2012), attracting customers for their many practical and entertainment applications, and because they can personalize devices, add features and applications specific to their needs. For these reasons, smartphones have gained global acceptance within a relatively short period of time (Barnes and Scornavacca, 2004), being central to most consumers, since they have the smartphone on and check it almost everywhere they go (Persaud and Azhar, 2012).

With the rapid development of the mobile communications and the large usage of the Internet, smartphone communication services have been widely adopted and popular in Spain. In fact, nowadays, with a large number of mobile device users –35 million-, and a smartphone penetration

rate of the 66% in year 2012 (Comscore, 2013), Spain has gained great opportunity for mobile services' companies. The UE regulation released mobile numbers' portability in year 2003, enforcing phone numbers' portability between operators. Consequently, the number portability between mobile companies does not longer act as a switching cost; and thus not preventing customers from terminating their contracts with service providers. Since the introduction of mobile number portability, the Spanish market has gone through a significant transformation, driving mobile companies to compete fiercely in a highly competitive market.

Additionally, in the Spanish mobile services market, it was a common practice to subsidize the purchase of smartphones and mobile devices; that is, give customers smartphones and other mobile devices for free or with a low price –a lower price than the one to be paid when no subscription contract is involved-, when they sign a contract with a mobile services company. In return, the companies required customers to sign long-term contracts to make up the loss on the smartphone or mobile device through the revenues obtained (Gerpott et al., 2001). By this practice, the companies clearly tried to lower the switching costs for new customers. As a result, after the required contractual period, a great number of customers terminated their contract, so they could obtain a new subsidized smartphone again. However, the discontinuing of subsidies for smartphones and mobile devices from year 2012, caused a reduction in the increase rate of new customers, and some companies experienced a drop in their customers, revealing that the market may have reached maturity. Once the number of mobile services' subscribers has reached a saturation point, obtaining new customers is rather difficult. So nowadays, the Spanish mobile communication industry is developing a new core marketing strategy, trying to retain the existing customers by improving customer perceived value and loyalty.

## **2.2. Smartphone services companies intangible attributes**

### *2.2.1. Perceived value*

Following Zeithaml (1988), perceived value could be conceptualized as the consumers' overall assessment of the benefits of a product or service, based on perceptions about what is being received. Moreover, perceived value is related to customer satisfaction (Sweeny and Soutar, 2001). In the mobile communications sector, perceived value could be defined as the evaluation of the benefits of a product or service by customers, based on their advance sacrifices and ex-post perceived performance when they use mobile services (Kuo et al., 2009). So, customers integrate their perceptions of what they get and what they give up in order to obtain mobile communication services. Previous researches have pointed out that the key factors of mobile companies' success are the enhancement of perceived value and customer satisfaction (Wang et al., 2004; Yang and Peterson, 2004); highlighting three variables as the main drivers of customers' perceived value – network quality, good value for money and customer service- (Gerpott et al., 2001). Empirical studies in the mobile communication industry have demonstrated that perceived value positively influences customer satisfaction (Lin and Wang, 2006; Turel and Serenko, 2006). Additionally, when consumers perceive that the value obtained from a smartphone services' company is high, they will be more willing to engage with this company (Deng et al., 2010). So, we propose that when customers perceive a higher value service, they will have an increased satisfaction, which in turn lead to a greater customer loyalty. Thus, the following research hypothesis is posed:

*H<sub>0</sub>: Perceived value is positively related to customer satisfaction*

### *2.2.2. Corporate image*

In the mobile services market, customers cannot fully regulate the business contract, so it is necessary for them to rely on the service providers not to engage unfair behavior (Gefen, 2002).

Thus, consumers' perceptions of attributes of the service company, such as integrity, ability or experience are crucial. When customers perceive that a mobile services company is reliable, trustworthy and with a wide experience, they will be more satisfied (Deng et al., 2010). Furthermore, better opportunities in searching for information about companies in the mobile communications' sector makes it easier for customers to evaluate corporate attributes before they purchase or subscribe (Methlie and Nysveen, 1999). Hence, corporate image should be considered as a critical factor for companies to build and maintain relationships with customers. Finally, following Martensen et al., (2000), the corporate image is an important driver of customer satisfaction and loyalty, whereas perceived quality has a relatively lower impact. Thus, we propose the following hypothesis:

*H<sub>1</sub>: The corporate image is positively related to customer satisfaction*

### **2.3. Smartphone services' switching costs**

Switching costs could be defined as the costs of switching from one supplier's product to another one (Stewart, 1998); or the costs that the consumer incurs by changing one service provider to another (Lee et al., 2001); including costs which can be measured in monetary terms, the psychological costs of facing a new company and the time and effort involved in using a new provider, service or product (Kim et al., 2003). Since switching costs face the uncertainty of dealing with a new service provider, switching costs make it costly for the customer to switch (Fornell, 1992), meaning a barrier to changing service providers (Deng et al., 2010). So, increasing the customers' perception of the risk in switching to other providers -such as the trouble in a new contract relationship or the difficulty in using new alternative services-, will increase the likelihood that the customer will keep the contract with the current service provider.

Regarding the mobile communications sector, the switching costs refer to the difficulty in switching to another mobile communication provider, which is encountered by customers who are not satisfied with the current service (Kim et al., 2004). Even though some customers may not feel any satisfaction toward their mobile companies, they do not wish to terminate the contractual relationship due to the switching costs, becoming captive customers (Gerpott et al., 2001). The contract or subscription with a mobile services company may be maintained involuntarily because a customer is prevented by switching costs from changing the service company (Gerpott et al., 2001). So, the higher the switching costs, the more customers are forced to remain with their current mobile services' providers. On the contrary, satisfied customers may switch to another mobile company for the low switching costs (Lam et al., 2004), such as low search costs, the service knowledge or the wide array of attractive alternatives. Finally, high switching costs may influence customer satisfaction, since they will perceive high switching cost as something negative which reduces their flexibility to switch service providers (Methlie and Nysveen, 1999; Bigné et al., 2011).

#### *2.3.1. Attractiveness of alternatives*

The attractiveness of alternatives means the image, reputation and service quality of the replacing services' companies, which are expected to more suitable services or superior o services than those of the current company (Kim et al., 2004). This variable is clearly linked to service differentiation and if few alternative competitors are available in the marketplace, then customers tend to remain with their current company (Bendapudi and Berry, 1997). The customers' perception of the risk in switching to other providers, such as the difficulty in finding an alternative service or the lack of attractive alternatives, will increase the likelihood that the customer will continue with the current provider (Lam et al., 2004); perceiving this switching costs as a negative since they reduce their availability to switch provider (Deng et al., 2010). Therefore, we predict a negative relationship

between the presence of attractive alternatives in the marketplace and customer satisfaction. So, the following research hypothesis is posed:

*H<sub>2</sub>: The attractiveness of alternatives is inversely related to customer satisfaction*

### 2.3.2. Search effort

Search effort is an important aspect of the switching costs (Fornell, 1992) and a key concept in consumer behaviour (Methlie and Nysveen, 1999). A major impact of electronic markets is that they reduce the search effort and costs related to searching for information about services. That is, the search effort is reduced when customers move from the traditional marketplace to electronic markets (Bakos, 1991; Methlie and Nysveen, 1999). As a result, it is less costly for customers to find alternative service providers (Methlie and Nysveen, 1999). However, customers are probably not satisfied when it is difficult to find alternatives and, thus, having limited flexibility imposed on them. In fact, many smartphone consumers found significant cost in switching from one service provider to another one, because doing so would mean a great search effort and a loss of time getting informed about other companies' services, prices or promotions (Bigné et al., 2011). This implies that high search effort leads to a poor customer satisfaction and to high customer loyalty. Therefore, it is assumed that the relationship between search effort and customer satisfaction is negative, as for switching costs. Consequently, these set of considerations leads us to the following hypothesis:

*H<sub>3</sub>: Search effort is inversely related to customer satisfaction*

### 2.3.3. Service knowledge

Consumers who have a high level of knowledge on the product category or service, have a greater ability to evaluate information on alternatives, acquire and process information and make purchasing decisions better suited to their needs, leading them to take better decisions (Bell et al., 2005). Therefore, the degree of knowledge about a product or service influences customer satisfaction (Bigné et al., 2011). However, consumers with a high level of product knowledge, are usually better informed about competitors; and thus, they may think that other purchasing alternatives would have been better. Consequently, the level of product knowledge acts as a switching cost when consumers have a low level of knowledge (Creyer and Ross, 1999). Thus, the following research hypothesis is posed:

*H<sub>4</sub>: The service knowledge is positively related to customer satisfaction*

## 2.4. Customer satisfaction and loyalty

Customer satisfaction could be conceptualized as an experience-based overall evaluation made by the customer based on whether his overall expectations on the services obtained from a provider have been fulfilled (Parasuraman et al., 1998). Thus, customer satisfaction is higher or lower compared to the extent to which the service provided exceeded or not what was expected (Parasuraman et al., 1998). So, customer satisfaction can be defined as a qualitative perception based on the assessments made by the customer regarding different value drivers referring to their purchase and consumption experiences (Johnson and Fornell, 1991; Eshghi et al., 2007), and is effective in predicting consumers' post-purchase behavior (Wang et al., 2004). In the mobile services context, customer satisfaction reflects the degree of a customer's positive feeling for a service provider of mobile services (Deng et al., 2010). So, if the customer has a good experience for using a mobile service provider, he will develop customer satisfaction (Dent et al., 2010). The customer satisfaction with mobile communication services has been related with the call quality, the good value for money, customer services and convenient procedures (Gerpott et al., 2001; Lee et al., 2001). The overall satisfaction is also influenced by how customers perceive that the mobile services benefit them personally, meeting their personal needs, along with a positive evaluation of the mobile

company (Gerpott et al., 2001). Consequently, we will define customer satisfaction as the total consumption perception of customers when using smartphone services.

On the other hand, customer satisfaction is considered as an important determinant of customer loyalty (Eggert and Ulaga, 2002), since customer satisfaction positively influences customer loyalty (Mittal et al., 1998; Choi et al., 2008), while negatively affects customer switching intention (Walsh et al., 2006). Moreover, customer satisfaction strengthens customer loyalty, lowers consumers' price sensitivity and enhances company reputation (Fornell, 1992). Previous research demonstrates that customers who experience a high level of satisfaction are more likely to remain with their current mobile service companies, maintaining their subscription. However, customer satisfaction is not always a sufficient condition for customer loyalty (Lee and Cunningham, 2001, Kim et al., 2004); and thus it is necessary to analyze other influencing factors, such as the switching costs (Jones et al., 2000). So, the following research hypothesis is proposed:

*H<sub>5</sub>: Customer satisfaction is positively related to customer loyalty*

## **2.5. Customer satisfaction and switching intention**

Customer switching intention could be defined as the exit or the customer decision to terminate the contract with a particular service company (Stewart, 1998). For mobile services companies customer retention is a crucial issue (Deng et al., 2010), since once customers' long-term links are of great importance to the success of the company (Gerpott et al., 2001). The reason is that the mobile services' contract represents a continuous contractual transaction carried out over a long period of time, while customers cannot be certain that the mobile services will we always provided with the promised quality (Gerpott et al., 2001). The contractual transaction is structured so that customers pay a monthly fee for the usage of the mobile communication network, and afterwards they pay their services and data charges in accordance with their use.

So, customer retention is concerned with maintaining the contractual relationship established between the mobile company and the customer, or by extending the customer's contract over a long period of time; and is positively related to customer satisfaction (Wang et al., 2004; Turel and Serenko, 2006). Moreover, satisfaction and loyalty have emerged as variables with a strong influence on customer retention, that is, whether a customer continues to a contract with a service provider (Eshghi et al., 2007). Following Deng et al. (2010), customer satisfaction is a direct determining factor in customer retention and switching intention. More specifically, customer satisfaction negatively influences customer switching intention (Walsh et al., 2006). So, once a customer is dissatisfied with a service provider, he will be much more likely to change to another one (Deng et al., 2010). Therefore, we propose the following research hypotheses:

*H<sub>6</sub>: Customer loyalty is inversely related to switching intention*

*H<sub>7</sub>: Customer satisfaction is inversely related to switching intention*

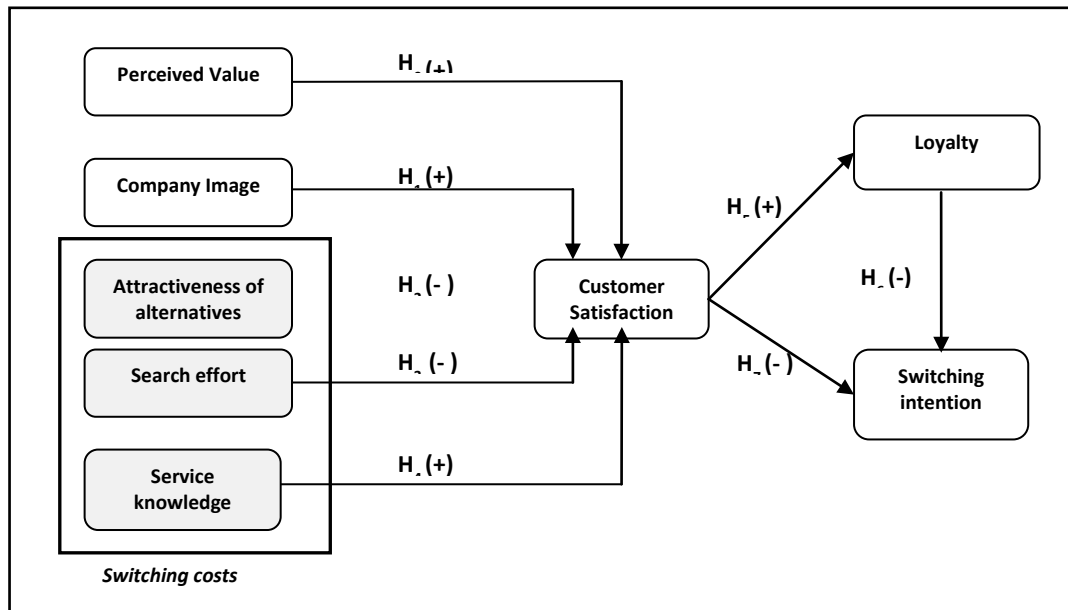

## **2.6. The mediating role of customer loyalty**

Following Oliver (1999), loyalty could be conceptualized as a deep commitment to rebuy or repatronize a preferred product or service consistently in the future, thus causing repetitive purchasing. In our study, we define customer loyalty as the customers' behavioral intention to continuously use smartphone communication services with their present service providers. Considering previous research we expect a more favorable customer loyalty for highly satisfied customers, than for these customers with a low degree of satisfaction; and additionally, a lower switching intention is expected for these customers with a high degree of loyalty (Kime et al., 2004). In our research, we propose that customer satisfaction is an important factor influencing customer switching intention, trough customer loyalty. So, the following hypothesis is posed, relative to the mediating role of customer loyalty:

*H<sub>8</sub>: Customer loyalty mediates the influence of customer satisfaction on customer switching intention.*

FIGURE 1.

Conceptual model of customer satisfaction and switching intention of smartphone services

### 3. METHODOLOGY

#### 3.1. Data collection

The data were collected by a self-administered structured on-line questionnaire in March 2013 among consumers residing in Spain. Potential respondents were contacted by e-mail to participate in the study. We first pre-tested the questionnaire on a small sample of 10 smartphone users. Then, we proceeded with a random sampling among consumers, inviting them to complete the on-line questionnaire, and asking them about their smartphone services' companies, in order to gather information regarding the specific company they have knowledge or consumer experience. Thus, each one of the participants evaluated their current smartphone services company. This procedure yielded a total of 411 completed questionnaires, obtaining a total amount of 370 valid responses comprising several smartphone mobile companies such as Movistar, Vodafone; Orange, R, Yoigo, Pepephone, Simyo, Masmovil and Yazztel. The sampling error was 5.19%, with a confidence level of 95% under the hypothesis  $p=q=0.50$ . The last part of the questionnaire contained several socio-demographic questions.

#### 3.2. Variables and measurement scales

All measures are adapted from or developed based on prior research, and were measured using the classic Likert-type 1-5 scale, asking respondents to indicate their level of agreement or disagreement with a series of statements (Table 1). The *services perceived value* is measured by three items adopted from Kuo al. (2009) and Bigné et al. (2011), in order to assess customers' perception the company vale. Secondly, we used three items to measure the *corporate image*, adopted from previous studies (Nguyen and LeBlanc, 2001; Bigné et al. 2011), based on the research line about the image and associations in consumers' perceptions. The *attractiveness of alternatives* is measured on a 3-item scale, comprising items proposed by Jones et al. (2000) and Bigné et al. (2011). The customers' *search*

*effort* are measured on the scale proposed by Srinivasan and Ratchford (1991) and Bigné et al. (2011), which evaluates the customer's overall searching effort when looking for a smartphone services company. For measuring *service knowledge*, we used three items proposed by Sharma and Patterson (2000) and Bigné et al. (2011) regarding whether the consumer has an overall knowledge on the mobile service companies. Regarding the variable consumer *satisfaction*, we considered four items proposed by Burnham et al. (2003) and Kuo et al. (2009). Moreover, in order to measure customers' *loyalty*, we adopted three items from previous research (Yoo et al., 2000). Finally, *switching intention* is measured on a 2-item scale, including items adopted from Jones et al. (2000) and Bansal et al. (2005).

**4. RESULTS**

**4.1. Analysis of the measurement model**

Structural equation modeling was carried out in order to analyze the proposed model with Amos 18.0, providing a confirmatory factor analysis and showing a clear factorial structure. In relation with the internal consistency and reliability, cronbach Alpha, composite reliability coefficients and analysis of the extracted variance extracted were calculated (Table 1). In first place, we obtained cronbach alpha values from 0.722 to 0.927, thus being acceptable, as suggested Anderson and Gerbing (1988) and Hair et al. (1998). The composite reliability (CR) of the latent variables was higher than 0.60, indicating that all measures had good reliability (Bagozzi and Yi, 1988; Hair et al., 1998). Additionally, the average variance extracted (AVE) varied from 0.506 to 0.789; thus reaching the threshold of 0.50; meaning that a good convergent validity was obtained (Fornell and Larcker, 1981; Steenkamp and Trijp, 1991). Confirmatory factor analyses were employed to address the issues of dimensionality, convergent and discriminant validity (Anderson and Gerbing, 1988). Our confirmatory factorial analysis shows that all standardized factor loadings are significant, with a reliability level of 95% and reaching the commonly used threshold of 0.60 (Nunnally, 1978), with the exception of ATR3, thus being subject for further research.

**TABLE 1.**

Factor loadings of latent variables and indicators of internal consistency and reliability

#### 4.2. Analysis of the structural model

Structural equation modeling was developed to assess the statistical significance of the research hypotheses. All the model fit indices exceeded the respective common acceptance levels (Hair et al., 1998), indicating that the measurement model of customers' satisfaction, exhibited a good fit of the collected data. Model fit criteria suggested by Hu and Bentler (1996) were used for both the measurement and the structural model:  $\chi^2 / df$ , goodness of fit (GFI), adjusted goodness of fit (AGFI), comparative fit index (CFI), root mean square residual (RMR) and root mean square error of approximation (RMSEA). Acceptable models should have  $\chi^2 / df \leq 3$ , AGFI  $\geq 0.80$ , RMR  $\leq .1$ , RMSEA  $\leq 1.0$  and GFI and CFI higher than 0.90. All of the obtained fit measures indicated that the structural model was acceptable ( $\chi^2 / df = 1.905$ ;  $p < .000$ ): RMSEA= 0.050; RMR= 0.055; GFI= 0.914; AGFI= 0.889; CFI= 0.969).

#### 4.3. Discussion

The results obtained report that perceived value is the dimension with higher loading on customer satisfaction ( $\beta_{16} = 0.623^{**}$ ), followed by corporate image ( $\beta_{26} = 0.262^{**}$ ) and the attractiveness of alternatives ( $\beta_{36} = -0.107^{**}$ ). Thus, in terms of the effect size, the perceived value seems to contribute the most to customer satisfaction (Table 2). Additionally, we found empirical evidence to propose a

significant positive relationship between corporate image and customer satisfaction, along with a significant negative relationship between the attractiveness of alternatives in the smartphone services companies and customer satisfaction. These relationships were in the expected direction. So, it can be stated that the better and more favorable perceived value of the smartphone services provide or the corporate image, the higher customer satisfaction.

On one hand, regarding the switching costs, it should be highlighted that only one of the proposed relationships is significantly positive, regarding the influence of the attractiveness of alternatives and customer satisfaction ( $\beta_{36}=-0.107^{**}$ ). However, the other switching costs, namely the search effort ( $\beta_{46}=0.026^{ns}$ ) and the service knowledge ( $\beta_{56}=0.024^{ns}$ ) showed not statistical significance on customer satisfaction, since the relationships were in the expected direction, but failed to reach statistical significance for both variables. The reason may be either the switching costs are regarded as insignificant or customers do not have the feeling of being retained by the smartphone services companies. This can be explained by the nature of the smartphone services, commonly available today, along with consumers perceiving the shift of the service provider as easy. Moreover, the no significant influence of the search costs may be explained by the fact that searching for alternative services does not lead to significantly better offers. On the other hand, our results highlight a significant positive relationship between customer satisfaction and loyalty ( $\beta_{67}= 0.959^{**}$ ), along with a significant inverse relationship between customer satisfaction and switching intention ( $\beta_{68}=-0.846^{**}$ ), as initially expected. Finally, and contrary to our proposed relationships, our findings do not find support for the negative relationship between loyalty and switching intention ( $\beta_{78}=-0.082^{ns}$ ).

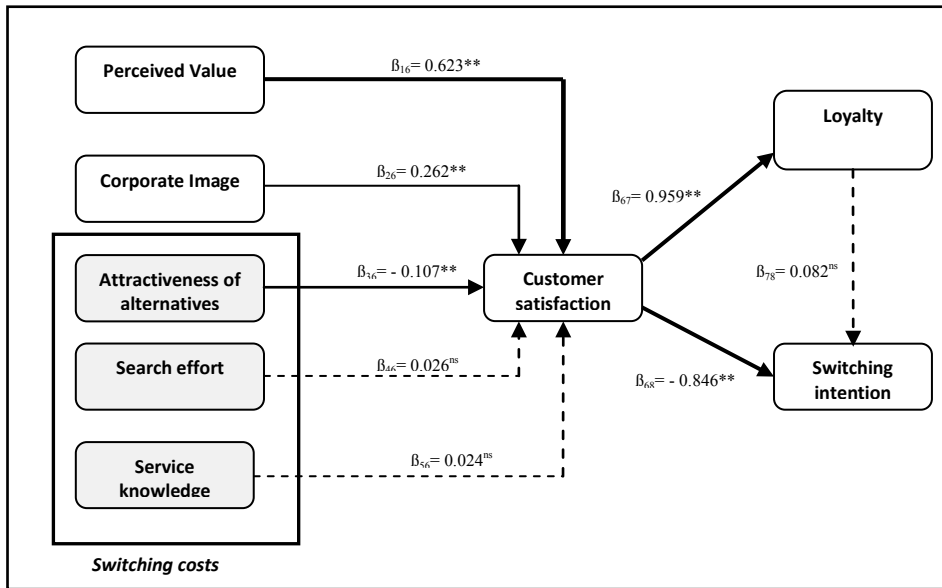

**TABLE 2.**  
Results of the structural model

<i>Causal relationships</i>	<b>Standardized Coefficients</b>	<b>t value</b>	<b>Hypotheses test</b>
Perceived Value → Customer Satisfaction	$\beta_{16} = 0.623^{**}$	7.047	H <sub>0</sub> : Supported
Corporate image → Customer Satisfaction	$\beta_{26} = 0.262^{**}$	3.272	H <sub>1</sub> : Supported
Alternatives' attractiveness → Customer Satisfaction	$\beta_{36} = -0.107^{**}$	-2.728	H <sub>2</sub> : Supported
Search effort → Customer Satisfaction	$\beta_{46} = 0.026^{ns}$	0.734	H <sub>3</sub> : No Supported
Service Knowledge → Customer Satisfaction	$\beta_{56} = 0.024^{ns}$	0.657	H <sub>4</sub> : No Supported
Customer satisfaction → Loyalty	$\beta_{67} = 0.959^{**}$	22.746	H <sub>5</sub> : Supported
Loyalty → Customer switching intention	$\beta_{78} = -0.082^{ns}$	0.354	H <sub>6</sub> : No Supported
Customer satisfaction → Customer switching intention	$\beta_{68} = -0.846^{**}$	-3.632	H <sub>7</sub> : Supported
<i>ns=no significative</i> <i>** significative (p&lt;0.01)</i>	$R^2_{\text{Satisfaction}} = 0.857$ $R^2_{\text{Post-purchase attitude}} = 0.919$ $R^2_{\text{Switch intention}} = 0.855$		

Our results provide strong support for all research hypotheses, except from H<sub>3</sub>, H<sub>4</sub>, and H<sub>6</sub>, thus not supporting a significant relationship between two of the switching costs and customer satisfaction, along with the relationship between loyalty and switching intention. On the other hand, our findings show that five of the eight initial research hypotheses are supported - H<sub>0</sub>, H<sub>1</sub>, H<sub>2</sub>, H<sub>5</sub> and H<sub>7</sub>-. Thus, customer satisfaction with smartphone services was found to be significantly influenced by perceived value and the corporate image, along with a slight inverse influence of the attractiveness of alternatives. Moreover, it was found that customer satisfaction exerts a relevant positive effect on loyalty, whereas it inversely affects the switching intention. Finally, there was not support for H<sub>6</sub>, since our results did not confirm a significant relationship between loyalty and switching intention.

FIGURE 2.

Final causal relationships

4.4. The mediating role of customer loyalty

For analyzing the mediating role of customer loyalty, we estimate both a direct and indirect effects (Table 3). Our research hypothesis H<sub>8</sub> predicted that customer loyalty would mediate the relationship between customer satisfaction and customer switching intention. As related to the direct effects, we found a positive and significant direct inverse effect of customer satisfaction and switching intention ( $\beta_{68}=-0.846^{**}$ ). With regard to the mediating indirect effects, we observed a significant positive effect of customer satisfaction on customer loyalty ( $\beta_{67}=0.959^{**}$ ), but the indirect mediating effect of customer loyalty on switching intention was not significant ( $\beta_{78}=-0.082^{ns}$ ). So, contrary to our expectations this relationship was not found significant, thus not supporting H<sub>8</sub>. A comparison between the indirect and the direct models shows that the direct mediating model had a significant decrease in Chi-square ( $\nabla\chi^2=12.148$ ;  $df=1$ ,  $p<0.001$ ), along with a substantive improvement of the model fit ( $CFI=0.969$ ) and a significant estimate for the relationship between customer satisfaction and the switching intention. Therefore, these results suggest that there is not a complete mediation. Additionally, we analyzed the partial mediation, identifying indirect effects from customer satisfaction to switching intention through the proposed mediating variable –loyalty-. Our results showed a significant positive relationship between customer satisfaction and loyalty ( $\beta_{67}=0.959^{**}$ ), the other indirect mediating effect of customer loyalty to switching intention showed a no significant relationship ( $\beta_{78}=-0.082^{ns}$ ). Thus, the model proposed does not support that customer loyalty provides partial mediation on the relationship between customer satisfaction and switching intention.

TABLE 3.  
Testing of the mediating effect of customer loyalty

Model fit	Chi-square	X <sup>2</sup>	df	p	RMSEA	CFI
Indirect mediating effects	415.994	1.953	213	0.001	0.052	0.967

Loyalty → Switching intention	$\beta_{78} = -0.916^{**}$	-17.267	$B_{78} = -0.082^{ns}$	-0.354
** <i>significant</i> ( $p < 0.05$ ) <i>ns</i> = <i>no significant</i>				

## 5. CONCLUSION

The present study aims to contribute to the existing literature by analyzing the variables influencing customer satisfaction, loyalty and the switching intention in the smartphone services marketplace. The conceptual proposed model was strongly supported by the data collected in the Spanish market, describing some empirical findings of what determines customer satisfaction and loyalty for smartphone users. Our findings show that perceived value, is found to have the greatest impact, followed by corporate image; while switching costs and the attractiveness of other alternatives have less explanatory power of customer satisfaction and loyalty.

One major finding is that perceived value is the most important driver of customer satisfaction, being the largest effect followed by corporate image. When smartphone services companies reinforce their perceived value, customer satisfaction and loyalty are directly improved and the switching intention can be negatively influenced. So, smartphone services' perceived value is critical to service providers' success in today's increasingly competitive marketplace, being the variable with higher influence on customers' satisfaction. This result is in line with previous research (Kuo et al., 2009), and implies that if smartphone services' providers aim to induce higher customer satisfaction, the enhancement of perceived value should be prioritized. Additionally, the corporate image influences customer satisfaction, but with a lower influence, being in line with Martensen et al. (2000), who highlighted image as one main driver for customers' satisfaction in the mobile sector. Therefore, since perceived value and corporate image are the main determinants of customer satisfaction, smartphone services companies should struggle to satisfy their customers and build high quality services, along with strong corporate image.

Other major finding is the low or poor influence of the switching costs on customer satisfaction. In fact, our results indicate stronger support for services' perceived value and corporate image than for switching costs as determinants of customer satisfaction and loyalty, being in line with previous research (Methlie and Nysveen, 1999). Only the attractiveness of other smartphone services alternatives showed a directly negative influence on customers' satisfaction, since our results do not provide empirical support of the effects of search costs and service knowledge on customer satisfaction. On one hand, our findings show that only the attractiveness of alternatives is a significant switching cost. So that the higher the attractiveness of alternatives, the lower customer satisfaction, and the greater likelihood it will drive consumers to stay with their current service providers. In this sense, the release of smartphones' number portability has removed the constraints set up by mobile services providers, allowing customers to have more options available (Kuo et al., 2009), and thus increasing the attractiveness of other alternatives. On the other hand, our results do not provide empirical support for service knowledge and the search effort as exerting a significant influence as switching costs. The reason may be that the vast majority of smartphone users are familiar to some extent to mobile devices available and the services provided by companies. Moreover, regarding the no significant influence of the search effort, the probable reason lies in that the cost of searching and learning about other providers is low, and that customers find smartphone service providers' information available easily and in great amount. Other reason may be that the services offered by smartphone companies are very similar; so searching for alternative services does not lead to significantly better offers. Additionally, the poor influence of switching costs may also be explained by the fact customers do not have the feeling of being retained by the smartphone services companies.

Furthermore, our results highlight a positive significant relationship between customers' satisfaction and their loyalty, along with a strong negative relationship between customers' satisfaction and their switching intention. The relevant influence of customer satisfaction on loyalty confirms previous findings that satisfied customers tend to be loyal (Methlie and Nysveen, 1999), and are in line with recent studies highlighting the strong relationship between customer satisfaction and loyalty (Eshghi et al., 2007). Our results showed that customer satisfaction has the most significant impact in customer loyalty, whereas the switching costs –and more specifically the attractiveness of alternatives- had a significant but minor explanatory power. Finally, other major finding is that our results do not support the mediating role of customers' loyalty. Our model supports the finding that customer loyalty does not provide complete nor partial mediation of the relationship between customer satisfaction and switching intention. We hypothesized that customer loyalty would mediate on the formation of customer switching intention, but this was not the case.

Derived from our findings, we propose some useful insights for company managers. Considering that our findings highlight low switching costs, smartphone services providers should focus their marketing efforts towards attracting new customers and increasing the primary demand, rather than retaining their existing customers. We suggest that since customer switching costs exert a slight influence, smartphone service providers are better off improving and enhancing customer satisfaction to minimize customer defection. That is, managers should direct their efforts to building and improving services' perceived value in order to retain loyal customers and gain new ones. More specifically, companies should evaluate the core services they currently offer and whether the release of new value-added services could make customers feel the services to be more valuable than costs. In order to improve the customer perceived value, the smartphone services companies could provide personal functional benefits, develop service innovations or enhance the key functionalities of smartphone services. Finally, the improvement of the corporate image is also required, since it showed a relevant influence on customer satisfaction. This research has several limitations. Although this study reports interesting results and contributes to the understanding of consumer behavior, caution must be exercised since this research was focused in one specific European market. As for the main limitation of this study, first we should notice that this empirical research was carried out in one market; and thus, the present study provides a limited empirical application. In second place, our study has analyzed a number of dimensions proposed in prior literature, which only represent a small part of all dimensions affecting customer satisfaction with smartphone services, such as trust in the company, the service quality or the price level. Accordingly, market scholars and practitioners should analyze variables other than those mentioned in our research.

# S-O-R MODEL PROPOSAL FOR ONLINE TRAVEL PURCHASING

---

JANA PRODANOVA

SONIA SAN MARTIN GUTIÉRREZ

*jprodanova@ubu.es, sanmargu@ubu.es*

*Universidad de Burgos*

## ABSTRACT

*In a situation of purchasing a travel over Internet, consumers are influenced by website characteristics such as the security, privacy, quality service and entertainment, which can affect their attachment to the website and furthermore, their buying decision. Therefore, we are proposing an implementation of the S-O-R model for the online travel purchase, where the store attachment is treated as the organism, in order to explore the effect that the website high-task relevant and low-task relevant atmospheric cues (stimuli) have on the store attachment and the decision to repeat the purchase at the website where they bought their last travel arrangement (result). The collection of information is in process and we expect to have the results by the end of July 2014. As far as we know, this is the first case of integration of S-O-R model with the store attachment scale for the case of online travel purchase.*

## KEYWORDS:

*Online purchase; S-O-R model; store attachment; website characteristics; intention to buy;*

## 1. Introduction and conceptual framework

Over the years there has been a great interest to explain the trends of the traditional (offline) purchase and customer behavior during the whole of the process, as well as the factors influencing it. One of the models used, especially in the offline purchase atmosphere, is the S-O-R model (Buckley, 1991; Brown et al., 2007). However, with the development of the Internet and electronic commerce, there is an increasing interest in online purchase research and literature is constantly increasing treating issues related to buyers' behavior and their attitude to new technologies. In this way, the S-O-R model has also been applied widely to examine the online shopping drifts and customer responses towards online website stimuli (Eroglu et al., 2001; Richard, 2005; Yoon, 2012; Wu et al., 2014). One example for that is Eroglu et al. (2003) research, which shows significant effects of website atmospherics on consumers' perceptions, attitudes, satisfaction, and various behavioral responses such as approach or avoidance behaviors.

The S-O-R model proposed by Mehrabian and Russell (1974) originated in psychology, encompasses the stimuli (S) and the organism (O) related to the purchasing environment and customer behavior, and the customer response (R) to those stimuli and organism function. Yoon (2012) explains the S-O-R model with a customer meeting the environmental stimuli, those stimuli influence the customer's organismic states, which determine his or her behavioral responses such as approach or avoidance behaviors. The stimuli have been conceptualized as "something that rouses or incites to action or increased action" (Sherman et al., 1997: p.365), while the organism is defined as "cognitive and affective intermediary states and processes that mediate the relationships between the stimulus and the individual's responses" (Chang and Chen, 2008, p. 820). Therefore, if we see the marketplace as a whole, the stimuli are factors that are controlled by the marketers, while the organism and the response are controlled by the customer.

Grounded on that literature, we are proposing an application of the S-O-R model to online travel purchasing. The stimuli that individuals perceive and process during shopping, such as store environmental elements, would impact their purchasing behaviors, like browsing and purchase behaviors (Lewis et al., 2008). In other words, the stimuli that the customer perceives influence his/her identity, dependency and/or social bond with the store (the store attachment), which develops into a response, in this case the customer's intention to repeat purchase. Store attachment includes three dimensions: identity, dependence and social bond with the store (Kyle et al. 2005; Williams and Vaske 2003; Galvagno, 2011). Therefore, the objective of this study is to apply the S-O-R model to the online travel purchasing considering website characteristics as stimuli, store/site attachment as organism and repeat purchase as a result.

## 2. Hypotheses and model proposal applying S-O-R model to online travel purchase

In their study, Eroglu et al. (2001) classify the environmental characteristics of a website into two general dimensions, those regarding the high task-relevant environmental characteristics and those referring to the low task-relevant environmental characteristics. The high task-relevant environment includes website features that are relevant to the customers' aim completion, letting them an easy way of executing the task, such as description of the product/service, its price and sale's terms, its delivery and return policies, product reviews and other type of verbal content or text-only content relevant to the product and customer's shopping goals. The low task-relevant environment indicates atmospheric cues that are not directly related to the goal of the purchase and are not significant for the task to be concluded, although they can make the environment more pleasant, interesting and pleasurable. Examples for those are website graphic design characteristics, entertainment indicators, music, animation and some information such as awards, affiliations etc.

Eroglu et al. (2001) defined stimuli in their investigation as "the sum total of all the cues that are visible and audible to the online shopper" (p. 179). Several studies implement indicators of the two groups of environmental cues such as stimuli that affect the organism and furthermore the response in the S-O-R model. For example, the website environmental cues treated as stimuli, both high task-

relevant and low task-relevant, are the website design, the image interactivity technology, the e-trust and the customization (Yoon, 2012), the informativeness and the effectiveness of the information content and the entertainment (Mazaheri et al., 2011; Richard, 2005), the enjoyment of Internet shopping, the concerns about privacy and security issues, and the experience and comfort with IT (Brown et al., 2007). Based on those researches and a pretest, we chose to study the influence that privacy and security issues and service quality -as high task-relevant variables- and entertainment -as a low task-relevant environmental cue- have on the store attachment in the online travel purchase.

### 2.1. Stimuli. Service quality, privacy and security issues, and perceived entertainment

There are several characteristics of a website/store related to the final assessment of the quality of the product/service offered that influence a customer's cognition-based behavior and are shown to be important for the customers as they shop online. Among them are the service quality and the perceived privacy and security of the website. We recall on a statement that describes the service quality in an electronic context as a firm's effort to provide better service through a wide assortment of products, a good quality-price relation, a good delivery service, and broad, detailed information on the product and services or a greater customization of them (Trocchia and Janda, 2003). Part of the service quality is the information quality which is related to the information that is found on the website regarding the product/service. The information on Internet varies in quality, accuracy, reliability and even update. Therefore, since the information and the details would help a potential customer to make a decision for buying or not the travel he is looking for, it is of great importance to pay a special attention on this characteristic. When customers perceive quality in the information presented by the website, they will perceive the seller as interested in maintaining the accuracy and currency of information (Kim et al., 2008), and will find themselves in a favorable position for making a decision.

The privacy and security policies are probably the attribute that most influences online buyer's decisions. The consumers usually have serious and legitimate concerns about the privacy of the information they provide to a seller, while that security is a determinant of overall quality of a website, representing an element affecting customer choice online (Ha, 2004). On the other hand, customers with a greater awareness of security and data privacy are more likely to use e-commerce (Wang et al., 2006). Thus, the importance of the privacy and security issues, especially when it comes to online intangible buying of travel, where customers also normally pay by a card, can be deduced.

Entertainment has been identified as a driving motive for consumers' Internet and websites usage (Papacharissi and Rubin, 2000). In the case of the online travel purchase, travelers look for information, not only for their functional needs, but also other social, visual, entertainment, and creativity needs and Internet is seen as a good place to find that information at, with entertainment (Kim et al., 2007). When it comes to the online purchase, the seller's site probably is the only way of communicating with the clients, hence to provide an entertaining experience is of key importance. In a situation like this, having in mind that the perceived level of entertainment influences the customer's response to and the perceptions of the website (Chen and Wells, 1999), we can suppose that entertainment elements of a website will stimulate attitudes toward staying, which in our case is the store attachment aspect.

### 2.2. Organism. Store attachment and its application to electronic commerce - Site attachment

FIGURE 1.

#### Proposed concept for interrelation between S-O-R and Store Attachment

Source: Authors' adaptation

To understand better how the site atmosphere and attributes can influence the customer, we will observe the store attachment concept (Williams and Roggenbuck, 1989), mostly applied for the offline context and presented as a strong tie between the customer and the store. It's described as the phenomena of human-place bonding (Kyle et al., 2005). The model includes an affective point, defined by the customers' affect, emotions and feelings, a cognitive point, explained by the thought, the knowledge and the belief of the customer, and finally the practice, the activity that takes the customer into action and the behavior of the customer involved (Low and Altman, 1992; Kyle et al., 2005), integrating these aspects into an interaction between people and place, consisted of different items that are divided into three principal dimensions (Figure 1): store identity, store dependence and the social bonding (Galvagno, M., 2011; Kyle et al., 2005). The store identity describes the affective point of the store-person connection, elements of customer's identity and personality in relation to the physical environment, that gives a considerable importance to the store that functions as a source and drive for emotions and relationships that give meaning to the person involved (Williams and Roggenbuck, 1989; Williams and Vaske, 2003; Kyle et al., 2005). The store dependence refers to the cognitive point of the store attachment model and it reflects the functional value that the implicated customer gives to the store's features and conditions that support person's goals or desired activities (Williams and Roggenbuck, 1989; Williams and Vaske, 2003; Kyle et al., 2005). The social bonding dimension supposes that the attachment the customer has to the store, is grounded on the incorporation of other groups of people, such as the family and friends, the community and even the culture (Low and Altman, 1992; Milligan, 1998; Kyle et al., 2005).

### **2.3. Response. Intention to repeat purchase**

If we consider the site attachment as the organism dimension in the S-O-R model, with its cognitive, affective and social factors, the stimuli will be the characteristics of the website and the result would be the intention to buy or to repeat the purchase (Figure 1). Thus, the intention to repeat the purchase online is directly conditioned by the customer's attachment to the website. Yen and Gwinner (2003) expose that the general consumer's satisfaction with Internet technologies has a positive impact on his/her willingness to continue purchasing from the same service provider. The purchase intention is the final objective of any company, either a physical store or a virtual one. The repetition of a purchase means a loyal customer and a bigger number of sure clients is the most important aim of a business in order to constantly develop and increase. Hence, if the mentioned characteristics have influence on the purchasing action, they will also have an influencing role in the customer site attachment, which will further lead to the purchase. A positive shopping experience, along with appropriate incentives (website stimuli), may encourage a positive attitude toward the repetition of the purchase.

Having in mind all the relations that we have elaborated, we propose the following hypotheses:

*H1. The website quality service positively affects the consumer's attachment to the site.*

*H2. The website privacy and security positively affects the consumer's attachment to the site.*

*H3. The perceived entertainment of the website positively affects the consumer's attachment to the site.*

*H4. The consumer's attachment to the site positively affects the intention to repeat the purchase.*

## **3. Empirical study**

For the purpose of this study, we are collecting information from randomly selected online travel buyers by questionnaires, constructed after a pre-test executed with professionals from the area and with 20 online travel buyers. The adapted scales have their base in the works by Kyle et al. (2005), Williams and Vaske (2003) and Galvagno (2011) for store attachment, Burke (2002), Montoya-Weiss et al. (2003), Harris and Goode (2004), Ramus and Nielsen (2005), Ranaweera et al. (2005) and Yadav and Varadarajan (2005) for quality service and website privacy and security, Goldsmith and Hofacker (1991) for entertainment, and finally, Shimp and Kavas (1984) and Bauer et al. (2005) for intention to repeat purchase. We expect to have the questionnaires concluded and the results analyzed by the end of July 2014. In order to estimate the model, we will consider site attachment as a second-order

construct comprising the three commented dimensions and structural equation modeling will be used to estimate the global model of stimuli-site attachment-repeat purchase.

#### 4. Contributions

The objective of this research is to study the influence that the website stimuli has on store attachment and the store attachment effect on the repetition of purchase when it comes to online travel purchase. The contributions of this study are as follows. We are implementing the S-O-R model, originally a psychological approach, for an online travel purchasing, an area where, up till now, we haven't found any researches treating this issue, allowing to study the electronic environment characteristics as stimuli. Besides, our model proposal includes the store attachment, a variable and scale that, to the extent of our knowledge, hasn't been studied in an electronic context. Finally, implications will be useful for practitioners to design the most appropriate strategy to get customers who are attached to the store and receive repeat buying.

## ABSTRACT

*Generativity is the human commitment with the well-being of future generations by the means of actions aimed at passing a positive legacy of the self. Generative consumers present two ways of expressing the generativity acts; agentic (I do it to be remembered by future generations) and communal (I cooperate altruistically with future generations). We will develop the concept of product transcendence to analyzes the preferences of generative consumers (agentic and communal). We expect that agentic generative consumers will have preference for ego-transcendent products while communal will prefer socio-transcendent products.*

Keywords: generativity, consumer behavior, product transcendence.

## **1. INTRODUCTION**

We see in everyday life that when they buy products and services, people consider the well-being of future generations. Many goods and services serve, totally or partially, the purpose of leaving some kind of legacy. Goods such as houses, works of art, jewelry, family pictures or organic products have an impact on future generations; services such as children's education, legacy websites, and life insurance do as well. Some companies have taken this consumer concern with future generations into consideration in their marketing activities. For example, the watchmaker Patek Philippe's slogan is "You never actually own a Patek Philippe. You merely look after it for the next generation," and Johnson and Johnson's mission statement is "We have a responsibility to take care of our planet and preserve its beauty, resources and strength for future generations."

Erikson (1950) named the commitment to future generations' generativity. Antecedents (e.g., altruism) and consequences (e.g., individual well-being) of this concept have been well studied in psychology (Ackerman et al. 2000). Generative individuals are concerned about leaving a positive legacy. This legacy can be built by acquiring goods that have meaning in the future and can improve future generations' well-being. Legacy is a broad concept. Durables can be passed on as a legacy, but transmitting values can be even more important (Hunter and Rowles 2005). Therefore, some products—whether they are goods or services, durable or ephemeral, cheap or expensive—can be meaningful in the future and, therefore, better suited for creating a legacy than others. Supporting certain companies can also be seen by generative individuals as contributing to a legacy of values. In summary, marketing decisions can be more efficient if managers know how generativity influences consumer behavior. However, despite the important effects that generativity may have on consumer behavior, there is a gap in the literature concerning the relationship between the two.

The goal of this research is to contribute to greater understanding of how individual generativity influences purchase intention and how this effect is moderated by product attributes and company actions. We will conduct one study to show how generativity influences purchase intention and then examine the influence of two types of generativity, agentic generativity and communal generativity.

## **2. CONSUMER GENERATIVITY**

After Erikson (1950) defined generativity as the concern for establishing and guiding future generations, Kotre (1984) described generativity as the desire to outlive the self by "generating an enduring personal legacy" (p. 10). In the integrative model developed by McAdams and de St. Aubin (1998), generativity is defined as the concern for and commitment to the well-being of future generations, to be achieved through actions aimed at passing a positive personal legacy on to those generations.

The relationship between consumer generativity and preferences for products remains underexplored. If generative consumers are committed to future generations and, therefore, aspire to leave a positive legacy, they must be more interested in products that help them build that legacy. Goods, services, and behaviors—whether material or intangible, durable or ephemeral—that can be transmitted to future generations have something in common: a long-lasting or transcendent meaning. Belk et al. (1989) approach the concept of transcendence when they describe how certain products can acquire special significance to a consumer. Williams and Harvey (2001) identify some transcendent experiences and characteristics as feelings of

overcoming the limits of everyday life and creating a sense of timelessness. Belk (1988) summarizes transcendence as “going beyond the limits” (p. 198). Transcendent products are accordingly those whose significance goes beyond the temporal limits of their mere functional nature or the user’s own existence. Those products are more suitable for creating a legacy. Consumers perceive some products and behaviors (e.g., environmentally friendly products, collector’s items, jewelry, works of art, and photos) as more transcendent than others. Generative consumers, concerned about the well-being of future generations, will thus be more interested in such products than non-generative consumers. We therefore propose:

H1: Generative consumers will show a higher purchase intention than non-generative consumers for transcendent products.

### **3. AGENTIC VS. COMMUNAL GENERATIVITY**

Leaving a legacy can satisfy both a need to keep living on in someone else’s mind (an egoistic need) and a need to improve someone else’s well-being (an altruistic need). McAdams and de St. Aubin (1992) suggest that the fullest expressions of generativity are both agentic and communal. The fundamental dimensions of human existence are agency and communion (Bakan 1966). Agency represents the pursuit of social dominance. Communion represents efforts to cooperate and preserve social bonds. Agency is about focusing on oneself and forming separations; communion is about focusing on others and forming connections. Following these ideas, McAdams and de St. Aubin (1998) accordingly propose two dimensions of generativity: one related to a positive legacy of the self (agency) and other related to the well-being of future generations (communion).

Agentic generativity is the expression of the desire to leave a legacy by the means of achievement and dominance, seeking some kind of immortality or outliving the self. The need to live on after death has been presented as a specific motivation of legacy transmission (Sargeant and Hilton 2005). Stevenson and Kates (1999) share this view; in their study on last gifts, they affirm that givers may immortalize their memory by finding the right home for their cherished possessions. Similarly, Price et al. (2000) argue that elderly consumers seek to achieve symbolic immortality through the disposal of such possessions (Price et al. 2000). Furthermore, Belk (1988) states that product should be considered extensions of the self and breeders of identity. Leaving a possession to later generations can therefore be seen as extending one’s existence beyond one’s death. In summary, consumer behavior may change depending on which consumer trait—agency or communion—is dominant.

Bagozzy and Dabholkar (1994) showed that pro-environmental consumer behaviors are driven by both egoistic (agentic) and altruistic (communal) goals. Based on this distinction, we posit that agentic-generative consumers (who want to be remembered) and communal-generative consumers (who want to contribute to future generations’ well-being) have different preferences in their purchase decisions. Personal-transcendent products, whose attributes have personal meaning and whose benefits endure over time (e.g., wedding rings and family pictures) will match more the goal of agentic-generative consumers than that of communal-generative consumers. On the other hand, socio-transcendent products, whose attributes have lasting social value (e.g., eco-friendly products, donating blood, and planting trees), will match more the goal of communal-generative consumers than that of agentic-generative consumers:

H2a: Agentic-generative consumers will show higher purchase intention than communal-generative consumers for personal-transcendent products.

H2b: Communal-generative consumers will show higher purchase intention than agentic-generative consumers for socio-transcendent products.

#### **4.- METHOD**

While generativity is a well-defined concept in psychology, transcendence has only been briefly mentioned in marketing literature (Belk et al. 1989). For that reason, we will run an exploratory study to check whether consumers perceive some products as more transcendent than others. This pretest will carry out in two stages. Stage one consists of a meeting with five marketing experts. They were told to use the Merriam-Webster dictionary (2009) definition of transcendence—“extending beyond the limits of ordinary experience”—during the study. In the questionnaire we will ask for them to list ten products or behaviors, five high in transcendence and five low in transcendence. In a second round, the 50 products will be presented to each expert. We will ask them to evaluate each product according to the statement “this product is very transcendent,” using a Likert scale ranging from 1 (“I totally disagree”) to 7 (“I totally agree”). The 16 products with the highest standard deviation were discarded, leaving a total of 34 products and behaviors.

Stage two will consist of a self-administered questionnaire distributed to a sample of students recruited from a large European university. The 34 products found during stage one will be shown to the respondents in random order. We asked the subjects to accomplish four tasks. First, they rated the transcendence of the products according to the statement “This product is very transcendent” (1 = “I totally disagree”; 7 = “I totally agree”). Next, they will rate the type of transcendence of the products according to the statement “this product is transcendent ...” (1 = “in a personal way”; 7 = “in a social way”). Then, we will ask them to write down which characteristics they thought defined products whose transcendence is high and which they thought defined products whose transcendence is low. Finally, we will ask them to write down which characteristics they thought defined personally transcendent products and which they think better defines socially transcendent products.

The independent variables—generativity, agency, and communion—will be measured afterward. For generativity, we will use McAdams and de St. Aubin’s 20-item scale (1992) Agency and communion will be measured using Dohi and Hirokawa’s (2004) 5-item scale for agency and their 5-item scale for communion respectively. The items on all the scales will rate on a 7-point scale (1 = “strongly disagree”; 7 = “strongly agree”).

#### **5. EXPECTED RESULTS AND CONCLUSIONS**

We expect that generative consumers will show a higher purchase intention than non-generative consumers for transcendent products. Consumers highly concerned with the well-being of future generations are more interested in transcendent products than those less concerned with it. Moreover, we predict that agentic-generative consumers will show higher levels of purchase intention for personal-transcendent products. Communal-generative consumers will show, as well, a higher purchase intention than agentic-generative consumers for socially transcendent products.

In summary, consumers differ in their concern about leaving a positive legacy to future generations, and the level of their concern affects their purchase intention. Leaving a personal legacy through purchasing personally transcendent products (e.g., family pictures) will be important for agentic-generative consumers. Socially transcendent products (e.g., recycled paper) will be more attractive to communal-generative consumers.

This research stems from the idea that individuals often think about the well-being of future generations, and that this has consequences for their behavior. More specifically, we addressed the question of how consumer generativity influences purchase intention and how this effect is moderated by product attributes. Our research increases the scant literature on generativity in the domain of marketing and consumer behavior.

We introduce a new criterion for product-classification schemas and find that consumers perceive different levels of transcendence in products. This new taxonomy of products and its relation with the characteristics of individuals contributes to the literature on the extended self and possessions (Belk 1988). Our findings will show that some consumers (generative) prefer transcendent products while others (non-generative) are indifferent to this attribute. Moreover, we find different behavior among generative consumers. Agentic-generative consumers pursue social dominance, while communal-generative consumers seek to form social bonds. Both groups show the same purchase intention for personal-transcendent products (e.g., family pictures) that benefit an in-group that is important to the consumers' identity.

## ABSTRACT

*People show a strong tendency to create a shared reality with others in terms of beliefs, emotions, or inner states; that is to say, they need others to be part of their reality. This desire is related to the so-called “saying-is-believing” effect, which occurs when individuals tailor their messages to particular audiences in order to achieve a shared reality. In this working paper, we demonstrate that the saying-is-believing effect plays a role in product evaluation, as consumers tailor their product attitude in the direction of other consumers’ opinion, with this effect being stronger for less preferred products. These findings provide important implications for marketing new products in today’s dynamic markets where category ambiguity is very frequent.*

## Keywords:

saying-is-believing effect, sharing sensations, product preference

## 1. Introduction

Humans, within their role of consumers and as social beings, show a strong motivation to share their understanding, emotions, beliefs, attitudes, goals and inner states with others (Hardin & Higgins, 1996; Higgins & Pittman, 2008; Rimé et al. 1999). This tendency is related to the idea of shared reality (Higgins, 2005), meaning that people who are motivated to create a shared reality with others frequently communicate to these others about a referent. Based on that premise, when people face new stimuli, they feel more confident about their evaluations when others agree, as part of their shared reality. Indeed, an interpersonal relationship is not even necessary. On the contrary, simply being aware of what others think can be enough for shared reality to emerge (Echterhoff et al. 2009). In that regard, the saying-is-believing effect occurs “when a message tailored to a particular audience influences a communicator’s subsequent memory and impression of the message topic” (Hausmann et al. 2008). Such audience tuning (Higgins, 1992) implies that communicators consider their audience’s point of view when sending messages (Schlosser, 2005).

As noted by Hirst and Echterhoff (2008), in addition to satisfy the need to affiliate and feel connected with others (relational need), the saying-is-believing effect is also a consequence of the need to know and to achieve a reliable understanding of the world and oneself (epistemic need). Thus, the creation of a shared reality is a process by which individuals achieve subjectively reliable and valid representations of their world as well as relationships with other people. The effect specially shows up when the subject perceives ambiguity in the available information about the target. That ambiguity elicits epistemic needs, which can be satisfied by creating shared reality through communication in order to (a) construct an audience-congruent representation of the target, and (b) attain a greater sense of certainty about what the target is actually like (Kopietz et al., 2010).

Product evaluation is a situation where ambiguities may play a significant role, as many new products that are launched in modern marketplaces are ambiguous with respect to the product categories that they belong to and possess features of multiple categories (Moreau, Markman and Lehmann, 2001). In this research, we demonstrate that the saying-is-believing effect plays a role in product evaluation, with the audience’s opinion leading to consumers’ evaluations being tuned with the expressed or perceived opinion. From a theoretical perspective, we extend previous results to consumer decision outcomes and show the relevance of this effect in consumer research. From a managerial perspective, our results are of high interest for marketers, offering additional ways to increase product evaluation.

The remaining of the paper is as follows. First, we present study 1, which serves as a first approach to the phenomenon in the context of product evaluation. Then, we report the main findings. Next, we design a follow-up study where we hypothesize the differential influence of the saying-is-believing depending on how preferable the product is. We then discuss the main results and draw implications for both theory and practice.

## 2. Study1

Based on the “saying-is-believing” effect, our prediction is that consumers would tailor their evaluation to the audience’s, i.e., opinions would be more favorable when information about the audience is available compared to the situation where no information is provided. Additionally, the moment the information is made available for the consumer may also play a role. Therefore, we expect the influence of audience to be stronger when consumers share their sensations while they taste the product. The rationale for this expected result relies on the fact that the consumer tastes the product and is informed about the audience opinion at the same time; consequently, she tries to accommodate her sensations to make it more likeable, trying to keep the positive sensations and disregard the negative ones. However, when sharing after tasting, the time elapsed between the tasting and the information received about the audience could interfere with the “tuning”, giving more weight to the consumer’s real sensations, and making the audience opinion less salient, which leads to a lower attitude. In other words, the “contamination” effect only occurs if the consumer does not have the opportunity to form an opinion previously and the chance only comes via tasting but also via external information about others’ opinion.

To test our hypothesis, we used a 2x2 experimental design where we manipulated the moment the experience was shared (during tasting vs. after tasting) and the availability of information about the audience opinion (no information, 95% of the audience likes the product).

We recruited a sample of 120 participants. Eight of them failed in the manipulation check so they were dropped from the database, leaving a total of 112 valid questionnaires. Results showed that the main effect of audience (no audience/audience) was significant ( $M_{na}=4.22$ ;  $M_a=5.09$ ;  $F(1, 108)=9.08$ ;  $p<.01$ ), whereas the main effect of moment of sharing (during/after) was not ( $F(1, 108)=0.828$ ;  $p>.10$ ). The interaction turned out to be non-significant as well ( $F(1, 108)=0.174$ ;  $p>.10$ ).

With regard to the influence of audience, as predicted, the exposure to other consumers' opinion makes the participant tune her opinion, leading to a more favorable attitude and confirming the saying-is-believing effect. A similar pattern was found for repurchase intention and positive emotions, whereas no effect was found for negative emotions, although the means followed the expected direction (see table 1). Thus, being exposed to others opinions leads consumers to adapt or tune their own opinion so that their attitude is more favorable, their intention to purchase the product is higher and the positive emotions related to the product are more intense. Consequently, we can assume that consumers show a tendency to adapt their opinion and about a product to that of others who have previously examined it. Audience is, then, an external factor that influences product evaluation.

Table 1. Means for experimental conditions

		During	After	Marginal means
Repurchase intention	No information	3.47	3.63	3.55
	95% likes	4.04	4.04	4.04
Positive emotions	No information	3.94	4.00	3.97
	95% likes	4.53	4.37	4.45
Negative emotions	No information	2.21	2.25	2.23
	95% likes	1.90	1.93	1.92

### 3. Study 2

The first experiment revealed that the “saying is believing” effect influences the evaluation of new products. However, so far we have not taken into account how likeable the product is. In other words, the tuning effect would be especially appealing if that implies that products whose flavor is not especially liked by consumers could turn into more preferred products merely because other people say they like it. To test that extent, we conduct a follow-up study, where we proposed that the presence of positive audience information can lead the consumer to like the product more.

The relevance of disliked or not really liked products for saying-is-believing effect is related to ambiguity. Following Gershoff et al. (2007), we can affirm that a liked product's attributes are likely to be lower in ambiguity than those of a disliked product, where attribute ambiguity is the extent to which the individual is uncertain about the product's underlying attribute ratings. For example, if a subject likes a restaurant, she is certain that she likes everything, but if she does not like that restaurant, she will associate greater attribute ambiguity because the underlying attribute ratings of hated alternatives may not be uniformly negative. Therefore, the effects of shared reality to satisfy needs of interpretation will be stronger when the consumer does not especially like new products but share her experience with others.

We used a 2x2 experimental design where we manipulated the availability of information about the audience opinion (no information, 95% of the audience likes the product) and the preference for the jelly bean flavor (less preferred flavor vs. highly preferred flavor). To identify the level of preference of the different flavors, we carried out a pretest where popcorn jelly beans were identified as a less preferred flavor and cantaloupe jellybeans as a highly preferred flavor. We controlled for participants' ability to correctly identify the jellybean flavor. For both popcorn and cantaloupe the participants had

difficulty to do it, that is to say, they could say whether they liked the flavor or not but they could not say what flavor it was.

At the moment of submission, we have recruited 101 valid questionnaires. We found a main effect of audience ( $F(1, 97)=4.04$ ;  $p<.05$ ) and preference ( $F(1, 97)=5.15$ ;  $p<.05$ ). Analysis of simple effects revealed that audience only had a significant influence for less preferred products (Figure 1). Thus, while there are no differences in attitude between information and no information about the audience for the highly preferred product ( $F(1,97)=0.58$ ;  $p>.10$ ), attitude was higher when information about the audience's opinion for the less preferred product was available ( $F(1, 97)=4.43$ ;  $p<.05$ ). Consequently, merely being exposed to positive opinions of other consumers can turn a low-preference product into a more likeable one.

**FIGURE 1**  
ANOVA results for attitude

#### 4. Study 3

At the time of submission, we are setting a follow-up experiment where we introduce the role of product attributes. The hypothesis we aim to test is that providing the consumer with the reason that leads the audience to like the product, i.e., a product attribute, alters the perception of such attribute, with subjects increasing their positive evaluation of it. The participants will be assigned to one of three conditions: no information about the audience opinion, 95% of the audience likes the product, 95% of the audience likes the product because it is sugar-free.

#### 5. Discussion

Consumers' need to share their reality with other people makes them susceptible to be influenced by others' opinions. Especially when consumers are asked to defend their opinion in the presence of others, they show a tendency to agree with the majority so that their evaluation is more easily understood. The consequences of this phenomenon are plain to see both from a theoretical perspective and from a managerial point of view.

Thus, as a first approach to the saying-is believing effect, study 1 confirmed that consumers tune their product evaluations to the opinion of others, regardless of the moment of sharing (during or after tasting). Study 2 clarified the initial results and showed that audience only plays a role for less preferred products. Thus, mere exposure to the favorable opinion of other customers turns a low-preference product into a highly preferred product. When the product is highly preferred, the tuning process does not occur because the consumer's real evaluation is close to the evaluation of other users so that no adjustment is needed to defend their opinion in front of others lately.

The implications for marketers are straightforward: highlighting that others like a product leads the focal consumer to be more attracted to it, even if she did not like it in advance. For sectors such as the food industry (e.g. healthy products that are not very tasty) or the pharmaceutical industry (e.g. an effective mouthwash whose flavor is not nice), our findings could help to build a positive attitude and

high purchase intention by making prospective consumers tune their opinion to match others' preferences.

## RESUMEN

*La gestión del conocimiento sobre el cliente (GCC) y la colaboración del cliente en los procesos de innovación han sido reconocidas como recursos estratégicos que proporcionan múltiples beneficios a las empresas, entre ellos resultados en su desempeño. En este sentido, este trabajo tiene como objetivo determinar la influencia de la colaboración del cliente -específicamente en el proceso de innovación-, sobre la GCC, así como el efecto que esta colaboración puede tener en los resultados de marketing, considerando el rol mediador de la GCC. Para ello se realizó un estudio con una muestra aleatoria de 210 empresas mediante entrevistas personales a sus directivos. Los resultados del estudio demuestran que la colaboración del cliente en el proceso de innovación es un antecedente de la GCC y que además ambos tienen efectos directos y positivos sobre los resultados de marketing. Los resultados obtenidos tienen implicaciones académicas y de gestión.*

## PALABRAS CLAVE:

*Gestión del conocimiento sobre el cliente; colaboración del cliente, resultados de marketing, innovación*

## 1. Introducción

---

<sup>1</sup> Este estudio ha sido financiado por la Cátedra Ciudad de Valencia 2013, convenio firmado por la Fundación Inndea (Ayuntamiento de Valencia) y la Universidad de Valencia.

La complejidad del entorno en el que actualmente actúan las empresas acelera la obsolescencia de sus competencias y al mismo tiempo exige la creación de nuevas fuentes de creación de valor (Spender, 1996). En un contexto de crisis económica, turbulencias del mercado y dificultades financieras, la gestión del conocimiento y la innovación se configuran como aliados para poder sobrevivir y mejorar el desempeño empresarial, manteniendo así la ventaja competitiva (Nonaka y Takeuchi, 1995; Pil y Holwelg, 2003; Ribeiro, 2003). En este contexto, las empresas innovadoras estarán más preparadas para operar en un entorno inestable, responder rápidamente a los cambios, encontrar nuevos productos y servicios y detectar las oportunidades que surjan en el mercado (Jiménez y Sanz, 2006).

La literatura señala como fuente de ventaja competitiva y recurso estratégico para la empresa la Gestión del Conocimiento (Teece et al., 1997; Vargo y Lusch, 2004). Este planteamiento está en línea con las últimas aportaciones desde el enfoque de Lógica Dominante del Servicio (LDS), y de forma particular, con las premisas fundamentales propuestas por Vargo y Lusch (2004) quienes afirman que el conocimiento es la fuente fundamental de la ventaja competitiva, representando la única base verdadera para el desarrollo de la misma, ya que es un recurso operante que potencia el servicio según Lusch, et al. (2007).

En base a la importancia que tiene la gestión del conocimiento y la creación del mismo a través de la colaboración con los *stakeholders* de la empresa como vía para generar ventajas competitivas sostenibles, el presente estudio tiene como objetivo general aportar comprensión sobre el comportamiento de la GCC en los resultados de marketing en el marco de los procesos de co-creación de innovación.

Si bien es cierto que en la revisión de la literatura se encuentran estudios sobre innovación y gestión del conocimiento, en realidad son pocos los que las han analizado de manera conjunta desde el marco teórico proporcionado por tres teorías: la teoría de recursos y capacidades (Wenerfelt, 1984; Barney, 1991), la LDS (Vargo y Lusch, 2004) y la teoría del aprendizaje organizacional (Senge, 1992). Otra contribución de este trabajo es el análisis de la variable gestión del conocimiento abordada de manera específica como gestión del conocimiento sobre el cliente. Si bien en la literatura existen numerosos trabajos sobre la gestión del conocimiento a nivel general (Bhatt, 2001; Alegre y Lapiedra, 2005; Lundwall y Nielsen, 2007; Esper, et al., 2010; Alegre et al., 2011; Tarí y García-Fernández, 2013; entre otros), son escasos los trabajos que abordan la gestión del conocimiento del cliente (Gibbert et al., 2002; Rowley, 2002; Gebert et al., 2003; Salomann et al., 2005; Sanayei y Sadidi, 2011). Desde el enfoque de la LDS, este conocimiento permite convertir al cliente en recurso operante en los procesos de co-creación de valor (Vargo y Lusch, 2004) y de innovación (Blazevic y Lievens, 2008), colaborando en la mejora de procesos y el desarrollo de nuevos productos.

Este trabajo se estructura de la siguiente forma. Primeramente, se examinan los conceptos de gestión del conocimiento y colaboración del cliente en la innovación, planteándose a continuación las hipótesis relativas a sus relaciones y de éstas con los resultados de marketing. Posteriormente, se presenta la metodología de la investigación y el contraste de hipótesis realizado a partir de un estudio empírico de naturaleza cuantitativa, con una muestra de 210 empresas de Valencia y su área metropolitana (España), utilizando como método de análisis la técnica de regresión por mínimos cuadrados parciales (PLS), para, finalmente, presentar resultados, conclusiones y futuras líneas de investigación.

## **2. Revisión de la literatura y planteamiento del modelo**

### ***2.1 Gestión del Conocimiento sobre el cliente***

Siguiendo la literatura y revisando las aproximaciones al concepto de conocimiento desde la teoría de recursos y capacidades, para Prahalad y Hamel (1990) éste representa un recurso valioso ya que la base de conocimientos de una empresa conforma sus competencias básicas y por tanto la creación de valor (Grant, 1996). Siguiendo con esta perspectiva, el conocimiento es un factor clave en la creación de valor de la empresa, lo que lleva a la misma a la necesidad de identificar cuál es su conocimiento disponible, y entender cómo adquirirlo, aplicarlo, almacenarlo y clasificarlo (Spender, 1996; Tsoukas,

1996). Desde la perspectiva de la LDS, Lusch et al. (2007) aportan que el conocimiento representa la única base verdadera para el desarrollo sostenible de la ventaja competitiva, ya que es un recurso operante que potencia la co-creación de valor.

El conocimiento, se encuentra dentro de las personas y se desarrolla por aprendizaje según Drucker (1993) y la teoría del aprendizaje organizacional. Una eficaz gestión del conocimiento implica que el mismo pase de ser un activo humano a ser un activo empresarial. Es por ello que se hace evidente la importancia de un compromiso expreso de todos los miembros de la organización, una correcta difusión del conocimiento en la empresa y, sobre todo, que se incorpore con éxito a los procesos o sistemas, productos y servicios, es decir, que quede institucionalizado en la empresa y perdure a sus miembros (Lloria, 2004).

Y puesto que el propósito de la gestión de conocimiento es mejorar el output para el cliente (Darling, 1996) la variable gestión GCC se configura como un constructo clave de estudio consecuencia del papel fundamental del cliente como co-creador de valor según la LDS (Vargo y Lusch, 2004). Dicha GCC se conceptualizaría como la aplicación de los conocimientos a través de la puesta en marcha de prácticas de organización para almacenar y difundir el conocimiento (Alavi y Leidner, 2001) y siguiendo a Alegre et al. (2011) la gestión del conocimiento en general, se considerará integrada por el conjunto de prácticas de gestión del conocimiento y por las capacidades dinámicas de la gestión del conocimiento. El conjunto de prácticas se refiere al resultado de la aplicación del conocimiento y consiste en los sistemas de gestión del conocimiento, las capacidades locales y conocimientos técnicos que se han implementado de manera específica en la empresa a fin de permitir la realización de actividades distintivas y las capacidades dinámicas son aquellas que se centran principalmente en la creación de conocimiento.

## ***2.2 Colaboración del Cliente en la innovación***

La investigación sobre la colaboración del cliente en la empresa como co-productor de servicios y co-creador de valor, constituye un área de investigación relativamente novedosa y por lo tanto, plantea una oportunidad de investigación (Blazevic y Lievens, 2008) dada la necesidad de operacionalizar y validar los modelos teóricos propuestos. Si bien es cierto que existen estudios previos que abordan la participación del cliente durante el encuentro del servicio (Bettencourt, 1997; Meuter et al., 2000; Bendapudi y Leona, 2003), aportaciones como la LDS reconocen la necesidad de abordar de forma más específica la colaboración del cliente para la provisión del servicio y la innovación (Blazevic y Lievens, 2008; Vargo y Lusch, 2004) pues a través de la colaboración de los clientes, las organizaciones aprenden, conocen mejor las necesidades del cliente, adaptan mejor sus productos y servicios y mejoran su rendimiento (Prahalad y Ramaswam, 2004).

Desde este enfoque, Ordanini y Parasuraman (2011) en las proposiciones de la LDS apuntan que un proveedor de servicios sin sus clientes no puede producir valor, esto es, que el cliente siempre juega un papel activo en la oferta de servicios por la integración de su propio conjunto de recursos y competencias en cualquier actividad de servicio (Zeithaml et al., 2009) y particularmente en la innovación a través de la competencia que denominan colaboración (Lusch et al., 2007). Así, la LDS define la capacidad para introducir a los clientes en el proceso y los utiliza como mecanismos para fomentar el cambio a través de la competencia de colaboración.

En el presente estudio se enfoca el concepto de colaboración del cliente en el proceso de innovación desde la perspectiva de la LDS y según la definición de Vargo y Lusch (2008), se entenderá dicha colaboración como un proceso donde la empresa interactúa y negocia con sus clientes para desarrollar una propuesta de valor y donde el cliente posee un papel activo como co-creador de innovación.

## ***2.3 La GCC, la colaboración del cliente en la innovación y los resultados de marketing***

Son escasos los estudios de carácter empírico que tratan la relación entre la colaboración del cliente en la innovación y la gestión del conocimiento -en general- en el ámbito de la innovación (Fang et al., 2008), encontrándose algunos de carácter conceptual (Lusch et al., 2007; Blazevic y Lievens, 2008). Fang et al. (2008) contrastan empíricamente que la participación del cliente en el desarrollo de nuevos productos afecta positivamente al intercambio de información y a la coordinación de la eficacia obteniendo resultados positivos. Blazevic y Lievens (2008) muestran cómo desde la perspectiva de la

LDS se puede ayudar a las empresas a gestionar la colaboración con el cliente y cómo las empresas pueden establecer a los clientes como socios de intercambio para la creación conjunta del conocimiento. En base a todo lo anterior y a la importancia del papel que desempeña el cliente en el proceso de innovación, se plantea la siguiente hipótesis:

**H1:** *La colaboración del cliente en el proceso de innovación afecta positivamente a la gestión del conocimiento sobre el cliente.*

Los directores de marketing sienten cada vez una mayor presión por medir el impacto y el valor del marketing en sus empresas (Clark, 1999; Kokkinaki y Ambler, 1999; Marketing Week, 2001) debido entre otros aspectos a la alta competencia y la escasez de recursos en las empresas. Estos son indicadores que valoran los resultados de cara al mercado y proporcionan una visión diferente y más estratégica de los resultados empresariales, ya que muchas veces se comete el error de evaluar la empresa únicamente teniendo en cuenta indicadores financieros que no proporcionan una visión externa, una visión de los resultados basada en el mercado. Los resultados de marketing permiten comprender, hacer seguimiento y gestionar las consecuencias de la aplicación de una u otra estrategia de marketing de cara a los mercados, a los clientes y a la competencia. Los resultados de marketing es un concepto que siguiendo a Vorhies y Morgan (2005) se utiliza para medir el grado en el que las empresas han alcanzado los objetivos comerciales (cuota de mercado, ingresos por ventas, adquisición de nuevos clientes y retención de los ya existentes).

Según Tarí y García-Fernández (2013) existen estudios teóricos que afirman cómo las prácticas de gestión del conocimiento influyen de manera positiva en los resultados operativos de las empresas (Davenport y Prusack, 1998; Massey et al., 2002) y ello ha sido validado empíricamente (Schulz y Jobe, 2001; Darroch y McNaughton, 2003; Tanriverdi, 2005; Lloch et al., 2007; Zack et al., 2009). Además existe una influencia positiva de la gestión del conocimiento sobre los resultados -como las ventas, la cuota de mercado y la rentabilidad- (Darroch y McNaughton, 2003; Tanriverdi, 2005; Huang y Shih, 2009). En base a lo anterior se plantea la siguiente hipótesis:

**H2:** *La gestión del conocimiento del cliente en el proceso de innovación tendrá efectos positivos en los resultados de marketing.*

Los trabajos de Matthing et al. (2004), Alam (2006) y Carbonell et al. (2009) concluyen que la interacción empresa-consumidor es favorable, entre otros, por los siguientes motivos: proporciona una idea más completa de lo que los consumidores quieren, desean o necesitan, reduce el tiempo de desarrollo de un nuevo servicio y se produce una mejora en el rendimiento económico-financiero del nuevo servicio. García et al. (2010) contrastan empíricamente que la participación de los clientes repercute favorablemente en los resultados de los clientes (como en la lealtad, la satisfacción del cliente y el valor añadido) y a su vez en los resultados empresariales como las ventas y la cuota de mercado.

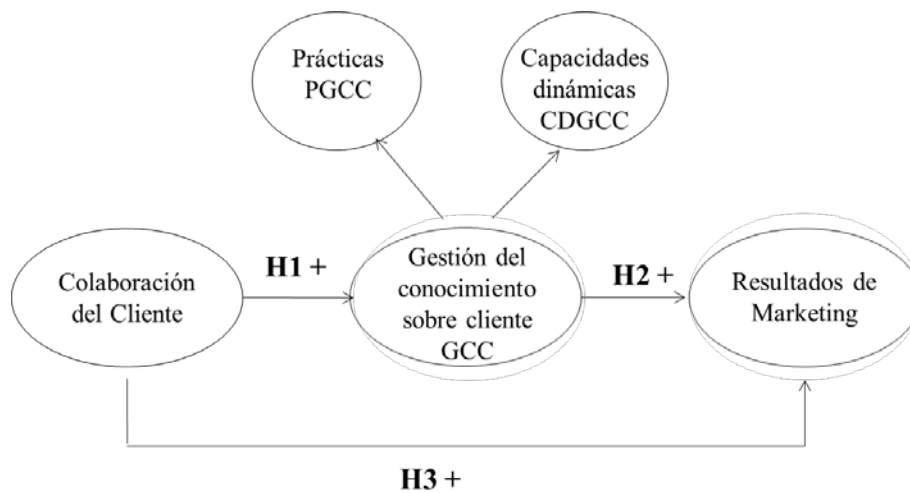

Además cuando el cliente colabora en el proceso de innovación se está llevando a cabo la co-creación del producto/servicio y ésta es la que provocará efectos positivos en los resultados empresariales (Vargo y Lusch, 2004; Ballantyne et al., 2008). Esto lleva a plantear la última hipótesis de investigación:

**H3:** *La colaboración de los clientes en el proceso de innovación tendrá efectos positivos en los resultados de marketing.*

En base a la discusión previa, se plantea en la Figura 1 el modelo de relaciones que incluye las tres variables analizadas así como las hipótesis propuestas

FIGURA 1

## Modelo de relaciones

Fuente: elaboración propia

### 3. Metodología de la investigación

Previamente a la recogida de información cuantitativa, se llevó a cabo una dinámica de grupo con representantes de las principales asociaciones empresariales de Valencia y su área metropolitana (8 asociaciones) con el objetivo de tener una mejor aproximación al concepto de innovación y mejorar el diseño del cuestionario utilizado. En este sentido, se les pasó un cuestionario sobre diversos aspectos relativos a su concepto de innovación, las barreras a la misma y ejes de oportunidades, tanto externas como internas.

Posteriormente, la obtención de los datos se realizó mediante encuesta personal estructurada a directores/gerentes de empresas, a una muestra de 210 empresas de Valencia y su área metropolitana, que fueron elegidas siguiendo un procedimiento de muestreo probabilístico por estratificación con afijación proporcional a todos los sectores de actividad de las empresas valencianas (agricultura-ganadería, industria, construcción y servicios). La mayoría de las empresas incluidas en la muestra tienen menos de 20 empleados (96%), el 60% son empresas con antigüedad de más de 6 años y los gestores/empresarios tiene más de 35 años de edad (81,5%), con estudios entre nivel básico e intermedio (69,5%). Se trabajó con un nivel de confianza del 95,45% y un error de estimación del +/- 7%. Considerando las características del universo de estudio, la muestra obtenida representa dicho universo y tal y como se observa corresponde un perfil de pyme. El trabajo de campo se realizó durante el mes de julio de 2013.

Los instrumentos empleados para la medición de las variables fueron adaptados de la literatura existente y se emplearon escalas Likert de 5 puntos. La colaboración del cliente en la innovación se midió mediante la escala de Ordanini y Parasuraman (2011) de 4 ítems. La GCC se midió adaptando la escala de Alegre et al. (2011), planteándose como un constructo de segundo orden con dos dimensiones: *prácticas de gestión del conocimiento sobre los clientes* (almacenaje del conocimiento y difusión del conocimiento) y *capacidades dinámicas de la gestión del conocimiento* (compuestas por las competencias de aprendizaje internas y externas) y para la medición de los resultados de marketing se empleó la escala de Vorhies y Morgan (2005) de 4 ítems la cual mide los resultados en relación a la competencia en los últimos 3 años (las escalas se encuentran recogidas en la tabla 1).

#### 4. Resultados

Los datos recogidos fueron analizados en dos etapas siguiendo a Barclay et al. (1995), en primer lugar se realizó la validación del instrumento de medida y en segundo lugar se continuó con la estimación del modelo estructural. Para estos análisis se utilizó la técnica de regresión por mínimos cuadrados parciales (PLS), mediante el software Smart PLS versión 2.0 (Ringle et al., 2005)

##### 4.1 Validación del Instrumento de Medida

La evaluación del modelo de medida implica el análisis de la fiabilidad individual del ítem, la consistencia interna o fiabilidad de una escala, la validez convergente y la validez discriminante (Barclay et al., 1995; Cepeda y Roldán, 2004).

La fiabilidad de los constructos se analizó en base a los criterios del  $\alpha$  de Cronbach y el índice de fiabilidad compuesta (IFC), obteniendo valores superiores a 0,7 en todos los casos, que es el valor recomendado (Churchill, 1979). Los valores del AVE fueron superiores a 0,5 en todos los casos, lo que refleja que más del 50% de la varianza de cada constructo es debida a sus indicadores (Cepeda y Roldán, 2004). Los resultados de estos análisis se resumen en la tabla 1.

**TABLA 1.**  
**Fiabilidad y validez convergente de las escalas de medida**

Factor	Ítem	Medias	Carga	$\alpha$ de Cronbach	IFC <sup>1</sup>	IVE <sup>1</sup>	
F1.Colaboración del Cliente (CC)	CC1	Interactuamos con los clientes para obtener información útil para el proceso	3,91	0,915*	0,97	0,98	0,91
	CC2	La intensidad con la que interactuamos con los clientes es elevada	3,83	0,966*			
	CC3	La frecuencia de encuentros con los clientes es alta	3,80	0,960*			
	CC4	El número de clientes con los cuales interactuamos es elevado	3,81	0,967*			
F2.Capacidades dinámicas de la gestión conocimiento sobre cliente (CDGCC)	CDGCC 1	(Soy mejor que mis competidores) en mi capacidad de obtener información sobre los clientes y sus necesidades (en ferias, eventos, noticias del sector, opiniones de expertos, boletines..) o de clientes con los cuales interactuamos es elevado	3,28	0,745*	0,86	0,89	0,58
	CDGCC 2	(Soy mejor ....) en mi eficaz y actualizada recopilación de información sobre los clientes	3,36	0,812*			
	CDGCC 3	(Soy mejor ....) en mi capacidad de obtener información sobre el cliente a través de la cooperación con las asociaciones de mi sector	3,20	0,719*			
	CDGCC 4	(Soy mejor ....) en mi capacidad de obtener información sobre el cliente a través de instituciones como universidades, institutos de investigación, escuelas de negocio	3,07	0,765*			
	CDGCC 5	(Soy mejor ....) en el grado de titulación académica de mis empleados, concretamente los que realizan las tareas de innovación y/o investigación	3,18	0,720*			
	CDGCC 6	(Soy mejor ....) en mi capacidad de situarme en primera línea de innovación (como capacidad de generar nuevos procesos, nuevos productos, nuevos mercados,..)	3,32	0,783*			
F3.Prácticas de la gestión del	PGCC1	Utilizamos sistemas de codificación del conocimiento o la información que tenemos sobre los clientes (en bases de	3,28	0,763*	0,92	0,93	0,66

conocimiento sobre cliente (PGCC)		datos, programas informáticos..)					
	PGCC2	Utilizamos mecanismos para fomentar el intercambio interno de información sobre los clientes	3,36	0,810*			
	PGCC3	Utilizamos técnicas de participación de nuestros empleados con los clientes (como reuniones con clientes, entrevistas con clientes para mejoras, etc.).	3,20	0,764*			
	PGCC4	Utilizamos herramientas para que la información de los clientes llegue a todos en la empresa	3,07	0,781*			
	PGCC5	Tenemos sistemas de procesamiento de información sobre los clientes	3,18	0,854*			
	PGCC6	Utilizamos sistemas de control y revisión de la información existente en la empresa sobre los clientes	3,32	0,847*			
	PGCC7	Empleamos sistemas que permiten que la información sobre el cliente que fue utilizada en tareas de innovación previas sea utilizada en nuevas tareas de innovación	3,41	0,865*			
F4.Resultados de Marketing (RM)	RMK1	El crecimiento de nuestra cuota de mercado es superior al de mi principal competidor	3,37	0,878*	0,92	0,94	0,81
	RMK2	El crecimiento de nuestros ingresos por ventas es superior al de mi principal competidor	3,28	0,915*			
	RMK3	La adquisición de nuevos clientes es superior a mi principal competidor	3,30	0,896*			
	RMK4	El incremento de las ventas a los clientes ya existentes es superior al de mi principal competidor	3,30	0,899*			

\* Todas las cargas son significativas  $p < 0,001$

<sup>1</sup> IFC: Índice de Fiabilidad Compuesta

IVE: Índice de Varianza Extraída

La validez discriminante se evaluó comparando la raíz cuadrada de los IVE con las correlaciones entre los factores. Se comprobó que las correlaciones eran inferiores a todas las raíces cuadradas del IVE (tabla 2).

**TABLA 2.**

**Instrumento de medida: validez discriminante**

	CC	CDGCC	PGCC	RM
CC	<b>0,9528</b>	0	0	0
CDGCC	0,3252	<b>0,7584</b>	0	0
PGCC	0,3285	0,4308	<b>0,8133</b>	0
RM	0,2538	0,4488	0,2896	<b>0,8974</b>

Los valores de la diagonal: son la raíz cuadrada de la varianza extraída

Los valores bajo la diagonal : son la correlación estimada entre los factores

De forma general y de manera descriptiva las medias de los indicadores que conforman las variables en una escala del 1 al 5 recogidos en la Tabla 1, indican con respecto a la colaboración activa de los clientes en la innovación que presentan una media superior a 3,8. En este sentido, esto indica que las empresas valencianas consideran clave, el papel del cliente en los procesos de innovación, interactuando con ellos para obtener información útil para dicho proceso, con una intensidad y

frecuencia adecuada. En relación a la variable GCC, en sus dos dimensiones (CDGCC y PGCC) se observa que la puntuación media de ambas es de 3,3. El ítem más valorado es aquel que se considera mejor que los competidores gestionando aspectos como búsqueda de información, recursos monetarios y formación, así como obteniendo información de los clientes en ferias, eventos, boletines y opiniones de expertos. Los dos ítems menos valorados han sido la gestión de información a través de instituciones de educación superior e institutos de investigación y la utilización de herramientas para que llegue la información a todos en la empresa. Los resultados de marketing con respecto al competidor señalan una media de 3,31. A nivel general esto señala un nivel medio en las capacidades para gestionar el conocimiento valorado por las empresas y los resultados de marketing de la muestra.

#### 4.2 Estimación del modelo estructural

Una vez evaluadas las propiedades psicométricas del instrumento de medida, se procedió a realizar el análisis del modelo estructural mediante PLS (*Partial Least Squares*). Para valorar la capacidad predictiva del modelo estructural se comenzó por evaluar los  $R^2$  que según Falk y Miller (1992) deben superar el valor de 0,1 y valores inferiores, aun siendo significativos, no serían aceptables. La Tabla 3, muestra que los  $R^2$  de todos los factores dependientes son superiores a 0,1 (el nivel crítico mencionado).

Se continuó evaluando la predictibilidad del modelo aplicando el *Test de Stone-Geisser* ( $Q^2$ ) para cada constructo dependiente a través del procedimiento *blindfolding*. Se comprobó que los  $Q^2$  revelaban una capacidad predictiva del modelo suficiente, ya que los valores superaban el 0 en todos los casos (tabla 3).

**TABLA 3.**  
**Contaste de las hipótesis**

Relación causal	Hipótesis	$\beta$ estandarizados	Valor T bootstrap
H1: Colaboración del cliente → GCC	Aceptada	0,385*	8,479
H2: GCC → Resultados de marketing	Aceptada	0,410*	7,878
H3: Colaboración del cliente → Resultados de marketing	Aceptada	0,096**	1,991
* $p < 0,001$ ; ** $p < 0,05$			
$R^2$ (gestión del conocimiento sobre cliente)= 0,1483 ; $R^2$ (resultados de marketing)= 0,2076			
$Q^2$ (gestión del conocimiento sobre cliente)= 0,0998 ; $Q^2$ (resultados de marketing)= 0,0217			

Los resultados obtenidos en la tabla 3 permiten aceptar las tres hipótesis propuestas, lo que significa que tanto la colaboración del cliente en la innovación como la GCC tienen efectos en los resultados de marketing, siendo la GCC quien tiene un mayor peso. Por lo tanto el efecto de la colaboración con el cliente en la innovación es mayor en los resultados, cuando éste es mediado por la GCC.

## 5. Conclusiones

Este trabajo plantea la importancia crítica de los recursos como base para la construcción de las capacidades organizacionales que sustenten la competitividad de las empresas (Wernerfelt, B. 1984; Grant, 1991; Amit y Shoemaker, 1993). Como afirma Grant (1996), cuanto más dinámico sea el entorno de la empresa, más sentido tiene basar su estrategia en los recursos y capacidades internos, a hacerlo frente a consideraciones de tipo externo. En este sentido, la gestión del conocimiento del cliente se configura como una variable estratégica clave, así como la colaboración del cliente en los procesos de innovación.

Detectado un hueco de investigación en torno a la variable GCC, este trabajo aporta un instrumento de medida así como antecedentes y consecuencias de esta variable que permiten comprender mejor su comportamiento.

Los resultados del contraste del modelo de relaciones analizado, confirman la importancia de la relación entre la colaboración con los clientes en la innovación, la GCC y los resultados de marketing.

Estos resultados son consistentes con la literatura, lo que demuestra que la gestión del conocimiento y la colaboración del cliente en los procesos de innovación de la empresa es un importante recurso estratégico para las mismas que contribuyen de manera positiva a la mejora en los resultados de marketing (Darroch y McNaughton, 2003; Chatham y Pastuzak, 2005; Huang y Shih, 2009).

Así mismo, se confirma la relación directa entre la colaboración de los clientes en el proceso de innovación y los resultados de marketing para la empresa

Los resultados obtenidos llevan a plantear diversas implicaciones para la gestión de las empresas. En primer lugar, debería ser una llamada de atención a los directivos sobre los beneficios que conlleva la gestión del conocimiento sobre el cliente en el proceso de innovación y en los resultados para sus empresas (Tari y García-Fernández, 2013), así como la necesaria orientación de la empresa hacia procesos que promuevan la colaboración del cliente en los diversos procesos de co-creación de innovación. Asimismo, los resultados ponen en evidencia la importancia que las empresas gestionen de manera sistemática sistemas de inteligencia de mercado, es decir, herramientas para el conocimiento real del mercado y sus tendencias, el conocimiento de los clientes y sus necesidades, más allá de percepciones sesgadas. En esta línea, recursos disponibles en instituciones como las universidades, los institutos de investigación o las asociaciones del sector son desconocidos como oportunidades para tal fin, como lo revelaron las medias de los indicadores obtenidos para diversos ítems de esa variable.

A continuación, se presentan las limitaciones del estudio así como nuevas líneas de investigación, muchas de ellas derivadas de las mismas. En primer lugar, señalar que se ha empleado una misma fuente de información (el director/gerente) para medir todas las variables del modelo (antecedente y consecuencia) y recoger la información en un mismo momento del tiempo, lo que podría generar un sesgo de la varianza común. Aunque esto es una práctica común, sería apropiado realizar la encuesta a diferentes informantes clave de la empresa y en momentos diferentes del tiempo. Un segundo aspecto a considerar se basa en que el estudio se ha realizado únicamente en Valencia y su área metropolitana, siendo interesante evaluar en un futuro el modelo con una muestra de empresas de diferentes áreas geográficas y / o países.

Finalmente, resultará de interés en estudios futuros introducir en el modelo otras variables que puedan actuar como consecuencias de la gestión del conocimiento sobre el cliente, tales como resultados financieros (rentabilidad, ROI) resultados para los clientes (satisfacción de clientes, retención de clientes) o la capacidad de innovación. Así mismo, resultaría de interés introducir nuevas variables antecedentes a la gestión del conocimiento sobre el cliente en las empresas como la cultura de innovación o la confianza y compromiso de los equipos de trabajo, (Davenport et al., 1998; Lloria, 2004). Por último, incluir como línea de investigación futura la colaboración de los trabajadores en el proceso de innovación tras las recientes evidencias de la importancia de dicha variable en proceso (Santos et al., 2013; Schlesinger y Andreu, 2013).

## RESUMEN

*El objetivo del estudio es analizar el modo en que los visitantes deportivos transfieren valor percibido y experiencia del evento a la marca patrocinadora. Así, en base a los modelos del comportamiento del turista y las teorías de patrocinio deportivo, se plantea un modelo global de patrocinio en un gran evento deportivo cuyo eje central se basa en los Modelos de Transferencia aplicados al valor y a la experiencia. Además, el modelo abarca tanto antecedentes que condicionan el comportamiento del visitante al evento deportivo como efectos derivados de la asistencia y la acción de patrocinio deportivo.*

*Los resultados permiten concluir que no se transfiere el valor percibido, pero sí la experiencia del evento a la marca patrocinadora. Asimismo, se observa el efecto de la experiencia sobre el valor percibido y se pueden confirmar la motivación, la identificación y la implicación como antecedentes del modelo, junto con todos los efectos propuestos.*

## Palabras clave

Patrocinio deportivo, transferencia, gran evento deportivo, turismo deportivo

## 1. Introducción

El turismo es una de las industrias con mayor importancia a nivel mundial y más en el contexto de la actual crisis e incertidumbre económica. Recientemente, los líderes mundiales del G20 han reconocido la importancia de los viajes y el turismo como motor impulsor del empleo, del crecimiento y de la recuperación económica (UNWTO, 2012; WTTC, 2013).

En el último informe Familitur publicado, el turismo de eventos deportivos es una de las razones que surgen entre las declaradas por los turistas para efectuar un viaje (IET, 2012). Este tipo de turismo puede elevar a nivel mundial la importancia del país o ciudad anfitriona y reposicionar su imagen (Smith, 2004; Walker, Kaplanidou, Gibson, Thapa, Geldenhuys y Coetzee, 2013). Asimismo, las empresas desembolsan grandes cantidades de dinero para patrocinar eventos deportivos (Chen y Zhang, 2011).

Sin embargo, hemos detectado un vacío en la literatura relativa al comportamiento del turista deportivo y al patrocinio deportivo y, en concreto, al estudio de la transferencia evento-marca patrocinadora (Smith y Stewart, 2007; Weed, 2009; Chang y McAleer, 2012; Reyes, 2013). Por ello, desde el presente trabajo se postula la necesidad de continuar investigando en este ámbito, que ha recibido poca atención (Wann et al., 2001) pero presenta un interés creciente (Preuss, et al., 2007; Weed y Bull, 2012), a fin de poder proporcionar a las empresas recomendaciones para optimizar su gestión.

La revisión de los modelos del comportamiento del turista deportivo y las teorías de patrocinio deportivo, permite el planteamiento de un modelo de patrocinio deportivo que recoja las principales aportaciones de la literatura. De manera más específica, el modelo se basa en los Modelos de Transferencia (Gwinner, 1997; Pracejus, 2004) aplicados a la transferencia del valor percibido y la experiencia.

Estos dos conceptos, estrechamente ligados al comportamiento del turista de este tipo de eventos, cobran cada vez más peso en la disciplina de marketing debido a la sofisticación del consumidor y el aumento de la competencia, entre otros. De hecho, en el ámbito del turismo, el estudio del comportamiento del turista ha mostrado la relevancia del valor percibido y la experiencia en el proceso de toma de decisiones.

Por tanto, en el presente trabajo se establece como hipótesis teórica la que a continuación se enuncia: Existe una transferencia evento-marca patrocinadora en términos de valor percibido y experiencia.

Con la intención de contribuir teórica y empíricamente al conocimiento en marketing, se propone como objetivo general del presente trabajo: plantear un modelo que aúne las teorías del comportamiento del consumidor y las teorías del patrocinio deportivo, en el marco de un gran evento.

Lo expuesto previamente, nos permite establecer un conjunto de objetivos y subobjetivos específicos de posible interés científico, tal y como se muestran a continuación:

El primer objetivo, es el análisis y evaluación del valor-experiencia percibidos por el visitante deportivo hacia un evento- marca patrocinadora. Este objetivo, que supone el eje central del modelo, se divide en cuatro subobjetivos, uno por cada una de las relaciones planteadas, y todas ellas referidas al visitante deportivo. Así, se realiza un análisis de la transferencia evento-marca patrocinadora, tanto de valor percibido como de experiencia. Y se analiza el efecto de la experiencia sobre el valor percibido, tanto del evento como de la marca patrocinadora.

El segundo objetivo, es el análisis y evaluación de las variables antecedentes del eje. Este objetivo se separa en cinco subobjetivos, uno por cada una de las variables antecedentes analizadas. Fruto del análisis de la literatura y de la revisión de los modelos del comportamiento del turista y de las teorías de patrocinio, estas son: la motivación del turista deportivo, la implicación con el evento, la exposición al evento, la identificación con el equipo o piloto y la familiaridad con la marca patrocinadora.

El tercer objetivo, es el análisis y evaluación de los efectos del eje. De igual modo que el objetivo previo, este tercer objetivo se divide en cinco subobjetivos en función de los siguientes efectos detectados en estudios previos: el conocimiento de la marca patrocinadora, la satisfacción con el evento, la satisfacción

con la marca patrocinadora, el comportamiento futuro con el evento y el efecto del patrocinio en la marca patrocinadora.

Para alcanzar los objetivos expuestos, se planteó la siguiente estructura: primero se establece el marco conceptual general. Seguidamente se presenta el modelo teórico propuesto y el desarrollo de las hipótesis. A continuación, se recoge la metodología de la investigación y, finalmente, se presentan, analizan y discuten los resultados de la investigación y se establecen las conclusiones generales.

## **2. Marco teórico**

Para el planteamiento de un modelo teórico es importante el uso de teorías que respalden y den consistencia a las relaciones que en el mismo se plantean. Es por ello que consideramos importante abordar las diferentes teorías del comportamiento del turista en primer lugar y del patrocinio deportivo en segundo lugar, en el marco del turismo deportivo para adoptar la visión del visitante deportivo. Así, a continuación se ahonda en el concepto de turismo deportivo, se detallan los modelos del comportamiento del consumidor y finalmente las principales teorías del patrocinio deportivo.

### ***2.1 Turismo deportivo***

En la literatura relativa al turismo deportivo, es posible encontrar tres tendencias diferenciadas para aportar una conceptualización del término, basadas en la propuesta de Latiesa y Paniza (2006). Así, los autores establecen un marco teórico sobre turismo deportivo, analizando tres concepciones distintas: modelo amplio, modelo intermedio y modelo restrictivo.

La mayoría de los autores mantienen un marco conceptual amplio que entiende el turismo deportivo como aquellas actividades que se realizan fuera del lugar habitual de residencia, tanto por motivos competitivos como recreacionales (Esteve Secall, 1991; Standeven y De Knop, 1999; Weed y Bull, 2009).

Las críticas que recibe este modelo amplio están relacionadas con su extensión, ya que, numerosas actividades pueden ser consideradas como deportivas y, por tanto, son susceptibles de clasificarse como turismo deportivo.

Con la intención de contrarrestar estas críticas, se encuentra el modelo intermedio, en el que el turista deportivo está motivado a priori por una actividad o evento deportivo para realizar sus desplazamientos recreacionales o competitivos (Hall, 1992; Gammon y Robinson, 1997; Gibson, Attle y Yiannakis, 1998; Gibson, Willming y Holdnak, 2002; Latiesa y Paniza, 2006; Hinch y Higham, 2001, 2011).

Finalmente, la conceptualización restrictiva se centra únicamente en aquel turista deportivo que participa activa o pasivamente en eventos deportivos competitivos (Nogawa et al., 1996; Weed y Bull, 1997; Deery et al., 2004; Weed y Bull, 2012). En este marco, el turismo deportivo es esencialmente turismo de eventos. Así, se considera que para que pueda identificarse a una persona en la categoría de turista deportivo, su motivación clave para realizar el viaje tiene que ser la práctica deportiva competitiva, ya sea como participante activo en el evento, o para visionar un evento deportivo (por ejemplo, la Fórmula 1).

El presente trabajo se centra exclusivamente en este modelo restrictivo del turismo deportivo. En concreto, se entiende la actividad deportiva como espectáculo, aunque se acepta el modelo amplio. La revisión de la literatura realizada respecto al concepto del turismo deportivo, permite afirmar que la mayoría de las definiciones comparten las motivaciones del viaje, capaces de clasificar a un turista como turista deportivo. De ahí la relevancia de ver las principales motivaciones del viaje y clasificar al turista en base a ellas. En todo momento, se observa como la motivación es una herramienta fundamental para explicar el comportamiento del turista deportivo y que juega un papel relevante el desarrollo de la comercialización turística y el marketing.

## ***2.2 Modelos del comportamiento del turista***

A lo largo de los años son muchos los autores que se han preocupado por explicar el comportamiento del turista a través de diferentes modelos, en concreto, desde la presente investigación proponemos una clasificación de cinco categorías entre los modelos desarrollados por la literatura.

En primer lugar, los modelos ampliados (Wahab, Crampon y Rothfield, 1976; Schmoll, 1977; Mayo y Jarvis, 1981; Van Raaij y Francken, 1984; Gilbert, 1991), son aquellos desarrollados a partir de los modelos clásicos del comportamiento del consumidor (Nicosia, 1966; Engel, Kollat y Blackwell, 1968; Howard y Sheth, 1969). En este grupo, destaca la importancia de ahondar con más detalle en los modelos previos comúnmente aceptados.

En segundo lugar, agrupamos los modelos que consideran el conjunto relativo de alternativas disponibles. En este campo han sido tres las aportaciones más destacadas (Woodside y Lysonski, 1989; Um y Crompton, 1990; Woodside y MacDonald, 1994), las cuales barajan las diferentes posibilidades de elección para explicar el comportamiento de compra del turista.

En tercer lugar, detectamos modelos ampliados y basados en el conjunto de elección (Moutinho, 1987; Crompton, 1992). Este tipo de modelos, comparten características de los dos grupos de modelos de comportamiento del turista previamente analizados, lo que implica una mayor complejidad que puede dificultar su operatividad.

En cuarto lugar, es posible clasificar un grupo de modelos dinámicos. En este grupo hemos incluido los modelos que reconocen la importancia del dinamismo de algún constructo que forma parte del proceso (Mathieson y Wall, 1982; Middleton, 1988; Valdez y Chebat, 1997). Así, por ejemplo Valdez y Chebat (1997) diseñan un modelo donde el dinamismo en la percepción del turista acerca de los atributos del producto turístico es el eje central, de forma que supera el problema de la visión estática de los destinos de otros autores.

En quinto y último lugar, se agrupan los modelos funcionales atendiendo a la facilidad, utilidad y comodidad de su empleo (Clawson y Knetsch, 1966, 2011; Teare, 1994; Eugenio-Martín, 2003; Hyde y Laesser, 2009). Comparten la idea de que el proceso de toma de decisiones del turista es una actividad de carácter funcional influida por variables psicológicas y no psicológicas.

En concreto, la presente investigación defiende los modelos funcionales, además de por su comodidad de empleo, porque destacan principalmente la importancia de la experiencia turística en el proceso de toma de decisiones del turista.

## ***2.3 Teorías de patrocinio deportivo***

Las principales teorías revisadas sobre patrocinio deportivo revisadas, a partir de las contribuciones de diversos autores (McDaniel, 1999; Madrigal, 2000; Meenaghan, 2001; Pracejus, 2004; Kim, 2006; Alonso, 2013), han sido especialmente relevantes para la proposición del modelo teórico de la presente investigación. A continuación se lista una escueta descripción de las mismas.

Teoría del Equilibrio (Heider, 1958): Frente a asociaciones nuevas o inesperadas para el consumidor éste tiende a alterar sus percepciones con el fin de armonizarlas.

Teoría de la Mera Exposición (Zajonc, 1968; 1980): La exposición repetida a un estímulo de aquellos que se identifican con él puede, sin que intervengan las actitudes, desencadenar por sí misma el conocimiento del objeto al que se está expuesto.

Teoría de la Identidad Social (Tajfel y Turner, 1979): Los individuos establecen auto-conceptos y definiciones a través de su afiliación o conexiones con ciertos grupos sociales a los que pertenecen (identificación con el equipo, deportistas, etc.).

Modelo de la Transferencia Afectiva (Pracejus, 2004): Considera la transmisión de sentimientos positivos desde un evento hasta una marca patrocinadora por asociación.

Modelo de la Transferencia de Imagen (Gwinner, 1997): La transferencia de asociaciones relacionadas con una marca o empresa desde el patrocinado al patrocinador.

Teoría de la Señal (Spence, 1973; Ross, 1977): Las actividades de patrocinio por parte de las organizaciones pueden deberse a importantes esfuerzos de marketing. Las señales de marketing influyen en la codificación de la información del consumidor.

Teoría de la Atribución (Heider 1958; Jones y Davis, 1965; Kelley, 1973): Los individuos asignan causas o explicaciones a un hecho observado a través de un proceso cognitivo. Existe una relación directa entre las motivaciones y sus actitudes y comportamientos.

### **3. Planteamiento de un modelo de patrocinio deportivo**

Sobre la base de la revisión de la literatura en materia de comportamiento del turista y patrocinio deportivo, se desarrollan y formulan las hipótesis de trabajo que nos han permitido plantear un modelo teórico de relaciones estructurales susceptible de ser contrastado empíricamente y capaz de satisfacer los objetivos de investigación. El modelo consta de tres partes fundamentales en las que se basa este apartado: eje central, antecedentes y efectos.

#### ***3.1 Eje central: valor percibido y experiencia, transferencia del evento a la marca.***

En relación con el eje central del modelo propuesto, es importante la transmisión de las percepciones que poseen de la actividad patrocinada hacia las percepciones de la marca o empresa patrocinadora, de manera que la asociación entre evento y marca conducen al visitante al evento a trasladar las percepciones hacia el evento hacia la marca que lo patrocina (Meenaghan, 2001; Smith, 2004; Grohs y Reisinger, 2005; Küster, Vila, Aldás y Rodríguez, 2009). En concreto, se ha considerado para dicha transmisión, los constructos valor percibido y experiencia. El valor percibido entendido como la evaluación global del consumidor de la utilidad del evento y la utilidad de la marca, basada en la percepción de lo que se recibe y de lo que se entrega (Zeithaml, 1988). La experiencia, considerada como un paso más allá de los servicios (Pine y Gilmore, 1999) generando emociones, de mayor o menor intensidad, que influyen tanto en el actitud del turista durante el evento como en su comportamiento futuro (Bigné, 2004). A partir de esta idea y en base a la clasificación de tipos de experiencias propuesta por Schmitt (1999), la presente investigación se ha basado en las emociones para aproximarse a la experiencia hacia el evento patrocinado, y en las actitudes para conocer la experiencia hacia la marca patrocinadora. Se asume así, que los asistentes al evento deportivo, por su relación con el mismo y por el ambiente físico, pueden generar diversas emociones (Bitner, 1992). Mientras que, como consecuencia del patrocinio, dichos asistentes al evento realizan asociaciones mentales, que se traducirá en una determinada actitud y comportamiento hacia la marca patrocinadora (Meenaghan, 2001).

Así, respecto al objetivo principal, y en base a los Modelos de Transferencia, postulamos la transferencia del evento a la marca, tanto del valor percibido como de la experiencia. Del mismo modo, según lo argumentado en la Teoría de la Atribución y en los modelos del comportamiento del turista, planteamos el efecto de la experiencia sobre el valor percibido.

#### ***3.2 Antecedentes del valor percibido y experiencia***

En segundo lugar, y atendiendo al segundo objetivo de la investigación, se recogen a continuación los cinco antecedentes del eje del modelo: motivaciones, implicación con el evento, exposición al evento, identificación con el equipo o piloto, familiaridad con la marca.

Respecto a las motivaciones, excepto en los viajes por motivos de trabajo, raramente las motivaciones del turista están influidas por un sólo motivo, la decisión de emprender un viaje y la elección de un destino, dándose varias motivaciones combinadas (Trail y James, 2001; Trail y James, 2011). De ahí la necesidad de tener en cuenta aspectos racionales e irracionales, conscientes e inconscientes, externos e internos, etc. Así, la elección del tipo de vacaciones y del destino viene representada por un compromiso entre las múltiples motivaciones que se interrelacionan entre sí y las posibilidades que el destino ofrece, pero en algunas ocasiones es posible encontrar un motivo predominante, como por ejemplo la asistencia a un evento deportivo (como es el caso de la presente investigación). Por lo que respecta a la motivación para realizar turismo de eventos deportivos, la revisión de la literatura muestra diversas motivaciones pertenecientes a dimensiones: psicológicas (estética / placer estético, drama / eustress, escapar, atracción física, entretenimiento, excitación, suspense); socio-culturales (interacción familiar y social, interacción social / grupo de afiliación, conexiones culturales, adquisición de conocimiento, habilidades físicas, factores económicos, modelos de rol, ambiente saludable, apoyo a las oportunidades de las mujeres, aspectos técnicos); y de pertenencia social (logro indirecto / autoestima, interés en el deporte, interés en el equipo, interés en el jugador, orgullo nacional, conexiones tribales).

De este modo, a partir de los estudios previos, y tomando como línea argumental lo postulado en la Teoría de la Atribución, planteamos que a más motivación más identificación con el equipo o piloto, y para el evento, más valor percibido, satisfacción y comportamiento futuro.

Por otro lado, se ha propuesto la implicación con el evento como un antecedente al considerarlo un factor clave en el proceso de persuasión del patrocinio, analizado en diversas investigaciones de espectadores deportivos (Wann, 1995; Iwasaki y Havitz, 1998; Trail y James, 2001; Fink, Trail y Anderson, 2002; Kyle y Mowen, 2005; Bouchet, Bodet, Bernache-Assollant y Kada, 2011). Además de representar un aspecto determinante para que el consumidor se vea expuesto al evento, también posee un efecto significativo en la identificación con el equipo (o piloto/deportista) y el conocimiento de la marca patrocinadora. Por todo ello, se postula que la implicación con el evento se asocia positivamente con la exposición, la identificación y el conocimiento de marca, tomando, para ello, como premisa la Teoría de la Identidad Social.

Otro antecedente considerado en esta investigación es la exposición al evento, importante para que el patrocinio se convierta en una herramienta de comunicación efectiva. El visitante al evento deportivo está disfrutando de un espectáculo que encaja con sus patrones de ocio, por lo que podemos afirmar que el patrocinio se convierte en una herramienta de comunicación más efectiva que otras. Así, y en base a la argumentación defendida por la Teoría de la Mera Exposición, nos centramos en la exposición al evento y su influencia tanto en el valor percibido del evento como en la experiencia con el evento.

La identificación con el equipo o piloto también se asume como antecedente a la transferencia entre evento y marca patrocinadora, por entenderse como la percepción de la conectividad de los espectadores a un equipo y la experiencia de los fallos y logros del equipo como si fueran propios (Ashforth y Mael, 1989). En este contexto, y en relación con los resultados alcanzados en estudios previos, basados en la Teoría de la Identidad Social, es posible plantear que conforme más identificación más experiencia con el evento y la marca, y más conocimiento y satisfacción con la marca.

Adicionalmente, podemos asumir que la familiaridad con la marca en términos de patrocinio, entendida como la cantidad de asociaciones que se encuentran en la mente de los consumidores sobre el evento patrocinado y el patrocinador, es un antecedente y punto de partida importante para explicar la identificación del patrocinio y transferencia de percepciones hacia la marca. Por ello, a partir de las premisas recogidas en la Teoría de la Señal y la Teoría del Equilibrio, es posible plantear que la familiaridad con la marca supone un mayor valor de marca.

### ***3.3 Efectos del valor percibido y experiencia***

En último lugar, coincidiendo con el objetivo tercero de la investigación, en relación a los resultados o efectos del patrocinio, la revisión de la literatura (Meenaghan, 1991; Rajaretnam, 1995; Crimmins y Horn, 1996; Hoek, Gendall, Jeffcoat y Orsman, 1997; Pope, 1998; Bennett, 1999; Meenaghan, 2001a; Meenaghan, 2001b; Harvey 2001; Calderón, Nicolau y Mas, 2002; Hickman, Lawrence y Ward, 2005; Alexandris, Tsaousi y James, 2007; Dees, Bennett y Villegas, 2008; Nickell, Cornwell y Johnston, 2011) nos permite plantear que los principales resultados del patrocinio son: la rentabilidad, la imagen del patrocinador, la transmisión de la imagen, la mejor disposición hacia el patrocinio que hacia la publicidad, el efecto halo, la respuesta del consumidor, generar niveles de conciencia, generar percepción de uso generalizado, generar gratitud o agradecimiento, la buena voluntad, aumentar la moral de los empleados y la implicación de los fans.

En concreto, el modelo teórico propuesto recoge dos efectos directos y dos efectos indirectos. Por un lado, observamos como efectos directos la satisfacción con el evento y con la marca patrocinadora que toman como base los principios postulados en los modelos de comportamiento del turista, y se propone que a más valor y experiencia más satisfacción. Por otro, y en base a la argumentación defendida por las teorías del Equilibrio, la Atribución y la Señal, observamos como efectos indirectos los comportamientos futuros hacia el evento y la marca provocados por la satisfacción. Con objeto de facilitar la lectura y la interpretación de todas las hipótesis de investigación, se construye la Tabla 1

**TABLA 1**  
**Resumen de las hipótesis y objetivos y subobjetivos de investigación**

**OBJ 1:** Análisis y evaluación del vínculo valor-experiencia percibidos por el visitante deportivo hacia un evento patrocinado- marca patrocinadora.

- 1.1 Transferencia del valor percibido del evento hacia el valor percibido de la marca que lo patrocina.
- 1.2 Transferencia de la experiencia con el evento hacia la experiencia con la marca que lo patrocina.
- 1.3 Efecto de la experiencia con el evento sobre el valor percibido del evento.
- 1.4 Efecto de la experiencia con la marca patrocinadora sobre el valor percibido de la marca.

**Hipótesis relativas al eje central del modelo**

- H1: El valor percibido del evento afectará al valor percibido de la marca.  
H2: La experiencia que se tenga con un evento afectará a la experiencia que se tenga con una marca.  
H3: La experiencia tendrá un efecto sobre el valor percibido.

- H3.1: La experiencia con el evento tendrá un efecto sobre el valor percibido del evento.
- H3.2: La experiencia con la marca tendrá un efecto sobre el valor percibido de la marca.

**OBJ 2:** Análisis y evaluación de las variables antecedentes de la transferencia valor percibido-experiencia.

- 2.1 Análisis y evaluación de la motivación del turista deportivo.
- 2.2 Análisis y evaluación de la identificación con el equipo o piloto.
- 2.3 Análisis y evaluación de la implicación con el evento.
- 2.4 Análisis y evaluación de la exposición al evento.
- 2.5 Análisis y evaluación de la familiaridad con la marca patrocinadora.

**Hipótesis relativas a las variables antecedentes**

- H4: A más motivaciones del turista deportivo:  
H4.1: Mayor será la identificación con el equipo (escudería) o piloto.  
H4.2: Mayor será el valor percibido del evento.  
H4.3: Mayor será la satisfacción del evento.  
H4.4: Mayor influencia en el comportamiento futuro del evento.  
H5: La implicación con el evento está positivamente asociada con:  
H5.1: Una mayor exposición al evento.  
H5.2: La identificación con el equipo o piloto.  
H5.3: La marca patrocinadora.  
H6: La exposición al evento patrocinado se asocia positivamente con:  
H6.1: El valor percibido del evento.  
H6.2: La experiencia del espectador con el evento.  
H7: La identificación con el equipo o piloto se asocia positivamente con:  
H7.1: La experiencia con el evento.  
H7.2: La experiencia con la marca.  
H7.3: El conocimiento de la marca patrocinadora.  
H7.4: La satisfacción con la marca patrocinadora.  
H8: La familiaridad con la marca se asocia positivamente con el valor percibido de marca.

**OBJ 3:** Análisis y evaluación de los efectos derivados de la transferencia valor percibido-experiencia.

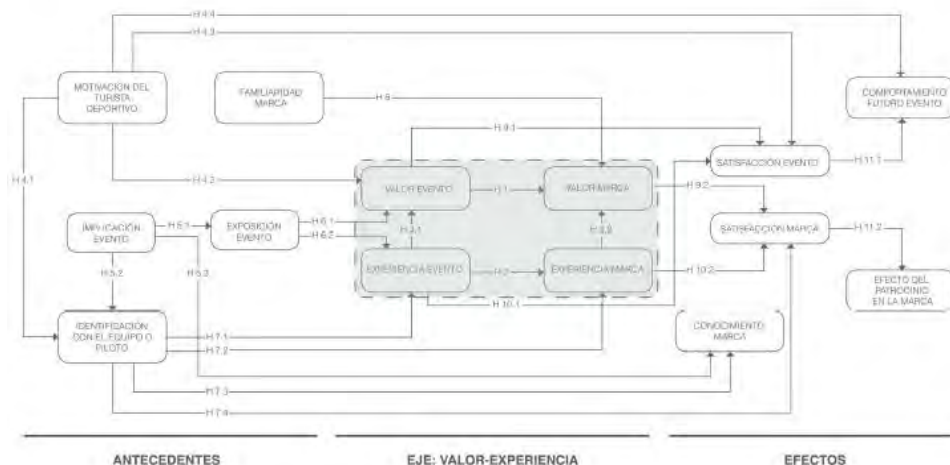

- 3.1 Análisis y evaluación del conocimiento de la marca patrocinadora.
- 3.2 Análisis y evaluación de la satisfacción con el evento.
- 3.3 Análisis y evaluación de la satisfacción con la marca patrocinadora.
- 3.4 Análisis y evaluación del comportamiento futuro con el evento.
- 3.5 Análisis y evaluación del efecto del patrocinio en la marca patrocinadora.

**Hipótesis relativas a los efectos**

- H9: Cuanto mayor sea el valor percibido por el individuo mayor será:  
H9.1: Su satisfacción con el evento.  
H9.2: Su satisfacción con el patrocinador.  
H10: La experiencia influye en:  
H10.1: La satisfacción del individuo con el evento.  
H10.2: La satisfacción del individuo con la marca.  
H11: Cuanto mayor sea la satisfacción del individuo con:  
H11.1: El evento mayor será su comportamiento futuro hacia el evento.  
H11.2: La marca patrocinadora mayor será el efecto del patrocinio en la marca patrocinadora.

Llegados a este punto, la suma de objetivos e hipótesis expuestos previamente, da como resultado el modelo global de patrocinio deportivo que se muestra en la Figura 1. Los diferentes conceptos del modelo se midieron con escalas validadas en estudios previos.

FIGURA 1.  
Modelo teórico propuesto

#### 4. Metodología

En relación a la metodología de la investigación, basamos la justificación del sector objeto de estudio, tratando de dar respuesta sobre el ¿dónde?, el ¿qué?, el ¿por qué? y el ¿cuándo?

Respecto al ¿dónde?, se ha barajado como mejor opción la ciudad de Valencia. La misma ha apostado decididamente por el deporte y los grandes eventos deportivos, y el turismo de eventos deportivos ha adquirido una importancia destacada dentro del panorama turístico de la ciudad. Adicionalmente, en los últimos años ha recibido importantes galardones, como reconocimiento a su trabajo en el ámbito tanto turístico como deportivo.

Respondiendo al ¿qué?, se ha seleccionado el Gran Premio de Europa de Fórmula 1, evento deportivo mundial de periodicidad anual hasta el año 2012. El principal motivo ha sido que esta competición está considerada como uno de los eventos deportivos más prestigiosos del mundo. En relación con los objetivos de la presente investigación, la selección de este evento es idónea tanto por lo que respecta a su notoriedad y afluencia de visitantes, como por lo que respecta al patrocinio deportivo.

Por otro lado, el ¿por qué? de la elección de la marca Telefónica para aplicar el análisis del patrocinio deportivo, es, principalmente, que se trata del patrocinador oficial del evento.

Finalmente, para justificar la elección tomada de ¿cuándo?, se ha optado por realizar el trabajo de campo durante el evento del año 2010 por la importancia detectada a priori en las primeras carreras disputadas del mundial de Fórmula 1 de ese año, y por las primeras noticias publicadas sobre la posible cancelación del contrato.

Para el diseño de la investigación empírica se plantea una investigación cualitativa y cuantitativa de manera complementaria, sin ser mutuamente excluyentes.

La investigación cualitativa pretende corroborar la inclusión de determinados elementos tanto en el desarrollo teórico, como en el modelo propuesto. En este sentido, se recurre a la dinámica y al pretest.

Adicionalmente se lleva a cabo una investigación de naturaleza cuantitativa a fin de poder contrastar la validez de las hipótesis y modelo propuestos en el evento objeto de estudio seleccionado a priori. Para ello se ha utilizado como método de recogida de información el cuestionario personal.

Cabe destacar de la ficha técnica del estudio (Tabla 2), que se han encuestado a 364 visitantes deportivos de los cuales 163 son excursionistas (que no pernoctan) y 201 turistas. De los turistas encuestados 96 son internacionales, a los que se les realizó el cuestionario en inglés.

TABLA 2.  
**Ficha técnica**

<b>Periodo del trabajo de campo:</b> del 25 al 27 de junio de 2010		
<b>Recogida de información:</b> mediante encuesta personal en los accesos al circuito		
<b>Población a analizar:</b> Asistentes al 3er GP de Europa Fórmula 1 2010		
<b>Error muestral</b> (si hubiera sido muestreo probabilístico): $\pm 5,2\%$ , aplicando el tipo de muestreo por cuotas, y bajo el supuesto de la situación más desfavorable ( $p=q=0,5$ )		
<b>Nivel de confianza:</b> 95%.		
<b>Muestra:</b> 364 asistentes:	163 excursionistas	
	201 turistas:	105 nacionales 96 internacionales
<b>Idioma del cuestionario:</b> inglés y castellano		

El perfil tipo de la muestra se trata de un hombre joven con estudios universitarios, y trabajador en activo de clase social media, que se declara fan del evento, o de una escudería o de un piloto. Respecto a la procedencia de los visitantes nacionales, la mayoría son de Valencia, Madrid, Alicante y las Islas Baleares. Respecto a los turistas extranjeros, puede destacarse que el Reino Unido es el principal país emisor, seguido de otros países, como Alemania e Italia.

## 5. Resultados

Para el contraste del modelo teórico propuesto y sus hipótesis derivadas, se han aplicado técnicas de Análisis de Ecuaciones Estructurales (SEM), mediante los programas EQS 6.1 y SmartPLS 2.0.

Llegados a este punto, para recoger los resultados de la investigación nos centramos en detallar exclusivamente el análisis del modelo estructural para contrastar las relaciones establecidas en las hipótesis. Sin embargo, no es posible llevar a cabo dicho análisis sin realizar previamente un proceso basado en las tres partes que a continuación se resumen.

En la primera parte, se hizo un análisis descriptivo para comparar visitantes nacionales e internacionales utilizando la *t* de *student*, contraste paramétrico de las medias para dos muestras independientes, que refleja, para un determinado nivel de confianza, si las diferencias son estadísticamente significativas o no (Bello, Vázquez y Trespalacios, 1996; Hair, et al., 2009). Tras ello, concluiríamos dos puntos: (i) que ambos grupos difieren significativamente en algunas variables, como por ejemplo motivación, exposición e identificación; y (ii) que por parte del visitante deportivo, tras la celebración del evento, se percibe de manera mucho más favorable el evento que la marca patrocinadora, con independencia de cuál sea su nacionalidad de origen.

En la segunda parte, se pasaron de segundo a primer orden las escalas multidimensionales, el valor del evento, el valor de la marca, mediante el siguiente proceso: (i) se procedió a analizar las características psicométricas de las cuatro escalas, y (ii) se calcularon las puntuaciones factoriales necesarias para transformar el modelo de segundo orden a primer orden.

En la tercera parte, Se validó el modelo. Para ello atendemos a la fiabilidad de los constructos; la validez discriminante; el tamaño y significación de los coeficientes *path*; y la habilidad predictiva del modelo (Hulland, 1999). Finalmente, se analiza el modelo estructural para contrastar las relaciones establecidas en las hipótesis.

En la Tabla 3, se observan los resultados del análisis estructural a través de PLS, mostrando los coeficientes *path*, que indican las relaciones entre los constructos, así como la significación de las

relaciones. Para el análisis de la estabilidad y significación de los parámetros estimados, se ha utilizado la técnica de *bootstrapping*, que permite generar los estadísticos *t de Student* y los errores estándar (Chin, 1998; Aldás, 2012).

El análisis de la significación permite indicar la existencia de relaciones estables en todas las relaciones estructurales planteadas, puesto que el valor del estadístico *t de Student* es significativo en la mayoría de los casos.

TABLA 3.  
Contraste de hipótesis

Hipótesis	Relación	$\beta$ estandarizado	Valor t
H1	valor evento $\rightarrow$ valor marca	-0,02	0,97
H2	experiencia evento $\rightarrow$ experiencia marca	0,10*	1,96
H3.1	experiencia evento $\rightarrow$ valor evento	0,15**	2,9
H3.2	experiencia marca $\rightarrow$ valor marca	0,89**	55,93
H4.1	motivación $\rightarrow$ identificación	0,43**	9,97

H9.2	valor marca $\rightarrow$ satisfacción marca	0,16	1,72
H10.1	experiencia evento $\rightarrow$ satisfacción evento	0,24**	4,44
H10.2	experiencia marca $\rightarrow$ satisfacción marca	0,27*	2,27
H11.1	satisfacción evento $\rightarrow$ comp. futuro evento	0,66**	15,26
H11.2	satisfacción marca $\rightarrow$ efecto del patrocinio	0,25**	5,22
R <sup>2</sup> (F4) = 0,01; R <sup>2</sup> (F5) = 0,01; R <sup>2</sup> (F6) = 0,02; R <sup>2</sup> (F7) = 0,28; R <sup>2</sup> (F8) = 0,44; R <sup>2</sup> (F9) = 0,81; R <sup>2</sup> (F10) = 0,04; R <sup>2</sup> (F11) = 0,55; R <sup>2</sup> (F12) = 0,20; R <sup>2</sup> (F13) = 0,66; R <sup>2</sup> (F14) = 0,06;			
Q <sup>2</sup> (F4) = 0,01; Q <sup>2</sup> (F5) = 0,00; Q <sup>2</sup> (F6) = 0,02; Q <sup>2</sup> (F7) = 0,21; Q <sup>2</sup> (F8) = 0,33; Q <sup>2</sup> (F9) = 0,61; Q <sup>2</sup> (F10) = 0,03; Q <sup>2</sup> (F11) = 0,47; Q <sup>2</sup> (F12) = 0,17; Q <sup>2</sup> (F13) = 0,56; Q <sup>2</sup> (F14) = 0,05;			

\*\*p < 0.01; \*p < 0.05

A partir de los coeficientes obtenidos y la significación de cada uno de ellos es posible establecer el contraste de las hipótesis. Así, el último paso es analizar la significatividad de la estimación del modelo *inner* que permitirá aceptar o rechazar las hipótesis del modelo (Aldás, 2012).

Como se ha comentado en líneas previas, la presente investigación plantea un eje central para el modelo global propuesto de patrocinio deportivo, en el marco del comportamiento del turista de eventos deportivos. La principal teoría de patrocinio deportivo en la que se apoya el eje central del modelo son los Modelos de Transferencia (de Imagen y Afectiva).

Los resultados muestran un efecto negativo pero no significativo del valor percibido del evento sobre el valor percibido de la marca (H1). Esto conduce a pensar que podría ser el valor percibido de la marca por parte del turista deportivo el que afectara al valor que percibe dicho visitante del evento, pero no queda

validada la primera hipótesis, con lo que no es posible aceptarla (H1:  $\beta = -0,02$ , NS). Por todo ello, para el valor percibido, no se confirma la transferencia de asociaciones relacionadas con una marca desde el evento patrocinado al patrocinador (Gwinner, 1997).

Siguiendo con el contraste de las siguientes hipótesis relativas al eje central del modelo, se observa que éstas sí se confirman debidamente. Así, respecto a la H2, se acepta que la experiencia con un evento afectará a la experiencia que se tenga con una marca, puesto que los datos muestran un efecto positivo y significativo (H2:  $\beta = 0,10$ ;  $p < 0,05$ ). En consonancia con lo postulado por la Teoría de Transferencia de Imagen, con la experiencia se consigue evocar sentimientos y actitudes positivas hacia la marca patrocinadora, vinculada a un evento que el individuo valora de forma elevada (Grohs y Reisinger, 2005).

Del mismo modo, se confirma que la experiencia tendrá un efecto sobre el valor, tanto para el evento (H3.1) como para la marca (H3.2). En concreto, queda validado tanto que la experiencia hacia el evento tendrá un efecto sobre el valor del evento (H3.1:  $\beta = 0,15$ ;  $p < 0,01$ ); como que la experiencia hacia la marca tendrá un efecto sobre el valor de la marca (H3.2:  $\beta = 0,89$ ;  $p < 0,01$ ). De manera que la influencia en ambos casos es positiva y significativa. Por tanto es importante tener en cuenta la experiencia que percibe el turista deportivo asistente al evento, respecto al evento y a la marca, para que asocie un mayor valor percibido en relación con ambos.

Por lo que respecta a las variables antecedentes del modelo, con el análisis realizado se demuestra que las motivaciones del turista deportivo influyen positivamente en diferentes conceptos (H4). En concreto, las motivaciones del turista deportivo influyen positivamente y de manera significativa en: (i) la identificación con el equipo (escudería) o piloto (H4.1:  $\beta = 0,43$ ;  $p < 0,01$ ); (ii) el valor del evento (H4.2  $\beta = 0,62$ ;  $p < 0,01$ ); (iii) la satisfacción del evento (H4.3  $\beta = 0,22$ ;  $p < 0,01$ ); y (iv) el comportamiento futuro del evento (H4.4  $\beta = 0,23$ ;  $p < 0,01$ ). Por todo ello es posible afirmar que las motivaciones del turista deportivo son un antecedente de nuestro modelo propuesto de patrocinio deportivo. De manera que a más motivaciones del turista deportivo, esté muestra: más identificación con el equipo o piloto, más valor percibido del evento, más satisfacción con el evento y más lealtad con el evento. Este resultado coincide con la Teoría de la Atribución, ya que plantea una relación directa entre las motivaciones percibidas por el cliente y sus actitudes y comportamiento (Walliser, 2003; Rifon, Choi, Trimble y Li, 2004).

Siguiendo con los antecedentes y tomando como premisa la Teoría de la Identidad Social, la implicación con el evento se confirma que está positivamente y significativamente asociada con una mayor exposición al evento (H5.1  $\beta = 0,16$ ;  $p < 0,01$ ), y con la identificación de turista deportivo con el equipo o piloto (H5.2  $\beta = 0,21$ ;  $p < 0,01$ ). Pero no sucede lo mismo con la relación entre la implicación con el evento y el conocimiento de la marca patrocinadora (H5.3); hipótesis no confirmada. Así, aunque se muestra una relación negativa entre la implicación con el evento y el conocimiento de la marca, esta no es significativa. Por tanto, no es posible afirmar que una mayor implicación con el evento por parte del espectador, vaya a suponer un mayor conocimiento de la marca patrocinadora.

Por lo que respecta a la H6, no es posible aceptar que la exposición al evento patrocinado se asocia positivamente con los diferentes conceptos analizados en el presente estudio. En concreto, no se confirma que la exposición al evento patrocinado se asocie positivamente con el valor del evento (H6.1), ni con la experiencia del espectador con el evento (H6.2). Por ello, a diferencia de los que propone la Teoría de la Mera Exposición, en este caso no aumenta el valor percibido con el evento, ni la experiencia con el evento conforme se incrementa exposición (Tom, Nelson, Srzentic y King, 2007).

En lo referente a la H7, y en base a la Teoría de la Identidad Social, es posible afirmar que la identificación con el equipo o piloto se asocia positivamente con algunos de los conceptos propuestos en la presente investigación. En concreto, se aceptan las hipótesis que asocian positivamente la identificación con el equipo o piloto con la experiencia hacia la marca (H7.2  $\beta = 0,18$ ;  $p < 0,01$ ) y con el conocimiento de la marca patrocinadora (H7.3  $\beta = 0,10$ ;  $p < 0,05$ ). Así, se puede decir aquellos visitantes que muestran una mayor identificación con el equipo o piloto del que son seguidores, percibirán una experiencia positiva hacia la marca y mostrarán un mayor conocimiento de la marca patrocinadora que los visitantes con una

baja identificación con el equipo o piloto. Sin embargo, no es posible aceptar que la identificación con el equipo o piloto se asocie positivamente con la experiencia hacia el evento (H7.1), ni con la satisfacción que se tenga con la marca patrocinadora (H7.4). Así, un turista deportivo muy identificado con el equipo o piloto, puede no tener una experiencia positiva con el evento y puede no estar satisfecho con la marca patrocinadora de dicho evento.

Finalmente, dentro de los antecedentes propuestos al modelo, no se puede confirmar la H8 referente a que la familiaridad con la marca se asocia positivamente con el valor percibido de marca (H8  $\beta = 0,04$ ; NS). Por lo que, a pesar de que el turista presente una alta familiaridad con la marca patrocinadora, no tiene porque percibir un alto valor de la misma, a diferencia de lo que cabría esperar atendiendo a las premisas recogidas en la Teoría de la Señal y a la Teoría del Equilibrio.

Pasando al contraste de los efectos del patrocinio deportivo planteados en el modelo propuesto de la presente investigación, se acepta que cuanto mayor sea el valor percibido por el individuo mayor será su satisfacción (H9). Este resultado coincide con los principios postulados por los modelos del comportamiento del turista, pero sólo para el caso del evento (H9.1  $\beta = 0,53$ ;  $p < 0,01$ ), ya que no se ha podido confirmar la hipótesis con su contraste para la marca (H9.2), de manera que no se acepta que cuanto mayor sea el valor percibido por el individuo con la marca mayor será su satisfacción con dicha marca.

Siguiendo con el contraste de las H10 y H11, referentes también a los efectos del modelo, ambas quedan sólidamente confirmadas, indicando la existencia de una estrecha relación entre los constructos estudiados. Así, se puede comprobar como la experiencia influye en la satisfacción del individuo (H10), acorde con las premisas recogidas con los modelos de comportamiento del turista. De hecho, la experiencia con el evento influye en la satisfacción del individuo con el evento (H10.1  $\beta = 0,24$ ;  $p < 0,01$ ) del mismo modo que la experiencia con la marca influye en la satisfacción del individuo con la marca (H10.2  $\beta = 0,27$ ;  $p < 0,05$ ). Asimismo, se confirma que la satisfacción del individuo influye sobre su comportamiento futuro hacia el evento y sobre el efecto del patrocinio en la marca (H11). De manera que, cuanto mayor sea la satisfacción del individuo con el evento mayor será su comportamiento futuro hacia el evento (H11.1  $\beta = 0,66$ ;  $p < 0,01$ ), es decir su intención de recomendar el evento a conocidos y su intención de volver al evento en futuras ediciones. Mientras que cuanto mayor sea la satisfacción del individuo con la marca patrocinadora mayor será el efecto del patrocinio en la marca patrocinadora (H11.2  $\beta = 0,25$ ;  $p < 0,01$ ). Este resultado coincide con los principios postulados por la Teoría de la Atribución, al mostrar una relación directa entre la satisfacción del individuo y sus actitudes y comportamientos.

La Tabla 3 también muestra los valores de R2 para cada una de las variables endógenas. Para determinar la capacidad predictiva del modelo estructural se considera el criterio establecido por Falk y Miller (1992), donde los valores de R2 para cada constructo dependiente deben ser iguales o superiores a 0,1, puesto que valores por debajo de dicho nivel, a pesar de ser estadísticamente significativos, proporcionan muy poca información. En la presente investigación los valores de R2 en la mayoría de los factores superan el valor mínimo recomendado, evidenciando la adecuada habilidad predictiva del modelo. La mayor cantidad de varianza explicada por el constructo sobre sus variables independientes se corresponde con el valor de la marca (F9), que explica el 0,81; el comportamiento futuro con el evento (F13) explica el 0,66 del total de la varianza; y la satisfacción del evento (F11) y el valor del evento (F8), explican el 0,55 y 0,44 respectivamente.

Asimismo, para cada variable endógena, se realiza el test de Stone-Geisser (Q2) de relevancia predictiva, para valorar el ajuste del modelo en el análisis PLS (Chin, 1998b). El estadístico Q2 representa una medida de lo bien que los valores observados son reconstruidos por los parámetros estimados. De esta forma, valores positivos indican que el modelo tiene relevancia predictiva, mientras que los valores negativos sugieren que el modelo carece de predicción (Wold, 1985; Fornell y Cha, 1994; Aldás, 2012). La Tabla 3 incluye los valores de Q2 para cada constructo. Como puede observarse, en todos los casos los valores son positivos, mostrando así que el modelo posee capacidad predictiva en la estimación de los valores.

## 6. Conclusiones

El propósito de este trabajo era plantear un modelo global de patrocinio deportivo que probara la transferencia evento-marca patrocinadora en términos de valor percibido y experiencia, incluyendo tanto antecedentes como efectos.

En primer lugar, atendiendo al eje del modelo, no se transfiere el valor percibido desde el patrocinado al patrocinador. Lo que muestra que el asistente a un gran evento deportivo puede tener una actitud favorable hacia el evento y desfavorable hacia el patrocinador. Este hecho puede deberse a que el visitante deportivo no ha transferido las percepciones de valor que posee de la actividad patrocinada hacia las percepciones de valor de la marca o empresa patrocinadora, a diferencia de lo que cabría esperar atendiendo a lo postulado por la Teoría del Equilibrio. De manera que esta acción de patrocinio concreta no ha mejorado el valor percibido de la marca por parte del espectador.

Por otro lado, la experiencia que se tenga hacia el evento sí afectará a la experiencia que se tenga hacia la marca. Por lo que es posible confirmar la transferencia de experiencia del evento a la marca patrocinadora. Del mismo modo, se confirma que la experiencia tendrá un efecto sobre el valor, para el evento y para la marca. Por tanto es importante tener en cuenta la experiencia que viva el turista deportivo asistente al evento (respecto al evento y a la marca) para que asocie un mayor valor percibido en relación con ambos conceptos.

En segundo lugar, por lo que respecta a las variables antecedentes del modelo, las motivaciones del turista deportivo influyen positivamente en las actitudes del visitante y su comportamiento, de acuerdo con lo postulado por la Teoría de la Atribución, es decir, existe una relación directa entre las motivaciones del visitante deportivo y sus actitudes y comportamientos. En concreto, a más motivación más presencia en el individuo de: (i) la identificación con el equipo (escudería) o piloto; (ii) el valor del evento; (iii) la satisfacción del evento; y (iv) el comportamiento futuro del evento. Por todo ello ha sido posible afirmar que las motivaciones del turista deportivo son un antecedente de nuestro modelo propuesto de patrocinio deportivo.

Siguiendo con los antecedentes, la implicación con el evento está asociada con una mayor exposición al evento y con la identificación del turista deportivo con el equipo o piloto. Pero no sucede lo mismo con la relación entre la implicación con el evento y el conocimiento de la marca patrocinadora. Este resultado podría deberse a que el seguidor deportivo en este tipo de gran evento, en el que se dan múltiples tipos de patrocinio (patrocinio de los pilotos, patrocinio de las escuderías, patrocinio de una curva del circuito, etcétera), recibe una elevada cantidad de estímulos. De ahí que, sea muy probable que por su alta implicación con el evento, y por ende su asociación con una determinada escudería y/o piloto, le lleve a tener un mayor conocimiento de alguna de las marcas patrocinadoras de la escudería y/o piloto de los cuales es seguidor, posiblemente antes que de la marca oficial patrocinadora del evento.

Por lo que respecta a la exposición al evento patrocinado, ésta no se asocia positivamente con los diferentes conceptos analizados en el presente estudio; a diferencia de lo que cabría esperar según la Teoría de la Mera Exposición. Esta situación podría deberse a que hay otros antecedentes más fuertes que anulan el efecto de la exposición, como por ejemplo lo sería la motivación. Otra razón posible es la influencia de la congruencia percibida entre marca y acontecimiento. En un contexto de alta congruencia, la mera exposición al acontecimiento mejora directamente el recuerdo, mientras que en contextos de baja congruencia, es necesaria la generación de una actitud favorable ante dicho acontecimiento. Este resultado derivado de que la ruta de procesamiento es más larga en contextos de baja implicación, refuerza la efectividad de las estrategias de *ambush* marketing y abona las iniciativas legislativas de algunos países que abogan por una prohibición expresa de esta táctica (Aldás, Küster, Rodríguez y Vila, 2009).

Asimismo, se puede concluir que los visitantes que muestran una mayor identificación con el equipo o piloto del que son seguidores percibirán una experiencia positiva hacia la marca y mostrarán un mayor conocimiento de la marca patrocinadora que los visitantes con una baja identificación con el equipo o

piloto. Sin embargo, un turista deportivo muy identificado con el equipo o piloto, puede no tener una experiencia positiva con el evento y puede no estar satisfecho con la marca patrocinadora de dicho evento. Este resultado puede explicarse atendiendo a las tres características de las experiencias en turismo, apuntadas por Olivero y León (2011). (i) Las experiencias surgen de los orígenes sociales y culturales de las personas. Dado que los diferentes orígenes dan lugar a interpretaciones diversas para un solo producto turístico, ¿cómo puede un único evento interesar y emocionar a todos los asistentes? (ii) Las experiencias tienen múltiples facetas. Surgen de las actividades y el entorno físico, así como del significado social integrado en las actividades. Los espectadores tienen experiencias diferentes, incluso si están haciendo lo mismo en el mismo lugar. (iii) Las experiencias son existenciales, es decir, personales y únicas.

Finalmente, dentro de los antecedentes propuestos al modelo, podemos concluir que a pesar de que el turista presente una alta familiaridad con la marca patrocinadora, no tiene porque percibir un alto valor de la misma. Este resultado puede deberse a que el turista tenga una mala imagen de la marca patrocinadora, quizás motivada por una mala experiencia anterior vivida con dicha marca (por ejemplo cuando ésta disfrutaba de una situación de monopolio en el mercado de la telefonía o por su gestión realizada de la atención al cliente).

En tercer lugar, en lo relativo a los efectos del patrocinio deportivo planteados en el modelo propuesto de la presente investigación, se acepta que cuanto mayor sea el valor percibido por el individuo mayor será su satisfacción para el caso del evento. De la misma manera, sin embargo, no se puede concluir que cuanto mayor sea el valor percibido por el individuo con la marca mayor será su satisfacción con dicha marca. Esto podría deberse, de nuevo, a las bajas percepciones asociadas con la marca patrocinadora.

Por su parte, la experiencia con el evento influye en la satisfacción del individuo con el evento del mismo modo que la experiencia con la marca influye en la satisfacción del individuo con la marca. Asimismo, se concluye que la satisfacción del individuo influye sobre su comportamiento futuro hacia el evento y sobre el efecto del patrocinio en la marca. De manera que, cuanto mayor sea la satisfacción del individuo con el evento mayor será su comportamiento futuro hacia el evento, es decir su intención de recomendar el evento y su intención de volver al evento en futuras ediciones. Mientras que cuanto mayor sea la satisfacción del individuo con la marca patrocinadora mayor será el efecto del patrocinio en la marca patrocinadora.

## ABSTRACT

*Organisations today including the much affected banking sector need to create, maintain and reinforce relationships with clients. CRM seems to have helped firms to better understand their relationships. However, past studies have looked at technology and customer orientations as key factors. This paper aims to investigate a proposed model by analysing the simultaneous effect of market orientation, knowledge management and other organisational factors in order to explain how to implement a successful CRM.*

## Keywords

*CRM, resources, banking sector*

## 1. Introduction

Increasing economic globalisation and the development of new information technologies are changing the rules of the market and require tailored strategies and business practices (Wang et al., 2004). Consumers demand more individualised treatment; in many cases they want to be involved in the process of product creation and are increasingly prone to exchanging views via the Internet and social networks (Bonnemaizon et al., 2007; Cambra et al., 2013). The effect of these new technologies, coupled with volatile consumer preferences, has meant that companies are obliged to collect information about consumer characteristics, tastes and previous purchases to predict future buying patterns and tailor their offers to each individual. Thus, companies can gain competitive advantages that not only allow them to maintain and strengthen relationships with their customers, but also increase their market share (Colgate and Danaher, 2000). Consequently, the marriage of the marketing philosophy with information technology has resulted in the concept of Customer Relationship Management (CRM) (Boulding et al., 2005; Jayachandran et al., 2005).

CRM first emerged in the 80s and since then has sparked a great of interest from both academics and business practitioners. As a case in point, the Journal of Marketing launched a special issue on CRM in 2005. From a business management perspective, CRM reflects the great interest in managing successful and profitable customer relationships (Ambler, 2005). Conceptually it is based on relationship marketing, whose primary purpose is the pursuit of profitability through customer satisfaction and loyalty whilst trying to maximise long-term customer profitability (Zikmund et al., 2003).

From a practical point of view, managing successful customer relationships begins with identifying and acquiring the right customers. Therefore, companies must strive to discover who are their best customers and gain their loyalty whilst simultaneously allocating fewer resources to manage relationships with unprofitable customers (Kracklauer et al., 2001; Tan et al., 2002). This requires analysing each client individually, which is possible by managing customer databases. However, many other factors, such as organisational leadership, human resources management or the allocation of other resources influence the success of CRM.

CRM has been researched from different perspectives: as a process (Grönroos, 2000; Reinartz et al., 2003), as a strategy (Kracklauer et al., 2001; Adenbajo, 2003), as a philosophy (Fairhurst, 2001; Piccoli et al., 2003) as a capacity (Peppers et al., 1999) and as a technological tool (Shoemaker, 2001; Gefen and Ridings, 2002). This latter perspective, as a technology, seems to carry more weight in the generic field of business management, which is why technology often becomes more important than the strategy itself. Therefore, companies often fail to make their CRM systems profitable. In addition, only a few studies have considered the influence of several resources simultaneously (eg, human factors, infrastructure, financial resources, knowledge) in the success of CRM.

For instance, Garrido and Padilla (2011) show that by having the proper leadership management, human resources, technology or interfunctional coordination positively influence the successful management of CRM. This is because these factors facilitate a correct knowledge management, which in turn allows the company to meet the demands of consumers. The authors also conclude that customer orientation is the right marketing approach to use when implementing a CRM philosophy. However, from the point of view of marketing, Market Orientation has proven to be superior to the Customer Orientation approach, because it also considers Competitor Orientation and Interfunctional Coordination (Slater and Narver, 1998).

To fill this gap identified in the literature our aim is to study the relationship between Market Orientation and Knowledge Management, from a marketing standpoint, as antecedents of a set of organisational factors that can determine the success of CRM. Thus, the two main contributions to the literature are, first, the adoption of a comprehensive approach to Market Orientation and, second, to analyse the influence of each factor in the success of CRM.

With the aforementioned in mind, the next section presents the concept of Customer Relationship Management and its different perspectives. Possible interactions with the Market Orientation and Internal Marketing are also proposed. The third section presents the model and the hypotheses which form the basis of the empirical study. The results are discussed in the fourth section. Finally, the article concludes with a set of managerial and research implications, as well as its limitations and suggestions for further research.

## **2. Theoretical background of CRM**

The specialised literature considers that the cornerstone of CRM is the Relationship Marketing paradigm (eg, Ryals and Knox, 2001; Reinares and Ponzoa, 2002; Gummesson, 2004; Zablah et al., 2004; Payne and Frow, 2005). This paradigm is based, among others, on the pioneering work of Berry (1983), that links it to the management of long-term relationships with customers. This approach to marketing is defined as a process to attract, retain and strengthen customer relationships (Morgan and Hunt, 1994; Grönroos, 2000). The main objective is the pursuit of profitability through customer loyalty, leaving the transactional goal of attracting new customers as a secondary matter (Grönroos, 1994; Seiders et al., 2005). From the point of view of marketing, CRM has developed as a firm commitment to maintaining positive relationships with customers, building loyalty and increasing their Customer Lifetime Value (CLV), that is, the value of the life cycle of the customer (Brassington and Pettit, 2000; Ahn et al., 2003; Verhoef and Lemon, 2013). However, there is no single definition of CRM as there are different perspectives from which this term can be addressed.

### **2.1. CRM Perspectives**

As Zablah et al. (2004) indicate, the concept of CRM can be approached from several perspectives: as a philosophy, a process, a capacity, a technology tool and as a strategy. However the common underlying basis is the pursuit of a competitive advantage based on managing profitable customer relationships (see Table 1).

The philosophical perspective requires that customers are the focal point for the entire company and the primary goal is creating value for them. So, the best way to achieve customer retention and profitability is ensuring that all members of the organisation are constantly focused on customer satisfaction (Piccoli et al., 2003; Zablah et al., 2004).

A second perspective views CRM as a process. This perspective considers that the customer-company relationship develops over time, can be characterised by a life cycle and must evolve to endure (Parvatiyar and Sheth, 2000; Zablah et al., 2004). Issues such as information sharing, trust, the compliance of mutual expectations or cooperation determine this evolution, success and profitability (Dwyer et al., 1987; Grönroos, 2000; Gustafsson et al., 2005) .

Both perspectives, philosophical and process, can be related to Market Orientation, which focuses on satisfying the needs of customers in a more superior way than the competitors. In order to manage successful relationships it is necessary to collect information about the real needs and expectations of customers, supply and competitive capabilities, internal resources and skills. Additionally, it is necessary to understand that the environment changes and that buying behaviour patterns are not stable. Two approaches have dominated the conceptualisation of Market Orientation: the perspective of culture and behaviour or operational perspective. On the one hand, the Market Orientation is described as a form of organisational culture with three key components: Customer Orientation, Competitor Orientation and Interfunctional Coordination (Narver and Slater, 1990). We can intuitively relate this to the perspective of CRM as a philosophy. On the other hand, Kohli and Jaworski (1990) define Market Orientation as the generation of market intelligence at all levels of the organisation, the dissemination of this information among all departments and the development of an appropriate organisational response, indicating which key tasks need to be performed. It is possible to relate this approach with the CRM perspective as a process. However, authors such as Cadogan and Diamontopoulos (1995), Avlonitis and Gounaris (1997), Homburg and Pflesser (2000), Helfert et al., (2002) and Gao and Bradley (2007) consider them as complementary approaches rather than rivals, which is why we propose that both philosophical and process CRM perspectives are also complementary.

In turn, the two previous perspectives are related to the CRM perspective as a capability. According to this perspective, maintaining lasting relationships with customers is only possible if the company has a set of adequate resources and is flexible enough to constantly adapt and readapt their behaviour towards their customers (Peppers et al., 1999; Zablah et al., 2004). In other words, the management of a long-term relationship with clients is based on the ability to know and understand their changing needs that may require new adaptations (Zablah et al., 2004; Mithas et al., 2005). This perspective is in line with the Resource View that defines a company as a set of productive resources that help determine their competitive position, depending on the way in which it makes use of them. Obtaining competitive advantages involves developing strategies that exploit the unique features of a set of resources and capabilities (Grant, 1991). Therefore, the key of profitability lies not in doing the same as competitors but in exploiting the differences.

CRM as a technology tool is a perspective that contemplates CRM as an important resource because it not only facilitates the collection and storing of customer data, but also building knowledge from it and disseminating it through the organisation (Crosby and Johnson, 2001; Greenberg, 2001; Bose, 2002; Zablah et al., 2004). Thus, CRM tools enable the proper management of customer relationships which in turn means that these are lasting and profitable (Chen and Popovich, 2003; Zablah et al., 2004). Therefore, in a strict sense, we may consider this perspective as a particular case of the capability perspective.

Finally, the CRM approach as a strategy emphasises the idea of Customer Lifetime Value (CLV), that is, the value that customer represent over the lifetime of this relationship with the company. In this respect, if we consider all the perspectives it is possible to define strategies and actions that not only maintain positive relationships with customers and increase their loyalty, but also maximise the CLV through cross-selling or up-selling, amongst others (Venkatesan and Kumar, 2004).

Table 1 provides a summary of the general description of each of the CRM perspectives and highlights that the common theme is the importance of managing lasting and profitable relationships.

**TABLE 1**  
**CRM perspectives**

<i>PERSPECTIVES</i>	<i>DESCRIPTION</i>
<i>PHILOSOPHY</i>	CRM focuses on building and maintaining long-term relationships with customers. The entire organisation must have the customer as the main reference.
<i>PROCESS</i>	CRM focuses on the dynamic and evolving nature of customer relationships.
<i>MARKET ORIENTATION</i>	CRM, considering its philosophical and behavioural aspect, can additionally provide competitive advantage.
<i>CAPACITY</i>	The resources and capabilities of the organisation and their exploitation are essential to achieve competitive advantages.
<i>TECHNOLOGY TOOL</i>	CRM is an essential resource as it allows the collection and storing of data to build and disseminate knowledge throughout the organisation.
<i>STRATEGY</i>	It consider in an aggregate form of the other perspectives and additionally focuses on Customer Lifetime Value (CLV)

Source: Adaptation of Zablah et al. (2004).

## ***2.2. Contributions of Market Orientation and Internal Marketing***

As technology has developed and the market has become more competitive, companies have been forced to change their management approach. Currently, customers determine the commercial action, so companies need to adapt their offer to the specific customer requirements (McKenna, 1991). As

Levitt (1960) predicted, companies should focus on meeting the needs of customers instead of selling their products.

However, focusing only on the needs of customers may not be enough. Customers are an essential part of business success, but they form part of a larger picture. Companies interact with their environment, in which there are other companies competing to satisfy these same customers. Therefore, delivering superior value proves decisive. (Slater and Narver, 1998; Boulding et al., 2005).

For this reason it is necessary to differentiate between Customer Orientation and Market Orientation as the two concepts that are often used interchangeably and have generated misunderstandings. In the work of Slater and Narver (1998) and Perez and Cambra (2013) a clear distinction is made, noting that while Customer Orientation has a more reactive and adaptive nature (focusing on understanding the wishes of customers and developing products and services to satisfy them), Market Orientation has a more proactive and long term character (in addition to focusing on the expressed and latent needs and wishes of customers, it also focuses on the skills and strategies of the competitors through the process of acquiring and evaluating market information in a systematic and proactive way).

Therefore, companies should not only be oriented to customer or competition, but must also adopt an integrated management approach (Boulding et al., 2005). Customers, competitors and the organisation itself become the point of reference (Kohli and Jaworski, 1990). In addition, Market Orientation involves implementing the marketing concept throughout the organisation and not just the marketing department, acquiring a strategic dimension (Bello et al., 1999).

In this sense, there have been many authors who have analysed the role of Market Orientation in the firm (eg, Jaworski and Kohli, 1993; Chang and Chen, 1998; Vorhies et al., 1999; Lings and Greenley, 2009). Indeed, these studies have shown positive effects, such as improvements in the short and long term sales, profit growth, increased market share, successful launch of new products, higher customer satisfaction or better performance assets compared with other organisations that are less market-oriented (eg, Deshpandé et al., 1993; Jaworski and Kohli, 1993; Slater and Narver, 1994; Kirca et al., 2005; Jimenez and Cegarra, 2007; Grinstein, 2008; Kumar et al., 2011).

Based on these arguments we consider that the success of a CRM strategy must be considered under a Market Orientation approach as it is much more complete than the Customer Orientation.

However, to ensure that the Market Orientation is successful, as a first step, the company has to develop a proper Internal Marketing Orientation. Lings and Greenley (2009) provided the first quantitative evidence for the significant relationship between Internal Marketing Orientation, motivation and success in the foreign market. That is, Market orientation, financial performance and customer satisfaction.

Berry et al. (1976) were the first to use the concept of Internal Marketing, defining it as the effort made by the company to understand the needs of their employees and all departments, and thus increase the level of job satisfaction and efficiency in management. It is postulated that employees are more likely to excel and produce a product that better meets customer expectations. Obviously, this increases the probability of customer satisfaction. According to these authors, an adequately developed Internal Marketing is important to meet the needs of the employees of a company before meeting those of customers. In a similar way, Berry (1981) and Grönroos (1981) consider employees as internal customers, contemplating their work as internal products that satisfy the needs and wants of these internal customers, which in turn provides sufficient performance to satisfy the external customers. Similar ideas can be found in the works of Ahmed and Rafiq (2003), Ballantyne (2003) and Brady (2004).

Thus, the importance of properly managing the workforce to improve the efficiency of the organisation in general and other specific aspects, such as CRM in particular, is understood.

### **3. Conceptual framework and hypotheses development**

Given the complementarity between the perspectives of CRM as a philosophy, process and capability, this study aims to analyse the specific factors that contribute to the success of CRM. The proposed model starts from a Market Orientation approach and relies on Knowledge Management as a

fundamental pillar of CRM. This model introduces a significant change by adopting the Market Orientation as reference, instead of Customer Orientation, which was the reference used in previous studies, such as that of Garrido and Padilla (2011). We propose that certain organisational factors, such as the leadership of senior management, the employees and the endowment of resources (economic, technological and know-how of CRM) may be key factors in determining the success of CRM, and that they also act as mediators of the other factors analysed (the Market Orientation and the Knowledge Management).

Figure 1 shows the reference model that forms the basis for developing the hypotheses. We take as a base the idea proposed by Boulding et al. (2005), who understand CRM as a strategic tool for managing the dual value creation, the intelligent use of data and technology, the customer knowledge acquisition and the dissemination thereof to the relevant parties, the development of appropriate relationships (long-term) to specific customers and/or customer groups, and integration of processes across various business areas that collaborate to generate customer value. However, we additionally consider that in such a competitive environment, in which the same needs can be met in many ways and by many companies, companies need to not only create value but create a higher value than the competitors. Therefore, it is necessary to adopt a holistic approach of Market Orientation.

### ***3.1. Market Orientation, Knowledge Management and CRM Success***

The Resource Based View considers the firm as a set of resources and capabilities (Barney, 1991; Grant, 1991). Competitive advantages of firms are achieved by controlling a range of resources and capabilities that are valuable, rare, difficult to imitate and non-substitutable. These resources may be tangible or intangible, including management capabilities of a company, its processes and organisational routines, and the information and knowledge it controls. In this sense, Market Orientation can become a valuable intangible resource that promotes a management based on meeting the needs of customers with greater excellence than the competition, that is, as a source of competitive advantage.

Market Orientation can be defined from two perspectives: cultural (Narver and Slater, 1990) and behavioural (Jaworski and Kohli, 1993). The cultural approach includes customer orientation, competitor orientation and interfunctional coordination. This approach has possibly received greater dissemination as it considers factors that are external to the company (Sittimalakorn and Hart, 2004; Verhees and Meulenbergh, 2004) and for its psychometric characteristics. Through numerous studies, the aforementioned factors have proven to be superior than the behavioural approach (Siguaw et al., 1994). However, in the previous sections we defended the complementarity between the two major approaches. Kohli and Jaworski (1990) highlight the importance of generating market intelligence on the current and future needs of the customers, disseminate the information internally, and the ability to respond to those needs. This approach is similar to the concept of knowledge management, proposed by authors such as Darroch (2003), who highlight the importance of acquiring knowledge, its dissemination and use, or the ability to respond to the acquired knowledge. Thus, from a commercial standpoint, we could use both terms interchangeably and defend the complementarity of the two main Market Orientations.

Reviewing the literature we found consensus on the relationship between Market Orientation and value creation (eg, Narver and Slater, 1990; Lambin, 1995; Kaur and Gupta, 2010). Also, investigations about the relationship between Knowledge Management and value creation confirmed positive results (eg, Gebert et al., 2003; Kaplan and Norton, 2004; Rezegui, 2007; Martelo et al., 2011).

Thus, the study of Martelo et al. (2013) considers Market Orientation and Knowledge Management as two organisational capabilities which, when combined properly, contribute to generate a higher level of value. While Market Orientation is considered a strategic capability that systematically gathers, interprets and uses information about the market, the customers, the competition, the environment and the same organisation; Knowledge Management is an operational capability or tool which may assist in reaching satisfactory results by managing knowledge and articulating appropriate processes.

It is necessary to highlight that the cultural or attitudinal approach of Market Orientation proposed by Narver and Slater (1990) was chosen for the purpose of this study. We believe, that from a practical standpoint, it is essential to have a vision of the final outcome before you determine the procedures to

successfully implement CRM. So, based on all the above arguments we can establish the following hypotheses:

**Hypothesis 1.** *Market Orientation positively influences Knowledge Management.*

**Hypothesis 2.** *Knowledge Management positively influences CRM success.*

Similarly, there are numerous studies that directly relate Market Orientation with the outcomes. Authors such as Narver and Slater (1990), Jaworski and Kohli (1993) and Chang and Chen (1998) were pioneers in demonstrating that the Market Orientation is relevant in any market environment. This idea is also highlighted in the work of Lash (1990) and Gray et al. (1998), who conclude that Market Orientation has a positive effect on the management of customer relationships. Therefore, if we consider CRM as a proper form of managing these customer relationships, we can establish that:

**Hypothesis 3.** *Market Orientation positively influences CRM success.*

### **3.2. Organisational factors, Market Orientation, Knowledge Management and CRM success**

The purpose of CRM is to increase the efficient and effective acquisition and retention of profitable customers. This is achieved by building and maintaining appropriate relationships with selective customers. It is therefore necessary to have adequate sufficient allocation of resources such as employees, capital, technological tools and know-how. For authors such as Dans (2001) the development of CRM has been made possible because of the technological evolution, which has enabled businesses to organise themselves around customer needs. Thus, information technologies play a fundamental role (Payne, 2006). However, it is not enough to just obtain market information but that information must become knowledge through human activity (Salojärvi et al., 2010). Though systems and technological processes are important for CRM activities without a proper human interaction, or sufficient investment in this area, CRM may be inefficiently and unsuccessfully managed (Boulding et al., 2005).

In this regard, Slater and Narver (1995) suggest that the value of Market Orientation is twofold: first, it forces companies to focus on gathering information about customer needs and competitors capabilities and; second, it uses that information to continuously create superior value. However, in order to spread this knowledge it is necessary to make the right changes in the organisational structure (Kohli and Jaworski, 1990; Becker et al., 2009). Often, these changes include the training, motivation and the appropriate rewards for employees who are involved in activities related with CRM (Reinartz et al., 2004; Becker et al., 2009). Specifically, Payne and Frow (2005) conclude that a successful CRM implementation requires processes, people, operations and marketing capabilities that are interfunctionally integrated and enabled through the use of information technology and its applications.

To Mendoza et al. (2007), when this transition takes place it is necessary to develop certain skills, acquire the right resources and tools, and the proper knowledge to meet customer needs with the right products and services, exceeding the performance of possible competitors. Senior management plays a very important role because, on the one hand, they should help employees assimilate and understand the changes and, on the other they should ensure that employees have the skills needed to overcome new challenges. Thus, training becomes one of the most important aspects for both the organisation and employees themselves (Tetenbaum, 1998).

Furthermore, as Parsons et al. (1996) or Ryals and Knox (2001) indicate, the successful implementation of CRM requires a more effective management of functional interdependencies and a review of the ways in which the employee's performance is measured and how it is rewarded. Thus, to achieve a suitable change in expectations and behaviour towards the CRM the commitment and support of top management is vital (Fletcher and Wright, 1996).

Other authors, such as Reinartz et al. (2004), Sin et al. (2005), Greve and Albers (2006) or Keramati et al. (2010), among others, conclude that infrastructure resources (human and organisational resources) and technology allow the creation of value through CRM, as these infrastructures are the most influential. Finally, as noted by Rigby et al. (2002), the success of CRM also depends on the financial resources allocated, although the strategy is more relevant. The strategy refers to the proper allocation of resources to achieve superior performance. Therefore, we consider that one of the main ways to

achieve success in CRM is to align the organisational structure with business processes prior to implementing the specific technology. Second, it uses that information to continuously create superior value. In this regard, the role of senior management is crucial and will require a proper allocation of resources. Thus, based on the previous ideas and arguments we suggest the following hypotheses:

**Hypothesis 4.** *Market Orientation influences the profile of organisational factors a) employees, b) leadership, c) economic resources, d) technological resources, e) specific know-how about CRM.*

**Hypothesis 5.** *Knowledge management influences the profile of organisational factors a) employees, b) leadership, c) economic resources, d) technological resources, e) specific know-how about CRM.*

**Hypothesis 6.** *Organisational factors employees, b) leadership, c) economic resources, d) technological resources, e) specific know-how about CRM positively influence CRM success.*

Thus, from the point of view of the company, the success of CRM is measured in terms of customer satisfaction, customer loyalty and maximising the value of this relationship over time (interest in other goods offered by the company which are not yet consumed by them, their share-of-wallet, the cross-selling and up-selling, or the effect of word of mouth with other customers). This should improve the competitive position of the company, its profitability and its market value. Based on the aforementioned, we understand why many authors (eg, Reinartz et al., 2005; Krasnikov et al., 2009) argue that firms with stronger relationships with the right customers enjoy greater profitability for longer periods of time. Companies try to identify the most valuable customers, build lasting relationships with them and maximise the profitability of their customer base. Managing CRM properly allows companies to maintain better communication with customers and enables them to better meet their needs through actions such as customising the products and services (Venkatesan and Kumar, 2004). Meanwhile, as customers see their needs met they tend to have a longer-lasting relationship with the company, buy more frequently and are less likely to maintain relations with the competition (Johnson and Selnes, 2004; Krasnikov et al., 2009). This is the dual creation of value of CRM, for both company and customers.

#### 4. Research Methodology

To test the proposed hypotheses a pilot study was carried out in the Spanish banking sector. In general, the financial sector can be considered as one of the main economic drivers, as it enables the financing of economic growth of a country and plays a decisive role in the process of channeling savings into investment. In the Spanish economy, the banking sector is very important due to its structure -in 2007 Spain had 151 banks, 46 savings banks and 85 credit unions-. However, the 2008 crisis has led to a remodeling of the sector resulting in numerous mergers and acquisitions. This has significantly reduced the total number of banks, particularly savings banks (now 72 and 20 respectively) (Bank of Spain, 2013).

This sector has been chosen for the empirical study because CRM is widely used. The complicated situation of the financial sector in recent years - characterised by increased competition, the development of technological innovations or customers with more financial knowledge (Momparler, 2008) - has forced financial institutions to use IT tools to collect and process customer information to achieve greater involvement and profitability of each of them (Lara et al., 2013). On the other hand, emotional aspects such as trust influence the customer loyalty. According to a study of the Emo Insights Company, 62% of customers choose to break up with their bank because of a poor emotional relationship with the entity (Gutiérrez, 2012). Thus, the management of company-client relationships is a valuable source of competitive advantage. We interviewed the directors of bank branches because, as middle managers, they are responsible for contacting customers and manage commercial relationships. Also, they know the organisational structure of the entity and they are in contact with the highest levels of the company. So, we identified them as the key informants for this study. Table 2 shows the technical data of the study.

**TABLE 2**  
**Technical data of fieldwork**

<b>Universe</b>	Directors of bank branches
<b>Sample size</b>	81 items
<b>Geographical scope</b>	National (Spain)
<b>Sampling</b>	Intentional non-probability
<b>Type of questionnaire</b>	Closed response
<b>Fieldwork</b>	April-July 2013
<b>Analysis of information</b>	PLS

To measure each of the constructs we used a questionnaire, which was completed by directors of banks, whose content and structure was adapted from previously validated and contrasted scales. Before finalising the questionnaire a focus group was held with three directors, followed by a pretest given to ten individuals. This process allowed us to adjust the length of the questionnaire and clarify possible interpretations of terms. The scales finally used and its bibliographic reference sources are shown in Appendix 1. To analyse the proposed model a structural equation modeling technique was employed using Partial Least Squares (PLS) (SmartPLS v. 2.0). This methodology has recently been advocated and used in the marketing literature (Chung, 2009; Jayawardhena et al., 2009; Reinartz et al., 2009; Cambra et al., 2011).

Regarding the measurement model, we note that the Market Orientation construct is considered a second-order construct composed of three factors: Customer Orientation, Competition Orientation and Interfunctional Coordination, taking as a reference the proposal of Narver and Slater (1990). Knowledge Management is also considered a second-order construct formed by two factors: the acquisition and application of knowledge and the dissemination of knowledge, taking as base the scale of Sin et al. (2005). Each of the organisational variables and CRM success are first-order constructs. Sources used for reference are also included in Appendix 1.

With the objective of evaluating the quality of the data obtained, an individual reliability analysis of each item relative to its construct was carried out. The results show that all the values exceed the threshold of 0.707 required by Carmines and Zeller (1979). The same applies when assessing the reliability of the variables using Cronbach's Alpha and composite reliability. Appendix 1 shows that all constructs are reliable as they exceed the reference value of 0,8 for each index (Nunnally, 1978).

In order to analyse the convergent validity we used the average variance extracted (AVE), which according to Fornell and Larcker (1981), must exceed 0.5. As such, over 50% of the variance of the construct is due to recommended indicators. Appendix 1 shows these results and we may observe that in all cases the reference value is exceeded.

The presence of discriminant validity was confirmed using AVE (Fornell and Larcker, 1981), comparing the square root of this measurement with the correlations among constructs.

## 5. Findings

In relation to the structural model, to assess the statistical significance of the loadings and of the path coefficients, a *Bootstrap* analysis was performed. We created 500 subsamples, employing t-Student distribution with 499 degrees of freedom (N-1, with N: number of subsamples), obtaining the values:  $t_{(0.05; 499)} = 1.964726835$ ;  $t_{(0.01; 499)} = 2.585711627$ ;  $t_{(0.001; 499)} = 3.310124157$ . From these values, we determined the acceptance or rejection of our hypotheses (Table 3, Figure 1).

A measure of the predictive power of a model is the  $R^2$  value for the endogenous constructs. The results indicate that our model has an adequate predictive power (see figure 2), because it explains 39% of the variance in active loyalty, 33.5% in passive loyalty and almost 12% in satisfaction, these levels being over the established level of acceptance of 0.1 (Falk and Miller, 1992).

**TABLE 3**

\* When the t value obtained by the Bootstrap technique over comes the T Student value  $t(0.05, 499) = 1.964726835$ , the hypothesis is accepted at 95% significance.  
\*\* When the t value obtained by the Bootstrap technique over comes the T Student value  $t(0.01, 499) = 2.585711627$ , the hypothesis is accepted at 99% significance.  
\*\*\* When the t value obtained by the Bootstrap technique over comes T Student value  $t(0.001, 499) = 3.310124157$ , the hypothesis is accepted with 99.9% significance.  
NS: Not significant.

The data does not show a significant relationship between Market Orientation and success of CRM, hence we are not able to initially accept the hypothesis H3. However, we can confirm the first hypothesis (H1) that proposed a direct relationship between OM and Knowledge Management. Furthermore, the results highlight that Knowledge Management has a direct and significant relationship with the success of CRM (H2). Therefore, through this indirect path we are able to defend, at least partially, the influence of Market Orientation on the success of CRM.

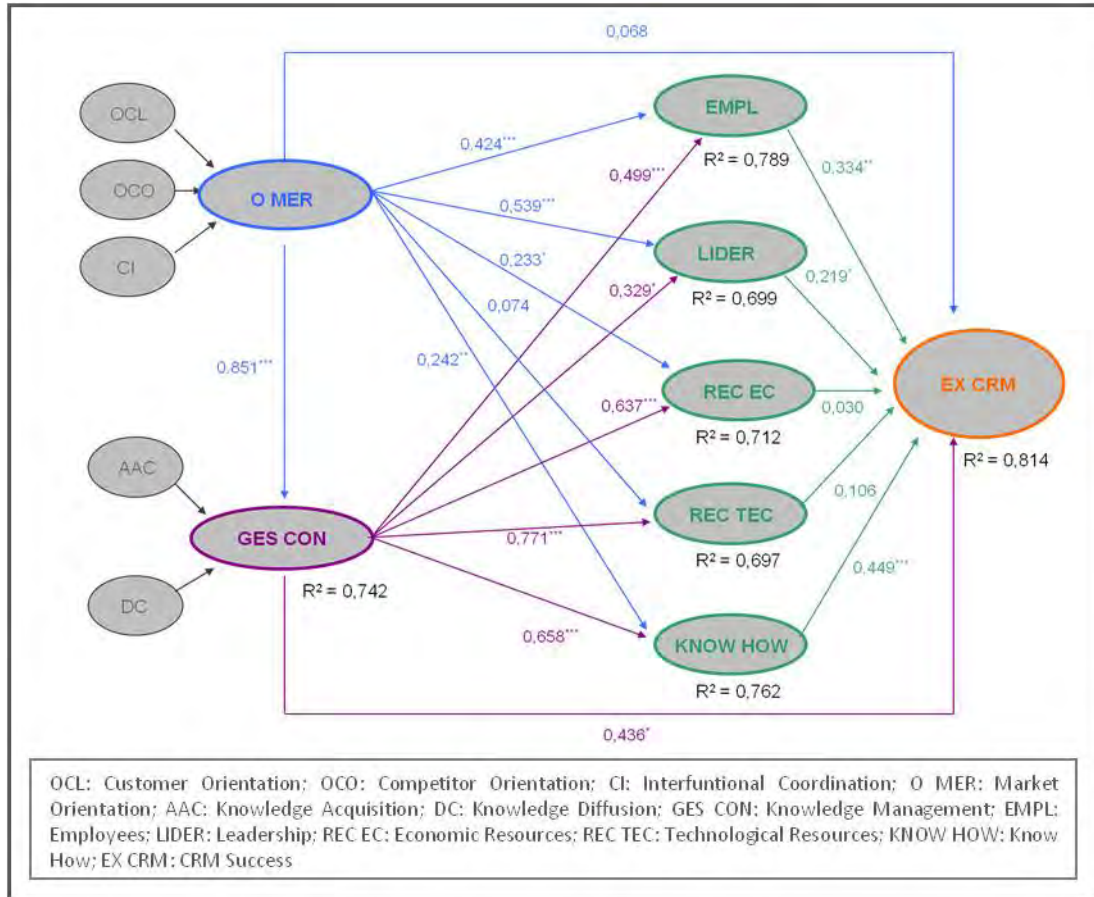

The hypotheses that establish a direct relationship between Market Orientation-Management of human resources (H4a) and Knowledge Management-Management of human resources (H5a) are accepted with the highest level of significance (99.9%). The hypotheses directly relating leadership (H4b), economic resources (H4c) and the specific know-how of CRM (H4e) with Market Orientation are also accepted. However, the hypothesis that established a link between Market Orientation and technological resources (H4d) cannot be confirmed.

Furthermore, Knowledge Management exerts a direct influence on all organisational factors which enables us to accept H5a, H5b, H5c, H5d and H5e. We can also accept the proposed relationship between employees and CRM success, leadership-CRM success and know-how-success of CRM (H6a,

H6b and H6e, respectively), whereas there is no significant relationship between economic resources (H6c) and technological resources (H6d) with the success of CRM.

Data for R<sup>2</sup> are included in Figure 1 and allow us to corroborate the explanatory power of the model.

**Causal model and results**

## 6. Discussion

The aim of this study was to further the analysis of factors that have been postulated as generators of a successful CRM strategy. Specifically, our objective was to study the simultaneous effect of Market Orientation, knowledge Management and a number of organisational variables that might explain this success. This is important because numerous extant studies have addressed this phenomenon from a purely technological perspective and have forgotten the true essence of the concept of CRM, or they have focused on very specific factors.

For instance, Gefen and Ridings (2002) analyse the success of CRM from a purely technological perspective, while others such as Fairhurst (2001) do so from a purely philosophical approach. On the other hand, there are works that adopt a Customer Orientation approach in interaction with the management of human and technological resources (eg, Garrido and Padilla, 2011), but they forget that Market Orientation is a superior approach to the Customer Orientation. Also, there are other factors such as economic issues, or the specific knowledge about CRM, that can also affect the success of a CRM strategy.

To fill these gaps, we considered the different approaches from which the CRM concept can be addressed, such as complementary proposals (philosophy, process, capacity, technology and strategy)

and, thus, one of the main contributions of this work has been to consider their complementarity. Moreover, the adoption of the Market Orientation rather than the Customer Orientation approach, which is more limited, also makes an important contribution.

From the point of view of business management, the importance of CRM lies in the ability to exploit competitive advantages, starting with the management of profitable relationships with customers. Moreover, in order to increase efficiency in the management of limited resources it is important to identify the most important factors. In this sense, our study suggests that the first step is to adopt a philosophy based on Market Orientation. This is a comprehensive approach that considers not only the customer but also the competition and the structure of the company. This approach, as suggested by authors such as Boulding et al. (2005), allows the company to monitor the complete environment, both internally and externally, not only to create customer value, but to ensure that this value is higher than that of competitors (Boulding et al., 2005). This approach allows companies to develop the right mindset to manage positively and profitably relationships with customers.

However, the survey data also indicate that simply adopting this approach does not guarantee success in a CRM strategy. For this to happen we must consider Market Orientation as precursor of Knowledge Management. This last factor allows the attitudinal component to be translated into suitable behaviour (process perspective). Knowledge Management enables the generation of market intelligence about the needs and expectations of customers, how they are being met and how they might be met, and to disseminate this information among the organisation. Thus, understanding CRM as a philosophy combined with a proper Knowledge Management, guarantees success in managing business relationships.

Regarding organisational factors (employees, leadership, economic resources, technology and know-how) we see that, in some cases, their inclusion intensifies the relationship between Market Orientation, knowledge Management and CRM success. We can assert that Market Orientation positively influences all factors analysed, except the technological resources. This may be due to the fact that developing the correct attitude to maintain appropriate relationships with customers is primarily related to people management. These people are the link between the company and its top management and the customers, and are those that actually develop the daily work of contacting and interacting with customers. Moreover, the role of leadership is key as employees tend to imitate the behaviour of their superiors. It is noteworthy that, from an attitudinal point of view, technological resources are not relevant. This is may be owing to the human factor, in so much as without the willingness of employees to provide feedback and use the information properly, technology is not very useful.

However, from the point of view of CRM as a process, Knowledge Management affects all organisational factors (hypotheses H5a, H5b, H5c, H5d and H5e were confirmed). In order to generate intelligence and disseminate it throughout the organisation, a company must have the right staff, economic resources and specific know-how, as well as the appropriate technological tools. It is clear that in relatively large organisations, as it happens in the sector, the technological tools provide the ability to capture, process and use the information obtained from clients. Without these tools this would be virtually impossible due the sheer volume of customers and the different situations of each one of them. it may be posit that due to information technology, firms may deepen the relationship with some customers who notice favourably when the firm knows their name, purchase history, the last visit or any other circumstance. This information may help improve not only their frequency of purchase, but also their loyalty.

Finally, when analysing which organisational factors contributed to the success of CRM, we observed that only employees, leadership and the specific know-how were the key determinants (the hypotheses H6a, H6b and H6e are true, but not the H6c and H6d). Given that CRM is based on the paradigm of Relationship Marketing, which is concerned with maintaining long-term relationships with customers, it is not surprising that we have obtained these results. In the analysed sector, the employees are the visible face of the company as they deal directly with customers. If the success of CRM is measured, among others, in terms of satisfaction, it is logical that the way employees are treated, their level of motivation and their know-how in terms of CRM will directly affect the satisfaction of customers,

their loyalty, interest in other products of the bank and its share of wallet. Therefore, the organisational factors that are directly linked to people have a significant impact on the success of CRM. Our data suggest that technology can be a useful tool to efficiently manage business relationships but the impact is not decisive. Above all, the business model and the employees are the real engine of the companies.

Therefore, from the point of view of the efficient management of resources, companies must focus on programmes for selection, training and motivation of employees that are appropriate to achieve the objectives of CRM. These objectives must stem from the business model of the organisation and managers must take a leading role. Furthermore, for the CRM system to function properly an adequate Knowledge Management must be in place and investment in specific knowledge about CRM should be undertaken. Economic and technological resources are therefore of secondary importance, since they have not been shown to be critical factors.

The ideas and suggestions outlined above are in line with the opinion of experts in business practice. As noted by Liz Shahnham (2003), analyst at META Group. *"CRM is a term that is not really new. What is new is all the technology that allows to do what used to be done in the corner shops. The owner had few customers and enough memory to keep track of the preferences of every single client. Technology allows us to return to that kind of business models"*.

## 7. Conclusions

This work shows a review of the different perspectives from which the concept of CRM can be addressed and defends the superiority of adopting an approach based on Market Orientation rather than a Customer Orientation approach. In addition, we have simultaneously analysed several organisational factors as possible antecedents of a successful CRM strategy.

The results for the analysed sector allow us to defend the relevance of a business model based on Market Orientation that also promotes Knowledge Management. Employees, leadership and know-how about CRM are also specific factors that are relevant to the success of CRM. The economic and technological resources are not significant factors, although they weakly exert influence in the expected direction.

Despite the important contributions of this study there are a number of limitations. First, it is a cross-sectional study focused on the Spanish banking sector. However, it is noteworthy that, as justified in the methodology section, the sector is appropriate to study the phenomenon in question. However, from our point of view, before extrapolating the results to other sectors it would be necessary to do both a structural and conjunctural comparative study. Also, given that this study is based on opinions, there is a chance that the results are biased as respondents sometimes answer without absolute sincerity. However, to try to eliminate or minimize this limitation, we have taken a number of actions a priori as recommended by Podsakoff et al. (2003) and Baumgartner and Steenkamp (2006). These measures, called process measures, suggest i) ensure the anonymity of participants, ii) clarify that there are no right or wrong answers, iii) use scales previously validated in the literature and adapted to the situation under study, and iv) eliminate possible ambiguities through pre-tests by checking the wording of each item, ensuring its simplicity, specificity and conciseness.

To conclude, as possible lines of future research it would be interesting to include other sectors which may expand the size of the study to i) establish intersectorial patterns and ii) increase the robustness of the conclusions. Another interesting aspect would be to replicate the study as a longitudinal investigation to assess prior and post important structural adjustment processes of the industry. Finally, it would also be interesting to study the possible relationships that may exist between each of the organisational factors considered.

## APPENDIX 1

MEASUREMENT SCALES (Cronbach's  $\alpha$ , FCI, AVE)

<b>Market Orientation (O MER) (Narver y Slater, 1990) (0,858; 0,914; 0,779)</b>
<b>Customer Orientation (OCL)</b>
OCL1 The business objectives of the company are focused on customer satisfaction.
OCL2 The Company continually monitors its level of commitment to meeting the needs of customers.
OCL3 The strategy of the company to gain a competitive advantage is based on understanding the needs of customers.
OCL4 Business strategies of the company are aimed at creating value for customers.
OCL5 The company frequently measured customer satisfaction.
OCL6 The company pays great attention to after-sales service.
OCL7 The company offers customized products and services to key customers.
<b>Competitor Orientation (OCO)</b>
OCO1 The sales team of the company regularly shares information about the strategy of competitors.
OCO2 The corporation regularly discusses the strengths and weaknesses of competition
OCO3 The company responds quickly to competitor actions.
OCO4 The company sets objectives to capture customers in the markets where it has competitive advantages.
<b>Interfunctional Coordination (CI)</b>
CI1 Employers in all functional areas contact regularly with current and potential customers.
CI2 The information regarding customers is fluidly communicated through the company.
CI3 All functional areas are integrated and coordinated to serve the needs of the target markets.
CI4 All managers understand how each functional area of the company can contribute to creating customer value.
CI5 The various functional areas share resources with each other.
<b>Employees (EMP) (Sin et al., 2005; Greve y Albers, 2006) (0,937; 0,950; 0,760)</b>
E1 The company has qualified staff for the success of the CRM strategy .
E2 Training programs are designed to help employees develop the skills necessary to properly manage customer relationships.
E3 The employee performance is measured based on the detection of customer needs and customer satisfaction with the service received.
E4 The company encourages employees to meet the objectives of CRM.
E5 The company offers compensation systems in case of meeting the objectives of CRM.
E6 I think the employees are committed to the CRM strategy.
<b>Lidership (LIDER) (Sin et al., 2005; Greve y Albers, 2006) (0,869; 0,921; 0,795)</b>
L11 The company has established clear business goals with respect to the acquisition and retention of customers, and communicated these
L12 Managers consider a priority the CRM strategy.
L13 Managers are highly involved in implementing CRM strategy
Estructura de la organización (ESTRUCT)
EO1 La estructura organizativa está diseñada siguiendo el enfoque centrado en el cliente.
EO2 Existe comunicación abierta y recíproca entre los diferentes departamentos.
EO3 Los diferentes departamentos trabajan juntos para alcanzar los objetivos del CRM.
<b>Resourcing (DOT REC) (New proposal)</b>
<b>Endowment of economic resources (REC EC)</b>
RECE1 The Company devotes sufficient economic resources to carry out CRM strategy.
<b>Endowment of technological resources (REC TEC)</b>
RECT1 The company has sufficient technological resources to implement CRM strategy.
<b>Endowment of Know-How (KNOW HOW)</b>
RECKH1 The company has enough know-how to carry out CRM strategy
<b>Knowledge Management (GES CON) (Sin et al., 2005) (0,875; 0,941; 0,889)</b>
<b>Knowledge Adquisition</b>
AAC1 The company provides channels to allow a continuous two-way communication with key customers.
AAC2 The company has established processes for acquiring knowledge about customers.
AAC3 The company has established processes for acquiring knowledge for the development of new products and services.
AAC4 The company has established processes to acquire knowledge about their competitors.
AAC5 The company understands the needs of its core customers through its orientation of the knowledge .
AAC6 The company can make decisions quickly thanks to the availability of knowledge about customers.
AAC7 The company can provide real information about customers that enable rapid and accurate interaction with them.
AAC8 The company has established processes to apply knowledge to solve new problems.
<b>Knowledge Diffusion</b>
DC1 The company encourages employees to share knowledge.
DC2 The organizational culture of the company encourages the acquisition of knowledge and its transmission among employees.
DC3 The company has developed processes to facilitate the knowledge transfer between different functional areas.
<b>CRM Success (EX CRM) (Sin et al., 2005) (0,895; 0,927; 0,760)</b>
RT1 In your opinion, the customer satisfaction is high.
RT2 In your opinion, the loyalty of its customers regarding the same product is high.
RT3 Customers are interested in other products offered by your organization.
RT4 In your opinion, your organization has a high proportion of the total financial consumption of customers.

*Universidad de Alicante*

## RESUMEN

*El aumento de la competencia, derivado de los cambios regulatorios y estructurales, ha favorecido el estudio de la reacción de las empresas establecidas ante las entradas a su mercado. Recientemente, el aumento de las entradas de las empresas de bajo coste al mercado de cualquier sector, ha generalizado la competencia en publicidad por parte de las empresas establecidas. Nuestro trabajo analiza el papel de los costes de cambio sobre la reacción competitiva en publicidad de la empresa establecida en el sector aéreo, así como la respuesta asimétrica ante los diferentes entrantes. La metodología efectúa una estimación instrumental, sobre una muestra de reacciones ante la entrada durante el decenio 2000-2009, evidenciando un efecto moderador de los costes de cambio sobre la respuesta competitiva asimétrica del implicado según el tipo de entrante, así como la importancia de la dominación del mercado por parte de la empresa establecida.*

## Palabras clave:

Reacción publicitaria, Entrada al mercado, Costes de cambio, Sector aéreo

## 1. Introducción

La importancia de la competencia entre las empresas ha llamado la atención de los investigadores, los cuales han tratado de examinar la reacción de las empresas establecidas ante las entradas en su mercado (ver Robinson, 1988; Shankar, 1999). En este contexto competitivo, algunos instrumentos de marketing, como la inversión publicitaria, se han convertido en un elemento clave para las empresas establecidas de cara a proteger sus mercados de los nuevos entrantes.

Básicamente, la literatura distingue tres corrientes de investigación sobre la reacción publicitaria del implicado ante la entrada. La primera perspectiva considera que la inversión publicitaria tiene un efecto restrictivo o “persuasivo” sobre la competencia (Kessides, 1986), de forma que la inversión publicitaria del implicado reduce la probabilidad de que los clientes actuales migren de una empresa establecida a un nuevo entrante, porque actúa como una barrera a la entrada de nuevos competidores (Bain, 1956). Ello obedece, por un lado, a su capacidad para crear lealtad de marca y para generar ventajas de la diferenciación del producto y de las economías de escala en publicidad para la empresa establecida (Comanor y Wilson, 1979). Por otro lado, la inversión publicitaria del implicado fuerza a los nuevos entrantes a incrementar sus gastos promocionales, los cuales pueden llegar a convertirse en *costes hundidos* si deciden salir del mercado (Baumol y Willig, 1981). Una segunda corriente considera que la inversión publicitaria puede estimular la competencia porque tiene un efecto “informativo”, de forma que un aumento de la inversión publicitaria del implicado atrae a nuevos clientes al mercado, lo cual es una señal para los nuevos entrantes del atractivo del mercado y favorece la competencia (Kessides, 1986). En este sentido, una empresa establecida debería reducir su inversión publicitaria para reducir su efecto informativo y, de este modo, disuadir o acomodar la entrada de los nuevos competidores (Fudenberg y Tirole, 1984). Una tercera vía analiza ambos efectos opuestos de la publicidad ante la entrada al mercado (Ej.: Kessides, 1986), mostrando la predominancia del efecto informativo sobre el persuasivo, dado que la inversión publicitaria del implicado aumenta el tamaño global del mercado y estimula más la entrada de potenciales competidores que la atracción o retención de clientes en favor de la empresa establecida.

Alternativamente, otro grupo de autores no presta tanta atención al instrumento estratégico de la publicidad en la reacción, sino que sugiere que la reacción del implicado, en general, depende de las características de la industria, de las características del entrante e implicado, así como de la relación previa entre entrante e implicado (Ej.: Robinson, 1988; Gatignon, Anderson y Helsen, 1989; Shankar, 1999). Así, los análisis empíricos realizados en el sector aéreo revelan que las reacciones del implicado ante la entrada cambian de acuerdo con las características de la industria y del entrante (Call y Keeler, 1985). Por ejemplo, los patrones de reacción se modifican tras la desregulación del sector aéreo en EE.UU. en 1978, en Europa desde 1987 a 1997, y en España a principios de 2000 (Rey, 2003), porque se produce un cambio radical en el perfil del entrante. En España, el entrante pasa de ser una compañía tradicional “hub and spoke” (Air Europa y Spanair) a una compañía de bajo coste (Ryanair, Easyjet, AirBerlin, Vueling, Clickair). Las características de las empresas establecidas originariamente en el mercado (Ej.: Iberia) también influyen en la reacción porque tienen una posición dominante, la cual es erosionada gradualmente conforme aumenta la competencia. A pesar de ello, los estudios realizados no han considerado los costes de cambio como un elemento a estudiar en la relación entre implicado y entrante.

El objetivo principal de este trabajo es analizar el efecto de los costes de cambio sobre la reacción en inversión publicitaria de las compañías aéreas establecidas, ante la entrada de nuevos competidores al mercado doméstico español desde 2000 hasta 2009. Este objetivo se puede concretar en los siguientes sub-objetivos: i) definir un modelo de reacción en inversión publicitaria ante la entrada, que permita analizar el efecto de los costes de cambio sobre la respuesta del implicado; ii) analizar la respuesta asimétrica de las empresas establecidas en relación al tipo de compañía aérea entrante (tradicional, regional y de bajo coste); y iii) evaluar los patrones temporales que definen la reacción del implicado ante la entrada.

## 2. Revisión de la literatura e hipótesis

Uno de los factores que describen la relación entre el implicado en un mercado y el entrante, son los costes de cambio, que pueden definirse como los costes en que incurre un cliente cuando cambia desde la empresa actual a alguna de las competidoras (Shy, 2002). Un tipo específico de costes de cambio, los costes de cambio “pecuniarios”, los cuales son creados artificialmente por las empresas, constituyen una forma de descuento en cantidades (Klemperer, 1987) y prevalecen en industrias de servicios, como el sector aéreo, donde las compañías aéreas inscriben a los pasajeros en “programas de vuelos frecuentes” que les recompensan por los viajes repetidos en la misma compañía (Klemperer, 1987). Estos costes de cambio crean lealtad de marca en los viajeros una vez que han comprado los servicios de una compañía en particular, mientras que los viajeros que cambian de compañía pierden la oportunidad de ganar puntos que luego generan ganancias, a través de vuelos gratuitos o de coste reducido.

Unos elevados costes de cambio tienden a reducir la competencia entre las empresas porque crean clientes cautivos. Además, la estructura institucional y de regulación puede reforzar esta situación anticompetitiva porque incrementa el poder de mercado derivado de los costes de cambio. Por ejemplo, la estructura institucional y de regulación puede facilitar la obtención de ventajas del “pionero”: las compañías originariamente reguladas tienen un acceso privilegiado a recursos escasos, como los derechos de vuelo y el control del aeropuerto (Borenstein, 1989, 1991; Evans y Kessides, 1993); y por tanto, sus programas de vuelos frecuentes pueden aprovechar las ventajas de la amplia red de rutas que disponen. En este contexto, si una empresa establecida disfruta de unos elevados costes de cambio en relación a sus competidores, tendrá menos predisposición a reaccionar en precios y publicidad cuando se enfrenta a una entrada competitiva; actuando estos costes de cambio como una barrera de entrada real (Bowman y Gatignon, 1995; Kuester et al, 1999). Siguiendo la tipología animal de Fudenberg y Tirole (1984), una empresa establecida decidirá permitir la entrada (y ello con independencia del perfil estratégico de la empresa entrante: tradicional, regional y de bajo coste) actuando como un “fat-cat” para explotar su base de clientes con elevados precios.

En general, las estrategias anteriores asumen que los mercados con costes de cambio son estables. Sin embargo, los costes de cambio también pueden tener importantes efectos dinámicos. Farrell y Klemperer (2007) argumentan que el escenario contrario es también posible: las empresas establecidas podrían actuar agresivamente en períodos de transición a un entorno aéreo desregulado, donde la estrategia “fat-cat” dejará de aplicarse, porque conforme el entrante de bajo coste llegue a estar mejor establecido en el mercado, será capaz de construir su red y llegará a estar más comprometido incluso con el viajero de negocios (Call y Keeler, 1985). Es decir, en un contexto desregulado, si un entrante de bajo coste sigue una estrategia de entrada agresiva (Ej: precios bajos) que le confiere una ventaja sobre las previamente establecidas en el mercado, dicha entrada será percibida como una amenaza (Gatignon, Weith y Bansal, 1990) y, de acuerdo con Fudenberg y Tirole (1984), presionaría a las implicadas a aumentar su nivel de inversión publicitaria para dirigir su comportamiento agresivo en contra del entrante. En cualquier caso, esta presión será diferente cuando se reaccione ante otros entrantes con diferentes estrategias competitivas, como por ejemplo, los entrantes tradicionales y regionales, que poseen una similar estructura de costes que el implicado. En base a lo anterior, se propone la siguiente hipótesis:

H1: El efecto de los costes de cambio del implicado sobre su reacción en inversión publicitaria ante la entrada, está condicionado por el tipo de entrante.

La reacción publicitaria de los implicados está también condicionada por las características de las empresas establecidas. En general, los autores sugieren que la dominación en el mercado está directamente relacionada con la cuota de mercado que una empresa defiende y, por tanto, con los beneficios que la empresa establecida puede obtener al disuadir dicha entrada competitiva (Gatignon et al, 1989; Gruca, Kumar y Sudharshan, 1992). En el sector aéreo, la dominación en el mercado genera ventajas competitivas, debido a la explotación de economías de escala y de densidad derivadas de la creación de valor de marca, y reduce los costes

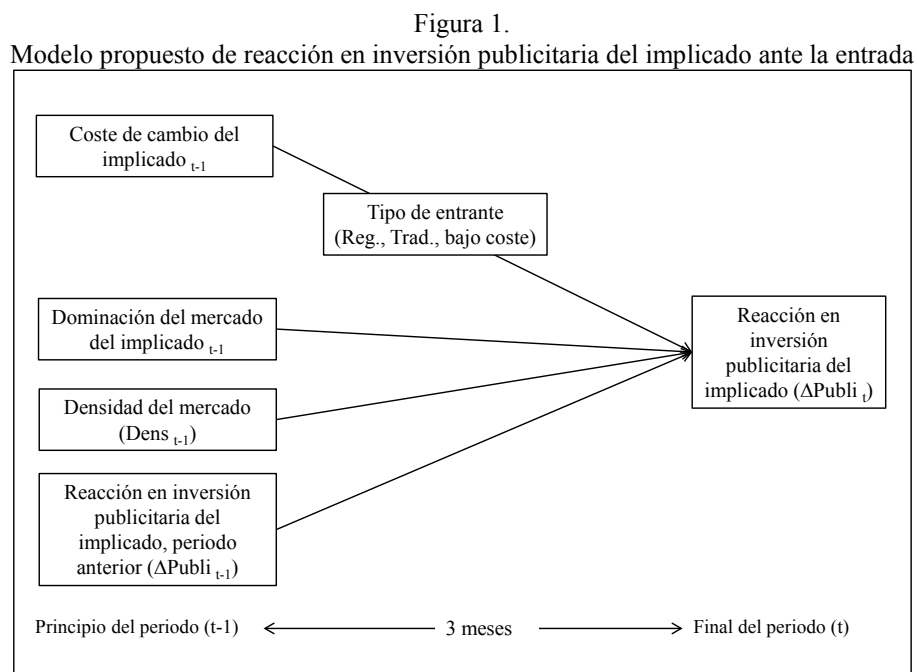

marginales de comunicación de las empresas establecidas. Esta mayor rentabilidad de la inversión publicitaria (menores costes unitarios de comunicación) emana de la naturaleza acumulativa de los contactos entre la empresa y los clientes (las establecidas están presentes en el mercado con anterioridad) y de la explotación de economías de escala en términos de comunicación que disfrutaban las implicadas en sus centros de conexión (Hubs), al transmitir tanto la información global sobre la marca (Ej.: imagen de marca de la compañía aérea) como la información específica de los servicios (Ej.: información sobre tarifas y rutas) (Levine, 1987). Por tanto, se espera que un elevado nivel de dominación del implicado en un mercado actúe como barrera de entrada ante los nuevos competidores, que no pueden explotar dichas economías de escala y de densidad, lo que reducirá el incentivo entre las empresas establecidas a incrementar su nivel de inversión publicitaria ante la entrada. Ello permite proponer la siguiente hipótesis:

H2: El nivel de dominación del implicado en un mercado tiene un efecto directo y negativo sobre la reacción en inversión publicitaria del implicado ante la entrada.

El último factor analizado es el nivel de competencia global del mercado (o densidad del mercado), definido por el número de empresas que ofrecen de forma simultánea sus productos en el mercado (aparte de la entrada), el cual afecta a la reacción publicitaria del implicado ante la entrada dado que refleja el nivel de poder de las empresas que compiten en el mercado. Es decir, a medida que el número de competidores aumenta, se reduce de forma sustancial el poder de mercado de cada uno de ellos (Ej.: en el extremo se llegaría a mercados disputables y a mercados en competencia perfecta), por lo que cabe esperar que una atmósfera de mayor competencia incentive a las empresas establecidas a aumentar su nivel de inversión publicitaria como respuesta a una nueva entrada. Ello permite plantear la siguiente hipótesis:

H3: La densidad del mercado en el que se produce una entrada, tiene un efecto directo y positivo sobre la reacción publicitaria de la empresa establecida.

La figura 1 resume las hipótesis previas, presentando los principales factores que determinan la reacción en inversión publicitaria del implicado ante la entrada.

### 3. Metodología y datos

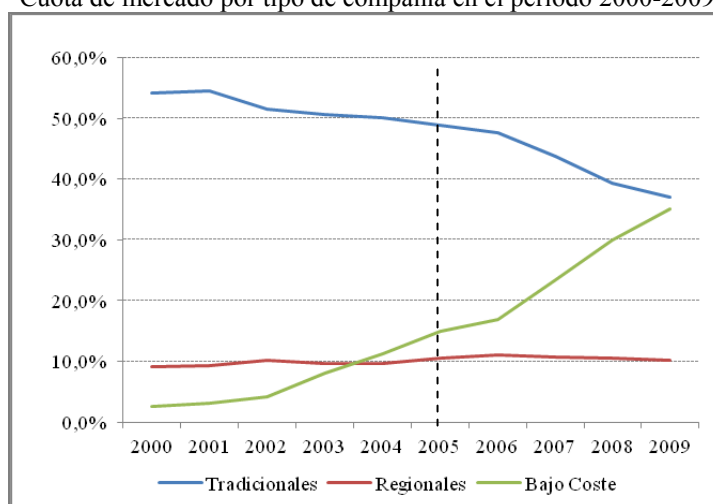

A partir de los datos sobre tráfico y pasajeros, recogidos por AENA (Regulador Español de Aeropuertos y Espacio Aéreo), nuestro trabajo analiza las reacciones de las compañías aéreas cuando se produce la entrada de un nuevo competidor, lo que implica seleccionar 193 rutas que

presentan dichas reacciones en el mercado doméstico español desde 2000 hasta 2009 (de un total de 1400 rutas). Este estudio sólo considera las 11 compañías aéreas<sup>1</sup> que presentan operaciones regulares domésticas. Un análisis descriptivo preliminar de la información permite evidenciar lo siguiente:

El gráfico 1 presenta la evolución de la cuota de mercado de las compañías aéreas, agrupándolas en tres tipos: tradicional, regional y de bajo coste. Se observa una paulatina disminución de la cuota de las compañías tradicionales paralela a un aumento continuado de cuota de las compañías aéreas de bajo coste (mayor en la segunda mitad de la década).

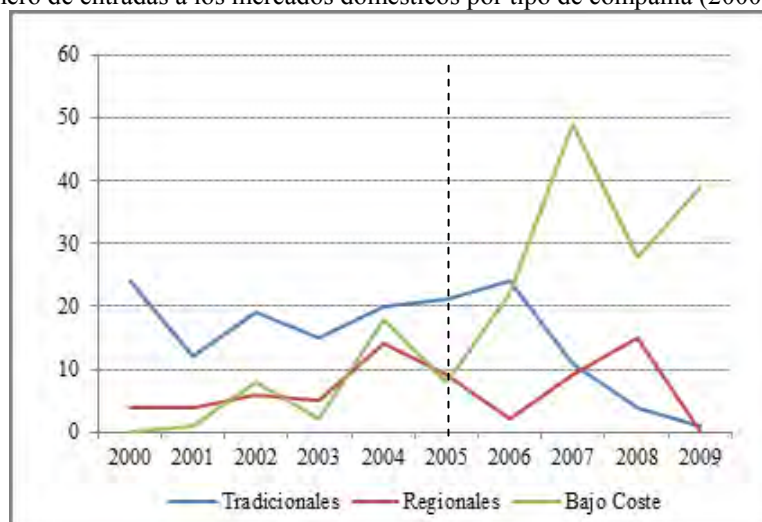

Gráfico 1.  
Cuota de mercado por tipo de compañía en el periodo 2000-2009

Fuente: elaboración propia a partir de la base de datos de AENA

El gráfico 2 muestra la evolución del número de entradas al mercado por tipo de compañía aérea. En el conjunto de rutas que cumplen los criterios de inclusión en el análisis, se observa 394 entradas competitivas. Además, se evidencia un cambio en el perfil de los entrantes entre los dos quinquenios que componen la década, de forma que en 2000-2005 prevalecen las entradas de compañías tradicionales, mientras que en 2006-2009 aumentan exponencialmente las entradas de las compañías de bajo coste.

Gráfico 2.  
Número de entradas a los mercados domésticos por tipo de compañía (2000-2009)

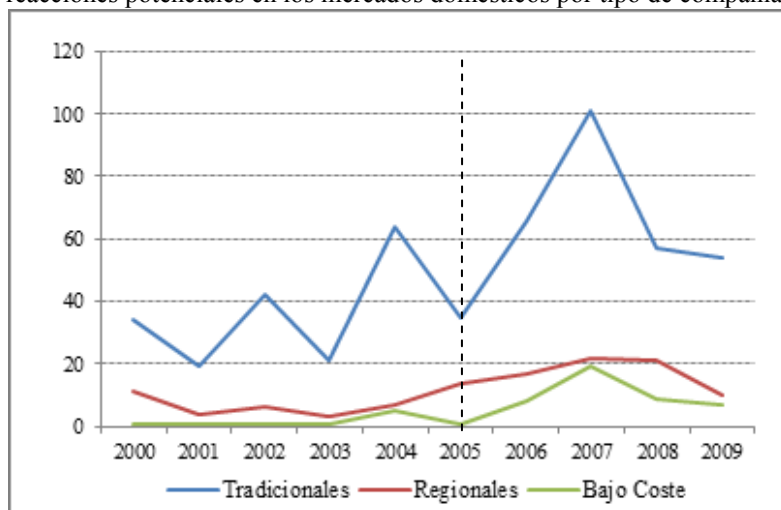

Fuente: elaboración propia a partir de los datos de AENA.

<sup>1</sup> Las compañías aéreas con vuelos domésticos regulares son: i) las tradicionales: Iberia, Air Europa y Spanair; ii) las regionales: Air Nostrum, Binter y Naysa; y iii) las de bajo coste: Vueling, Clickair, Ryanair, Air Berlin e Easyjet.

El gráfico 3 presenta las reacciones potenciales por tipo de compañía para el decenio 2000-09, medidas por el número de rutas que presentan una entrada competitiva donde operaba una compañía aérea establecida previamente. Se observa que las compañías aéreas tradicionales presentan el mayor número de reacciones potenciales (75%) y que esta diferencia se incrementa a partir de la segunda mitad de la década. Por otro lado, tanto las compañías regionales como las de bajo coste implicadas reaccionan ante la entrada, sin embargo lo hacen en menor medida, aumentando desde el año 2004 (21%). En suma, para el conjunto de rutas que cumplen los criterios de inclusión en el análisis, se observa 661 reacciones potenciales de las compañías aéreas establecidas ante 394 entradas competitivas.

Gráfico 3.

Número de reacciones potenciales en los mercados domésticos por tipo de compañía (2000-2009)

Fuente: elaboración propia a partir de los datos de AENA.

En cuanto a la metodología aplicada, el modelo propuesto de reacción publicitaria del implicado relaciona el comportamiento de la compañía aérea establecida con una determinada entrada competitiva, y con los factores que condicionan dicho comportamiento; por lo que se utiliza un modelo dinámico con variable dependiente en diferencias. Es decir, para cada reacción “k” del implicado “i” en la ruta “m”, dado el entrante “j” y durante el periodo “t”, la respuesta de la empresa establecida se mide mediante la diferencia entre el nivel medio de inversión publicitaria en el periodo corriente (t) y el nivel medio de inversión publicitaria en el periodo anterior (t-1). El modelo intenta analizar la decisión tomada por la empresa establecida en el periodo “t” (variación en la inversión publicitaria  $\Delta y_{kt}$ ), dada la nueva entrada, mediante otras variables relevantes al principio del periodo ( $X_{k,t-1}$ ) y a través de la decisión en el periodo anterior “t-1” (variación en la inversión publicitaria,  $\Delta y_{kt-1}$ ). Finalmente, para cada una de las reacciones se utiliza información sobre los siete trimestres que circundan la entrada, con el propósito de tener una medida de la reacción anticipada y otra medida tanto de la reacción a corto como a medio plazo posteriormente a la entrada. De este modo, se incluye el trimestre anterior a la entrada (-1) y los seis siguientes trimestres posteriores a la misma (0, +1, ..., +6). En virtud de lo anterior, el modelo propuesto sería el siguiente:

$$\Delta y_{kt} = X' \beta_{k,t-1} + \gamma \Delta y_{kt-1} + \epsilon_{kt} \quad \text{para } k = 1, 2, \dots, K \text{ (reacciones) y } t = -1, 0, +1, \dots, +6 \text{ (trimestres)}$$

Este modelo general de reacción se puede concretar en el siguiente modelo de reacción en inversión publicitaria ante la entrada:

$$\begin{aligned} \Delta \text{Publi}_{k,t} = & \alpha_{k,t} + \beta_1 [D(\text{implicado pequeño})_{k,t-1}] + \beta_2 [D(\text{implicado grande})_{k,t-1}] \\ & + \beta_3 [ \text{Coste cambio implicado} \times (D \text{ entrante} - \text{bajo coste}) ]_{k,t-1} \\ & + \beta_4 [ \text{Coste Cambio implicado} \times (D \text{ entrante} - \text{regional}) ]_{k,t-1} \\ & + \beta_5 [ \text{Coste Cambio implicado} \times (D \text{ entrante} - \text{tradicional}) ]_{k,t-1} \\ & + \beta_6 [ \text{Densidad mercado} ]_{k,t-1} + \beta_7 [ \Delta \text{Publi}_{k,t-1} ] + \epsilon_{k,t} \end{aligned}$$

La variable dependiente ( $\Delta\text{Publi}_{i,t}$ ) recoge la variación en la inversión publicitaria de la empresa establecida en una determinada ruta, y se mide con datos procedentes de INFOADEX. Las dos variables categóricas de tamaño (pequeño y gran implicado<sup>2</sup>) miden el grado de dominación del implicado en una determinada ruta (en términos de la importancia de su cuota de mercado), cuando decide su reacción ante la entrada. La variable coste de cambio del implicado, mide el coste de cambio “pecuniarios” observado por los clientes de la compañía establecida en relación al entrante en términos de precios medios (Shy, 2002) y se mide con datos procedentes de AENA y SABI. El efecto de interacción entre los costes de cambio de la compañía aérea establecida y el tipo de entrante (tradicional, regional y de bajo coste) evalúa el efecto asimétrico de los costes de cambio dependiendo del perfil del nuevo competidor. La densidad del mercado, o presión competitiva global en una ruta (aparte de la nueva entrada), se mide por el número de empresas que ofrecen simultáneamente sus productos en el mercado. Finalmente, se incluye el comportamiento publicitario en el periodo anterior ( $\Delta\text{Publi}_{i,t-1}$ ) para captar el posible carácter inercial (estratégico) del comportamiento publicitario de la empresa establecida.

Las ocho estimaciones independientes, una para cada trimestre relativo a la entrada, están relacionadas por el lado de los regresores ya que se incluye la variable dependiente retardada como variable explicativa; lo que permite evaluar la relación dinámica entre periodos consecutivos, pero también supone una potencial fuente de endogeneidad. Con el objeto de superar esta limitación, se utilizan estimaciones por variables instrumentales, como los Mínimos Cuadrados en dos etapas (MC2E) y el Método Generalizado de los Momentos (MGM) (Greene, 2008; Pérez, 2007). Por otro lado, la potencial heterocedasticidad, causada por la estructura de los datos de sección cruzada, se solventa mediante la estimación de la matriz de varianzas-covarianzas de White. Asimismo, se emplea la corrección de Windmeijer para corregir la reducción en eficiencia del estimador MGM derivada del reducido número de observaciones empleado en la estimación (Windmeijer, 2005). Finalmente, dado el cambio estructural acaecido en el sector aéreo doméstico español, como resultado de la desregulación y la consecuente entrada masiva de las compañías aéreas de bajo coste durante la segunda mitad de la década de 2000, se divide la muestra de reacciones en dos grupos (2000-2005 y 2006-2009), efectuando una estimación en cada grupo.

#### 4. Resultados

Las tablas 1 y 2 presentan las estimaciones detalladas del modelo de reacción de las compañías aéreas establecidas ante la entrada de nuevos competidores, para ambos periodos (ver anexo). Los resultados obtenidos muestran, en primer lugar, que el efecto de los costes de cambio del implicado (CC) sobre su reacción en inversión publicitaria ante la entrada, está moderado por el tipo de compañía aérea entrante y condicionado por el contexto competitivo general en el momento de la entrada. Así, durante el periodo 2000-2005 el efecto de los CC del implicado es positivo, y mayor cuando el entrante es tradicional ( $\beta_{\text{trad},2000-05}=+7,994^3$ ), seguido por el caso del entrante regional ( $\beta_{\text{reg},2000-05}=+7,183$ ); mientras que no es significativo cuando el entrante es de bajo coste. Sin embargo, durante el periodo 2006-2009 estas magnitudes cambian sustancialmente, de modo que el efecto de los CC del implicado pasa a ser negativo en el caso de los entrantes de bajo coste ( $\beta_{\text{lcc},2006-09}=-5,804$ ), y positivo para los entrantes tradicionales ( $\beta_{\text{trad},2006-09}=+13,276$ ) y los regionales ( $\beta_{\text{reg},2006-09}=+5,614$ ). Esta evidencia impide rechazar la hipótesis 1, por lo que se confirma el efecto moderador del tipo de compañía aérea entrante (tradicional, regional y de bajo coste) entre el coste de cambio del implicado y su reacción en inversión publicitaria.

<sup>2</sup> Los pequeños implicados poseen una cuota de mercado menor del 33%, mientras que los grandes implicados tienen una cuota de mercado mayor del 66% (el grupo omitido son los implicados intermedios, con una cuota entre el 33 y el 66 %).

<sup>3</sup>  $\beta_{\text{trad},2000-05}=+7,994$  significa que una disminución de 1 euro en los costes de cambio del implicado (cuando el entrante es tradicional), generará una disminución en la diferencia de inversión publicitaria de 7994 euros, lo que implica que la inversión publicitaria en “t” caerá en 7 994 euros respecto al periodo “t-1”.

En segundo lugar, el análisis de la influencia de la dominación en el mercado sobre el comportamiento publicitario del implicado revela resultados contradictorios. Se observa un efecto negativo de los implicados dominantes sobre su comportamiento publicitario (es decir, los grandes implicados reaccionan con una menor inversión publicitaria) durante el periodo (2000-05); mientras que durante el segundo periodo (2006-09) se detecta tanto un efecto negativo como uno positivo del nivel de dominación del implicado sobre su inversión publicitaria. Ello permite rechazar parcialmente la hipótesis 2, dado que no siempre que aumenta el grado de dominación de la empresa establecida se produce una disminución en la reacción publicitaria del implicado.

En tercer lugar, la densidad del mercado tiene un efecto significativo sobre la respuesta en inversión publicitaria del implicado. Desde el punto de vista temporal, un aumento en el número de competidores provoca un descenso en la inversión publicitaria del implicado de forma anticipada a la entrada en ambos periodos ( $\beta_{2000-05,-1} = -1,659$  y  $\beta_{2006-09,-1} = -7,130$ ). En contraste, un incremento en la densidad del mercado genera un aumento en la inversión publicitaria del implicado con posterioridad a la entrada durante ambos periodos ( $\beta_{2000-05} = +3,346$  y  $\beta_{2006-09} = +7,366$ ). Es decir, estos resultados muestran que un aumento en la inversión publicitaria del implicado, derivado del aumento del número de operadores, sólo se produce con posterioridad a la entrada, lo que parcialmente apoya la hipótesis 3. Finalmente, la inversión publicitaria del implicado en el periodo anterior ( $\Delta\text{Publi } t-1$ ) es un factor relevante a la hora de explicar el comportamiento publicitario actual de reacción ante la entrada ( $\Delta\text{Publi } t$ ).

## 5. Discusión

Los resultados descritos en la sección anterior del papel moderador del tipo de compañía aérea entrante (y del contexto regulatorio) en la relación existente entre los costes de cambio del implicado y su reacción en inversión publicitaria ante la entrada, pueden ser argumentados del siguiente modo: El efecto positivo y de mayor magnitud de los costes de cambio sobre la reacción publicitaria del implicado (es decir, su menor inversión publicitaria) cuando el entrante es una compañía aérea tradicional, podría explicarse en el primer periodo (2000-2005), no sólo por el hecho de que las compañías establecidas venían disfrutando de elevados costes de cambio pecuniarios derivados de sus programas de vuelos frecuentes, sino porque además dichos costes de cambio vienen reforzados por un contexto de elevada regulación (la cual facilita el control de los aeropuertos y los derechos de vuelo por parte de las compañías establecidas). Ellas optaron por no competir en precios (de hecho, llegaron a un acuerdo de paz; ver Rey, 2003), ni en publicidad. Estas compañías aéreas establecidas (originariamente reguladas) estaban disfrutando de las ventajas del “pionero”, que favorecían su poder de mercado derivado de los elevados costes de cambio de sus clientes: sus programas de vuelos frecuentes podían aprovechar las ventajas de sus sistemas de red de destinos (Hub & Spoke networks) (Levine, 1987; Borenstein 1989; 1991; Carlsson y Löfgren, 2006). Del mismo modo, durante el primer periodo (2000-2005), las compañías aéreas tradicionales establecidas no consideraban a los entrantes de bajo coste como competidores principales. Por lo que se comportaban como “fat-cats” (Fudenberg y Tirole, 1984) y no reaccionaban ni en precios y ni en publicidad ante las primeras entradas a sus mercados. Sin embargo, durante el segundo periodo (2006-2009), el signo negativo del efecto de los costes de cambio sobre la reacción publicitaria, cuando el entrante es una compañía de bajo coste, sugiere que las compañías de bajo coste se convierten en duros competidores (el entrante de bajo coste está mejor establecido en el mercado –en otras rutas- y es capaz de construir su red para estar más comprometido incluso con el viajero de negocios), que motivan a las compañías establecidas al aumento de su nivel de inversión publicitaria tras la entrada. De este modo, una empresa establecida tradicional endurece su reacción contra los entrantes de bajo coste, aumentando su inversión publicitaria. En suma, los costes de cambio muestran importantes efectos dinámicos en los periodos analizados.

En relación al nivel de dominación del implicado en un mercado y su efecto sobre la reacción publicitaria ante la entrada, y contrario a lo asumido en la literatura clásica (ver Fudenberg y Tirole, 1984; Borenstein, 1989; Evans y Kessides, 1993), los resultados no revelan una relación

monótona entre el nivel de dominación del implicado y su comportamiento de respuesta ante la entrada. Estas diferencias pueden derivar de que, durante el periodo 2000-2005, las empresas establecidas (principalmente grandes compañías tradicionales) disfrutaban de economías de escala y de densidad y, por tanto, tenían menor incentivo a aumentar su inversión publicitaria en respuesta a las nuevas entradas. Sin embargo, durante el segundo periodo (2006-2009) las empresas establecidas tienen mayor incentivo a aumentar su inversión publicitaria ante la entrada debido a que las importantes inversiones realizadas en los aeropuertos españoles desde 2005 por AENA permiten eliminar las restricciones de capacidad de los entrantes.

En relación a la densidad de competidores a nivel de ruta, los resultados muestran un efecto diferente antes y después de que la entrada se haya producido. Con anterioridad a la entrada, un aumento en el número de competidores genera una reducción en la inversión publicitaria de las compañías aéreas establecidas; pero, una vez la entrada se ha producido, un aumento en el número de competidores genera un aumento en la inversión publicitaria de las compañías establecidas. El efecto post-entrada de aumento de la inversión publicitaria es el asumido en nuestro trabajo, dado que un incremento en el número de competidores disminuye la cuota de mercado de las empresas establecidas, disminuye la concentración de la oferta e incentiva a las compañías establecidas a aumentar su inversión publicitaria con el objetivo de recuperar cuota de mercado (Baum y Korn, 1996; Ito y Lee, 2003). Sin embargo, este efecto post-entrada difiere del efecto pre-entrada, de reducción de la inversión publicitaria, y ello puede ser explicado porque el implicado, ante una posible entrada, intenta evitar el efecto informativo de la publicidad.

## **6. Conclusiones, implicaciones, limitaciones y futuras líneas de investigación**

El estudio de los determinantes de la reacción en inversión publicitaria ante la entrada de competidores en el mercado aéreo doméstico español en el periodo 2000-2009, permite inferir diversas conclusiones. En primer lugar, el entorno institucional y de regulación incide en la reacción de las empresas establecidas, distinguiendo dos sub periodos de tiempo en el sector aéreo (2000-2005 y 2006-2009). En segundo lugar, los costes de cambio del implicado determinan su respuesta en inversión publicitaria ante la entrada, siendo este efecto moderado por el tipo de compañía aérea entrante. Tercero, la dominación de los implicados, a nivel de ruta, influye de forma diferente en su reacción en inversión publicitaria en los periodos de baja y alta presión competitiva. Finalmente, el nivel general de competencia en un mercado (ruta) determina una menor reacción en publicidad de las empresas establecidas antes de la entrada, pero esta reacción será mayor con posterioridad a la entrada.

Las implicaciones de gestión de estos resultados son las siguientes: En primer lugar, una interesante implicación para los gestores públicos es que los resultados proporcionados por el modelo de reacción competitiva ante la entrada les permite conocer la interacción competitiva en inversión publicitaria y sus principales determinantes. En el caso que nos ocupa del sector aéreo doméstico español, el conocimiento de estos factores puede permitir a los diferentes Organismos reguladores (Ej. AENA) desarrollar políticas para el fomento de la competencia y de la entrada de nuevas compañías (Ej. facilitar la entrada de nuevos operadores en los aeropuertos). Estas políticas deben tener en consideración que la posición dominante, en términos de la imagen de marca y notoriedad de las empresas establecidas y del efecto acumulativo de la publicidad (Erickson, 1985), pueden suponer una verdadera barrera de entrada para los nuevos competidores que acceden al mercado.

En segundo lugar, desde el punto de vista de los gestores de las empresas, los resultados obtenidos permiten comprender los factores que determinan la reacción en publicidad del implicado cuando se enfrenta a la entrada de un nuevo competidor. El conocimiento de la influencia de estos factores, como por ejemplo, el efecto asimétrico de los costes de cambio sobre la reacción en publicidad del implicado, y su evolución temporal, permite a los gestores la toma de decisiones sobre la inversión publicitaria más adecuada al contexto económico y al tipo de nuevo competidor que acceda a su mercado. Del mismo modo, la influencia detectada del nivel de dominación de la compañía aérea establecida sobre su reacción en inversión

publicitaria, refleja la necesidad de explotar las economías de escala y de densidad publicitarias a nivel de centro de conexión (Hub). Es decir, la estructura de destinos de una aerolínea condiciona el efecto de la reacción competitiva en publicidad, ya que permite reducir el coste marginal de comunicación por cliente.

Finalmente, como limitaciones y futuras líneas de investigación destacan las siguientes: En primer lugar, y derivado de la tendencia actual a la consolidación en el sector en forma de fusiones (Ej. Iberia y British Airways en AIG en 2008) y absorciones (Vueling por Clickair – filial de Iberia- en 2009), sería interesante analizar el posible efecto moderador del grupo empresarial de pertenencia de la compañía aérea en el análisis de la reacción en inversión publicitaria ante la entrada. Ello podría revelar posibles limitaciones de la competencia. En segundo lugar, el estudio de la reacción en inversión publicitaria del implicado, distinguiendo los grupos estratégicos de entrantes en el sector aéreo, puede permitir evaluar la respuesta asimétrica en comunicación en relación al perfil estratégico de la aerolínea entrante y la establecida. Finalmente, y dado el componente agregado de la variable de reacción considerada en el estudio (inversión publicitaria a nivel de ruta), sería interesante aprovechar la riqueza de las fuentes de datos en inversión publicitaria disponibles (INFOADDEX) para analizar los componentes de dicha inversión publicitaria (Ej. inversión institucional a nivel de compañía, campañas específicas de promoción de un servicio, entre otras), lo que permitiría comprender en mejor medida la reacción competitiva en publicidad de la compañía aérea establecida.

Universidad de Valladolid

## RESUMEN:

*Un sistema de dirección de reclamaciones y quejas eficaz puede ser un instrumento estratégico clave para mejorar los resultados de la empresa. Sin embargo, a pesar de los beneficios esperados es relativamente fácil encontrar organizaciones con procesos de gestión de reclamaciones incapaces de satisfacer las expectativas de los consumidores. En buena medida, este problema puede explicarse mediante la teoría de los mecanismos de defensa del personal de la empresa, que les lleva a concebir las quejas como una complicación incómoda y no como una oportunidad. Fundamentándonos en el enfoque mecanicista, en este trabajo en curso planteamos que uno de los mecanismos para superar los comportamientos defensivos es normalizar el sistema de reclamaciones y quejas. De forma más específica, tratamos de determinar la influencia que ejercen tres tipos de normas –de procedimiento, de comportamiento y de resolución– en el logro de soluciones más justas para los clientes y, por consiguiente, de una mayor satisfacción con el sistema de reclamaciones y quejas. El modelo propuesto será contrastado sobre una muestra de empresas de fabricación españolas con 50 o más empleados. Los hallazgos de este estudio servirán para recomendar a las empresas sobre qué tipo de normas han de hacer recaer el énfasis en el establecimiento de un sistema de gestión de reclamaciones y quejas para evitar situaciones de ineficiencia.*

## PALABRAS CLAVE:

*Normas de procedimiento, normas de comportamiento, normas de solución, justicia en la solución, satisfacción del cliente*

## 1. Introducción

La gestión de las reclamaciones y quejas, hasta décadas recientes, no ha sido un área de la organización que haya gozado de especial interés, ni en el ámbito académico ni en el profesional. Sin embargo, a medida que las empresas desarrollan sus actividades en mercados cada vez más maduros y competitivos, los objetivos tradicionales del marketing ofensivo, como captar nuevos clientes, promover el cambio de marca y aumentar la frecuencia de compra, son cada vez más difíciles de conseguir, por lo que es necesario compensar tales situaciones con la adopción consciente de una estrategia comercial defensiva para maximizar la retención de clientes.

En este sentido, destaca la creciente preocupación de las empresas por conocer el impacto sobre sus resultados de las estrategias de recuperación de clientes tras cometer un fallo ante el consumidor. La falta de cumplimiento de las condiciones pactadas, el pobre rendimiento del producto o un deficiente servicio postventa pueden dar lugar a una reclamación del cliente y éste dejar de serlo si percibe que

tal reclamación no ha merecido una respuesta justa por parte de los responsables de la organización. Un sistema de dirección de reclamaciones y quejas eficaz, que no sólo permita solucionar de una forma satisfactoria el descontento del consumidor sino que, tal y como prescribe el enfoque de marketing de la orientación al mercado, facilite también un mejor conocimiento de sus necesidades y el descubrimiento de nuevas oportunidades de negocio, puede ser un instrumento estratégico clave para mejorar los resultados de la empresa.

Sin embargo, a pesar de los beneficios esperados, tanto económicos como de mantenimiento de relaciones a largo plazo con el cliente, derivados de una buena gestión del sistema de reclamaciones y quejas (Goodwin y Ross, 1992; Tax et al., 1998; Smith et al., 1999), es relativamente fácil encontrar organizaciones con procesos de gestión de reclamaciones incapaces de satisfacer convenientemente las expectativas de los consumidores (Grainer et al., 2014). Homburg y Fürst (2007) trataron de dar una explicación teórica a la persistencia de este problema aludiendo a la teoría de los mecanismos de defensa del personal de la empresa, que les impide establecer un correcto contacto con los clientes insatisfechos y difundir la información procedente de ellos dentro de la propia organización debido a sus deseos de mantenerse psicológicamente alejados de las cuestiones desagradables. Así, no es extraño encontrar empresas en las que las quejas se conciben como un problema embarazoso, lo que lleva a que no se informe adecuadamente sobre dónde, cómo y ante quién pueden quejarse los clientes, se eludan responsabilidades o no se muestre una verdadera preocupación por identificar las razones de las quejas y analizar los datos de reclamaciones para identificar oportunidades de mejora. Este tipo de comportamientos defensivos de los empleados y directivos se traducen en barreras a la gestión eficiente de las reclamaciones y quejas. Aún realizando inversiones razonables en este área, las empresas pueden fracasar si no consiguen superar tales barreras (Grainer et al., 2014).

En este trabajo en curso planteamos que uno de los mecanismos para superar los comportamientos defensivos es normalizar o sistematizar el sistema de reclamaciones y quejas. Los fundamentos teóricos del estudio quedan circunscritos, por tanto, a la teoría del comportamiento organizacional que se conoce como enfoque mecanicista<sup>1</sup>. Desde tal enfoque se indica que la empresa puede mejorar el comportamiento de sus miembros mediante la implantación de normas y procedimientos operativos estandarizados que guíen sus decisiones y acciones en sintonía con los objetivos de la organización (March y Simon, 1993). Esta concepción de la empresa está basada en la idea de que es un sistema racional y, por tanto, la conducta de su personal viene determinada por elementos intencionales y coordinados desde la alta dirección (Simon, 1947). El hecho de establecer normas, estructurando y ordenando las tareas, puede ayudar a los empleados a actuar de manera más disciplinada y mejorar su atención hacia las actividades que deben desarrollar en el día a día.

Aplicado a nuestro estudio, y tomando como punto de partida el artículo de Homburg y Fürst (2005), pretendemos avanzar en el conocimiento del sistema de reclamaciones y quejas desde la perspectiva de la empresa. En general, con escasas salvedades –como Homburg y Fürst (2005) o Santos-Vijante et al. (2010)–, las investigaciones sobre tramitación de quejas se han realizado desde la perspectiva del consumidor (por ejemplo, Blodgett et al., 1993; Tax et al., 1998; Smith et al., 1999; Saxby et al., 2000; Del Río-Lanza et al., 2009). En estos trabajos, las evaluaciones de percepción de justicia del cliente se han basado en su categorización en tres dimensiones: la justicia procedimental, comportamental y distributiva. Pero, con la excepción de trabajos como los de Homburg y Fürst (2005) o Homburg et al. (2010), no se había planteado que estos tres tipos de justicia pueden tener su contraparte en el establecimiento de unas normas de procedimiento, de comportamiento y de resolución dentro del sistema de dirección de reclamaciones y quejas de la empresa. Por lo tanto, la primera aportación del trabajo es tratar de contribuir a la literatura sobre la gestión de reclamaciones y quejas estudiando el efecto específico que el establecimiento de estos tres tipos de normas –de procedimiento, de

---

<sup>1</sup> Con carácter adicional a la fijación de normas o enfoque mecanicista, reconocemos la existencia de otro tipo de mecanismos para mejorar la gestión de las reclamaciones y quejas. Concretamente, la literatura considera relevante el denominado enfoque orgánico. Tal enfoque postula la importancia de crear un ambiente interno favorable al tratamiento de quejas entre los recursos humanos de la empresa y se concreta en variables como la cultura de orientación a los empleados (capacidad de decisión, formación, satisfacción) o su comportamiento extra-rol (lealtad, iniciativa propia, respuesta emocional positiva). Esta perspectiva de estudio, y sus correspondientes variables, está siendo considerada en el proyecto de investigación en el que se enmarca el presente trabajo en curso, sin embargo, con objeto de profundizar en el enfoque mecanicista, aquí únicamente se plantea la influencia de la perspectiva orgánica a efectos de control.

comportamiento y de solución de la queja– tienen en el logro de soluciones justas para los consumidores.

Por otra parte, la mayoría de la investigación empírica realizada hasta el momento sobre este tema se ha centrado en el estudio de empresas de servicios. Dos características distintivas de los servicios han podido decantar la investigación en tal sentido. La primera de ellas, la inseparabilidad entre producción y consumo, conduce a un alto grado de interacción entre cliente y empleado, lo que requiere que este último tenga que estar más preparado para responder rápida y eficientemente cuando se presenta un problema. La segunda característica, la mayor probabilidad de heterogeneidad en el servicio, hace que la percepción de riesgo de fallo aumente. Ambas circunstancias han podido contribuir a que la investigación se escorde hacia el ámbito de servicios, ya que es para este tipo de empresas para las que cabe esperar un mayor impacto del establecimiento de la fijación de normas sobre la resolución de los problemas generados en las quejas (Homburg y Fürst, 2005). Nuestro estudio, sin embargo, da un giro a lo mayoritariamente realizado hasta ahora y se propone, como segunda aportación, el análisis de los sistemas de reclamaciones de empresas fabricantes. A la vez que cubre esta laguna de investigación, testa las relaciones que se plantean en un contexto más desfavorable, lo que a la postre reforzará el valor de los efectos significativos encontrados.

Los hallazgos de este trabajo servirán para recomendar a las empresas qué tipo de normas deben enfatizar en el establecimiento de un sistema de gestión de reclamaciones y quejas. La falta de conocimiento sobre cuales son las más adecuadas para que, a través de la interacción entre el empleado y el consumidor, se consiga restaurar el daño causado al cliente y no se desaprovechen ocasiones de aprender cómo mejorar los productos, puede estar generando situaciones de ineficiencia, incluso en empresas que están haciendo fuertes inversiones y esfuerzos para mejorar su sistema de reclamaciones.

## **2. Impacto en los resultados del sistema de reclamaciones y quejas de las normas de procedimiento, comportamiento y resolución**

Como antes hemos señalado, la teoría del comportamiento que se conoce como enfoque mecanicista, prescribe la fijación de normas como vía para lograr un comportamiento eficiente. En el caso particular del diseño de un sistema de reclamaciones y quejas, y de acuerdo con Homburg y Fürst (2005), tales normas se pueden sistematizar en tres grupos: normas de procedimiento, normas de comportamiento y normas de resolución.

Homburg y Fürst (2005) definen las **normas de procedimiento** para la gestión de quejas como la existencia de una estructura organizacional formal para el registro y procesamiento de las quejas consistente con las necesidades de los clientes. Entendemos que estas normas abarcan desde la puesta a disposición del cliente de los distintos canales de recepción de la queja hasta el protocolo de tramitación y la posible intervención del cliente en el proceso y solución de la queja. Concretamente, nuestra propuesta es considerar cuatro dimensiones del constructo: la *iniciación*, la *tramitación*, la *participación del cliente en el proceso* y la *participación en la solución*.

La *iniciación* alude a los distintos mecanismos o canales de comunicación que la empresa pone a disposición del cliente para permitir que se oiga su “voz”. Estudios como los de Goodwin y Ross (1992) y Davidow y Leigh (1998) confirman el efecto positivo que ejerce la facilitación al cliente en su nivel de satisfacción. La *tramitación* implica la existencia de un protocolo de actuación rápido en materia de registro de las quejas, la clasificación en función de su origen y gravedad y la asignación de un responsable de su gestión, de tal forma que el cliente perciba el esfuerzo de la empresa por resolver el problema ocasionado. La *participación del cliente en el proceso* hace referencia a la oportunidad que se le ofrece para exponer y explicar su queja, en definitiva, a las facilidades para transmitir a la empresa su punto de vista. La oportunidad de explicar el problema incrementa las percepciones del cliente sobre el control del proceso, así lo indican algunos resultados empíricos (Goodwin y Ross, 1992). Los individuos aceptamos mejor las decisiones cuando sentimos, en cierto modo, que controlamos los procesos (Saxby et al., 2000). Finalmente, la *participación en la solución* es una oportunidad que la empresa brinda al cliente para trabajar conjuntamente en la búsqueda de una solución, teniendo en cuenta sus necesidades y deseos.

En cuanto a las **normas de comportamiento**, éstas permiten guiar las conductas de los empleados en el proceso de interacción con el cliente mediante un trato interpersonal adecuado y aportando información relevante sobre el problema objeto de la queja. Algunos estudios empíricos señalan que un estilo de interacción orientado al consumidor ayuda a incrementar la percepción de justicia del cliente (Maxham y Netemeyer, 2003) y su satisfacción (por ejemplo, Smith y Bolton, 1998; McCollough et al., 2000). Tomando como base su definición, componemos este constructo a partir dos dimensiones: el *trato interpersonal* y el *nivel de explicación* que da la empresa al cliente.

El *trato interpersonal* es un elemento esencial en la interacción con el cliente en la medida en que los empleados muestran una atención personal, cortesía y empatía con el problema. La inclusión de los factores de interacción puede explicar por qué algunas personas pueden sentir injustamente tratados a pesar de que el resultado para el consumidor pueda ser justo (Bies y Shapiro, 1987). El *nivel de explicación* indica el esfuerzo que realiza la organización para proporcionar información de interés para el consumidor sobre por qué se ha producido el fallo (Greenberg, 1993). Cuando las explicaciones recibidas permiten al cliente entender que el problema no es algo que normalmente ocurre, entonces hay una mayor probabilidad de recuperación del fallo cometido (Blodgett et al., 1997).

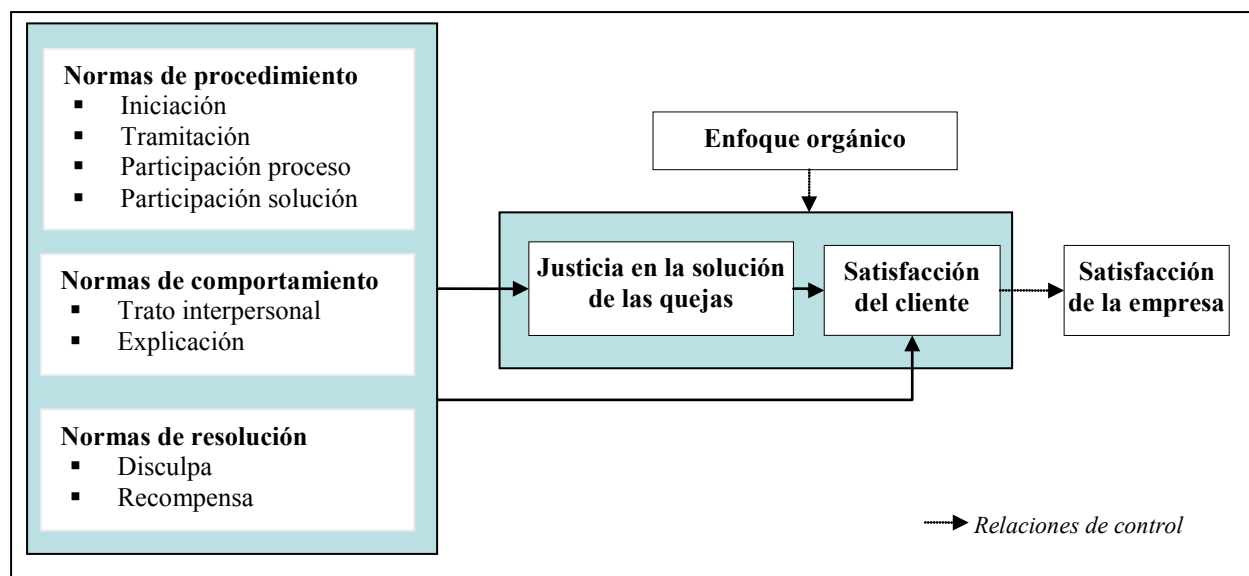

El tercer bloque de normas se refiere a las **normas de resolución**, es decir, al conjunto de compensaciones tangibles y psicológicas que la empresa otorgará al cliente por el daño ocasionado. La explicación proporcionada al cliente –que se prescribe como una norma adecuada de comportamiento–, puede ser un medio insuficiente para mantener o recuperar su favor. Recompensas como la reparación, el cambio, el descuento o el reembolso (Kelley et al., 1993) o, al menos, una disculpa, pueden ser necesarias para percibir que la solución es justa. Dos son, por tanto, las dimensiones que contemplamos en este constructo: la *disculpa* y la *recompensa*.

Según Davidow (2000), la *disculpa* es un tipo de compensación psicológica. A diferencia de las excusas y las justificaciones, la disculpa tiene por finalidad informar al cliente de que la organización acepta la responsabilidad del evento ocurrido y, además, expresa su pesar sincero por ello (Conlon y Murray, 1996). Su importancia es tal que hay investigaciones centradas en la disculpa como única compensación (Hoffman et al., 1995; Boshoff, 1997; Webster y Sundaram, 1998). La *recompensa* la definimos como una compensación adicional más allá de la solución aportada al cliente. Es una manera de indemnizarle económicamente –bien de forma directa (rebajas en el precio o pago de una indemnización) bien de forma indirecta (vales de descuento, puntos canjeables...)– por los perjuicios ocasionados.

A partir de estas variables, se propone un modelo que, desde una perspectiva de empresa y con un enfoque mecanicista, tiene como primer objetivo explicar si la normalización del sistema de dirección de reclamaciones y quejas influye, en primer lugar, en la percepción de justicia en las soluciones aportadas a los clientes y, en segundo lugar y como consecuencia de ello, en su satisfacción con el sistema. Además, como segundo objetivo, nos proponemos establecer la importancia relativa de cada tipo de norma en la explicación de la justicia de las soluciones. Algunas de estas normas, a pesar de ser necesarias a efectos organizativos, podrían no ser fuente de satisfacción en el consumidor, o no ser tan importantes como otras. Finalmente, y como tercer objetivo, trataremos de conocer en qué medida la justicia en la solución aportada media total o parcialmente la relación entre las normas –de procedimiento, comportamiento y resolución– y la satisfacción del consumidor. Es decir, trataremos de determinar qué tipos de normas pueden ser motivo de satisfacción más allá de que se consiga o no una solución justa para el consumidor.

Junto a las relaciones principales mostradas en la Figura 1, a modo de control, en el trabajo se plantea que la satisfacción del cliente ha de traducirse en una mayor satisfacción de la empresa. Adicionalmente y como indicábamos en la introducción, también se incluyen como variables de control aquellas propuestas desde el enfoque orgánico con objeto de determinar en qué medida la explicación mecanicista mantiene su relevancia en presencia de tales variables.

FIGURA 1  
Modelo propuesto

Fuente: Elaboración a partir de Tax et al. (1998), Davidow (2003), Maxham y Netemeyer (2003), Homburg y Fürst (2005) y Homburg et al. (2010).

### 3. Metodología

Tal y como se indicó en la introducción, la investigación sobre la gestión de reclamaciones y quejas se ha centrado más en el ámbito de los servicios, por lo que, ante la escasez de estudios en el ámbito de las empresas manufactureras, el modelo propuesto se contrastará en una muestra de empresas de fabricación de productos de consumo e industriales que asuman todas o la mayor parte de las tareas asociadas a la gestión de reclamaciones. A partir de la base Amadeus (actualizada el 28 de octubre de 2013), se ha seleccionado como universo de población un conjunto de empresas fabricantes españolas con 50 o más empleados pertenecientes a los siguientes sectores (con su correspondiente código NACE entre paréntesis): alimentación (10), bebida (11), tabaco (12), textil (13), prendas de vestir (14), cuero y calzado (15), industria del papel (17), artes gráficas (18), industria química (20), productos farmacéuticos (21), productos de caucho y plásticos (22), productos informáticos, electrónicos y ópticos (26), material y equipo eléctrico (27), equipos de transporte (29), muebles (21) y otras industrias manufactureras (32). La selección de un amplio y variado número de sectores tiene la ventaja de hacer posible la generalización de los resultados más allá de la idiosincrasia que se pudiera atribuir a alguno de ellos. De acuerdo con los datos de Amadeus, el universo de población considerado para este trabajo está constituido por 2.536 empresas.

Para la obtención de los datos necesarios para la investigación empírica se ha elaborado un cuestionario para cuya distribución se están utilizando simultáneamente varios canales. En primer lugar, se envió a todas las empresas del universo de población el cuestionario vía postal, junto con una carta de presentación del estudio y una dirección web a la que podían acceder aquellos destinatarios que preferían cumplimentar el cuestionario online. La carta iba dirigida al director de marketing, si bien se indicaba que el cuestionario y la información de la investigación debían cumplimentarla en cada empresa el máximo responsable de las cuestiones relacionadas con la gestión de las reclamaciones y quejas. Posteriormente, se inició una ronda de llamadas a una selección aleatoria de empresas que aún no habían respondido. A aquellas que acceden a colaborar se les envía por correo electrónico la presentación de la investigación y el cuestionario en formato Word que pueden cumplimentar y devolver online o por correo electrónico.

La recogida de información se inició en el mes de noviembre y continuará hasta que se reúna una muestra suficientemente amplia. A fecha 25 de abril de 2014 se han conseguido 123 respuestas válidas. Puesto que el cuestionario contiene una pregunta filtro en la que se pide al responsable de marketing que conteste sólo si en su empresa la gestión de las reclamaciones y quejas no está

subcontratada en su mayor parte, desconocemos qué número de las 2.536 empresas integran realmente nuestro universo de población (es decir, superan esta pregunta filtro porque asumen la gestión de las reclamaciones y quejas que recibe su empresa). Además, se ha observado que en la base Amadeus aparecen registros que corresponden a distintas empresas filiales que pertenecen a un mismo grupo o corporación y que muy posiblemente tienen centralizada la gestión de reclamaciones. Por todo ello, resulta difícil determinar la tasa de respuestas efectiva.

Como hemos señalado en la presentación de este estudio, a pesar de la abundante cantidad de investigaciones sobre el tratamiento de reclamaciones y quejas, son escasos los trabajos realizados desde la perspectiva de la organización. Por tanto, el proceso de adaptación de las escalas –en una buena parte tomadas de estudios realizados desde la óptica del consumidor– ha sido profundo. En la Tabla 1 se pueden ver los ítems concretos utilizados para la medición de los constructos de nuestro modelo. Los principales trabajos en los que nos hemos basado para desarrollar los instrumentos de medida utilizados son los de Tax et al. (1998), Smith et al. (1999) y Homburg y Fürst (2005).

TABLA 1  
Medición de los constructos<sup>1</sup>

VARIABLES	ÍTEMS
<b>Normas de procedimiento</b>	
Iniciación	Ponemos a disposición del cliente varios canales de recepción de quejas. Algunos canales de recepción están disponibles 24 horas. Informamos al cliente sobre dónde, cómo y a quién hay que presentar la queja.
Tramitación	Confirmamos rápidamente al cliente que nos ha llegado su queja. Todas las quejas, tanto por escrito como verbales, quedan registradas en un sistema informático. Todas las quejas se ordenan y clasifican en función del origen y la gravedad del problema. En cuanto se recibe una queja asignamos un responsable de su gestión. Las quejas son transmitidas rápidamente a sus responsables cuando el personal de contacto con el cliente no las puede resolver.
Participación del cliente en el proceso	Permitimos que el cliente se explique sobre la queja. Le damos la oportunidad de exponer todos los detalles. Escuchamos su punto de vista sobre el problema ocasionado.
Participación del cliente en la solución	A la hora de establecer la solución tenemos en cuenta las necesidades del cliente. Consultamos al cliente sobre las posibles soluciones. Empresa y cliente trabajamos conjuntamente en la búsqueda de una solución a la reclamación presentada.
<b>Normas de comportamiento</b>	
Trato interpersonal	El personal de atención al cliente dispensa un trato amable al cliente cuando formula la queja. El personal se preocupa por el problema del cliente. Los encargados de la gestión de la queja tienen capacidades de empatía con el cliente.
Nivel Explicación	Proporcionamos al cliente una explicación razonada sobre las causas del problema que originó la queja. Damos respuesta precisa a todas aquellas cuestiones planteadas en la queja del cliente.
<b>Normas de resolución</b>	
Disculpa	Siempre reconocemos nuestra culpa frente al cliente cuando estimamos que su queja es razonable. Cuando ocurre un fallo, aceptamos nuestra responsabilidad y se lo hacemos saber al cliente. Además de solucionar el problema que originó la queja, siempre nos disculpamos ante el cliente.
Recompensa	Más allá de la solución, ofrecemos al cliente una recompensa económica directa (rebajas en el precio, indemnización...).
	Más allá de la solución, ofrecemos al cliente una recompensa económica indirecta (vales descuento, puntos canjeables...).
<b>Justicia en la solución de la queja</b>	
Justicia en la solución de las quejas	Proporcionamos una solución a la queja acorde con las necesidades del cliente. Las soluciones dadas al cliente son justas. Nos esforzamos para ofrecer una solución satisfactoria.
<b>Satisfacción del cliente con el sistema de reclamaciones y quejas</b>	
Satisfacción del cliente	Satisfacción con el procedimiento de presentación de la queja. Satisfacción con el trato recibido. Satisfacción con la solución aportada por la empresa. Satisfacción con el sistema general que se utiliza para resolver las reclamaciones y quejas.
<b>Satisfacción de la empresa con el sistema de reclamaciones y quejas</b>	
Satisfacción de la empresa	Grado de satisfacción global de la empresa con el sistema de reclamaciones y quejas

<sup>1</sup> Para la medición de todas las escalas se ha utilizado una escala Likert de 1 a 7, en la 1 significa “desacuerdo” y 7 “acuerdo”, excepto para el ítem “satisfacción global de la empresa con el sistema de reclamaciones y quejas”, para el que 1 denota “muy bajo” y 7 “muy alto”.

#### 4. Resultados preliminares

Aunque no ha finalizado la fase de recogida de datos, se han ejecutado algunos análisis preliminares con las respuestas recibidas. Concretamente, se ha llevado a cabo un análisis factorial exploratorio que ha permitido comprobar que los indicadores de medida se estructuran en una serie de factores que se corresponden bastante bien con los constructos teóricos considerados en nuestro modelo.

Asimismo, se ha realizado una primera tentativa de estimación del modelo propuesto mediante la técnica de Partial Least Squares (PLS) y los resultados indican que los tres tipos de normas contribuyen a explicar la justicia en la solución de las quejas y, por esa vía, la satisfacción de los clientes con el sistema de reclamaciones y quejas. Ahora bien, se observan diferencias en la importancia que tienen los distintos tipos de normas y sus correspondientes dimensiones.

En cuanto a las normas de procedimiento, la participación de los clientes en el proceso de planteamiento de la queja y en la búsqueda de una solución parece influir positivamente, mientras que la iniciación y las normas de tramitación no tienen incidencia en los resultados del sistema. Por su parte, las normas de comportamiento tienen un efecto notable sobre la percepción de justicia de los clientes. Respecto a las normas de solución, parece que es la disculpa la que más influye sobre las variables dependientes, mientras que la recompensa económica de las reclamaciones recibidas, con carácter general, no tiene un impacto significativo e incluso los resultados apuntan a que pueden tener un efecto negativo en la justicia de la solución de las quejas.

Aunque, obviamente, aún no podemos ser muy concluyentes en la interpretación de estos primeros resultados empíricos, también se aprecian algunas relaciones directas significativas sobre la satisfacción del cliente con el sistema, lo que apunta a la existencia de efectos de mediación parcial e incluso efectos de supresión (efectos directos e indirectos de signo contrario) que conllevarían implicaciones para la gestión muy interesantes. Un análisis de ecuaciones estructurales más riguroso nos permitirá comprender mejor qué tipo de relaciones se dan entre los distintos tipos de normas y la justicia de las soluciones aportadas a las quejas y la satisfacción de los clientes con el sistema de reclamaciones. Habrá que determinar qué tipo de técnica –análisis basado en las covarianzas, CBSEM, o en la varianza, PLS– es más adecuada a tenor de la muestra final con la que se realice el análisis empírico.

## ABSTRACT

*Nowadays, customers frequently initiate contacts with the company because they become more involved in activities that previously were exclusively reserved for the firm: promoting the brand, suggesting ideas for new products, deciding on logos, etc. Thus, the growing importance of customers inside the domain of value creation changes the rules of the game in customer-firm interactions. Companies are now looking for ways to manage this new stage in customer-firm interactions and they are trying to take more control over customer behaviors with the aim at improving customer profitability. Therefore, our study aims at analyzing whether the proactivity of customers that frequently initiate the contact may be profitable for the firm. In addition, according to social exchange theory, we analyze the moderating role of customer trust in the relationship between customer initiated contacts (CICs) and customer profitability. The framework will be empirically tested applying linear regression techniques to longitudinal data for a sample of 1998 customers in the financial services industry.*

## Keywords:

Customer initiated contacts, customer interactions, transactional behaviors, customer profitability, customer trust.

## 1. Introduction

Traditionally, marketing communication activities mainly focused on pushing messages on to customers (Shankar and Malhotra, 2007; Wiesel, Pauwels and Arts, 2011). However, these firm-initiated contacts (FICs) understood as those interactions or contacts that the company initiates in order to communicate with their customers, are increasingly unwanted by customers and less effective at improving profitability (Blattberg et al., 2008; Wiesel, Pauwels and Arts, 2011).

In contrast to FICs, customer-initiated contacts (CICs) understood as any communication with a company that is initiated by a customer (Bowman and Narayandas, 2001), are an important source of information about customers' concerns, preferences, tastes and questions (Ramani and Kumar, 2008). These customers' contacts are really valuable for firms and companies view CICs as an opportunity to increase customer profitability (Bowman and Narayandas, 2001).

This is because nowadays customers frequently initiate the contact with the company. They become more involved in activities that previously were exclusively reserved for the firm (Beckers et al., 2013). Customers are involved "promoting the brand, suggesting ideas for new products, choosing advertising copy, deciding on logos, and even reacting to competitive actions" (Libai, 2011: p. 275) and the most proactive customers adopt the role of being co-creators of value for companies (Vargo and Lusch, 2004). This new reality means that "firms no longer control marketing, but rather customers define what a company is (and is not)" (Leeflang 2011, p.78). Thus, the growing importance of customers inside the domain of value creation changes the rules of the game in customer-firm interactions.

Companies are now looking for ways to manage this new stage in customer-firm interactions. Godes et al. (2005), for instance, identify some approaches that companies can take when dealing with social interactions ranging from re-active to pro-active. These approaches are observing the occurring interactions, moderating the interactions by fostering them, mediating the interactions by controlling the information flow to customers, and actively participating and even creating these interactions themselves (Godes and Mayzlin, 2009). In practice, it is observed that many companies try to take more control over customer behaviors with the aim at improving customer profitability.

Regarding CICs, prior research has focused primarily on customer complaints demonstrating the importance of encouraging and managing them (Fornell and Wernerfelt, 1988). However, the limited research on CICs other than complaints also emphasizes the overall importance of CICs. Smith, Bolton, and Wagner (1999) are among the researchers who have discussed the need to generalize knowledge of customer-firm contact beyond the domain of complaints, which represent a modest percentage of CICs. Therefore, in this study we focus on CICs beyond the domain of complaints and we mainly aim at measuring whether these CICs may be profitable for firms. Are the more proactive customers more profitable? Is determinant the company's management of these CICs? To what extent companies can manage CICs to improve customer profitability? In this study, we attempt to answer these questions. To do so, we aim (1) to deepen the influence of CICs on customer profitability distinguishing between economic and non-economic CICs and, (2) to analyze the role of trust in the relationship between CICs and transactional customer behaviors, according to social exchange theory.

The remainder of this manuscript is organized as follows. In the next section, we describe the literature review about CICs. Subsequently, we show the conceptual model and present the research hypotheses that relate different types of CICs to customer profitability, taking into account the moderating role of customer trust. Finally, we discuss the research methodology and describe the data that we will use to empirically test and validate our model.

## **2. Literature review of customer contacts**

Interactions are the starting point of the relationship (Dwyer, Schurr and Oh, 1987). Depending on the customer's perception about the company's investment in the relationship, the customer's evaluation about the company can be reinforced. Some of these interactions may become critical incidents -or trigger events-. They are defined as "interaction incidents, which the customer perceives or remembers as unusually positive or negative when asked about them" (Roos, 2002; p.194). Literature evidences that trigger events lead to five specific responses: a reevaluation, a change in standards level, an emotional response, a change in values, and a behavioral change – product/service use- (Fisher et al., 1996). Therefore, interactions are critical for the company because they may affect customer emotions and customer behaviors among others. So, as contacts are extremely important in a relationship marketing context, and may generate different reactions in customers, we want to consider these interactions as the starting point of our framework.

Although companies have traditionally tried to establish frequent contacts with their customers (FICs) with the aim at building solid and profitable relationships with them, currently, companies have to accurately manage CICs (Wiesel, Pauwels and Arts, 2011). In our research we propose to focus on CICs as a key driver of transactional customer behavior because of different reasons. Firstly, FICs are not always well perceived. De Wulf et al. (2001) find that companies' efforts to enhance relationships are not always positively perceived by customers due to some customers do not value the feeling of distinctiveness (Butori and De Bruyn, 2013). Secondly, CICs are more important than FICs for companies because the customer indicates some interest in the firm by this act and customer effort reduces the marketing costs of the firm (Berger et al., 2002). Thirdly, empirical studies report a much higher sales elasticity for CICs than FICs (Sarner and Herschel, 2008; Wiesel, Pauwels and Arts, 2011). This is because existing or prospective customers are more attentive to information that is directly relevant to what they are searching for, while FICs often reaches them at the wrong time and with a suboptimal message (Wiesel, Pauwels and Arts, 2011). Therefore, CICs are critical for the company because they may increase the efficiency and profitability of the company.

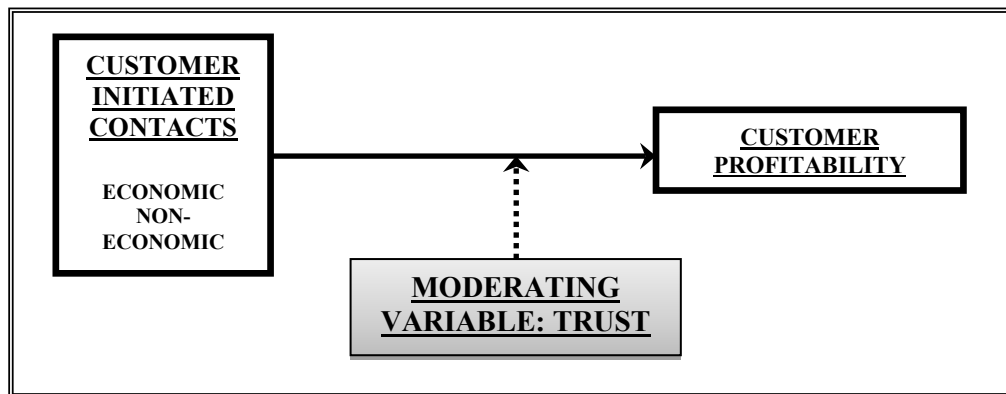

In addition, although much prior research has focused solely on complaints, Bowman and Narayandas (2001) and Bolton (1998) show how the fraction of non-complaints in a sample of CICs was higher than the percentage of complaints (approximately a 60% were classified as inquiries). Goodman, Fichman, Lerch and Snyder (1995) for example, found that responsiveness to customer inquiries influences not only their overall satisfaction, but also their evaluation of a firm's core product. Hence, empirical research suggests analyzing the differential processing of CICs. Thus, we examine a broader set of CICs than just complaints and we categorize them into economic vs. non-economic CICs in line with Gelbrich and Roschk (2011).

## **3. Conceptual framework**

Theoretical support for a link between interactions and customer transactional behaviors is provided by social exchange theory (SET). This theory is based on the reciprocity principle (Palmatier et al., 2009; Cropanzano and Mitchell, 2005; DeWulf et al., 2001) and identifies conditions under which people feel obligated to reciprocate behaviors or actions when they receive some benefit from others (Groth, 2005; Mahn and Jaebeom, 2003). An exchange requires a bidirectional transaction –something has to be given and something returned-. This is precisely what Bagozzi (1995) postulated: that investments made by one party in a relationship generate the desire to reciprocate in the other party which, in turn, motivates investment in the relationship in order to avoid the guiltiness for not having corresponded to the initial investment action.

Applying SET is also interesting because it reflects a customer-firm process (Schiele et al., 2012). SET considers the relationship initiation and the evolvement of this start. In this sense, as we use longitudinal data over a two-year period, SET enables us to understand the consequences in terms of reciprocity and trust of these initial interactions. Thus, the conceptual framework intends to provide new insights into the measurements of different kinds of CICs (economic vs. non-economic customer contacts) and their consequences for firms in terms of customer profitability. In addition, according to social exchange theory, we identify one key relational characteristic (trust) as a moderating variable in the relationship between CICs and transactional behaviors (FIGURE 1).

FIGURE 1  
Conceptual framework

CICs especially differ depending on the type of contact (Bowman and Narayandas, 2001). In line with the work of Gelbrich and Roschk (2011), we identify two main types of CICs: economic and non-economic. Economic CICs refer to interactions that have financial implications and non-economic CICs refer to service contacts or just informational contacts regarding the company's products and services which have no financial implications. The proactivity of these customers can lead to transactional customer behaviors after these CICs. Thus, we expect a positive influence of both types of CICs on customer profitability.

However, the different type of contact that the customer initiates (economic vs. non-economic), may lead to significant differences in outcome levels (i.e. customer profitability). The perceived risk, understood as a consumer's belief about the potential uncertain negative outcomes from the transaction, has been found to influence customer decisions (Kim et al., 2008). Economic CICs have more risk because they lead to financial implications. Hence, the positive customer response -in terms of profitability- after an economic interaction can be greater than in other case. Specifically, we propose:

**H1:** *Economic CICs will have a positive influence on customer profitability.*

**H2:** *Non-economic CICs will have a positive influence on customer profitability.*

**H3:** *Economic CICs will have a higher positive influence on customer profitability than non-economic CICs.*

According to social exchange theory, the level of trust between the customer and the company is essential to develop a certain feeling of reciprocity. Trust has been defined as "the willingness to rely on an exchange partner in whom one has confidence" (Moorman et al., 1992; p. 315). When customers have trust in the company, interactions become easier because customers feel greater security to the transaction and it reduces customer uncertainty and vulnerability (Berry, 1995). Trust creates benefit for the customer in terms of relationship efficiency through decreased transaction costs (Morgan and Hunt, 1994). If these interactions achieve to develop trust, customers will have good reasons to remain in the relationship, because relationships based on trust and reciprocity will often develop (Groth, 2005). Thus, we propose that the

higher the level of trust, the greater the positive influence of CICs on customer profitability. However, for economic CICs, we expect that trust has a higher positive impact in the relationship between these CICs and customer profitability than for non-economic CICs. As this type of contacts has more risk, the level of trust will make the customer feel greater security and peace during the interaction and that can lead to future transactional customer behaviors more often than for non-economic CICs. In addition, Bowman and Narayandas (2001) show how relevant are customer characteristics as moderating variables inside of the specific factors of CICs. Therefore, we test in our conceptual framework trust as a key moderating variable in the relationship between economic and non-economic CICs and transactional behaviors. Specifically, we propose:

*H1a: The higher the level of trust toward the firm, the greater the positive impact of economic CICs on customer profitability.*

*H2a: The higher the level of trust toward the firm, the greater the positive impact of non-economic CICs on customer profitability.*

*H3a: The level of trust will have a higher positive impact in the relationships between economic CICs and customer profitability than in the relationships between non-economic CICs and customer profitability.*

#### **4. Methodology**

In this study, we test our conceptual framework on the financial services industry. The international financial system currently faces a great uncertainty resulting from both zero economic growth prospects in the short term and the problems of European banks to obtain funding. Thus, resources invested by companies in managing CICs should be optimally allocated to generate growth and a good return on this investment. It is important for firms to develop a strategy to effectively manage them in order to increase customer profitability.

To carry out this research, we use data from a major bank in a European country. The bank sells financial products in different categories (e.g. certificates of deposit, savings accounts, mortgages) to individual customers (B2C). The financial services company provided a sample of customers who had operated with the company between March 2011 and March 2013. After removing customers with incomplete information or missing values in some of our key variables, we have an effective sample size of 1998 customers with monthly information. For these customers, we have access to two sets of information: (1) interactions-related data, which offers information about the number and type of CICs (economic vs. non-economic); and (2) transactional data, which includes customer margin, service usage, and additional customer-level information (including demographics). With this information, we will develop an econometric model (linear regression with panel data) to empirically test the proposed conceptual framework and its associated hypotheses. To estimate our proposed model we will employ the software Stata 10.

#### **5. Conclusions**

In this research, we try to provide a comprehensive conceptual framework for managing CICs to increase profitability. In the proposed framework, we describe two different types of CICs and analyze to what extent they affect customer profitability. The study findings will enable us to contribute to existing marketing literature in several critical ways. Firstly, we focus on analyzing CICs -instead of FICs- which are more effective and profitable for companies. Secondly, we identify two different types of CICs (economics and non-economics) beyond complaints. And, thirdly, we analyze their impact on customer profitability taking into account the moderating role of trust according to social exchange theory.

## RESUMEN

*Our study examines multimarket rivalry of strategic groups defined according to the size of their member firms in banking. We hypothesize that, owing to group-level effects, including efficiency, standardization and funding, groups comprising large firms expect no retaliation from firms within their group in any market, while the rivalry will be of a dominant-fringe type between groups when the actions take place in the loan market and of a leader-follower type when competition is measured in the deposit market. We will carry out an estimation of the effect of group interactions (rivalry) in markets on firm performance.*

**Palabras clave:** *multimarket rivalry, strategic groups, firm size.*

## **INTRODUCCIÓN**

Strategic groups are relevant to explain the persistence of profits or of competitive interactions between firms of an industry (Peteraf, 1993). Research has evolved since the original analysis of whether rivalry is greater between members of different groups than between members of the same group (Porter, 1979; Hatten and Hatten, 1987), until studies that analyze how groups act competitively (Smith, Grimm, and Wally, 1997). In any case, these studies do not incorporate multimarket contact on firm behavior, thereby impeding a better understanding of firms' competitive behavior.

We study the presence of asymmetric rivalry within and between size-defined strategic groups across markets by estimating the effect of group-level strategic interactions on firm performance through a model based on the New Empirical Industrial Organization (NEIO) framework. We analyze the Spanish bank loans and deposits markets between 1992 and 2004, using the approach of Dranove et al. (1998) as well as the history of the industry (Peteraf, 1993) to identify strategic groups according to firm size (see in Mas-Ruiz et al. (2014) the strategic groups in Spanish banking).

## **THEORY AND RESEARCH HYPOTHESES**

From a point of view of multimarket rivalry, most of the previous research defines a strategic group of an industry according to strategic similarity between firms, and analyzes mutual forbearance hypothesis (Edwards, 1955), which predicts that as the number of multimarket contacts between a pair of firms increases, the rivalry between them across markets decreases. However, these studies do not examine “spoiling” conduct (Areeda and Turner, 1979), which suggests collusion in some markets but rivalry in others as a result of multimarket contact. In addition, the empirical support to mutual forbearance hypothesis has been inconsistent (Guedri and McGuire, 2011), which has been explained because strategic similarity and multimarket contact are two substitutive mechanisms fostering mutual forbearance (Young, Smith, Grimm and Simon, 2000). These two mechanisms rest on two different processes, resources versus markets respectively, and could have opposite effects on the intensity of rivalry (Gimeno and Woo, 1996): multimarket contact will reduce the number of moves that a firm will take (Edwards, 1955), while that resource dissimilarity will increase the number of moves that a firm will take (Caves and Porter, 1977). In brief, researchers suggest that the main question relates to the way of identification of strategic group and to how work the linkages across specific markets.

Accordingly, we analyze how size-defined strategic groups act competitively in two different markets, loan and deposit, but related for the whole banking industry, in order to see how firm size affects group behavior not only in a single market, but across markets as well. We argue that firm size serves as a determinant of that group's behavior within and across markets through the effects of efficiency, standardization and access to sources of funding. Funding and operating cost advantages of large banks intensify their competition for loans in comparison to the smaller banks while the advantage of wholesale funding of large banks allows them to not compete aggressively for deposits, which are a more expensive funding source (Park and Pennacchi, 2009). It would show a “spoiling” conduct. But, major competition in the loans market could lead a large bank to “forbear” as a way to avoid a retaliation from its own group in the deposit market; retaliation that would entail a high cost for large firms disposing a cheaper source of wholesale funding.

According to Park and Pennacchi (2009), and at the level of size-defined strategic groups, the efficiency, the standardization and the access to sources of funding, support a stronger reaction of large firms for loans and a lower reaction of large firms for deposits. But, we

expect to find that the multimarket rivalry is of the “mutual forbearance” type within the group of large firms in any market, and of the “spoiling” type where the asymmetric rivalry will be of a “dominant-fringe” type between size-defined strategic groups in the loans market as well as of a “leader-follower” type in the deposits market. On this basis, group-level effects (efficiency, standardization and access to sources of funding) may explain the asymmetrical rivalry within and between size-defined groups across the loans and deposits markets. Thus, we propose the following hypotheses:

H1a: The members of the group comprising large firms in the loans market expect to experience no reaction from other members of their group and accommodation from the members of strategic groups comprising smaller firms in any market.

H1b: The members of the group comprising smaller firms in the loans market expect to experience a strong retaliation from the members of the strategic group comprising large firms and accommodation from the other members of their own group in any market.

H2a: The members of the group comprising large firms in the deposit market expect to experience no reaction from other members of their group and a small amount of retaliation from the members of strategic groups comprising smaller firms in any market.

H2b: The members of the group comprising smaller firms in the deposit market expect to experience accommodation from the members of the strategic group comprising large firms and a large amount of retaliation from the other members of their own group in any market.

## **METHODOLOGY**

This study attempts to analyze the oligopolistic behavior of banks selling their products in two different markets (loans and deposits), but common to the whole banking industry. The most appropriate models to characterize this situation are those assuming imperfect competition with product differentiation. These models introduce the possibility that firm’s quantity decisions depend on the actions of their rivals, as well as the existence of product differentiation derived from the market that supplies each entity has different characteristics from the rest.

We apply the theory-based empirical approach of Dranove et al. (1998) to identify distinct group-level effects across markets. It considers that a strategic group exists if the performance of a firm in the group is a function of group characteristics, controlling for firm and industry characteristics. In this way, the approach must allow us to distinguish between “true” (group-level) effects and “spurious” (firm or industry-level) effects. Specifically, considering a set of multiproduct firms and taking in mind the underlying idea that group-level interactions (derived from the size of their members) affect firm performance, we implement a model based on the NEIO framework to determining whether a strategic group exists in the real. Through estimating conjectural variations (see Amit et al., 1988) based on strategic interactions, this model lets us to test for the existence of multimarket and asymmetric rivalry within and between strategic groups defined according to the size of their members. Basically, conjectural variations reflect agents’ adaptation of their expectations about a firm’s strategic behaviors as a function of past experience.

To estimate our proposal, we take the work of Carbó et al. (2009) as the starting point. We develop a model which simultaneously considers the specifications of cost, demand, and rivals’ reactions. We consider a set of firms,  $i=1, \dots, n$ ; two different markets, deposits and loans, where these  $n$  firms are interacting, and also a purchased funds or money market (M) where banks are price-takers. To better illustrate the econometric method underlying this paper, we expose the three main specifications separately.

Cost specification: As the implementation of our model requires the description of the cost structure for each bank, we assume a cost function ( $c_{it}$ ) affected by quantity of loan and deposit outputs of bank  $i$ , as well as the price of their input factors  $w_{it}$ :

$$c_{it} = c(l_{it}, d_{it}, w_{it}) \quad (1)$$

Where  $l_{it}$  is the demand for loans, and  $d_{it}$  is the supply of deposits at time  $t$ . As the marginal cost of the firm is part of this analysis, this study considers a translog function, since it deals with both scale and scope economies in multiproduct firms.

Demand specification: With product differentiation and multimarket competition, the inverse demand for loans ( $r_{it}^l$ ) and for deposits ( $r_{it}^d$ ) at time  $t$  is a function of the bank's own ( $l_{it}$ ,  $d_{it}$ , respectively) and its rivals' ( $l_{jt}$ ,  $d_{jt}$ ;  $j=1, \dots, n$ ,  $j \neq i$ ) demands on these interest rates, and a vector of exogenous factors influencing the overall demand for loans and deposits ( $z_{it}^l$ ,  $z_{it}^d$ ):

$$r_{it}^l = r^l(l_{it}, l_{jt}, d_{jt}, z_{it}^l); j = 1, \dots, n, j \neq i \quad (2)$$

$$r_{it}^d = r^d(d_{it}, d_{jt}, l_{jt}, z_{it}^d); j = 1, \dots, n, j \neq i \quad (3)$$

The estimation of the equations (2) and (3) becomes affected by the availability of degrees of freedom given the high number of banks in our sample. Strategic groups overcome this complication, assuming that the loans and deposits markets are composed by  $n$  financial firms, which can be ranked by output size and formed into two mutually exclusive strategic groups.

In order to operationalize these groups, we replace the  $(n-1)$  individual rivals' loans and deposits demands terms with two (one per strategic group) condensed measures. These condensed measures can be computed, following Carbó et al. (2009), as two weighted averages of the rivals' quantity outputs, taking into account the regional context of competition. In other words, the average values of loans quantities for strategic groups I and II ( $l_I$  and  $l_{II}$ ) and of deposits quantities for strategic groups I and II ( $d_I$  and  $d_{II}$ ) are calculated for each one of the banks in order to express the output of all of the other banks competing in the same geographical area in each one of the strategic groups. In this way, and for each one of the markets, loans and deposits, each bank faces two different weighted rivals whose dimension are the average dimension of the banks compelling each strategic group. We justify our use of these measures by the fact that the intensity of competition (and of the consequent rivals' response) may be stronger and better locally identified within regional markets (Carbó et al. 2009).

Rivals' reactions specification: Finally, each firm will try to maximize its profits ( $\pi_{it}$ ):

$$\pi_{it} = \left( r_{it}^l(l_{it}, d_{jt}, l_{jt}, z_{it}^l) - \bar{r}_t \right) l_{it} + \left( \bar{r}_t - r_{it}^d(d_{it}, l_{jt}, d_{jt}, z_{it}^d) \right) d_{it} - c_{it}(l_{it}, d_{it}, w_{it}) \quad (4)$$

The results of maximizing this profit function will let us to estimate the conjectural variation

$$CV_{I,I}^{LL} = \frac{\partial l_{it}}{\partial l_{it}}, \forall i \in h = I$$

parameters. Regarding these parameters, is the reaction in the loans quantity of firms belonging to the strategic group I to an initial loans quantity move of firm  $i$ . That is, this parameter is measuring the competitive interaction within strategic group I in the loans market. The same interpretation can be made in the rest of conjectural variation parameters.

We empirically implement our model by estimating it in two stages. In the first stage, we estimate the operating cost function for full information maximum likelihood. We then use the estimated parameters to express the marginal cost for each bank  $i$ . In the second stage, we use these estimates of marginal costs as input for estimating the profits (rivalry) and the

demand functions. We estimate this equation system simultaneously by applying 3-stage least squares.

We focus on the effects of competition in both loans and deposits markets, simultaneously (rather than in isolation), during 1992-2004 period in Spain. In 2004, our sample of financial firms (25 savings banks and 13 banks) constituted almost 70% and 86% of the Spanish private deposits and loans markets, respectively, and contains 494 observations over a 13-year period. In 2004, the first group (GI) comprises the six largest firms and constitutes 55.5% of the loans market and 56.2% of deposits market. The second group (GII) comprises 32 medium firms and constitutes 44.5% of loans market and 43.4% of deposits market.

## PREVIOUS RESULTS

To determine the marginal operating costs, we estimate the cost function (Equation 1). We find a high adjusted R<sup>2</sup> of 94 percent. The model also detects a cost difference across groups in each one of the markets during the period analyzed. On the one hand, the loans market shows significant differences ( $F=227$ ,  $p<0.0001$ ) in the marginal operating cost of loans for GI (0.010) and for GII (0.032). On the other hand, the deposits market also shows significant differences ( $F=445$ ,  $p<0.0001$ ) in the marginal operating cost of deposits for GI (0.027) and for GII (0.006).

## RESUMEN

*Los consumidores buscan establecimientos con mayor personalidad, que apuestan por lo auténtico (honestidad, transparencia y sinceridad). En este marco, el presente trabajo, pretende conocer cómo construir una personalidad del punto de venta que goce de autenticidad, analizando para ello el rol que juegan las experiencias externas (ambiente, diseño, layout, personal de contacto), las experiencias de marca así como, la identificación en su construcción, midiendo el impacto final en términos de intención de compra del consumidor. Para ello, se ha encuestado a 300 clientes a la salida de un determinado punto de venta identificando que todos los elementos postulados afectan la configuración de su personalidad auténtica, impactando positivamente sobre la intención de compra. Solo uno de los factores no ha podido ser confirmando, debiendo rechazar la influencia significativa del diseño/estética en la construcción de la personalidad auténtica de un punto de venta.*

## PALABRAS CLAVE

*Experiencias externas, experiencias de marca, personalidad del punto de venta, autenticidad e intención de compra.*

## 1. Introducción.

En entornos competitivos como el actual, caracterizados por la creciente competencia y recesión económica (Villafañe, 2004) los puntos de venta necesitan de un posicionamiento claramente definido en la mente de los consumidores que les permita ser vistos como algo “diferente” y “mejor”. De manera más específica, como algo “auténtico”. De tal forma, la ventaja competitiva de una enseña posicionada en base a la autenticidad de su personalidad se concretará en que el consumidor terminará visitando y comprando en este tipo de enseñas (Zorrilla, 2002). En este sentido, cada vez es mayor el interés por construir puntos de venta con personalidades auténticas, identificando esta autenticidad en la esencia de los establecimientos (Cook, 2007). En efecto, es precisamente la autenticidad de una personalidad lo que se convierte en una fuente de ventaja competitiva que permite a los establecimientos comerciales diferenciarse y posicionarse en el mercado, influyendo en la intención de compra del consumidor. Así lo demuestran las numerosas investigaciones al respecto (Véase, Alier y Falces, 2000; Zorrilla, 2002; Díez De Castro y Navarro, 2003; Baker et al., 2002).

La autenticidad viene conceptualizada por el diccionario de la Real Academia Española como la cualidad de auténtico, que viene definido como honrado, fiel a sus orígenes y convicciones. Son los autores Gilmore y Pine (2007) los que, en su tarea de articular el constructo de autenticidad, identifican cinco géneros de autenticidad percibida, articulando además cinco axiomas relacionados a estos géneros: (i) si eres auténtico, entonces no tienes que decir que eres auténtico, (ii) si eres auténtico, entonces es mejor que seas auténtico, (iii) es más fácil ser auténtico si uno no dice que es auténtico, (iv) es más fácil prestar servicios auténticos cuando reconoces que son auténticos, (v) no tienes que decir que tus ofertas son auténticas si tú las ofreces como auténticas. En la misma línea, se han desarrollado estudios experimentales para profundizar en la creación de autenticidad (Molleda y Roberts, 2008).

En la tarea de construir personalidades auténticas cobra cada vez mayor importancia el marketing experiencial (Schmitt, 1999). Así, para este autor, el marketing experiencial consigue que las marcas se carguen de experiencias apelando a los cinco sentidos, al corazón y a la mente de los consumidores, otorgando de esta manera a la enseña una personalidad que refleja algo importante para el consumidor. En el ámbito de la distribución comercial, Zeithaml y Bitner (2003) exponen como la combinación de los estímulos presentes en la atmósfera de un establecimiento conducen a diferentes emociones consiguiendo que los consumidores tengan diferentes experiencias de compra. Esto explicaría el auge de negocios como Starbucks, IKEA o Abercrombie entre otros (Alfaro, 2012).

En el contexto descrito, deviene una prioridad identificar como lograr una enseña con personalidad auténtica, que aporten al consumidor algo distinto y superior (Cook, 2007). Ello se debe a que los consumidores son sensibles tanto al valor recibido (beneficio recibido por el precio pagado en el proceso de compra), como a la orientación a los valores de la enseña (reflejo de los valores personales en la experiencia de compra). Es decir, los patrones de consumo no vienen marcados exclusivamente por el precio, sino que se observa un cambio de los valores, detectándose como tendencia la preferencia por la autenticidad marcada por atributos tales como el respeto a la naturaleza, la sostenibilidad, el respeto al medio ambiente, la honestidad y la transparencia (Molleda, 2009).

Es por ello que, a través del presente trabajo se pretende analizar cómo construir una personalidad auténtica para un punto de venta a partir de las experiencias externas vividas en el punto de venta (ambiente, el layout, la estética y el personal de contacto), de las experiencias de marca y de la identificación con el punto de venta. Todo ello para abordar, en último término, su impacto en términos de intención de compra del consumidor. Para tal fin, se ha contado con la opinión de 300 individuos que han valorado los aspectos indicados a la salida de un determinado punto de venta escogido para el estudio: Ikea.

Con esta investigación se trata de acotar la brecha existente en el estudio del rol conjunto pueden jugar distintos elementos a la hora de configurar la personalidad auténtica de una marca (Cook, 2007). En el caso que nos ocupa, de un punto de venta. Justifican el estudio las escasas investigaciones que abordan esta incidencia compartida de una diversidad de elementos enmarcados en el marketing experiencial en la determinación de la personalidad auténtica (Baker, 2002). En efecto, aunque algunos antecedentes de la personalidad auténtica han sido abordados de manera separada (Zorrilla, 2012), son limitados los trabajos que abordan de manera integrada la incidencia de factores dispares, relativos

tanto a la experimentación del propio punto de venta, como a la experimentación de la marca. (Babin et al, 1994).

En suma, la premisa de partida es que los detallistas deben desarrollar su labor comercial como un compendio de diversos elementos (Gorospe, 2000). De tal modo, la aportación del presente trabajo radica, en aglutinar los factores generadores de experiencia de compra bajo el prisma de la personalidad del punto de venta, dando mayor valor (autenticidad) y un poder de actuación conjunto y real. Es decir, se trata de añadir valor a los gerentes de los establecimientos, empresarios, profesionales del marketing e investigadores al desarrollar un enfoque que pretende contrastar qué elementos, se deben de combinar para configurar la autenticidad de la enseña. Para, de esta manera, traducir estos esfuerzos en incremento de compra y a la larga, en mejores resultados empresariales.

El trabajo se estructura de la siguiente manera: en primer lugar, se realiza una revisión exhaustiva de la literatura existente con el propósito de analizar los constructos que se presentan y lanzar las hipótesis de estudio; en segundo lugar, se propone un modelo de las relaciones existentes y, a través de un modelo de ecuaciones estructurales, se estudia si las hipótesis planteadas se cumplen o no. Finalmente, se presentan las conclusiones, las implicaciones organizacionales y las futuras líneas de investigación.

## **2. Marco Conceptual.**

La cuestión a investigar sería del presente estudio sería ¿cómo se puede lograr construir para un punto de venta una personalidad auténtica, que añade valor a lo que ya existe en el mercado? Mediante la combinación de tres grandes ejes de actuación: (i) las experiencias con elementos externos (como el ambiente, la estética interior y exterior, el layout y el personal de contacto), (ii) las experiencias de marca y (iii) la identificación con el punto de venta. Es por ello que el presente estudio ha considerado de interés la creación de un modelo que explique claramente las relaciones entre estos tres ejes. Para, de esta manera, avanzar en la explicación del comportamiento del consumidor en un punto de venta.

***2.1.Experiencias externas: ambiente del punto de venta (H1), estética interior y exterior (H2), layout (H3), personal de contacto (H4).***

### **2.2.1. El ambiente del punto de venta. (H1).**

El ambiente de la tienda o atmósfera, es la percepción global que el consumidor elabora en su mente de un punto de venta a partir de una percepción holística de las características físicas del mismo. (Kotler 1973). En la literatura se ha investigado ampliamente la multidimensionalidad del ambiente en los puntos de venta, haciendo referencia en diversos estudios a la música, el orden y la limpieza, la iluminación, la aglomeración y otros. Sin embargo, no existen apenas estudios que analicen las interrelaciones entre estos estímulos (Mattila y Wirtz 2001).

Existe un número importante de investigaciones que han realizado un análisis exhaustivo de los efectos sobre las respuestas del comprador ante estímulos ambientales experimentados en un punto de venta, basando sus estudios en elementos ambientales concretos como puede ser la música (Milliman,1982), la aglomeración (Hui y Bateson, 1991),el olor (Spangenberg, Crowley y Henderson,1996 ), la iluminación (Golden y Zimmerman, 1986), el color (Bellizzi, Crowley y Hasty, 1983 ), la limpieza (Bitner 1990; Gardner y Siomkos 1985) entre otros. Todos estos elementos ambientales, generan una experiencia que influye en la percepción que el consumidor tiene del establecimiento, desencadenando en su mente una idea de la personalidad que pueda tener el mismo (Sharma y Stafford, 2000). En la misma línea, Donovan et al. (1994) explican como el placer que transmite el ambiente del establecimiento, es un motivo importante para que los consumidores pasen más tiempo en ella y valoren mejor el punto de venta. En línea con los argumentos esgrimidos, cabría proponer la primera hipótesis:

**H1: Las experiencias positivas de compra producidas por el ambiente en el punto de venta influyen positiva y significativamente sobre la autenticidad de su personalidad.**

### **2.2.2. La estética interior y exterior del punto de venta. (H2).**

En el punto de venta la estética se puede encontrar tanto en el interior como en el exterior. En lo relativo a la estética interior, los elementos que lo definen son los siguiente (i) tipo de mobiliario, (ii) decoración, (iii) señalética, (iv) material promocional, de animación, informativo y plv, (Andrés, 1983). Este diseño del interior del establecimiento contribuye a formar sentimientos positivos en los consumidores conduciendo a percepciones favorables (Kumar y Karande, 2000; Gilboa y Rafaeli, 2003) sobre la personalidad que ostenta el establecimiento en cuestión. Es por ello, que los minoristas recurren con frecuencia a cuestiones estéticas para configurar su personalidad. En lo relativo a la estética exterior del establecimiento, éste hace referencia a la estética de la fachada, al escaparate y a la aplicación de la imagen corporativa del establecimiento, etc, (Wagner, 1999). Todos estos elementos externos, condicionan también, la percepción que se forma el consumidor acerca de la personalidad del punto de venta que se tiene delante.

Berman y Evans (1995) argumentan que el diseño exterior supone un importante elemento de atracción a los consumidores, en tanto en cuanto, diseños atractivos derivan en la creencia de que el establecimiento goza de mayor personalidad. De la misma forma, en el estudio de Alfaro (2012) se constata la auténtica personalidad lograda por establecimientos como Abercrombie, Apple, Armani, Starbucks, lograda gracias a las experiencias vividas en el punto de venta en virtud de los elementos proporcionados por la estética interior y exterior. Esto es, la percepción de la estética se concreta en valores emocionales (Babin et al. 1994; Holbrook 1999). Es por ello que, una adecuada gestión de la estética en el punto de venta, mejora las percepciones asociadas al mismo (Newman y Patel 2004), optimizando la consolidación de su personalidad. En línea con los argumentos esgrimidos, cabría proponer la segunda hipótesis:

**H2: Las experiencias positivas producidas por la estética tanto interior como exterior del punto de venta, influyen positiva y significativamente sobre la autenticidad de su personalidad.**

### **2.2.3. Layout. (H3).**

Se entiende por layout la representación de la distribución estratégica del mobiliario en una planta de distribución, consiguiendo optimizar la circulación de los clientes, evitar aglomeraciones y especificar la ubicación exacta de los productos. Según Mills y Paul (1988) el merchandising visual es la presentación de la tienda y su mercancía para vender los bienes y servicios ofrecidos, lo que permite conformar una óptima percepción de la dimensión de autenticidad de la personalidad del punto de venta. Una correcta política de merchandising va a dirigir la clientela, evitar cuellos de botella y orientar a los clientes dentro del recinto de venta, controlando al tiempo tanto la aglomeración como la afluencia de público al establecimiento. Un punto de venta sin público, se traduce en un factor negativo para su actividad comercial, por lo que el minorista debe animar su establecimiento para conseguir la afluencia de público sin llegar a la aglomeración. Como técnicas para atraer a la clientela el minorista cuenta con la disposición y colocación de los productos, la distribución del espacio de ventas o layout.

En esta línea, Buttle (1984) investigó como afectaba la disposición del interior del punto de venta sobre el volumen de ventas del establecimiento, incrementando la frecuencia de visitas a las zonas menos visitadas o puntos fríos del punto de venta, mejorando además la rotación de stocks. En la misma línea, Newman, Yu y Oulton (2002) analizan el flujo de tráfico según la disposición interna del punto de venta y como consecuencia, la provocación de estrés (emociones negativas) o bienestar en el cliente (emociones positivas), lo que determina en último termino la personalidad (negativa/positiva) que se asocia al punto de venta.

En suma, según ha quedado reflejado en líneas previas, el layout del establecimiento constituye un elemento esencial para informar, orientar y emocionar a los consumidores en la tienda, actuando como valor añadido a la enseña (Burns, 1996) que, gracias al layout, se podrá diferenciar de sus competidores a través de la autenticidad. En línea con los argumentos esgrimidos, cabría proponer la tercera hipótesis:

**H3: Las emociones positivas producidas por el layout del punto de venta, influyen positiva y significativamente sobre la autenticidad de su personalidad.**

#### **2.2.4. Personal de contacto. (H4).**

Según Baker (1986) el personal de contacto y los clientes, forman parte de la dimensión social de la personalidad del punto de venta. Esta dimensión incluye aspectos relativos al trato prestado por el personal de contacto, que determina también la forma en que se experimentan el establecimiento (Doria y Rico, 2003). De esta manera, el éxito de la estrategia relacional de la empresa con el cliente depende en gran medida de su personal de ventas en tanto en cuanto éstos son los que tienen una influencia determinante en los clientes (Harris, Mowen y Brown, 2005). En esta línea Webster (1992) sostiene que “las funciones tradicionales de la venta personal están evolucionando hacia una definición más amplia de responsabilidades, hacia la gestión de las relaciones”.

De lo dicho, podemos deducir que el vendedor influirá de manera notable en cómo perciban los clientes la autenticidad de la personalidad del punto de venta, puesto que él es el verdadero gestor de relaciones. Cuando los clientes confían en el punto de venta, porque su personalidad les convence, se desarrolla una relación más sólida que ni el producto ni el precio, podrían darle (Thompson, 2004). De este modo, la venta personal se ha convertido en los últimos años en uno de los pilares fundamentales que tienen los puntos de venta, para proporcionar un servicio de mayor valor añadido a los clientes que asegure el éxito empresarial y competitivo (Farrell y Hakstian 2001). En el nuevo entorno de venta relacional, la fuerza de ventas configura la imagen de la organización, representando la cultura de relaciones que la empresa desea transmitir siendo ésta el principal vehículo de comunicación y pilar fundamental en el trato directo con el cliente, principal activo de la empresa. Así, Doria Y Rico (2003) consideran que el establecimiento requiere de una atención personalizada, en cuanto a predisposición, actitud y trato a los clientes, factores que afectan favorablemente en la creación de su propia personalidad. En línea con los argumentos esgrimidos, cabría proponer la cuarta hipótesis:

**H4: El trato del personal de contacto en el punto de venta, influyen positiva y significativamente sobre la autenticidad de su personalidad.**

#### **2.2. Experiencia de marca. (H5).**

En su investigación, Brakus, Schmitt y Zarantonello (2009), diferencian claramente el constructo de la experiencia de marca de otros conceptos relacionados con la marca, como son las asociaciones de marca, la imagen de marca y la personalidad de marca. Confirman en su investigación que la experiencia de marca es un antecedente de la personalidad de marca o, en otras palabras, cuanto mayor sea la puntuación general en la escala de experiencia de marca existirán más posibilidades de que el consumidor dote la marca con mayores rasgos de personalidad.

Brakus et al. (2008) desarrollan uno de los trabajos más importantes sobre el citado tema, conceptualizando, delimitando y proponiendo una escala de medida para el mismo. Según estos autores cuando un consumidor busca, compra, usa o consume marcas no solo está expuesto a sus atributos funcionales sino también a sus atributos experienciales. Así, como planteamiento de partida, definen la experiencia de marca como un conjunto de respuestas internas, subjetivas y de comportamientos, suscitadas o provocada por los estímulos vinculados a la marca (tales como su diseño, identidad, presentación, comunicación y entorno de venta), lo que determina en último término la personalidad asociada a dicha marca. En línea con los argumentos esgrimidos, cabría proponer la quinta hipótesis:

**H5: La experiencia positiva de marca en el punto de venta, influye positiva y significativamente sobre la autenticidad de su personalidad.**

#### **2.3. Identificación. (H6).**

Un consumidor se identificará con una marca/punto de venta en tanto en cuanto: (i) existan valores compartidos entre ambos (Hunt, Wood y Chonko, 1989) (ii) se solapen los rasgos y características de la personalidad de la organización con las del sujeto (Ashforth y Mael, 1989); (iii) operen ambos movidos por objetivos comunes (Bhattacharya y Sen, 2003). En este escenario, los distribuidores aspiran a que su establecimiento goce de una personalidad que refleje aspectos que desea poseer su

clientela, por ejemplo, la búsqueda de la autenticidad. Identificándose con estos atributos, se genera un vínculo entre comprador y punto de venta percibiendo que comparten determinadas características. (Bhattacharya y Sen, 2003). Cuando se produce esta identificación, se desencadenan respuestas, tanto en los estados afectivos del consumidor hacia la empresa, como en su posterior comportamiento hacia la misma (Marin y Ruiz, 2007). En línea con los argumentos esgrimidos, cabría proponer la sexta hipótesis:

**H6: La identificación del consumidor con el punto de venta influyen positiva y significativamente sobre la autenticidad de su personalidad.**

#### **2.4. Efectos de la personalidad del punto de venta.**

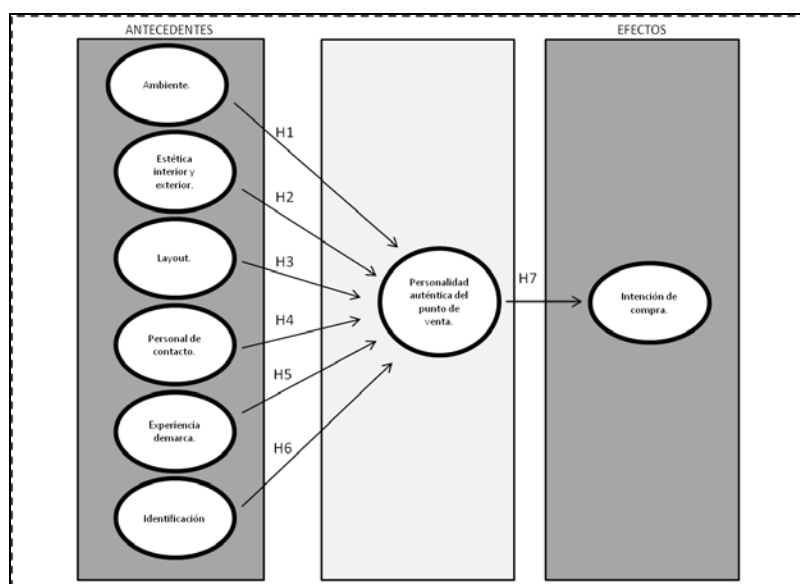

Según Baker (2002), son escasas las investigaciones que relacionan el efecto conjunto de las diferentes dimensiones que configuran y definen la personalidad de un establecimiento comercial con otras variables y constructos que explican el comportamiento del consumidor ante decisiones de intención de compra. Es por ello, que en el presente trabajo, plantea como eje el efecto que la personalidad del punto de venta ejerce sobre la intención de compra del consumidor.

En el presente estudio y en base a la proposición de Zorrilla (2002), se asimila el concepto de personalidad del punto de venta a lo que la autora denomina “ambiente global” siendo un nexo de unión entre sus distintos antecedentes. Todo ello con el fin de demostrar la configuración de la personalidad del punto de venta sobre la intención de compra. De hecho, investigaciones en el área de psicología de muestran que las experiencias percibidas por el consumidor en un punto de venta son, en efecto, motivadoras de la intención de compra. (Donovan y Rossiter, 1982). En línea con los argumentos esgrimidos, cabría proponer la séptima hipótesis:

**H7: Es la configuración de la personalidad del punto de venta como auténtica, la que influye positiva y significativamente sobre la intención de compra.**

Habiendo realizado una revisión de la literatura pertinente resulta factible el establecimiento de un modelo teórico donde resumir las hipótesis planteadas en los apartados anteriores, tal y como muestra la figura 1.

**FIGURA 1**  
**Modelo teórico propuesto.**

### **3. Diseño Metodológico.**

En este apartado se describen las bases metodológicas del trabajo empírico realizado.

### ***3.1. Justificación e importancia del estudio***

Con el fin de contrastar el modelo propuesto, se decidió recopilar la información a la salida de los puntos de venta de la enseña que un grupo de colaboradores sugirió en la realización del pretest (integrado por 22 personas como se detalla en líneas sucesivas). Así, cuando se les preguntó que propusieran un punto de venta en España que, desde su punto de vista, tuviera una personalidad auténtica, solicitándoles adicionalmente que justificaran su respuesta, para saber también como habían percibido esta autenticidad, propusieron mayoritariamente IKEA. En efecto, el 75% del grupo se refirió a la enseña IKEA como referente de los atributos de la personalidad auténtica, percibiendo el 65% de los mismos estos atributos a través de la visita a la propia tienda.

Adicionalmente, fuentes secundarias presentan IKEA como una de las compañías que la población identifica con diversidad, creatividad y dinamismo. Esta imagen es producto de un estilo de gestión responsable, de un modelo de negocio inclusivo y cercano a las personas. Así, la responsabilidad con las personas con discapacidad es uno de los ejes de atención de IKEA, como también lo es la gestión de la diversidad y las compras responsables [www.grupofundosa.es](http://www.grupofundosa.es). Además, según el informe de Sostenibilidad 2011 de IKEA, el grupo considera que se trata de una enseña responsable con las personas y el medio ambiente, considerando esto como un requisito indispensable para hacer buenos negocios. Todo ello le ha llevado a ser el mayor minorista mundial del sector del mueble con un valor de marca cifrado en 9.000 millones de euros, según los datos financieros que figuran en el informe anual de 2011 emitido por Inter Ikea Group. Además, en 2011 generó alrededor de unos 26.000 millones de euros en ventas en todo el mundo, recibiendo alrededor de 14.000 solicitudes de licencias de franquicias. (El economista, 10/08/2012).

En suma, los resultados del pretest y de la información secundaria analizada constatan que IKEA es reconocida tanto a nivel nacional como internacional como una empresa comprometida, transparente y que cree en los valores que comunica. Además y siguiendo Vallet y Mollá (2006) firmas como IKEA con una atractiva imagen de marca, han entrado con fuerza en España. Por lo que este comercio especializado, ha sido elegido como eje de la investigación desarrollada para el contraste de las hipótesis planteadas.

### ***3.2. Recogida de información y perfil de la muestra.***

Con carácter previo a la administración del cuestionario definitivo, fue realizado un pretest con 22 participantes: 2 profesionales del marketing, 3 investigadores en marketing, 2 expertos en investigación de mercados, así como con 15 clientes del punto de venta estudiado. Estos participantes, pretestaron el cuestionario aportando sus conocimientos a la hora de subsanar errores y deficiencias del mismo. De manera más específica, su colaboración resultó decisiva para la determinación de la enseña objeto de estudio, y para garantizar la correcta interpretación y funcionamiento del cuestionario. Tras el pretest, los datos cuantitativos del estudio, fueron recogidos a través de un cuestionario autoadministrado a pie de calle, a la salida de las tiendas IKEA de Zaragoza, Bilbao, Madrid Alcorcón y Murcia. La ficha técnica del estudio es la que se muestra en la tabla 1. Se obtuvieron un total de 300 encuestas válidas.

El instrumento de medida se basó en escalas previamente utilizadas por la literatura (tabla 3), que fueron perfiladas en el pretest. Se quiere señalar que estudios preliminares al de Alain D'Atous y Le'vesque (2003) demuestran que la personalidad del punto de venta está compuesta por cinco dimensiones: (i) sofisticación,(ii) firmeza,(iii) autenticidad, (Iv) entusiasmo y (v) molestia. Sin embargo, para el presente trabajo de investigación, se ha abordado la dimensión de autenticidad para aproximar el constructo personalidad. Ello obedece a que cómo se recoge en investigaciones previas (D'Atous et al. 2002) la medición de la personalidad debe de realizarse considerando la dimensión/enfoque más apropiado en cada situación, siendo la "autenticidad" en este caso el factor que mejor refleja el constructo personalidad. En efecto, como se advierte en otros estudios (Fine, 2003; Gilmore y Pine, 2007; Cook, 2009) la autenticidad de la personalidad es un constructo de especial relevancia en los tiempos actuales, resultado de gran ayuda el estudio de sus antecedentes y consecuencias.

TABLA 1  
**Ficha técnica del estudio.**

<b>Ámbito Geográfico</b>	Tiendas de IKEA de las ciudades, Zaragoza, Bilbao, Madrid- Alcorcón y Murcia.
<b>Universo</b>	Individuos clientes de IKEA.
<b>Metodología</b>	Cuestionario autoadministrado on line y a pie de calle.
<b>Procedimiento de Muestreo</b>	No probabilístico de conveniencia.
<b>Tamaño Muestral</b>	302 encuestas. 2 encuestas no válidas.
<b>Fecha del trabajo de Campo</b>	Del 1 de agosto al 9 de septiembre

La selección de la muestra fue aleatoria, siendo el perfil de la misma el que figura en la tabla 2.

TABLA 2  
Perfil de la muestra.

Variable	Respuestas	Porcentaje
Género	Hombres	49,7
	Mujeres	49,3
Edad	Menos de 18 años	1,3

### 3.3. Técnicas de análisis de datos aplicadas y validación del instrumento de medida

Las hipótesis planteadas se comprobaron utilizando la información recogida mediante modelización estructural, aplicando el método de máxima verosimilitud a partir del software EQS 6.1. No obstante, antes de contrastar el modelo, se evaluaron las escalas empleadas para aproximar los constructos mediante un Análisis Factorial Confirmatorio.

Las escalas y el instrumento de medida fueron sometidos a un Análisis Factorial Confirmatorio. Los datos recogidos la tabla 4 permiten corroborar la *fiabilidad o consistencia interna*. En la misma tabla se puede verificar la *validez convergente*. Posteriormente se procedió a analizar la *validez discriminante* del instrumento de medida; utilizando, para ello, las pruebas de intervalos de confianza y los valores del AVE (tabla 5). **TABLA 4**

measurement

## 4. Resultados y conclusiones del contraste de hipótesis.

Una vez efectuadas las comprobaciones pertinentes con respecto a la fiabilidad y validez de las escalas que conforman el modelo propuesto, se ha procedido a realizar las estimaciones del modelo en un modelo de ecuaciones estructurales mediante el método de máxima verosimilitud utilizando para ello el software EQS 6.1 cuyos resultados se exponen en la tabla 6. Los estadísticos de bondad del ajuste sugieren que el modelo estructural encaja bien con la estructura de datos y que modelo planteado resulta satisfactorio para explicar 6 de las 7 hipótesis enunciadas.

TABLA 6  
Contraste de hipótesis

Resultados de la estimación del modelo planteado.				
Hipótesis		Beta estandarizada	t value	Contraste
H1	Ambiente del punto de venta-personalidad	0,402**	7,014	Aceptada

H7	Personalidad –Intención de compra	0,716**	11,743	Aceptada
RMSEA (90%CI)=0,118(0,111,0,125);CFI=0,910;TLI=0,973				

Primero, por lo que respecta a H1, los resultados confirman que las experiencias vinculadas al ambiente de la tienda (aromas, música, iluminación, temperatura, limpieza etc.) influyen significativamente en la consolidación de una personalidad auténtica ( $\beta=0,4$ ,  $p<0,05$ ). No en vano, este el antecedente más relevante identificado en el presente estudio. Este resultado está en consonancia con la propuesta de Baker (1986), que establece que el ambiente puede llegar a ser incluso más relevante que otro tipo de señales. Estudios como el de Hirsch (1995) demuestran también que, ante entornos agradables como podría ser el olor en un casino, el cliente tiende a acumular una experiencia positiva, experiencias que le llevan a percibir la verdadera personalidad del punto de venta. En la misma línea, otras investigaciones, como las Lisen, (1975) y Smith y Curnow (1996) en supermercados, la de Milliman (1986) en restaurantes o la de Areni y Kim (1993) en tiendas de vinos, constatan que la música (su intensidad e incluso estilo), influenciaban la percepción del punto de venta, variando conforme la intensidad o el estilo de la música eran modificados.

En lo relativo a H2, se advierte que la estética no influye de manera significativa sobre la personalidad de la enseña. Este resultado puede venir explicado por los resultados del resto de constructos. Así, en un estudio conjunto como es el que nos ocupa, ejercen más peso el resto de antecedentes que la estética, anulando el efecto significativo de este factor.

En cuanto a H3, aunque se confirma la relevancia significativa del layout en la creación de autenticidad en un punto de venta, su influencia no es tan potente como la del resto de antecedentes considerados ( $\beta=0,132$ ,  $p<0,05$ ), concluyéndose que, efectivamente, el layout afecta a la percepción de autenticidad de un punto de venta pero, dentro del estudio conjunto de todos los antecedentes, su peso es el menos importante. Este menor impacto puede ser debido a que, como explica Buttle (1984), el cliente no es realmente consciente de los esfuerzos que en cuestiones de distribución del espacio de ventas realizan los responsables del punto de venta para evitar aglomeraciones y cuellos de botella. Tal vez si en las comunicaciones de empresa se divulgara esta labor, en un futuro tendría mayor importancia.

Respecto H4, que hacía referencia a la relevancia del personal de ventas en la configuración de la personalidad del punto de venta, queda igualmente confirmada ( $\beta=0,197$ ,  $p<0,05$ ). Más aún, este deviene un antecedente fundamental de la creación de una personalidad auténtica, ya que el cliente busca una atención personalizada y una respuesta a sus emociones como han probado Doria y Rico (2003).

Con referencia a H5, se confirma igualmente que las experiencias con la marca son determinantes de la personalidad del punto de venta ( $\beta=0,345$ ,  $p<0,05$ ). Ello se debe a que a partir de las experiencias con la marca y de las consiguientes respuestas del individuo (en términos de emociones, sensaciones, pensamientos y comportamientos) (Brakus et al. 2009), se forman los rasgos de su personalidad (auténtica, sofisticada, etc.). Tímidos y meritorios estudios interesados por estudiar la incidencia de esta variable (experiencia de marca) son los de Borghini, Diamond, Kozinets, Mcgrath, Muñiz y Sherry (2009), Brakus et al. (2009) y Hollenbeck, Peters y Zinkhan (2008). En ellos, se explora cómo el significado que puede adquirir una marca (su personalidad) se amplifica y se expande debido, por ejemplo, a la experiencia socio-cultural que envuelve el consumo de dicha marca (sería el caso de Harley-Davidson) o al uso de espacios asociados a la marca (como museos y tiendas temáticas), en los que en ocasiones se ofrecen entretenimientos, espectáculos, etc. En esta línea, Butterfield (2009) trata

de ilustrar la importancia de crear una conexión más real y significativa con las marcas despertando los cinco sentidos en el consumidor. Sería el caso de marcas como BMW y Niketown, que a través de la creación de eventos que permiten experimentarlas tratan de transmitir el espíritu de sus marcas. También de marcas como Apple y Disney, que a través en este caso de sus tiendas experienciales tratan de reforzar su identidad. O de marcas como Samsung Experience, que apelan a la experimentación mediante el sistema Brand Sensory Identity (identidad sensorial de marca) creado por la propia empresa. En suma, los estudios apuntados constatan, como en nuestro estudio, que las marcas más experienciales son las que tienen la capacidad para perfilar una personalidad más definida con la que pueda identificarse el individuo.

En cuanto a H6, tal y como los se muestra en los resultados, se constata la relación positiva y significativa entre la identificación punto de venta-consumidor y la personalidad auténtica del punto de venta ( $\beta=0,281$ ,  $p<0,05$ ). Es decir, las interacciones marca-consumidor son relevantes puesto que favorecen que se despierte en el individuo el componente emocional que subyace tras cualquier tipo de identificación (Einwiller, Fedorikhin, Jhonson y Kamis, 2006; Homburg, Wieseke y Hoyer, 2009).

Por último, H7 presenta la relación más fuerte del modelo, constatándose, de este modo, el gran impacto que tiene mejorar la personalidad del punto de venta para incrementa sus ventas ( $\beta=0,716$ ,  $p<0,05$ ). No en vano, son cada vez más numerosas las empresas que, para vender más, diseñan sus estrategias de marca en torno a la creación de experiencias que aporten valores sensoriales, emocionales, cognitivos, conductistas y sociales que complementen y enriquezcan los valores funcionales (Brakus, Schmitt y Zarantonello, 2009).

## **5. Implicaciones gerenciales, limitaciones y líneas futuras investigaciones.**

La naturaleza de la investigación ha permitido proporcionar algunas conclusiones de diversa índole. De las 7 hipótesis enunciadas, 6 pudieron ser constatadas. Así, en lo relativo a antecedentes, se constata que el ambiente, el layout, el personal de contacto, la experiencia de marca y la identificación son, efectivamente, antecedentes de la personalidad del punto de venta en su dimensión de autenticidad. Sin embargo, 1 de las 7 hipótesis propuestas no pudo ser aceptada a pesar de las importantes aportaciones teóricas encontradas en la revisión de la literatura. Se trata de la relativa a la estética interior y exterior del punto de venta. A la luz de tales resultados, cabe concluir que la presente investigación ha conseguido avanzar en la aplicación de un modelo de diseño de los antecedentes que configuran la autenticidad en la personalidad del punto de venta y de la influencia en su conjunto en la intención de compra.

Como implicaciones gerenciales cabría apuntar las siguientes: En primer lugar, se debería de apostar por la creación de un ambiente adecuado de ventas que no sea monótono, que implique al comprador haciéndole sentir a gusto dentro de la tienda, proporcionándole una experiencia gratificante. Para sorprender al cliente, se podrían incluir aromas en el punto de venta que le evoquen sensaciones placenteras. No en vano, junto a la relevancia del logotipo, cada vez cobra más auge la avocación de marcas con odotipos (Correa 2012). Pero no solo a través del aroma, también se podría mejorar el ambiente de la tienda mediante acciones novedosas, como espectáculos de animación afines al target de la tienda, que creen en el punto de venta un ambiente estimulador de las ventas y aporten una experiencia inolvidable al consumidor.

En segundo lugar, sería interesante la creación de espacios que favorezcan la circulación y la rápida localización de productos en la superficie de ventas. En este sentido, la apuesta por una correcta señalización sería una de las vías, siendo una de las alternativas más recientes el recurso a envases luminosos, a señales en el suelo sobre la ruta a seguir o a la entrega de mapas a la entrada del punto de venta. Aprovechando las nuevas tecnologías, el desarrollo de aplicaciones móviles que faciliten el transitar por el establecimiento y la localización del género serían otras alternativas diferenciadoras que permitirían avanzar en la autenticidad de la enseña.

En tercer lugar, no se debería descuidar la implicación del personal de contacto y su relación con el cliente. Así, los resultados obtenidos subrayan la importancia de prestar especial atención a la forma en que atienden y que se muestran al cliente. Para ello, se debería de vigilar que el personal de contacto utilice vestimenta adecuada, puesto que, a diferencia de lo que sucede en un entorno de

ventas industrial, en un entorno de ventas familiar (como es el caso que nos ocupa), la imagen, el trato y la profesionalidad del vendedor resultan claves. Así, para aumentar la profesionalidad, sería recomendable la realización de cursos periódicos de formación que permitan ofrecer un servicio que cumpla con los valores/requerimientos que la enseña desea transmitir. En cuanto al trato sería recomendable delegar en los vendedores la gestión relacional con los clientes (Webster, 1992), pero proveyéndoles antes de una formación previa en técnicas novedosas de atención al cliente.

En cuarto lugar, se debe trabajar la experiencia de marca y la identificación con la enseña a fin de conseguir la percepción de autenticidad que se desea, incidiendo en aspectos como la comunicación de los valores de la enseña con los que el cliente se va a sentir conectado. Sin embargo, no todas las marcas tienen la misma capacidad para satisfacer esta dimensión social y para favorecer este estado de relación ideal que permite al individuo crear un fuerte vínculo con la marca al usarla convirtiéndola en un vehículo de definición personal y de expresión social. Para tal fin, la literatura ha venido recomendando distintas fórmulas (véase Ahearne et al., 2005; Bhattacharya y Sen, 2003; Scott y Lane, 2000). Éstas van desde el uso de la comunicación, hasta el incremento de la presencia de la marca en la vida del consumidor para favorecer las interacciones marca-consumidor y consumidor-consumidor. Incremento de la presencia que podría efectuarse, por ejemplo, a través de redes sociales, blogs, clubs de clientes, etc.

Tal y como se viene indicando, tanto los fabricantes como los retailers, deberían de esforzarse en transmitir los atributos de la personalidad de su enseña con los que el comprador se pueda identificar. Para tal fin, sería interesante intensificar la personalización en el proceso de compra, por ejemplo, llamándole al cliente por su nombre (gracias a una pegatina que se le podría facilitar en la entrada de la tienda), ofreciéndole servicios a medida, envoltorios que combinen los elementos/colores que prefiere, o, en general, haciendo un uso efectivo de técnicas CRM (Alcaide, 2010) para ofrecer al cliente una experiencia personalizada.

Además de la personalización del servicio, se podría implicar al cliente con la política de autenticidad de la enseña a través de comunicaciones, eventos, cursos que impliquen y demuestren la autenticidad del punto de venta y que, efectivamente, esa autenticidad es real y existe (Gilmore y Pine, 2007). De tal forma, se conseguiría que la atribución de ciertos valores a la enseña sea una tendencia que perdure, sobrepasando las coyunturas económicas.

Por último, y dado que se ha constatado que tanto la estética interior como exterior no influyen significativamente sobre la creación de una personalidad del punto de venta, este sería un factor sobre el que, en épocas de recursos económicos limitados, los gerentes del punto de venta deberían de invertir comparativamente menos recursos o con mayor austeridad. Ello es debido a la posible percepción de superficialidad de la estética por clientes que otorgan más relevancia a valores más profundos (como la honestidad, la sinceridad o el grado de compromiso). Con esto no se pretende restar importancia al concepto de la estética, sino más bien apuntar que se trata de un factor menos importante. Es decir, otros aspectos, como puede ser la relación que se establece con el personal de contacto, la experiencia vivida en la superficie de ventas o incluso la identificación con la enseña, cobran más peso en la consolidación de la autenticidad en la personalidad de un punto de venta. Si bien es cierto que, como apuntan Newman y Potel (2004), una adecuada gestión de la estética ayuda a una percepción positiva de su personalidad.

Como limitaciones del presente estudio, cabría apuntar que la recogida de información se ha realizado sólo de clientes, sin incluir no clientes ni personal del punto de venta. Además, el procedimiento de recogida de información puede no haber sido el óptimo debido a que la atención de los clientes a la salida de la tienda se veía mermada por las ganas de cargar lo comprado, pudiendo crear un sesgo en las respuestas. Adicionalmente, hay que apuntar como limitación que el desarrollo de la investigación se ha llevado a cabo en un sector concreto y para una categoría de puntos de venta off line y a nivel nacional.

De tal forma, las limitaciones mencionadas anteriormente, darían pie al desarrollo de futuras líneas de investigación. Así, cabría la posibilidad de replicar el estudio en otras líneas de investigación que abarcaran tanto: (i) otros contextos con el fin de comprobar el comportamiento de las hipótesis en sectores distintos, (ii) la aplicación del estudio en entornos on line, (iii) la ampliación del estudio al

resto de las dimensiones de la personalidad del punto de venta, (iv) la ampliación de la presente investigación con datos cruzados y análisis clúster sacados de los datos almacenados en el programa SPSS utilizado para la tabulación de las respuestas al cuestionario.

## RESUMEN

*Basándose en la teoría de los usos y gratificaciones, el presente estudio analiza la influencia de las gratificaciones emocionales derivadas del uso de la red social Qzone en la interacción con las marcas por parte de los adolescentes chinos en esta plataforma online. Con este propósito, se llevan a cabo encuestas auto-administradas a 220 adolescentes en la ciudad de Shanghai usuarios de la red social Qzone. Los resultados del estudio reflejan que mientras que las gratificaciones referentes a la socialización y el entretenimiento ejercen una influencia positiva y significativa en el grado de interacción con las marcas, la gratificación vinculada a la búsqueda de información, por el contrario, no incrementa la interacción de los adolescentes chinos con las marcas en Qzone. Estos resultados confirman la opinión de algunos investigadores que sugieren no centrar las estrategias de comunicación de marcas, dirigidas al segmento de adolescentes en redes sociales online, en proveer información acerca de las características del producto, sino en crear contenidos que entretengan y permitan satisfacer las necesidades de socialización de éstos.*

## PALABRAS CLAVE

*Marcas, Publicidad, Redes Sociales Online, Qzone, Adolescentes chinos*

## 1. Introducción

Actualmente, para las empresas que quieren internacionalizar su marca, los medios sociales son una poderosa plataforma para la proyección internacional de empresas por su capacidad para generar conversaciones, conectar con los consumidores de cada país, canalizar reacciones, reforzar vínculos con el público y desarrollar y potenciar la imagen de marca (Lázaro, 2013). Identificar los medios sociales locales más relevantes en cada país y realizar un análisis exhaustivo del comportamiento de la audiencia local online son dos de los factores más importantes para lograr dicho objetivo. En el caso específico de China, donde numerosas empresas desean internacionalizar sus marcas por su enorme potencial de mercado, el medio social que concentra la mayor audiencia es Qzone. Esta red social fue creada en 2005 por la compañía *Treencent* y actualmente sobrepasa los 700 millones de usuarios, lo que la hace la segunda red social mundial tras Facebook en términos de número de usuarios registrados. Al igual que otras redes sociales online, Qzone ofrece la posibilidad de compartir fotos, escribir blogs y escuchar música, siendo un medio muy popular entre jóvenes adolescentes. La mayor parte de los servicios ofrecidos por Qzone —cuya aplicación para teléfonos móviles también es muy activa— incluyen el pago de una cuota. Sin embargo, es posible conseguir un pase conocido como *Canary Diamond* que garantiza el acceso gratuito a casi todas sus aplicaciones.

Además de a través de perfiles personales, las marcas comerciales también pueden estar presentes en Qzone a través de sus páginas web o creando eventos en los que los usuarios de Qzone pueden participar. En los últimos años, muchas marcas han creado sus páginas oficiales en esta red social china buscando en esta plataforma un modo eficiente de contactar con los adolescentes a un bajo coste. Algunas publicaciones de expertos señalan que los consumidores jóvenes usan ahora los medios sociales con mayor frecuencia que las páginas web corporativas a la hora de buscar información sobre una compañía, marca o producto (Dei Worldwide, 2008). Asimismo, varios estudios señalan que las redes sociales han reemplazado al email como la actividad online más popular, convirtiéndose en la principal fuente de información (Fuscaldo, 2011; Albanesius, 2010). Por ello, para las marcas es muy importante estar presente en dichas plataformas con el objeto de interactuar con el público adolescente (Araujo y Neijens, 2012), más influenciable por el marketing, y conseguir fidelizarlo con el fin de que éste haga publicidad de la marca a través de un boca-oreja positivo (Chu y Choi, 2011). Al mismo tiempo, los medios sociales ofrecen nuevas oportunidades a los gestores de marca para poder construir relaciones más personalizadas con los consumidores (Kelly, Kerr y Drennan, 2010; Rowley, 2009). La literatura reciente sobre las actividades de los consumidores relacionadas con marcas sugiere que la participación en comunidades virtuales se asocia positivamente con la receptividad ante campañas virales y mensajes comerciales en los medios sociales (Chi, 2011; Chu, 2011), así como con el desarrollo de una mayor confianza en la marca y lealtad hacia ésta (Laroche et al., 2012; Laroche et al., 2013; Casalo et al., 2007).

Para que las estrategias de comunicación de las marcas en estas plataformas online sean efectivas, resulta fundamental que las empresas entiendan muy bien qué mueve a los adolescentes a interactuar con las marcas. Sin embargo, hasta el momento apenas encontramos estudios en la literatura centrados en cómo y por qué los individuos interactúan con las marcas en las redes sociales online, y menos aún, para el caso de redes sociales que no sean Facebook. Uno de los pocos estudios relacionados existentes en la literatura es la investigación reciente de Tsai y Linjuan (2013), que analiza las motivaciones de los consumidores para el uso de las páginas de marca en redes sociales. Estos autores observan que los encuestados normalmente usan una página de marca de Facebook como plataforma para buscar descuentos o noticias sobre rebajas, para intercambiar información con otros miembros y para divertirse y buscar pasatiempos. De acuerdo con los resultados de su investigación, cuando los usuarios visitan o siguen una página comercial de Facebook, lo hacen esencialmente por razones utilitarias, más que por la motivación de ganar mayor apoyo social, gestionar identidades sociales o expresar sus opiniones y expectativas.

Dada la carencia de investigaciones en relación a estos aspectos, planteamos el presente estudio con el objeto de contribuir al avance del conocimiento teórico sobre el mecanismo sobre el que se basa el compromiso de los consumidores con las marcas en redes sociales online y cubrir dicha carencia en la literatura científica.

El objetivo de este trabajo será el estudio de cómo las gratificaciones online pueden influenciar el comportamiento del usuario adolescente. En concreto, se pretende analizar la influencia de las gratificaciones derivadas del uso de la red social Qzone (socialización, búsqueda de información y entretenimiento) sobre el grado de interacción con las marcas de los adolescentes chinos. Este aspecto apenas ha sido tratado previamente en la literatura científica y, menos aún, para el caso de China. Es más, las investigaciones previas sobre redes sociales online en China son muy escasas (Jackson y Wang, 2013; Wang et al., 2012; Chu y Choi, 2013), especialmente en lo concerniente a Qzone, a pesar de la importancia de esta red social para los adolescentes chinos y el tiempo que éstos pasan en ella. Debido a las importantes diferencias culturales entre las culturas occidentales y orientales, creemos necesario no centrarse únicamente en Estados Unidos y Facebook, sino desarrollar investigaciones alrededor de otras redes sociales online en los países orientales para alcanzar un mejor conocimiento del impacto de los servicios de redes sociales online sobre el comportamiento adolescente.

## 2. Revisión de la literatura

### 2.1. Gratificaciones derivadas del uso de redes sociales online

Algunos estudios han demostrado las bondades del enfoque de la teoría de los usos y gratificaciones en el contexto concreto de los entornos online por su gran capacidad explicativa para predecir comportamientos individuales en los servicios de redes sociales (Lee y Ma, 2012). Existe cierto consenso en la literatura al identificar la socialización, la búsqueda de información y el entretenimiento como algunas de las principales gratificaciones asociadas al uso de las redes sociales online (Ko et al., 2005; Chua et al., 2012; Diddi y LaRose, 2006; Dunne et al., 2010; Lee et al., 2010; Lin et al., 2005; Park et al., 2009), inclusive en el caso de China (Wang et al., 2012; Chu y Choi, 2011; Ku et al., 2013; Jackson y Wang, 2013).

En primer lugar, la *socialización* se encuentra entre las gratificaciones principales y más estudiadas que los adolescentes obtienen del uso de las redes sociales online (Boyd, 2007; Kim, Sohn y Choi, 2011; Liu, 2008; Tong, Van Der Heide, Langwell y Walther, 2008; Howard y Corkindale, 2008; LaRose y Eastin, 2004; Lee y Ma, 2012; Chen y Marcus, 2012). Ellison et al. (2007) demuestran que Facebook se usa para vincular y mantener el capital social del que los usuarios obtienen satisfacción afectiva. En un estudio longitudinal de los datos de panel de usuarios de Facebook, Steinfield et al. (2008) detectan que la intensidad de uso de Facebook durante el primer año es un potente indicador de resultados de capital social en el segundo año. Estos autores argumentan que el uso de Facebook ayuda a superar las barreras de las que pueden ser víctimas alumnos con baja autoestima a la hora de relacionarse con otros en entornos off-line. En relación a los medios sociales, Park et al. (2009) apuntan que los alumnos universitarios consideran la socialización como una de las gratificaciones que les llevan a formar parte de grupos de Facebook. Los usuarios pueden encontrarse con viejos amigos y compañeros en Facebook, comunicarse con ellos y saber qué hacen y qué es de ellos últimamente. Urista et al. (2008), basándose en temas comunes que surgen en conversaciones de grupo cotidianas, proponen que los usuarios de redes sociales las usan como una forma selectiva, eficiente e inmediata de comunicación interpersonal (mediada) con los demás y de buscar su aprobación y apoyo. De forma similar, Dunne et al. (2010) describen el mantenimiento de relaciones como un estímulo fundamental para el uso de las redes sociales online. La socialización permite a los adolescentes estar en contacto con los demás, compartir opiniones y sentir que son escuchados, satisfaciendo así las necesidades de expresarse y de pertenecer a un grupo propias de esta edad.

En segundo lugar, la gratificación de la *búsqueda de información* se refiere al uso de los servicios de redes sociales para encontrar información útil y oportuna sobre eventos, tendencias, música, etc. Los adolescentes comparten temas candentes, nuevas tendencias, noticias interesantes e información útil en estas plataformas online (Lee y Ma, 2012; George et al., 2013; Papacharissi y Rubin, 2000; Luo, 2002). Investigaciones previas muestran que la búsqueda de información —junto con la posibilidad de compartir información con otros usuarios con intereses similares— constituye una de las gratificaciones más importantes del uso de estas plataformas (LaRose y Eastin, 2004; Ko et al., 2005; Leung, 2007).

Por último, el *entretenimiento* se refiere a la forma en que los medios sociales proporcionan formas de entretenerse y escapar de la rutina. Esta gratificación emocional trata del disfrute con amigos, sentirse bien y no aburrirse. Muchas personas usan los servicios de redes sociales para entretenerse en su tiempo libre y pasar el tiempo cuando se aburren. Por ejemplo, Qzone ofrece muchos juegos online para usuarios que pueden jugarse con amigos. De este modo, los servicios de redes sociales no son sólo proveedores de información básica, sino que también ofrecen un espacio para el disfrute a través de la interacción entre personas por medio de la discusión y el cotilleo. Van der Heijden (2004), en una investigación sobre los sistemas de información orientados al placer (juegos, por ejemplo), señala que el disfrute y el placer percibidos permiten "interactuar con un sistema hedonista diseñado para ser un fin en sí mismo". Los servicios de redes sociales han sido clasificados por muchos investigadores como sistemas recreativos de este tipo (Kang y Lee, 2010; Sledgianowski y Kulviwat, 2009; Lin y Lu, 2011; Nov et al., 2010; Lee et al., 2010; McQuail, 2005), ya que la principal motivación de uso de los usuarios es el ocio, o lo que es lo mismo, la posibilidad de disfrute, entretenimiento y pasatiempo.

## ***2.2. La influencia de las gratificaciones derivadas del uso de la red social Qzone sobre el grado de interacción con las marcas de los adolescentes chinos***

Las estrategias y necesidades de comunicación de las marcas han cambiado con la introducción de los entornos de los medios sociales. Las empresas buscan dirigirse al segmento de los adolescentes interactuando con ellos a través de sus perfiles oficiales de marca de un modo personalizado y directo (Kelly et al., 2010; Rowley, 2009). Para ello, las marcas se centran en proporcionar a sus clientes potenciales experiencias lúdicas y de entretenimiento, información y una participación activa que fomente la interactividad entre el consumidor y la marca. Los consumidores pueden dialogar con la marca de un modo inmediato, opinar, conocer sus nuevos productos o campañas, disfrutar de contenidos de diversa índole e incluso publicitar ellos mismos los productos a través de sus perfiles personales en la red social (Othman-Yousif, 2012).

A pesar de los esfuerzos que se están realizando desde las marcas, algunos estudios señalan sin embargo que el grado de interacción de los adolescentes con las marcas en las redes sociales es todavía bastante bajo (Hadija et al., 2012; Cooper, 2011). No es que no les gusten sus mensajes publicitarios, sino que simplemente no se fijan en ellos, les pasan desapercibidos entre el resto de las informaciones (Kelly et al., 2010). Lo que ocurre es que los jóvenes centran su atención en otros asuntos, para ellos más relevantes, como los perfiles de sus amigos, vídeos, fotos, etc. (Zeng et al., 2009). Según Hadija et al. (2012), es muy difícil llegar a ellos a no ser de que estén realmente muy interesados en la marca. De ahí, también la relevancia de la publicidad segmentada para lograr que los mensajes publicitarios lleguen al público objetivo de manera más efectiva (Bhattacharya et al., 2006). Y que después sea este público seguidor de la marca quien reenvíe los mensajes a sus amigos, ejerciendo de prescriptor de la marca (Othman-Yousif, 2012).

Por otra parte, otro de los grandes obstáculos de la publicidad en redes sociales es el nivel de intrusismo percibido por los usuarios: un anuncio puede definirse como intrusivo cuando distrae o irrita a los consumidores (Lee, 2002). Los consumidores perciben un contrato social implícito con los anunciantes en el caso de los medios tradicionales como televisión, radio y prensa escrita, ya que disponen de programas gratuitos o de bajo coste dedicados a actividades publicitarias (Gordon y De Lima-Turner, 1997). Por el contrario, los usuarios de Internet no perciben la publicidad como un contrato, sino como una desviación intrusiva y molesta (Mathews, 2000; Gaffney, 2001).

Para solucionar estos problemas y lograr que las estrategias publicitarias de las marcas en las redes sociales online sean efectivas, se necesita comprender por qué se usan los servicios de redes sociales y también cómo los usuarios responden o reaccionan a las acciones publicitarias (Rodgers y Thorson, 2009; Zeng et al., 2009). Algunos autores (Stafford, 2008; Stafford y Schkade, 2004) sugieren que las principales razones que hacen que los usuarios naveguen por Internet incluyen factores estructurales de contenido (información y entretenimiento) y de socialización (por ejemplo, contactar con los demás). Según la teoría de usos y gratificaciones (Katz y Foulkes, 1962), los consumidores buscan activamente formas de satisfacer necesidades tanto hedonistas como utilitarias. Por ejemplo, pueden ver la televisión para entretenerse con una película o para informarse con un documental o un

programa de noticias. Por lo tanto, esta teoría muestra que el valor de un anuncio se deriva de su capacidad para satisfacer las necesidades de entretenimiento, evasión, diversión y liberación emocional de los consumidores (McQuail, 1983; Sansone et al., 2012).

Asimismo, en relación con los contenidos más adecuados para las estrategias de comunicación de marca en los servicios de redes sociales, según algunos autores, el anuncio adquiere relevancia solo por su contenido informativo; es decir, un contenido que informa a los usuarios acerca de las bondades del producto (Rotzoll, Haefner y Sondage, 1990). Sin embargo, en opinión de otros autores ésta última no sería la táctica publicitaria más idónea para las marcas en sus estrategias de comunicación en redes sociales (Williams, 2010; Goldsmith y Lafferty, 2002). Para estos investigadores, cuando las marcas se dirigen al público adolescente, ya no basta con centrarse en proporcionar información acerca de las bondades del producto, como se hacía antaño en televisión, sino que se deben crear además contenidos entretenidos, que supongan algún tipo de diversión o entretenimiento para el usuario (por ejemplo, juegos publicitarios) y valerse también de herramientas como foros o chats que permiten a los adolescentes interactuar y entablar diálogos acerca de la marca con amigos u otros usuarios y, de este modo, satisfacer sus necesidades afectivas de socialización.

A tenor de lo anterior, en la presente investigación planteamos entonces la existencia de una relación positiva entre las principales gratificaciones derivadas del uso de las redes sociales online y el nivel de interacción de los adolescentes con las marcas dentro de la red social. Así, proponemos que —cuanto mayor es la percepción de entretenimiento, socialización y provisión de información útil y oportuna en Qzone por parte de los adolescentes chinos— mayor es su interacción con las marcas dentro de esta red social.

Derivado de lo anterior planteamos, por lo tanto, las siguientes hipótesis de investigación:

*H1: La socialización en Qzone incrementa la interacción de los adolescentes chinos con las marcas en esta red social.*

*H2: La búsqueda de información en Qzone incrementa la interacción de los adolescentes chinos con las marcas en esta red social.*

*H3: El entretenimiento en Qzone incrementa la interacción de los adolescentes chinos con las marcas en esta red social.*

### **3. Metodología de la investigación**

#### ***3.1. Características y selección de la muestra***

Para el contraste de las hipótesis y cuestiones de investigación planteadas, se entrevistó mediante encuestas auto-administradas a 220 adolescentes chinos en la ciudad de Shanghai (129 chicas y 91 chicos), usuarios de la red social Qzone, de edades entre los 14 y 19 años. Las encuestas se llevaron a cabo en siete distintos colegios de educación secundaria, después de haberse obtenido los correspondientes permisos de autorización, tanto por parte del centro escolar como de los padres de los participantes.

Asimismo, los adolescentes fueron informados acerca de que su participación sería voluntaria y anónima, y de que podrían dejar de realizar la encuesta en el momento que desearan.

#### ***3.2. Medición de variables***

Para la recopilación de la información y medición de las variables que se precisan, se ha elaborado un cuestionario que plasma, a través de una serie de preguntas, los objetivos perseguidos en la investigación. Asimismo, el desarrollo de las escalas de medición de las variables estudiadas se basa en la revisión de la literatura al respecto, con el fin de garantizar la validez de contenido de las mismas.

En primer lugar, para la medición del grado de interacción con las marcas en la red social online Qzone por parte de los adolescentes, siguiendo las recomendaciones de Bergkvist y Rossiter (2007) se

utiliza una escala de un único ítem. Así, se pregunta a los participantes “*en qué medida interactúan con las marcas en la red social Qzone*”, estando formada la categoría de respuestas por un intervalo de 4 puntos, donde: (1)=nada en absoluto, (2)=poco, (3)=bastante y (4)=mucho.

En segundo lugar, para la medición de las distintas gratificaciones derivadas del uso de la red social Qzone: *socialización, entretenimiento y búsqueda de información*, siguiendo las recomendaciones de la literatura (Lee et al., 2010; Park et al., 2009; Lee y Ma, 2012), se utiliza una escala multi-ítem con puntuaciones desde 1 hasta 4, donde (1)=nada en absoluto, (2)=poco, (3)=bastante y (4)=mucho. En la Tabla 1 se listan los ítems utilizados para medir cada constructo.

**TABLA 1**  
**Ítems de medición de cada una de las gratificaciones derivadas del uso de la red social Qzone:**  
**Socialización, entretenimiento y búsqueda de información**

Variable	Descripción	Ítem	Carga factorial	Media	Desviación típica	$\alpha$
Socialización	Mide el grado en el que la red social Qzone ayuda a mantener relaciones con amigos	Siento que puedo hablar más con mis amigos	0,81	2,56	0,95	0,83
		Siento que puedo mantener el contacto con mis amigos y acercarme a ellos	0,87	2,62	0,96	
		Puedo interactuar con mis amigos a la hora de compartir noticias	0,69	2,71	0,90	
Entretenimiento	Mide el grado en el que la red social Qzone proporciona una forma de divertirse y pasarlo bien	Me parece agradable	0,77	2,35	0,78	0,85
		Me parece placentero	0,92	2,10	0,73	
		Me parece emocionante	0,76	1,87	0,70	
Búsqueda de información	Mide el grado en el que la red social Qzone puede proporcionar a los usuarios información relevante y oportuna	Me ayuda a acumular información importante	0,73	2,33	0,92	0,82
		Me ayuda a encontrar información útil	0,86	2,23	0,91	
		Es fácil conseguir información cuando la necesito	0,75	2,03	0,89	

#### 4. Resultados

Con el fin de contrastar las hipótesis propuestas en el marco teórico, se procedió al desarrollo de un modelo de ecuaciones estructurales con el objetivo de determinar los efectos causales entre las variables latentes. Los coeficientes de ajuste del modelo estructural, así como los resultados del análisis de ecuaciones estructurales sobre las relaciones entre las variables latentes, se presentan en la Tabla 2.

Las medidas indican el buen ajuste del modelo (Bollen, 1989). El análisis de ecuaciones estructurales indica una influencia positiva significativa tanto de la gratificación de socialización (SRC=0.20, p=0.021) como de la de entretenimiento (SRC=0.20, p=0.022) en el grado de interacción con las marcas de los adolescentes en la red social Qzone. Se corroboran, por tanto, las hipótesis 1 y 3. Por otro lado, el análisis de ecuaciones estructurales indica la existencia de una relación positiva no significativa de la gratificación referente a la “búsqueda de información” en la interacción con las marcas de los adolescentes (SRC=0.05, p=0.54); en consecuencia, los datos obtenidos no permiten ratificar la hipótesis 2.

**TABLA 2**  
**Análisis de ecuaciones estructurales**  
**Coefficientes de ajuste y relación entre variables latentes**

Factor	Regression Coefficients (standardized, non-standardized; p)
Socialización → Interacción con las marcas	0,20; 0,25; $p = 0,021$
Entretenimiento → Interacción con las marcas	0,20; 0,31; $p = 0,022$
Búsqueda de información → Interacción con las marcas	0,05; 0,06; $p = 0,54$
<b>Ajuste del modelo</b>	GFI = 0,96; AGFI = 0,93; NFI = 0,95; CFI = 0,98; RMR = 0,03; RMSEA = 0,04 Chi cuadrado=44,1; Chi cuadrado/df=1,47

Nota: GFI = Índice de bondad de ajuste; AGFI = Índice ajustado de bondad de ajuste; NFI = Índice de ajuste normalizado; CFI = Índice de ajuste comparado; RMR = residuo cuadrático medio; RMSEA = Error de aproximación cuadrático medio.

## 5. Conclusiones e Implicaciones

Las dos principales contribuciones de este trabajo a la literatura científica son: en primer lugar, analizar el papel de las gratificaciones obtenidas del uso de las redes sociales online en el grado de interacción con las marcas de los adolescentes en estas plataformas, hasta ahora apenas estudiado en la literatura científica y, en segundo lugar, analizar dicho fenómeno para el caso de los adolescentes chinos y de la red social china Qzone. Dicha red social, a pesar de ser la segunda red social más grande en número de usuarios después de Facebook, no ha sido analizada hasta el momento en la literatura científica.

Los resultados de la presente investigación demuestran la existencia de una influencia positiva significativa tanto de la gratificación de socialización como de entretenimiento en la interacción con las marcas de los adolescentes en la red social Qzone. Por otro lado, el análisis de ecuaciones estructurales indica la existencia de una relación positiva no significativa de la gratificación referente a la “búsqueda de información” en la interacción con las marcas de los adolescentes en Qzone.

Los resultados confirman la opinión de algunos investigadores que sugieren no centrar las estrategias de comunicación de marcas en redes sociales online en proporcionar información acerca de las características del producto, sino en crear contenidos que entretengan a los adolescentes y les permitan satisfacer sus necesidades de socialización (Williams, 2010; Fosdick, 2012; Stafford, 2008; Kelly et al., 2010). Así, la provisión de información acerca de los atributos del producto habrá de dejarse para otros soportes de comunicación de la marca como, por ejemplo, su página web en Internet, pero no para las plataformas de redes sociales online. En esta misma línea, Goldsmith y Lafferty (2002) sugieren que para que las estrategias de marca dirigidas a los adolescentes en redes sociales sean efectivas, las marcas han de redefinir y cambiar su discurso publicitario. Así, este discurso debe pasar de estar centrado en las bondades del producto a enfatizar los valores y experiencias emocionales asociadas a él, intentando entretener, sorprender y persuadir al usuario con mensajes que van más allá de los propiamente informativos sobre el producto. Por citar un ejemplo, los diferentes formatos publicitarios que la marca *Coca Cola* utiliza en su perfil de Facebook se centran en el valor de la felicidad, recurriendo a cuestiones como la música, el amor o el ocio. Estos valores sociales cumplen una función persuasiva e intentan transmitir la necesidad de adquirir un producto determinado y, por extensión, adquirir también el valor que se pone en juego y sentirse aceptados socialmente como miembros pertenecientes a una ideología (Sáez, 2003; Martínez-Rodrigo y Marta-Lazo, 2011, p. 112).

El entendimiento de las motivaciones de los usuarios a la hora de interactuar con las marcas en las redes sociales online puede ayudar a los publicistas a atender mejor las necesidades y los intereses de los usuarios, lo que les permitiría estimular el compromiso con las marcas de los usuarios y construir relaciones de calidad. En concreto, de los resultados de la presente investigación se deriva que cuanto

mayor es la percepción de entretenimiento y de socialización en Qzone por parte de los adolescentes chinos, mayor es la interacción de éstos con las marcas dentro de dicha red social.

En consecuencia, dado que las gratificaciones emocionales del entretenimiento y la socialización potencian la interacción de los adolescentes con las marcas en redes sociales, los responsables de comunicación de marca en dichas plataformas deberían incorporar una gran variedad de contenido entretenido y agradable para los jóvenes como historias divertidas y emocionantes, adivinanzas, juegos, bromas, horóscopos diarios, vídeos musicales de sus cantantes favoritos, cómics, etc., tal y como recoge también el estudio de Tsai y Men (2013), realizado para el caso de Facebook. En otras palabras, los comunicadores de marca deberían centrarse en el contenido y las aplicaciones de la red social Qzone que son entretenidas y posibilitan satisfacer las necesidades de socialización de los adolescentes chinos a través de la interactividad y la participación activa con otros usuarios. Las futuras investigaciones deberían analizar si estos resultados son generalizables y en qué grado, por ejemplo, reproduciendo el análisis en mercados geográficos diferentes u otras redes sociales online.

## 6. Futuras líneas de investigación

El estudio e implementación de nuevas estrategias y acciones de comunicación que puedan ayudar a las marcas a seguir buscando y construyendo su identidad social en estos entornos digitales y a saber conectar y fidelizar al público joven constituye una línea de investigación de gran importancia e interés para la empresa, en la que se deberá continuar profundizando en el futuro. No obstante, entendemos que es necesaria, también, la formación de los adolescentes en redes sociales. No hay que olvidar que en ellas están constantemente recibiendo contenidos persuasivos. Por esta razón, creemos que aunque la competencia digital debe desarrollarse entre los adolescentes, también se les debe aportar las destrezas y conocimientos necesarios para enfrentarse a contenidos publicitarios en la red y que éstos no influyan negativamente en su desarrollo (Martínez-Rodrigo y Marta-Lazo, 2011).

**Agradecimientos:** A través de estas líneas los autores desean expresar su agradecimiento a los siete centros escolares de la ciudad china de Shanghai, que desde un principio mostraron interés en el estudio y que, gracias a su apoyo y colaboración, hicieron posible el presente trabajo de investigación.

# THE IMPACT OF COLLECTIVE BRANDS ON THE ECONOMIC EFFICIENCY OF EXPERIENCE GOODS PRODUCERS

---

*Universidad De Alicante*

## RESUMEN

*The aim of this paper is to analyse the economic efficiency of members of Protected Designations of Origin (PDO). For the first time we analyse the value of PDO labels from the point of view of economic efficiency. The central hypothesis is that a PDO has a positive impact on the economic efficiency of its member companies and that this is because a PDO label is a collective reputation indicator that foments efficient investment in quality in terms of member returns. The methodology applied to test this hypothesis is based on Data Envelopment Analysis (DEA) to estimate economic efficiency, and econometric models to explain company efficiency through both the PDO label, as an indicator of collective reputation, and the characteristics of the company. Overall, the results reveal the importance of PDOs in industries in which the signal of reputation is not only reliant on the individual brands.*

## Palabras clave:

PDO, collective reputation, efficiency, experience goods.

## 1. Introduction

Collective brands have proliferated in recent years, and the products marketed under these brands now represent an important percentage of consumer purchases (Winfrey and McCluskey, 2005). This tendency in consumer preferences has led the European Union to introduce the following public labels (Fernández-Barcala and González-Díaz, 2006; Loureiro and McCluskey, 2000): Protected Designation of Origin (PDO), Protected Geographical Indicator (PGI) and Guaranteed Traditional Speciality (GTS). A PDO covers the term used to describe foodstuffs which are produced, processed and prepared in a given geographical area using recognized know-how (e.g., Mozzarella di Bufala). A PGI indicates a link with the geographical area in at least one of the stages of production, processing or preparation (e.g., Turrón de Alicante). The link with the area is therefore stronger for PDOs and the level of protection is also stronger for PDOs. Two examples of products that can be categorized as PDOs are wine and cheese, and they are the object of our study. Finally, Guaranteed Traditional Specialities are agricultural products and foodstuffs that comply with certain specifications concerning their composition or method of production.

A determinant of the success of products under the umbrella of these labels is collective reputation: if the collective reputation of the product is high, the collective label will be a powerful indicator of quality (Tirole, 1996). In this way, collective labels created by public or government institutions are designed to ratify the product quality of the individual member companies, which can sell their products with a legal guarantee and the prestige of the superior quality of the specified geographical region and/or production method.

The wide use of the collective label strategy has provoked interest in the academic world but the extant studies are only based on estimating collective brand equity through the price premium consumers are ready to pay (e.g. Fernández Barcala and González Díaz, 2006) and on the impact of collective reputation indicators on product price (e.g. Landon and Smith, 1997, 1998; Loureiro and McCluskey, 2000; Schamel, 2000). This has allowed the characterisation of collective labels through two main features (Fishman, Finkelshtain, Simhon and Yacouel, 2008): i) their labels are perceived as signs of superior quality by consumers, who are prepared to pay a price premium for them; and ii) the member producers of collective labels only share a brand name, and are generally autonomous companies that take individual decisions and make their own profits.

In any case, we can ask ourselves what the efficiency of a member company of a PDO label would be and whether there are conditions that affect this efficiency. The efficiency of a company refers to a relative judgement around the relationship between the resources used -inputs- and the results obtained -outputs- in the development of its activities; bearing in mind that between the two elements is the underlying idea of opportunity costs. A company will be efficient if, given a certain availability of inputs, it is able to produce the maximum amount of output possible; or, alternatively, if it can reach a certain level of output using the lowest quantity of inputs possible. The efficiency of a company has a relative character, as it includes the performance of the other companies that make up the sample. The interest in studying these aspects rests on their important implications on managers' decisions in terms of the effectiveness of public PDO labels in creating value-added for producers.

Thus, the objective of this study is to examine the capacity of a PDO label to generate greater performance from a company efficiency perspective while controlling the role of the different characteristics of the member companies. The central hypothesis is that a PDO has a positive impact on the economic efficiency of its member companies and that this is because a PDO label is a collective reputation indicator in experience goods (i.e., the quality of a product is imperfectly observable prior to purchase) that foments efficient investment in quality in terms of member returns. The methodology is based on the non-parametric efficiency estimation technique of Data Envelopment Analysis (DEA) and on the application of different regression models that explain company efficiency through both the PDO label, as an indicator of collective reputation, and the characteristics of the company. The empirical analysis is made on PDO labels in the experience goods of wine and cheese in Spain; two interesting examples for our purposes given the proliferation in the wine and cheese markets of PDO labels. Concretely, PDOs are used in Spain as a recognition of superior quality, resulting from individual differential characteristics due to the geographical environment where the

raw materials are produced and the product is made and the influence of the human factor (MMAMRM, 2009). These PDOs are used by a plurality of companies under the control and authorisation of the titleholder (the Regulatory Council of each PDO), which certifies that the products comply with certain common requisites, especially those concerned with quality, geographical origin, technical conditions or method of production.

Having established the objective of the study, the rest of the paper is organised as follows. In the second section we develop and argue the hypothesis. The third describes the methodology and sample used. In the fourth section, we present the results and the final section summarises the conclusions made from the study.

## **2. Literature review**

Researchers have given little empirical attention to the relationship between collective brands and the efficiency of their member companies. Despite this, the traditional theoretical position in Industrial Economy holds that collective labels can increase the efficiency of their members by providing scale economies in production and promotion (Fishman et al., 2008), meaning that companies in collective brands would be more efficient than those that do not use collective brands. With regard to scale economies in production (see Tirole, 1988), the bringing together of activities, derived from the same product or from different products, is related to reduced production costs. Thus, participation in a collective brand facilitates specialisation and brings significant savings. Moreover, coordinated activities are motivated by complementariness of demand. One can imagine a diversity of companies specialising in wine making, but the coordination required by membership of a PDO creates synergy. In this way, collective brands can deliver scale economies in production for their member companies. In terms of scale economies in promotion, the grouping together of activities can not only be associated with production in the strict sense of the word, but also with the services that accompany it (Tirole, 1988), such as promotion. Such groupings avoid the duplication of the fixed costs of promotion or they at least reduce them. In fact, one of the objectives sought by the use of collective brands is to reduce the marketing investment needed to launch new products.

Although the effects derived from scale economies in production and promotion could explain the greater efficiency of companies in collective brands, the logic of our proposal is based, alternatively, on the idea that collective labels are economically efficient in signalling quality when some characteristics of the product cannot be observed by consumers before or after its purchase.

### ***2.1. Economic efficiency in signalling quality***

Our proposal begins with the Signalling Theory of the Information Economics (see Erdem and Swait, 1998; Kreps and Wilson, 1982), which refers to the role of brand reputation as a quality indicator that reduces the perception of risk in conditions of asymmetric information on quality in the market. Basically, this theory assumes the existence of imperfect and asymmetric information in markets. When these information asymmetries refer to quality, high and low quality products can co-exist in the market (Akerlof, 1970), which means that consumers have to make ex-ante evaluations of the quality of their purchases; making the choice both problematic and costly (Nayyar, 1990) as there will be doubts around the quality of a product and the consumer will not know a priori which product to buy. Assuming rational consumer behaviour, we can expect consumers to try to make good purchases and reduce risk; meaning that the purchase decision process will be guided by any intrinsic and/or extrinsic signals of quality. One of the most analysed signals for reducing these asymmetries in consumer markets is brand reputation (Kreps and Wilson, 1982; Erdem and Swait, 1998). In fact, brand value is defined by the utility it gives the consumer as an information signal (e.g. Erdem et al., 1999), which means that the main determinant of brand value is consumer belief in the brand, which can help improve perception of quality and reduce the search costs and risk associated with purchase.

In this respect, the researchers of Industrial Economy distinguish two reputation models (Landon and Smith, 1997, 1998): individual company reputation and collective reputation. The role of individual company reputation has been developed in the theoretical models of Klein and Leffler (1981), Kreps et al. (1982), Shapiro (1983), Allen (1984), Rogerson (1987) and Jin and Leslie (2009), who explain the reputation of an individual company through its past output quality. Thus, with experience goods, the

quality of a product is imperfectly observable prior to purchase and can only be determined through its use. If these experience goods are not frequently bought, the information on the current quality of the product is not available to consumers or is costly to acquire. This means that consumer demand will depend, at least in part, on consumer predictions around the quality of the product. In this sense, these models consider that the reputation of an individual company is only a function of its past quality and proposes that the price of an individual company's product is explained by its reputation based on the past quality of its output.

For its part, the role of collective reputation, understood as an aggregate of individual reputations, is developed in the theoretical model of Tirole (1996), which uses group information to approximate the quality of the product of the individual company. In fact, in industries with a large number of producers, the specific information on the current or past quality of a given company is not easily available and it will only be possible (or it would be cheaper) to obtain information on the quality of a group of companies with which the company in question can be identified. This group information can be used as an indicator of the product quality of an individual company in the group.

In summary, among the mechanisms of reputation, the collective label stands out as the individual member companies share a collective reputation and the consumers of a given individual company can learn something about the quality of all the member companies. In any case, our proposal considers that collective reputation foments efficient investment in quality in terms of returns of members that produce experience products (i.e.: where quality is difficult to observe before purchasing). It is argued through the following extension of the ideas of Shapiro (1983): if consumers rely on the quality reputation of a group of companies, a company that chooses to join a collective label with a certain level of quality initially has to invest in reputation through the production of quality products, and continue the quality strategy over time as it will obtain high profits from its investment in quality derived from the large number of consumers that are adequately informed about the past quality of the group (Fishman et al., 2008). In fact, a collective label covers a larger market segment than any of its member companies, and given that the information on past quality is imperfectly disseminated, for example by word of mouth, the consumers of any given member company have a greater probability of having previously interacted with past consumers of the collective label than with those of a company outside the collective. Consequently, a collective label can promote more efficient investment in quality in its member companies in terms of returns on this investment.

Taking the above argumentation, we can expect PDO labels to increase the economic efficiency of their members because the PDO label provides a collective reputation indicator which foments efficient investment in quality in terms of the improvement of its members' returns. Consequently, we propose the following hypothesis:

H1. Companies that use PDO labels are more efficient from an economic point of view than companies that do not use PDO labels.

### **3. Methodology and sample**

#### ***3.1. Methodology***

The methodology is based on the estimation of the economic efficiency of a company, as well as on the different non-parametric tests to analyse the relationship between the PDO label, as a collective reputation indicator, and company economic efficiency. With regard to the first aspect, various models have been proposed to estimate efficiency. In this study economic efficiency is estimated using the non-parametric methodology of Data Envelopment Analysis (DEA) (Charnes et al., 1978, 1981), which is based on linear programming techniques, in which it is not necessary to include specific functional forms for the production function (relationship between inputs and outputs) to establish the efficient frontier.

In general, DEA is an extension of the traditional ratios analysis insofar as each decision making unit (DMU) evaluated is considered efficient if no other DMU is able to produce higher outputs from the same inputs or, alternatively, produce the same output using lower input levels. In the literature on productivity and efficiency analysis the term DMU is used to describe a productive entity such as a

company, a retail outlet, a bank branch, or a business unit. The underlying assumption is that these decision making units employ the same type of inputs to obtain the same type of outputs. In our case, we employ the term DMU referring to a company (winery or cheese factory). With the DEA models we can distinguish units (companies) that operate efficiently from those that do not, with the efficient units defining the efficient frontier.

More concretely, we apply an output orientated model (it considers that a company will be efficient if, given a certain availability of inputs, it is able to produce the maximum amount of output possible), bearing in mind that the input and output orientated models estimate exactly the same frontiers and, therefore, identify the same companies as efficient. For each DMU we solve the linear programming problem of the BCC model (Banker et al, 1984) that assumes variable returns to scale. Returns to scale is a long run concept which reflects the degree to which a proportional increase in all inputs increases output. Constant returns to scale (CRS) occurs when a proportional increase in all inputs results in the same proportional increase in output. Variable returns to scale (VRS) occurs when a proportional increase in all inputs results in a more than proportional increase in output (increasing VRS) or in a less than proportional increase in output (decreasing VRS). The CRS assumption is only appropriate when all companies are operating at an optimal scale. However, when this is not the case, efficiency measurements can be confounded by scale efficiencies. The use of a VRS specification permits the calculation of efficiency devoid of these scale efficiency effects. Thus, to estimate scale efficiency we estimate the CCR model (Charnes et al., 1978), which assumes constant returns to scale (CRS). The efficiency measurements obtained with this model ( $\theta^*CRS$ ) are always lower than those obtained with the BCC model (Banker et al, 1984) ( $\theta^*VRS$ ), which assumes variable returns to scale (VRS), so that scale economies (SE) are defined as  $\theta^*CRS/\theta^*VRS$ . If  $SE = 1$ , the DMU analysed operates with scale efficiency, whereas if  $SE < 1$ , it indicates the presence of scale inefficiencies.

Second, to test whether PDO labels influence efficiency (Hypothesis 1) we use a series of non-parametric tests with the estimations of the efficiency of the different companies. Concretely, we apply the test of Mann-Whitney to the null hypothesis that the sample means of the different groups of companies are generated by the same density function, as opposed to the alternative hypothesis that the efficiency of a group is stochastically better than that of another. At this point, it is useful to remember that the estimated efficiency values are not independently distributed and that it is not possible to apply the central limit theorem, which impedes the application of a variance analysis as it does not meet the assumption of normality in the distributions of the indices of efficiency. Finally, to control the influence of some of the characteristics of the company on the relationship between the PDO label, as a collective reputation indicator, and the efficiency of the company, we also use a regression analysis. Concretely, we make a second stage analysis in which the efficiency estimations of each company are explained as a function of a dummy variable (that takes the value 1 if the company belongs to a PDO and 0 otherwise), the age of the company, the average wages paid by the company and the company size. Given that the estimated efficiency values are restricted to between 0 and 1, the usual procedure for this type of analysis is to employ a Tobit regression model estimated by maximum likelihood (e.g. Bravo-Ureta et al., 2007). Hoff (2007) indicates that this type of model is sufficient to analyse the effect that certain independent variables have on efficiency levels estimated through DEA. We have conducted two different regressions because the efficiency estimates for the wineries and the cheese factories are not comparable since they are specific for the sample considered.

### **3.2. Sample, data and variables**

The empirical analysis is performed on two samples of companies operating in the Spanish wine and cheese sectors, respectively. For the samples selection we use the populations of companies registered in paragraphs 1042 and 1053 of CNAE-2009, which are the equivalent of codes 2084 (“Wines, brandy and brandy spirits”) and 2022 (“Natural, Processed, and Imitation Cheese”) of the US SIC classification, and which are found in the SABI database (the Iberian version of the Bureau Van Dijk database). The initial sample comprises 2,563 companies in the wine sector and 456 in the cheese sector. To guarantee the homogeneity of the companies analysed, we exclude wineries that principally produce brandy and other distilled high alcohol products. When this database does not provide information on certain relevant variables (especially with regard to employee numbers at wineries), we use information from the FEV (Spanish Wine Federation). Finally, 46 wineries were contacted by e-

mail and/or telephone to complete the information on some of the variables needed to estimate efficiency. The companies in the 80 Spanish wine PDOs and in the 27 Spanish cheese PDOs are listed on the PDO websites. The final sample used for the empirical study is made up of 1,257 wineries, of which 437 are not members of any PDO, and of the 820 that are members of the 58 PDOs represented in the sample, 110 wineries are members of more than one PDO. The final sample of cheese factories is made up of 378 companies, of which 267 are not members of any PDO, and 111 are members of the 22 PDOs represented in the sample.

With regard to the variables used to estimate economic efficiency, we consider different representative inputs and outputs of the economic activity of the companies considered. As inputs, we use the following three productive factors: i) the number of employees, which represents the labour factor (Bucklin, 1978; Ingene, 1982; Pilling et al., 1995; Yoo et al., 1997; Thomas et al., 1998); ii) the funds of the company (capital plus reserves); and iii) the level of debt (long and short term). The last two variables are used as an alternative to a single capital variable as access to financing and the costs derived from it are a fundamental factor of international competition in the wine industry (Viviani, 2008).

In terms of outputs, firstly we use sales volumes (Bucklin, 1978; Ingene, 1982; Lusch and Serpkenci, 1990; Ratchford and Stoops, 1988; Donthu and Yoo, 1998; Thomas et al., 1998; Zhu, 2000). The justification of this choice is that companies work with a wide range of products (e.g., red, white, or rosé wines with different qualities and prices), which makes it impossible to obtain disaggregated information on the outputs produced. As a second output we use the profit volumes of the company (Bucklin, 1978; Doust, 1984; Thomas et al., 1998; Zhu, 2000) for the following reasons: i) companies can obtain atypical returns distinct from their principal activity which are not included in their sales volume figures; ii) along with sales volumes, company managers have to pay special attention to results, as they guarantee both the visibility of the company and the possibility of making future investments; and iii) considering profit levels allows us to include the influence of costs not considered as inputs. The consideration of these two outputs in monetary terms allows us to estimate an eminently economic concept of efficiency. We do not consider outputs in physical terms (for example, hectolitres of wine produced or tonnes of cheese produced) because this would entail estimating a technical concept of efficiency outwith the scope of this study.

Finally, in order to explain the estimated efficiency of the companies we consider the following variables. First, a collective reputation indicator, measured through a dummy variable that takes the value 1 if the winery or cheese factory belongs to a PDO and 0 otherwise (Landon and Smith, 1997, 1998). Second, as control variables we use three company characteristics: i) Age of the company, measured in years since its creation. More age leads to better market knowledge and better individual company reputation. Thus, as a company establishes itself within a community, its awareness and reputation spread with positive word of mouth (Thomas et al., 1998). In this sense, greater age allows a company to have more know-how, which can lead to more capacity to develop its activities more efficiently. So, in principle, we can expect that the older companies will be more efficient than the newer companies. ii) Average wage paid (Gómez-Mejía and Balkin, 1992), measured as the quotient between the total amount destined for salaries and the number of employees at the company. This variable, related to the management of human resources, can have an impact on the efficiency of a company. The existing empirical findings around the relationship between average remuneration level and company efficiency are not conclusive, which could be because of the existence of contextual or situational factors (Sánchez and Aragón, 2002). And iii) Size of the company, measured as the assets volume. Company size can affect economic efficiency because it can explain individual reputation as bigger companies have more financial resources to invest in quality and promotion (Cagriota and Delmastro, 2008).

#### 4. Results

In this section we first estimate the economic efficiency of the companies, using the DEA methodology. As can be seen in Table 1, the average economic efficiency using the DEA models that assume constant returns to scale (CRS) and variable returns to scale (VRS) is 0.431 and 0.477, respectively, which reflects a high degree of inefficiency among Spanish wineries. This result implies that, on average, the wineries considered could have attained the same levels of output using 55% fewer inputs. The average scale efficiency of the sample analysed is 0.925, which means that the largest part of the deviation from the efficient frontier is due to poor use of inputs and, to a lesser extent, because the wineries are not operating at the optimum size. In the case of cheese factories, the average economic efficiency using the CRS and VRS models are 0.372 and 0.422, respectively, which also reflects a high degree of inefficiency among the cheese factories. This result implies that, on average, the cheese factories considered could have attained the same levels of output using 60% fewer inputs. The average scale efficiency of the sample analysed is 0.894.

With the model that assumes CRS there are 64 wineries (23 cheese factories) considered economically efficient. With the model assuming VRS there are 183 wineries (41 cheese factories) considered economically efficient. Finally, the results show that there are 295 wineries (52 cheese factories) with optimum scale efficiency.

TABLE 1  
Estimations of efficiency

	Wine			Cheese		
	CRS Eff.	VRS Eff.	SE Eff.	CRS Eff.	VRS Eff.	SE Eff.
Mean	0.431	0.477	0.925	0.372	0.422	0.894
S.D.	0.264	0.284	0.150	0.275	0.300	0.182
Min.	0.026	0.026	0.187	0.002	0.002	0.224
Max.	1.000	1.000	1.000	1.000	1.000	1.000

Second, we analyse the influence of PDOs on the efficiency of the companies analysed. As can be seen in Table 2, the average efficiency estimated with the CRS model for PDO wineries is 0.457, which is higher than the average efficiency of non PDO wineries (0.39). With the VRS model we find values of 0.495 for PDO wineries and 0.443 for non PDO wineries. Regarding cheese factories, results also show that the average efficiency estimated with the CRS model for PDO cheese factories is 0.436, which is higher than the average efficiency of non PDO cheese factories (0.346). With the VRS model we find values of 0.491 for PDO cheese factories and 0.394 for non PDO cheese factories. In both cases the non-parametric Mann-Whitney tests show that the PDO companies have significantly higher economic efficiency than the non PDO companies, which supports H1 that PDO labels positively influence the economic efficiency of their member companies. This result reveals the importance of PDO labels in the commercialisation of experience products, insofar as they reduce the risk perceived by consumers when making their purchases. It seems, therefore, that a PDO, as a collective reputation indicator, foments efficient investment in quality by the member companies, which would explain the greater economic efficiency of companies in a PDO label. It would support the idea of Fishman et al. (2008) that a company that chooses to join a collective label with a certain level of quality has to invest in reputation through the production of quality products as it will obtain high profits from its investment in quality derived from the large number of consumers that are adequately informed about the past quality of the group. With regard to scale efficiency, although the PDO companies (both wineries and cheese factories) have slightly better values than the non PDO companies, the result is not significant.

TABLE 2  
**Comparison between the efficiency estimations of PDO and non PDO companies**

		PDO label companies			Non PDO label companies		
		Ef. CRS	Ef. VRS	Ef. SE	Ef. CRS	Ef. VRS	Ef. SE

	Z	-2.056	-2.255	-1.144			
Prob>Z	0.040	0.024	0.253				

Further, to test the central hypothesis of the paper we also carry out a regression analysis, which allows us to control the effect of several characteristics of the company on its efficiency. As can be seen in Table 3 the results show that the coefficient of the dummy variable reflecting PDO membership is positive and significant, in both the wine and cheese sectors. This result shows that the PDO companies have significantly higher economic efficiency than the non PDO companies, which supports H1 that PDO labels positively influence the economic efficiency of their member companies. The results also show that in both sectors the coefficient of the age of the company (number of years since established) is positive and significant, which indicates a positive effect on the economic efficiency of the company. This result can be explained by the age of the company being linked with better market knowledge and better individual company reputation. In fact, as a company begins to establish itself within a community, its reputation will be more widespread and it will have positive word of mouth (Thomas et al., 1998). With regard to remuneration levels, the coefficient of the variable reflecting the average wage paid is negative and significant for the wineries, showing a negative effect of the average level of wages paid on the efficiency of the company. This could be because any wage increases that are not accompanied by productivity increases will raise labour costs per product unit, which would necessarily lead to price increases or reduced company economic efficiency. However, this coefficient is positive and significant for the cheese factories, showing a positive effect of the average wage level on efficiency. This empirical finding is consistent with Sánchez and Aragón (2002), who state that the relationship between average remuneration level and company efficiency depends on contextual or situational factors. Specifically, this result shows the importance of adequate employee motivation in labour intensive sectors such as the cheese sector. With regard to the influence of company size, the coefficient is positive and significant in both sectors, which suggests that as company size increases economic efficiency will be higher. This could be explained because company size explains individual reputation as bigger companies have more financial resources to invest in quality and promotion (Cagriota and Delmastro, 2008). Thus, larger companies are able to attract the attention of the media and gain visibility: “large companies tend to receive a lot of public scrutiny. Availability of information could disproportionately benefit large companies by inflating audiences’ familiarity with their activities” (Fombrun and Shanley, 1990; Cagriota and Delmastro, 2008).

TABLE 3  
**Estimation of the determinant factors of company efficiency (Tobit)**

Wine	Variable	Coeff.	S.D.	Z-Statistic	Prob.
Wine	C	0.952	0.033	2.852	0.000

	Company size	0.022	0.010	2.257	0.024
	Log likelihood	-32.320			

Finally, in order to examine the effect of the collective reputation indicators (i.e. PDO) on company efficiency, we estimate the average efficiency of PDO wine and cheese companies. To ensure representation of the average efficiency of each PDO, we only use those that have more than 3 companies. Accordingly, we estimate the average efficiency of the wineries in 34 PDOs and of the cheese companies in 12 PDOs. With the VRS model, the average efficiencies of the PDO wineries show wide differences, ranging between 0.713 and 0.708 for the two most efficient PDOs (PDO 8 and PDO 2) and 0.251 for the least efficient (PDO 24). The non-parametric Kruskal-Wallis test shows that the difference between the average efficiencies of the different PDO wineries is significant at a level below 1%. This result shows that there is not a homogenous perception of the collective reputation indicators of the wine PDOs in the market, with a differential effect on their economic efficiency. According to Cambra and Villafuerte (2009), this would suggest that consumers not only choose PDO products over non PDO products but are also capable of distinguishing among different PDO wines: for example, it is common to hear restaurant clients ordering wine from a particular PDO.

Regarding the cheese sector, the average VRS efficiencies of the PDO cheese companies show some differences, ranging between 0.572 and 0.564 for the two most efficient PDOs (PDO 9 and PDO 12) and 0.144 for the least efficient (PDO 1). However, in this case, the Kruskal-Wallis test shows that the difference between the average efficiencies of the different PDO cheese companies is not significant, showing a structural difference with the wine market.

The structural difference between these two markets could be explained in the following way: PDOs were introduced in Spain, as in France and Italy, to protect wines that, due to their place of origin, had specific characteristics that made them distinctive. In 1932 the first Spanish “Statue of wine and alcohol” was approved, which laid the groundwork for the PDOs, and in 1970 a new statute was approved that allowed PDOs to include all foodstuffs (Díaz, 2011). At present there are 80 wine PDOs in Spain, some very old such as Rioja, which has attained the level of “authorized”, for which it has to satisfy certain rules and age requirements; others which now have a reduced commercial importance, such as Jerez, whose excellent quality and almost unique product is losing its market share; others that entered the market some years ago and are now established, such as Ribera del Duero; some, such as Cava, which has been so internationalized that it is the biggest sparkling wine in the world; other more recent entrants that have surprised consumers with their quality, such as Toro or Somontano; others that are opening new market with promising futures, such as Madrid, which for years has been the only one bearing the name of a capital city; and many more that are in a growth phase.

It terms of cheese, around the middle of the 20th century there was growing interest in certifying certain cheeses whose traditional manufacturing methods, based on local raw materials, gave them prestige and individual personality and, therefore, differentiated characteristics (Frutos and Ruiz, 2012). However, the “Cheese catalogue” was not published until 1969 and led to the approval of the first cheese PDOs (Díaz, 2011). Actually only 8% of Spanish cheese production in 2010 is covered by PDOs (Frutos and Ruiz, 2012), and there are only 27 PDOs. The Spanish cheese industry was a late developer because of the lack of availability of milk, and this factor favoured the preservation of traditional cheeses, made in small regions with artisan methods. Nowadays, although cheese makers

emphasize quality and tradition without renouncing modernization and a commercial focus, they still give great importance to local development and to keeping an industry linked to its roots at a local or regional scale (Frutos and Ruiz, 2012). Finally, production levels of Spanish PDO cheese differ vastly to those of Italy and France. These two countries have reached far higher production levels because of their many differential factors, especially the willingness of the commercial sector (large supermarkets) to stock and promote a wide range of their PDO cheeses (Sanz, 1995).

The wide difference among average efficiencies of the PDO wine companies provokes the question of what distinguishes highly efficient companies from those showing lower efficiency. Thus, we have estimated a regression model for the PDO wineries where the dependent variable is the company economic efficiency and as independent variables we consider some specific variables related to the company (age, wages and size) and some specific variables related to the PDO in which the company operates: size of the PDO (number of wineries in the PDO), international market of the PDO (percentage of hectoliters of the PDO sold abroad) and age of the PDO (number of years since the PDO was established). Table 4 shows the results.

As expected, the coefficients of the company characteristics variables (age, wages and size) have the same significant signs as in Table 3. Regarding the variables related to the PDO in which the winery operates, the positive and significant coefficient of the number of producers of the PDO shows that as the number of producers in the PDO increases company efficiency is higher. This result is explained because large coalitions have higher resources for marketing campaigns and a larger buyer base which, combined with the word-of-mouth phenomena, make big coalitions more visible to the market (Rob and Fishman, 2005; Castriota and Delmastro, 2009). The positive and significant coefficient of the variable international market of the PDO shows that as the percentage of the international market of the PDO increases company efficiency is also higher, which could be explained by consolidated prestige in the international markets. Thus, the internationalization of some PDOs such as Cava, which has allowed it to overtake the volume of the mythical and much admired champagne; and Spanish wines are more and more well known, receiving maximum scores from Robert Parker and are also taking positions in emerging markets, especially the Asian markets (Díaz, 2011). Finally, the coefficient of the age of the PDO is not significant. Although we expected a positive and significant effect because older PDOs have built their reputations over time and it takes time for the age of the coalition and of its brand to be known among consumers (Castriota and Delmastro, 2009), the lack of significance would reflect that the new wine “boom” is a relatively recent phenomenon (Roberts and Reagans, 2007), and the markets may favour PDOs founded during the last two decades. For example, some PDOs have been relatively recently created but are surprising observers with their quality, such as Toro or Somontano (Díaz, 2011).

TABLE 4  
Determinant factors of PDO wineries efficiency

## 5. Conclusions

The objective of this study is to estimate the efficiency of PDO companies in two experience goods industries, and to explain it through both PDO labels, as collective reputation indicators, as well as different characteristics of the member companies. The basic assumption is that a PDO label has a positive impact on the economic efficiency of its member companies because a PDO label is a

collective reputation indicator that foments efficient investment in quality in terms of members' returns.

The results of the study, applied to a sample of 1,257 Spanish wineries and a sample of 378 Spanish cheese factories show low average levels of efficiency. Additionally, the average economic efficiency of PDO companies is significantly higher than that of non PDO companies, which allow us to generalise the influence of PDO labels on company efficiency to both experience good industries. Finally, some characteristics of the company influence company efficiency. The age and size of the company increase efficiency in both industries while wage levels have a negative effect on wineries' efficiency but a positive effect on cheese factories' efficiency.

The following managerial implications are relevant: The finding of efficiency differences between PDO and non PDO companies supports the protection policy of PDO developed by Spanish Autonomous Communities, given that PDOs have the capacity to affect the efficiency of their member companies. If we extend the theoretical model of collective reputation (Tirole, 1996), which focuses on price equilibrium, the result obtained in this study of the differential effect of the collective label on company efficiency suggests that wine and cheese consumers formulate their quality predictions on the output of an individual company using information on the output of other similar companies, giving a primordial value to the quality indicators of the group. The value that consumers assign to Protected Designations of Origin implies that their Regulatory Councils should provide constant information to the market on the characteristics of their products.

The results obtained also suggest that choosing a collective label strategy can play an important role in the success of a company; in particular, a PDO label can help a company be more efficient because it can promote more efficient investment in quality by its members in terms of the returns on this investment. In fact, the products with this collective reputation can be sold with a price premium, which is necessary for producers to invest in quality and reputation (Quagraine et al., 2003). Moreover, although a top company with an outstanding individual reputation may have enough resources to sustain high investment in quality on its own, it will also be motivated to participate in collective branding because the high production levels associated with a collective brand can also have a positive impact on individual efficiency due to the increased number of units whose quality is observed by consumers increasing the collective reputation effect. However, PDO labels should not be seen as a guarantee against failure. In fact, PDO labels contribute favourably to company efficiency but they only explain a percentage of efficiency variability. Certain characteristics of the company also help explain company efficiency, such as the age, size and wage levels of the company. The result that the age of the company increases its efficiency suggests that company age entails better market knowledge and better individual company reputation. The result that the size of the company increases its efficiency suggests that bigger companies have more financial resources to invest in quality and promotion; therefore, larger companies would be able to attract the attention of the media and gain visibility. Finally, the result that wage levels have an influence on efficiency suggests the importance of employee wage levels in labour intensive industries.

Although the intention of this study is to contribute to the understanding of the impact of PDO label strategies on company efficiency, it has some limitations. Lack of information impedes the analysis of other factors that could explain company efficiency in a PDO label, such as the strength of the PDO label. As further lines of research we suggest analysing the influence of the strength of the different PDO labels on the efficiency of the companies belonging to them. Basically, a collective label can promote more efficient investment in quality in its member companies because the collective label covers a larger market segment than any of its member companies, and given that the information on past quality is imperfectly disseminated, for example by word of mouth, the consumers of any given member company have a greater probability of having previously interacted with past consumers of the collective label than with those of a company outside the collective. But, it would also be necessary to consider the strength of the PDO label because brand strength is one of the most central components of any model of brand equity, and not only can brand strength be conceptualized in terms of consumers' attitude toward the brand with respect to quality, but it also integrates behavioural dimensions such as brand loyalty and brand share across the markets in which the brand competes (Smith and Park, 1992; Aaker, 1991); so it is expected that strength of the PDO label influences

company efficiency, because a stronger PDO label should be better able to stimulate trial of the products of its members than a PDO label of lower strength. Second, the analysis is a cross sectional study, which prevents us from finding the longitudinal nature of the effect. Because collective reputation is a long-term, path dependent process, stereotypes about the expected quality of a PDO are history dependent (Tirole, 1996), so it would be necessary to develop a dynamic model to explain persistence in collective reputations and thus its expected positive effect on company efficiency. Finally, and ideally, a research question in the future would be the design of an experiment that considers other experience goods (e.g., ham) and other parts of the European Union, in order to generalize the results obtained in our paper. We would expect to see similar results to those of our paper, because consumers would use collective reputation when the quality of a product is imperfectly observable prior to purchase (experience good).

## ABSTRACT

*Integrated Corporate Communication (ICC) has gained a great deal of attention among both academics and practitioners during the last three decades. The academic literature suggests that further empirical evidence for the beneficial effects of ICC implementation is called for. Thus, this paper aims to model the relationship between ICC and business market performance in the Spanish hospitality industry. To achieve this purpose, a new 25-item ICC scale has been developed (based on extensive literature review and a Delphi study) and subsequently pretested. Secondly, data were collected from senior managers via an online survey conducted to a sample of Spanish businesses providing accommodation services. A total of 180 valid responses was obtained. The findings provided evidence for the validity and reliability of the proposed ICC scale and demonstrated that ICC implementation significantly and positively influences business performance.*

## KEYWORDS:

Integrated corporate communication, integrated marketing communication, scale development, market performance, hospitality.

## 1. Introduction

Integrated Marketing Communication (IMC) has been considered “*the major communication development in the last century*” (Kitchen & Schultz, 2001) and is increasingly attracting interest and attention in both academic and professional contexts (Hackley, 2010) ever since its emergence in the early 1990s (Caywood, Schultz & Wang, 1991; Schultz, 1991, 1993). Despite the great *corpus* of publications developed over the last three decades on this area of knowledge, the theoretical background appears still fairly disjointed and characterised by the lack of scholars’ consensus over the definition and, especially in the last decade, there is not even a universally agreed terminology to be adopted to refer to the concept (Christensen, Firat & Torp, 2008; Christensen & Cornelissen, 2011; Einwiller & Boenigk, 2012; Smith, 2012; Smith, 2013).

Some academics (Taylor, 2010b; Laurie & Mortimer, 2011; Schultz, Kim & Kang, 2014) have pointed out that the voice of practitioners needs to be heard and taken into account in the process of theoretical development of the concept. In their provocatively entitled article “*IMC is Dead, Long Live IMC*”, Laurie & Mortimer (2011) underscored the need to reduce the gap between the academics’ and the practitioners’ views on IMC via a dialogue that would allow for a better clarification of the theoretical bases of the concept.

As mentioned above, communication and marketing practitioners have also formed part of the integrated communication development and are seeking to understand how integrated programmes can be implemented, what tangible and beneficial effects can be derived from them in terms of performance and how they can be assessed. For example, the *American Productivity and Quality Center* (APQC) promoted an IMC research study, led by Don and Heidi Schultz, consisting of a detailed analysis of how integration process takes place in US organisations and leading to the “*four levels pyramid of IMC development*” (Schultz & Schultz, 1998). Moreover, the *Association of National Advertisers* (ANA) regularly conducts research on IMC with marketing and corporate communication managers and practitioners and the results of the most recent IMC report (ANA, 2011) suggested that via integrating communication businesses achieve a sustainable competitive advantage.

Taylor (2010a, p.162), in his editorial published in the *International Journal of Advertising* and entitled “Integrated Marketing Communication in 2010 and beyond”, argued that in the current communication environment integration is more relevant than ever highlighting that “*there is clearly a need for more research on the return on investment from integrated programmes*” and “*to measure the positive returns it can provide when [IMC] is used effectively*”. The same author emphasised this call in the editorial entitled “Measuring return on investment from advertising: ‘holy grail’ or necessary tool” pointing out that “*too little research has focused on [IMC] performance metrics*” (Taylor, 2010b, p. 346-347).

Likewise, Ewing (2009) pointed out that the lack of valid and reliable scales to measure IMC is the main barrier preventing researchers from conducting more robust empirical researches, which are very much needed for both the theoretical development of integrated communication as a concept and for its understanding and implementation by practitioners. In fact, only few studies (Duncan & Moriarty, 1997; Low, 2000; Reid, 2005; Lee & Park, 2007) have addressed this research gap by developing and/or validating integrated communication measurement scales.

To sum up, the most recurrent themes of debate relate to definitional and measurement issues and to the ongoing paucity of in-company empirical research demonstrating the beneficial effects of integrated programmes.

Thus, the primary objective of this present paper is to determine whether the implementation of integrated communication exerts a positive influence on business performance in terms of economic-financial results, brand outcomes and customer satisfaction. To achieve the main research scope, two additional objectives are pursued: to provide further theoretical clarification over the integrated communication concept and to develop and validate a measurement tool to assess it.

## 2. Theoretical background

More than two decades of intense academic research after the first definition of the concept of Integrated Marketing Communication (IMC) by Caywood *et al.* (1991), the conceptual debate is still ongoing.

Although 'IMC' is the most popular and largely implemented term, several authors have dropped the term 'marketing' from IMC referring to the concept as Integrated Communication (Christensen *et al.*, 2008; Smith, 2012, 2013), or Integrated Communication Management (Einwiller & Boenigk, 2012) and Integrated Corporate Communication (Kitchen & Schultz, 2001; Pickton, 2004; Christensen & Cornelissen, 2011). In this regard, Kliatchko (2005, p. 7) argued: *"no matter what it is called, this new approach to business and marketing communication planning has become an irreversible prevailing tendency among academics and industry practitioners"*. Nowadays Integrated (marketing/corporate) Communication remains an *"extremely important topic in advertising literature"* (Kelly, 2010) and is considered as a very dynamic and challenging field of study (Schultz *et al.*, 2014), as demonstrated by the many calls for further research in this area.

The literature review suggests that integrated communication research has evolved from a narrow marketing communications-centered perspective to a more holistic approach, as marketing, more recently, a corporate and organisational concept. In fact, on the one hand, in the inception of the concept, Caywood *et al.* (1991) defined IMC as *"a concept of marketing communication planning that recognises the added value of a comprehensive plan that evaluated the strategic role of a variety of communication disciplines- e.g. general advertising, direct response, sales promotion and public relations- and combines these disciplines to provide clarity, consistency and maximum communications impact"*; on the other hand, a more recent definition introduced the concept of Integrated Communication (IC) as *"the notion and the practice of aligning symbols, messages, procedures and behaviors in order for an organisation to communicate with clarity, consistency and continuity within and across formal organisational boundaries"* (Christensen *et al.*, 2008, p. 424).

On the basis of an extensive literature review, we developed a theoretical framework for the concept termed 'Integrated Corporate Communication' (ICC) to explicitly embrace the more holistic corporate and organisational approach expressing that the *locus* of integration is the whole *corporation* and defined as the **stakeholder-centered interactive process of cross-functional planning and alignment of organisational, analytical and communication processes, that allows for the possibility of continuous dialogue by conveying consistent and transparent messages via all media in order to foster long-term profitable relationships that create value.**

The proposed conceptualisation reflects the multidimensionality of the ICC construct and four dimensions were identified: **tactical consistency** (e.g. Caywood *et al.*, 1991; Nowak & Phelps, 1994; Porcu, Del Barrio-García & Kitchen, 2012), **interactivity** (e.g. Duncan & Moriarty, 1998; Duncan & Mulhern, 2004; Porcu *et al.*, 2012), **stakeholder-centred strategic focus** (e.g. Kliatchko, 2008, 2009; Einwiller & Boenigk, 2012) and **organisational alignment** (e.g. Christensen *et al.*, 2008; Christensen & Cornelissen, 2011; Porcu *et al.*, 2012).

Tactical consistency and interactivity have been recognised as dimensions of IMC and/or IC in previous conceptualisations, while the remaining two dimensions reflect the effort to theoretically clarify the central role of stakeholders (not only of customers) in ICC as a concept that embraces organisational issues, as suggested by recent literature (Kliatchko, 2005, 2008; Christensen & Cornelissen, 2011; Laurie & Mortimer, 2011; Moriarty & Schultz, 2012; Einwiller & Boenigk, 2012; Schultz *et al.*, 2014).

More in detail, the dimension 'tactical consistency' deals with the most basic level of integration and refers to the communication of coherent and clear positioning (*"one sound, one sight"*, Caywood *et al.*, 1991) via all the organisation's sources of communication.

The dimension “interactivity” is the element *sine qua non* to establish a two-way symmetric communication, an essential condition for a dialogue between organisation/brand and all the stakeholders (Duncan & Moriarty, 1998). Interactivity is intended here in terms of general human social experience (“behavioral interactivity”, Burgoon, Bonito, Ramírez, Dunbar, Kam, & Fischer, 2002) and reciprocity (that characterizes the relationship between the interlocutors), speed of response (to received messages) and interlocutors' (organisation and stakeholders) responsiveness are considered as crucial facets of this dimension. The Internet plays a crucial role, since it has maximised all the facets of the “interactivity” dimension, for example via the combination of social media and the use of cutting-edge mobile devices enabling an unprecedented ubiquitous communication.

The dimension “stakeholder-centred strategic focus” refers to the need for the whole organisation (including the human resources at all the hierarchical levels within the organisational chart) to ensure that creation of added value for all the stakeholders and building long-term relationships with them is acknowledged as the core strategic goal within the organization. A crucial prerequisite for implementing this approach is to know the stakeholders in depth, hence information needs to flow and be shared among all the members (even the outsourced functions) of the organization.

Finally, the dimension “organisational alignment” refers to internal integration (vertical and horizontal) at the organisational level, including all the outsourced functions (external agencies and partners) in the process of integration. The wide range of communication activities must take into account the company as a whole, hence aligning organizational processes and reducing the departmental divisions (*silos*) is of paramount importance to achieve the highest level of integration.

Based on these premises, we posit the following hypotheses:

*H1a: Tactical consistency is a dimension of Integrated Corporate Communication (ICC)*

*H1b: Interactivity is a dimension of Integrated Corporate Communication (ICC)*

*H1c: Stakeholder-centred strategic focus is a dimension of Integrated Corporate Communication (ICC)*

*H1d: Organisational alignment is a dimension of Integrated Corporate Communication (ICC)*

As mentioned in the introduction, only few studies have attempted to empirically assess the relationship between the implementation of integrated (marketing/corporate) communication and business performance (Schultz *et al.*, 2014). Ewing (2009, p.114) suggested that the failure to demonstrate this link represents the most importance barrier hindering the concept's broader acceptance “among both pragmatic practitioners and sceptical scholars”.

Nevertheless, extant literature (Low, 2000; Duncan & Mulhern, 2004; Reid, 2005; Lee & Park, 2007; Einwiller & Boenigk, 2012) suggests that ICC significantly improves the business performance. Low (2000) found a positive and strong influence of integrated communication on both economic-financial results and brand outcomes, while Duncan & Mulhern (2004) highlighted its influence in terms of more favourable customer attitudes and higher customer loyalty and retention. Moreover, Swain (2004) called for more research on the relationship between integrated communication and attitudes towards the brand, brand reputation and awareness.

Reid (2005) carried out a rigorous empirical research in Australia with the aim of refining and validating the scale developed by Duncan & Moriarty (1997) and examining the relationship between IMC and market performance. The results indicated that integrated communication enhances economic-financial results (e.g., overall profitability), brand-related outcomes (e.g., brand awareness) and customer satisfaction. More recently, the results of a study conducted in Switzerland by Einwiller & Boenigk (2012) yielded insights to the role of integrated communication in respect of both ‘soft’ psychological and ‘hard’ economic measures of

communication outcomes, demonstrating a positive relationship between integrated communication and business performance.

Following Reid (2005), we focused on business ‘market performance’ as a multidimensional construct composed of three dimensions: financial-economic outcomes, brand-related outcomes and customer satisfaction.

According to these contributions, the following hypotheses related to the dimensions of market performance are advanced:

*H2a: Financial and Economic outcomes is a dimension of market performance*

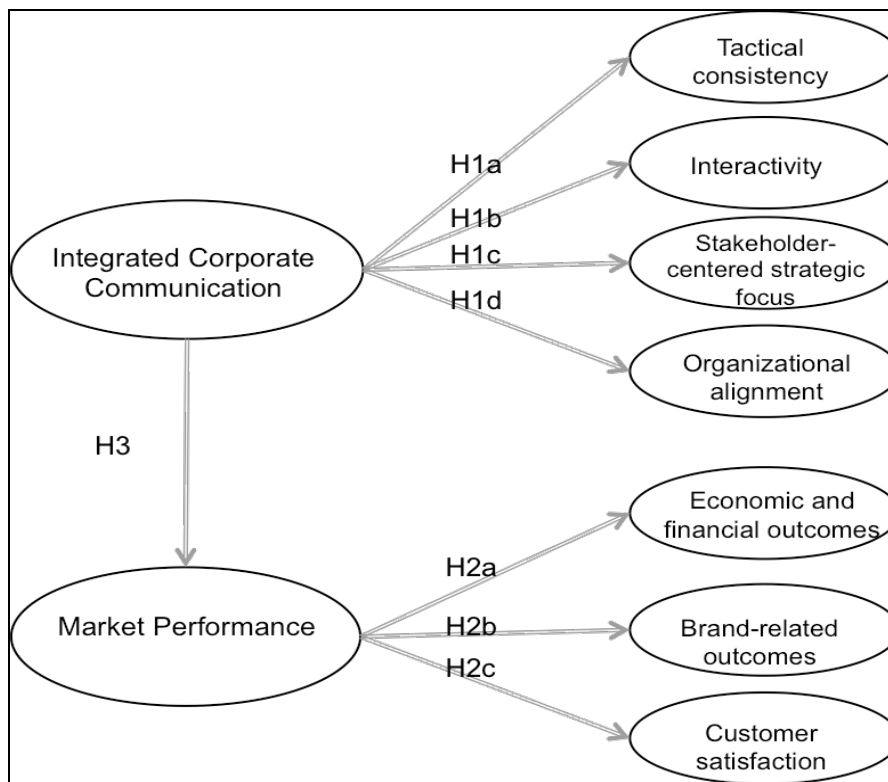

*H2b: Brand-related outcomes is a dimension of market performance*

*H2c: Customer satisfaction is a dimension of market performance*

*H3: Integrated Corporate Communication (ICC) significantly and positively affects the market performance.*

On the basis of the proposed hypotheses, a theoretical model was developed (see Figure 1).

FIGURE 1  
**Integrated Corporate Communication-Market Performance theoretical model**

### 3. Empirical study

#### 3.1. The field of the study: the Spanish tourism industry

In this research study we adopted a single-industry strategy, which is designed to remove potentially confounding interindustry effects on ICC and associated market performance. Reid (2005) suggested that both multi-industry and single-industry approaches are needed to build a strong theoretical body of knowledge around integrated communication, highlighting that at the single-industry level the goal should be to analyse whether those organisations in the industry that apply ICC have achieved some form of superior performance.

Thus, we deliberately focused on the Spanish tourism industry given its relevance at both national and international level. In fact, Spain is one of the world’s top tourism destinations in

terms of incomes and tourist arrivals, as indicated by the World Tourism Organisation (WTO, 2013). More specifically, Spain is the second largest earner worldwide and the first in Europe (US\$ 56 billion), while ranking 4th in the world by arrivals (58 million). In addition, tourism is currently the industry that registers the highest impact on domestic GDP and employment (INE, 2013). Due to the heterogeneity of the tourism industry, we opted to focus our research to the most prominent economic activity within this industry: the accommodation services.

### **3.2. Measures**

#### *Development of an ICC measurement scale*

A new measurement tool was developed to assess ICC. Following Churchill (1979), we carried out an extensive literature review to identify the theoretical domain of ICC construct and to examine the existing measurement scales. Based on this first step, an initial set of 60 items designed to measure each of the four identified dimensions of ICC was generated and, subsequently, a two-round Delphi study was carried out for content validation. In the first round, the proposed conceptual framework and the initial set of items has been presented to an international expert panel composed of ten senior academics (affiliated to top universities in US, Canada, Germany, UK and Spain) for content evaluation and amendment (if necessary). The most influential scholars in the field, including the authors of top and seminal publications on Integrated Communication, participated in the study. The experts were asked to critically evaluate both the ICC theoretical framework (definition and dimensions) and the items proposed.

The first round provided a qualitative feedback that was subsequently incorporated to modify and rephrase several items, resulting in a reduction of the total number of items from 60 to 49, that went through the second round. The second round aimed to further reinforce the content evaluation and to reduce the number of items to a more manageable number. With these purposes, the expert panel was asked to provide also a quantitative assessment of the adequateness of each item in a 7-point-Likert scale (1 = very inadequate, 7 = very adequate). The experts were recommended to pay special attention to the content validity, representativeness, dimensionality, comprehensibility and unambiguousness. As evaluation criteria, we opted to retain the items scoring at least a 5 out of 7 from all the experts. The experts' assessment enabled us to further refine the content and to reduce duplication of items, and then the number of items was reduced from 49 to 25 items.

The proposed ICC scale is thus composed of 25 items rated on a seven-point Likert scale (from 1 = strongly disagree to 7 = strongly agree): 4 items for 'tactical consistency', 7 items for 'interactivity', 7 items for 'stakeholder-centred strategic focus' and 7 items for 'organisational alignment'. Sample items assessing ICC are "My company maintains consistency in all visual components of communication (logos, colors, trademarks, etc.)", for tactical consistency; "My company promotes the creation of special programs to facilitate stakeholders' inquiries and complaints about our brands, products and the company itself", for interactivity; "The company's mission is a key consideration in the communications planning and it is promoted among stakeholders", for stakeholder-centred strategic focus; "My company ensures that its external agents and partners have at least several contacts/month with each other", for organisational alignment. All the items included in the final measurement are presented in Appendix 1.

#### *Others measures*

Market performance measures were drawn from the research on IMC and its impact on performance by Reid (2005), who implemented a modified version of the items previously proposed by Gray, Matear, Boshoff & Matheson (1998). The market performance scale was further slightly modified and the ten items included five perceptual items related to economic-financial results (in terms of sales and profitability), three related to brand outcomes and two related to customer satisfaction. All items were measured using a seven-point Likert scale (1 = much less compared with the closest competitor; 7 = much more compared with the closest competitor) and presented in Appendix 1.

Other items were included in the questionnaire to seek information on the characteristics of respondents (gender, experience, position in the company) and companies (business size, organisation type).

### **3.3. Sample and data collection**

The data for this research were gathered via an online survey study conducted between April and July 2013 to Spanish businesses providing accommodation services with 40 or more employees. As a sample frame, a commercial listing of 969 businesses was drawn from SABI (from the initials of its full name in Spanish, *Sistema de Análisis de Balances Ibéricos*, Iberian Balance Sheet Analysis System), the most comprehensive businesses database which includes relevant information of over 1.2 million Spanish companies and is based on both national (for example, CNAE, *Clasificación Nacional de Actividades Económicas*, National Classification of Economic Activities) and international (for example, SIC, *Standard Industrial Classification*) classification systems. The key informant method (Seidler, 1974) and top managers were targeted as key informants and a multi-item questionnaire was developed and hosted in the Qualtrics web platform ([www.qualtrics.com](http://www.qualtrics.com)).

The *modus operandi* of the empirical study consisted of two steps. First, a telemarketing firm was contracted to contact the sample (930 managers, after removing the 39 contacts used for the pre-test) by telephone to ask for their e-mail address (not included in the database due to privacy issues) and for their availability to participate in this study. Second, a customised link to the online questionnaire was emailed to the 524 managers who agreed to participate. Following an initial e-mailing, a follow-up e-mail was sent to encourage response. A total of 180 fully completed valid responses were received for an effective response rate of 18.6% (of the total population of 969 managers) and of 34.4 % of the 524 managers who agreed to participate. Appendix 2 presents a detailed description of the profile of respondents.

## **4. Results**

### **4.1. Pretest**

As a preliminary step, the proposed ICC scale was purified by conducting a pre-test to a sample of 180 businesses randomly extracted from the above described commercial listing and used in a pilot study carried out between February and March 2013, with the aim of assessing basic psychometric properties. The 25 items of the scale were included in an online survey hosted in the Qualtrics web platform ([www.qualtrics.com](http://www.qualtrics.com)) resulting in a total of 39 valid responses (21,6 % response rate). In order to test the dimensionality of the scale, an Exploratory Factor Analysis (EFA) with principal component analysis (varimax rotation) was applied resulting in four factors and items loading onto the previously identified factors. Moreover, Chronbach's alpha ( $\alpha_{\text{cons}}=.91$ ;  $\alpha_{\text{inte}}=.94$ ;  $\alpha_{\text{stak}}=.94$ ;  $\alpha_{\text{alin}}=.90$ ) exceed the recommended threshold of .8 for purified scales and item-to-total correlations exceed .5 and the inter-item correlations exceed .3 of each dimension.

### **4.2. Analysis of the psychometric properties of the measurement scales and hypotheses testing**

Analysis of data followed a process of testing the psychometric properties (dimensionality, reliability and construct validity) for both the ICC scale and the market performance measures and testing the hypotheses and the proposed ICC-market performance model.

Following Gerbing and Anderson (1988), the ICC scale was subjected to an Exploratory Factor Analysis (EFA) (principal components analysis with varimax rotation) to assess their **dimensionality**, resulting in four factors all indicators being loading onto the previously identified dimension, thus revealing the underlying structure of the construct. Secondly, we conducted a Confirmatory Factor Analysis (CFA) (using LISREL 8.8. software) and, based on the results of the multinormality test performed, the Robust Maximum Likelihood (RML) estimation method was used. We adopted a competing models strategy by estimating two alternative models: M1 (via a first order CFA) based on ICC as a unidimensional construct and 25 items being loading onto one factor and M2 (via second-order CFA) based on ICC as a

multidimensional construct and the 25 items being loading onto 4 factors (following the conceptual framework). The results indicate that M2 (Satorra-Bentler  $\chi^2= 470.81$ , d.f. = 271, p-value= .00; Normed  $\chi^2= 1.73$ ; RMSEA= .06; CFI= .99; TLI= .99) achieved an acceptable overall fit, while the overall goodness-of-fit indices for M1 (Satorra-Bentler  $\chi^2= 1301.7$  d.f.=275 p-value= .00; Normed  $\chi^2= 4.73$  RMSEA=.14; CFI= .94; TLI= .93) suggested that this model is not acceptable. Therefore, the dimensionality of ICC measures is confirmed.

A structural equation modelling (SEM) was conducted to assess the overall proposed model, thus enabling us to examine the reliability and the construct validity of both ICC and market performance measures and test the proposed research hypotheses. The results indicate that the proposed model has an adequate goodness of fit with the observed data of Satorra-Bentler  $\chi^2= 820.47$  (d.f. = 552, p-value= .00), Normed  $\chi^2 = 1.49$  and RMSEA = .052.

Following Hair, Black, Babin and Anderson (2010) and Del Barrio and Luque (2012), **convergent validity**, defined as the extent to which indicators of a specific construct share a high proportion of variance in common, is tested. First, the results indicate that all standardised coefficients are statistically significant (t-values above the point 2.56, thus achieving a .01 level of significance) and higher than .7, the ideal size recommended by the literature (Hair et al., 2010) for items that are considered good measure of their latent factor, excepting for the item ALIN\_3 ( $\beta= .55$ ) above the less conservative .5 cutoff. Moreover, all the  $R^2$  values exceed the suggested threshold of .5, excepting for ALIN\_3 ( $R^2=.31$ ) and REFI\_4 ( $R^2=.46$ ) that become prime candidates to deletion. Therefore, a chi-square difference test is performed to assess whether the difference between the two alternative models (with ALIN\_3 vs without ALIN\_3 and with vs without REFI\_4) is statistically significant, resulting in the removal of REFI\_4, while ALIN\_3 was retained to support content validity. These decisions led us to re-estimate the model (see Figure 2), that shows again an adequate goodness of fit of S-B  $\chi^2= 778.02$  (d.f. = 519, p= .00) and RMSEA = .053 (additional goodness of fit indexes are presented in Figure 2).

The results of the measurement model indicate that all standardised coefficients are statistically significant (p-value < .01) and above .7, excepting for the item ALIN\_3 ( $\beta= .55$ ) above the less conservative .5 cutoff. Moreover, all the  $R^2$  values exceed the suggested threshold of .5, excepting for ALIN\_3 ( $R^2= .31$ ), which was retained based on the results of a chi-square difference. All these findings provide evidence for the convergent validity of ICC and market performance measures. Moreover, all the standard second-order coefficients (see Table 3) were above .7 and significant (p < .01), indicating that the proposed dimensions load very well onto the corresponding second-order construct ( $\beta_{cons} = .90$ ;  $\beta_{inte} = .86$ ;  $\beta_{stak} = .84$ ;  $\beta_{alin} = .84$ ;  $\beta_{refi} = .71$ ;  $\beta_{rema} = .99$ ;  $\beta_{sat} = .81$ ).

Subsequently, three diagnostic measures are implemented to estimate the **construct reliability** that is the degree of consistency between multiple measurements of a variable. First, the item-to-total correlation and the inter-item correlation is analysed and both exceed the suggested cutoffs (.5 and .3, respectively). Second, the reliability coefficient, which assesses the consistency of the entire scale, is evaluated using Cronbach's alpha, which exceeds the most conservative threshold of .8 recommended for purified scales. Third, the Average Variance Extracted (AVE) and the Composite Reliability (CR) were calculated (see Table 2) and the results show that both exceeded the recommended cutoffs of .5 and .7, respectively, providing evidence of an adequate reliability of the scales.

The criteria proposed by Fornell and Larcker (1981) were applied to test the **discriminant validity** of the scales and, with this purpose, we calculated the square root of AVE and the correlations between the constructs (see Table 1). The results show that the squared root of the AVE was always greater than the correlation shared among the constructs, thus meeting the requirements indicated by Fornell and Larcker (1981) and providing evidence of discriminant validity. In addition, the correlations between the constructs do not exceed .8, the threshold suggested by Bagozzi (1980) and Bagozzi and Yi (2012) to consider two constructs as distinct, enabling us to confirm that the factors are strongly related, as it is to be expected since they measure the same second-order construct, while they retain conceptual difference.

TABLE 1  
Square root of AVE and correlations between constructs (Fornell and Larcker, 1981)

	stak	cons	alin	inte	refi	sat	refi
stak	<b>.82</b>						
cons	.76	<b>.87</b>					
alin	.71	.76	<b>.82</b>

refi	.40	.43	.40	.41	<b>.85</b>		
rema	.56	.60	.56	.58	.79	<b>.76</b>	
sat	.46	.49	.46	.47	.70	.60	<b>.88</b>

The above-described results indicate that all the proposed relationships in the measurement model show significant ( $p < .01$ ) and high coefficients, thus providing empirical support to *H1a*, *H1b*, *H1c*, *H1d*, *H2a*, *H2b* and *H2c*.

Then, the analysis of the psychometric properties of the measures indicates that they are sufficient to enable the analysis of the relationship between ICC and market performance to proceed. A significant ( $t = 5.90$ ;  $p < .01$ ) and strong ( $\beta_{icc \rightarrow mp} = .67$ ) relationship was found between ICC and market performance, providing empirical evidence to *H3* and confirming that the implementation of ICC is strongly and positively related to business market performance in Spanish tourism industry. Based on these findings, we can conclude that ICC is crucial for organisation to achieve higher economic-financial results, brand-related outcomes and higher customer satisfaction. Finally, we observe that the obtained results are in line with previous studies (Duncan & Moriarty, 1998; Reid, 2005; Lee & Park, 2007; Einwiller & Boenigk, 2012) enabling us to provide evidence of the **nomological validity** of the proposed ICC scale.

Integrated Corporate Communication-Market Performance SEM Model. Path Diagram

## 5. Discussion

This study sought to respond to the many calls for further research within the area of integrated communication and, more specifically, to provide more compelling evidence for the beneficial consequences of ICC in terms of performance, following the suggestions made by many authors (Taylor, 2010a; Einwiller & Boenigk, 2012; Moriarty & Schultz, 2012; Schultz *et al.*, 2014) who identified the dearth of empirical studies as the most salient research gap. Nevertheless, the lack of a valid and reliable ICC measurement tool and the confusion about the theoretical foundations of the concept have prevented scholars from conducting more rigorous and quantitative research studies. In this paper, we applied both qualitative and quantitative approaches to clarify the ICC conceptual background resulting in a new definition for the concept, the identification of its dimensions, the development and validation of an ICC scale and the assessment of the relationship between ICC implementation and market performance. These findings give relevant insights into the understanding of ICC definition, multidimensionality and measurement and provide researchers with the opportunity to further develop, refine and validate this instrument using both multi-industry and single-industry approaches.

As **managerial implications**, the assessment of the proposed ICC-market performance model and, more specifically, the revealed positive and strong link between ICC and market performance suggest that managers should pay more attention to ICC implementation. As suggested by Duncan & Mulhern (2004), the limited empirical evidence supporting the results derived from the implementation of integrated communication is a barrier that constrains its “*acceptance in boardrooms and practice by organisations*”. Therefore, the research presented here provides a relevant and empirically supported proof of the ICC benefits in terms of business performance suggesting managers to see ICC as a way to improve economic, financial, brand and customer-satisfaction related outcomes and encouraging top management to support and facilitate the introduction of ICC as a core organisational process. More specifically, the four constructs proposed to measure ICC have some important implications for managers, such as the need for the organisation to adequately coordinate the communication messages generated at all levels of the organisation (tactical consistency) to ensure that the voice of the stakeholders is listened and taken into consideration during the decision-making processes via enhancing the responsiveness and the speed of response and fostering the reciprocity of the relationship between the organisation and its stakeholders (interactivity), to develop mechanisms that allow for a meaningful dialogue with all the stakeholders, and not just the customers (stakeholder-centered strategic focus) and to ensure that the communication flows adequately both vertically and horizontally in the organisation and between the organisation and external partners and agencies to generate a climate of collaboration and cooperation (organisational alignment). In conclusion, the proposed ICC-performance model is likely to help top management and corporate and marketing communication practitioners in their decision-making processes. The ICC scale can also be used by senior managers as a tool to evaluate the level of integration among the diverse communication activities taking place in different organisational departments and functions.

Finally, as a **limitation**, the generalisability of the results could be limited due to the fact that this study was carried out in a specific industry and within Spain. However, we encourage **future research** to replicate this study across other sectors/industries and national contexts, with the aim of improving the external validity of these results, reinforcing the ICC theoretical background.

APPENDIX 1  
**Integrated Corporate Communication and Market Performance items**

<b>Integrated Corporate Communication</b>
<i><b>Tactical consistency</b></i>
CONS_1. My company carefully coordinates all the messages originated by all the departments and functions with the aim of maintaining the consistency of its strategic positioning.
CONS_2. My company maintains consistency in all visual components of communication (logos, colors, trademarks, etc.).
CONS_3. My company periodically reviews all our planned messages (e.g., advertising, sponsorship, PR and marketing PR, sales promotion, direct marketing and personal selling) to determine its level of strategic positioning consistency.
CONS_4. In my company it is paramount to maintain the consistency between product messages, that are inferred from, and comprise everything embedded in the organisation's product and service messages, that derived from the experience of dealing with the organisation, its staff, agents and products.
<i><b>Interactivity</b></i>
INTE_1. My company promotes the creation of special programs to facilitate stakeholders' inquiries and complaints about our brands, products and the company itself.
INTE_2. My company collects stakeholders' information collected or generated via different sources from all divisions or departments (inquiries, complaints and other relevant information about the relationship between the company and its stakeholders ) into a unified database, that is easily accessible (internally) and configured to be useful to all the organizational levels.*
INTE_3. In my company it is crucial for the organization as a whole and for all its human resources (i.e. employees, managers, etc.) to have a responsive attitude towards the messages received from its stakeholders.
INTE_4. In my company a strategic use of Internet and other ICTs (i.e. mobile devices like smartphones and tablets) enhances the speed of response and the responsiveness of the organization as a whole that are crucial for interacting with stakeholders and within the organization itself.
INTE_5. In my company actively listening to stakeholder-generated messages, for instance via word of mouth (WOM and e-WOM), is of vital importance to set its communication strategies.
INTE_6. My company considers that the relationship between the company and its stakeholders must be reciprocal in order to establish a trust-based and ongoing dialogue.
INTE_7. My company proactively implements social media, by listening to the existing conversations and promoting a dialogue with its stakeholders, to strengthen its relationship with stakeholders.
<i><b>Stakeholder-centered strategic focus</b></i>
STAK_1. The company's mission is a key consideration in the communications planning and it is promoted among stakeholders.
STAK_2. My company develops and implements systematic studies to assess the efficacy and consistency of its corporate communications in order to build and maintain sound relationships with all the stakeholders.
STAK_3. In my company the acknowledgement of the main touch-points between the company and its stakeholders is paramount to strengthen them for a more effective communication.
STAK_4. In my company social media are an alternative way for stakeholders to contact the company, providing the company with the possibility to respond via the medium that is most suitable for stakeholders.
STAK_5. In working towards the goal of establishing and maintaining stakeholder relationships, in my company human resources in all organizational areas must cooperate and collaborate (through incentives, empowerment, etc.) as needed.
STAK_6. In my company human resources in all the organizational areas pursue the objective of providing stakeholder-centered solutions.
STAK_7. My company establishes and nourishes relationships with external agents/partners in order to achieve high value solutions for stakeholders.
<i><b>Organisational alignment</b></i>
ALIN_1. My company carefully manages horizontal (between different departments and functions) internal communication by ensuring that all the organizational areas acknowledge the goals pursued by the organization /the company/ the brand.
ALIN_2. My company carefully manages vertical (top-down and bottom-up) internal communication by ensuring that the information flows through all the hierarchical levels of the organization, as needed.
ALIN_3. My company ensures that its external agents and partners have at least several contacts/month with each other.
ALIN_4. In my company horizontal and vertical cooperation are crucial because all the departments affect the corporate reputation.
ALIN_5. In my company employees and managers share the corporate values and the main goals of the company that guide them in carrying out their specific tasks and functions.
ALIN_6. In my company encouraging and promoting a collaboration culture and climate (at both intra- and inter-functional level) is highly relevant in order to activate cross-functional coordination mechanisms that increase the value of the solutions offered to stakeholders.

ALIN_7. My company trains all human resources to make them develop cooperation and coordination skills.
<b>Market performance</b>
<i><b>Economic and financial results</b></i>
Please, assess the level to which the following goals have been achieved by your company compared to the closest competitor in the last three years (1 = much less ; 7 = much more)
REFI_1. The overall profitability.
REFI_2. The market share.
REFI_3. The sales growth.
REFI_4. The proportion of sales generated by new products/services.
REFI_5. The return on sales (ROS).
<i><b>Brand-related outcomes</b></i>
Please, focus on the main brand of your company and assess the level of achievement of the following goals compared to the closest competitor in the last three years (1 = much less ; 7 = much more)
REMA_1. The brand awareness.
REMA_2. The ability to command premium prices over similar competing brands in the principal market of the company.
REMA_3. The level of channel cooperation received relative to similar brands in the principal market of the company.
<i><b>Customer satisfaction</b></i>
Please, focus on the main brand of your company and assess the level of achievement of the following goals compared to the closest competitor in the last three years (1 = much less ; 7 = much more)
SAT_1. The customer satisfaction.
SAT_2. The customer loyalty.

APPENDIX 2  
**Profile of Respondents**

<b>Gender</b>	<b>%</b>	<b>n</b>	<b>Age</b>	<b>%</b>	<b>n</b>

## RESUMEN

Maximizar el recuerdo generado por los spots es un objetivo prioritario para los agentes implicados en la utilización publicitaria de la televisión. En este contexto, los anunciantes deben optimizar la gestión de las variables de planificación debido a su influencia directa en el recuerdo. Entre estas variables destaca la duración del anuncio debido al creciente desarrollo de duraciones inferiores al estándar. El objetivo principal de este trabajo es analizar la relación directa entre el recuerdo espontáneo y la duración de un spot televisivo, controlando además el efecto directo de otras variables relacionadas con la planificación de medios. Concretamente se han analizado: (1) cadena televisiva, (2) posición del bloque publicitario respecto al programa, (3) presión publicitaria del bloque publicitario, (4) notificación de la duración del bloque publicitario, (5) notoriedad de marca, (6) día de la semana, (7) posición relativa del spot en el bloque y (8) efectos primacia y recencia. Dado que en la práctica el resultado de la eficacia de un anuncio depende de la interacción del conjunto de variables de planificación de medios, más allá del efecto individual de cada una de ellas, se ha planteado como segundo objetivo analizar o explorar el efecto moderador que tales variables ejercen sobre la influencia de la duración en el recuerdo. Para ello se ha llevado a cabo un estudio en un entorno real que ha supuesto la integración de dos fuentes de información, el panel de Kantar Media y un CATI aplicado a una muestra de 2.000 individuos que, mediante la utilización de un “coeficiente de ponderación”, han permitido obtener niveles de recuerdo espontáneo ajustados a la audiencia real de un elevado número de spots publicitarios. La consecución de estos objetivos ha permitido aportar sugerencias en la optimización de la planificación publicitaria en televisión para mejorar el recuerdo generado por los spots.

### Palabras clave:

Publicidad en televisión, recuerdo publicitario, spots, duración del spot, entorno real.

## 1. Introducción

En la actualidad, el medio televisión afronta la competencia de los nuevos medios publicitarios y de los cambios en los hábitos de consumo del medio de sus audiencias. En este contexto, la televisión debe mantener su liderazgo como soporte publicitario reforzando su capacidad para cumplir los objetivos de los anunciantes. A pesar de que presenta un contexto progresivamente desfavorable como soporte publicitario (Jeong et al., 2011), sus cualidades diferenciales frente a otros medios (Rubinson, 2009) hacen que, pese a sus limitaciones, sea líder en inversión publicitaria, con el 40% del total en medios convencionales en 2013 (Infoadex, 2014). Además existen estudios que afirman que la Televisión continuará siendo el soporte publicitario mayoritario, a pesar de la complejidad asociada a su gestión (Sharp et al., 2009; Precourt, 2010) y de las críticas acerca de la pérdida de su eficacia en el cumplimiento de los objetivos, relacionadas con la saturación, *zapping*, atomización de las audiencias, entre otras (Martín et al., 2011). La aparente pérdida de eficacia de la Televisión (Lowrey et al., 2005) exige a los anunciantes, a las agencias y centrales de medios, y a las cadenas de televisión, una utilización creativa del medio para conseguir el recuerdo publicitario de las campañas (Smit et al., 2009), así como una mayor atención por parte de la audiencia (Romaniuk, 2012). En esta línea, Jeong et al. (2012) señalan que los agentes publicitarios, para conseguir la eficacia, no sólo deben velar por la calidad de los anuncios, sino que además deben tener en cuenta una serie de estrategias creativas en la planificación de medios.

Entre las técnicas de medición de la eficacia publicitaria destaca el recuerdo, que es una medida de la capacidad de un anuncio para generar la atención y atraer el interés (Ross, 1982), siendo utilizada principalmente en los medios audiovisuales frente al reconocimiento, habitualmente utilizado en medios impresos (Beerli y Martín, 1999). Además, en la investigación publicitaria, tanto en el ámbito académico como aplicado, es considerada como una medida válida y fiable (Beerli y Martín, 1998; Wells, 2000), e idónea cuando el test se realiza en un período muy próximo a la exposición a los estímulos (Shapiro y Krishnan, 2013). De hecho, su utilización se fundamenta en la creencia de que la publicidad es más eficaz en la medida en que genera un mayor recuerdo, ya que en estas circunstancias es mayor la probabilidad de que se produzca un cambio de actitud y se consiga la conducta deseada (Vakratsas y Ambler, 1999). Entre las diferentes medidas de recuerdo publicitario, el recuerdo espontáneo destaca por su capacidad para detectar si el anuncio ha sido capaz de dejar alguna huella en la mente del individuo de forma espontánea, de manera que se evitan posibles distorsiones provocadas por campañas previas que los individuos puedan recordar en el momento de la recogida de los datos, si se les proporciona información que estimule el recuerdo (Beerli y Martín, 1999).

En este entorno, los anunciantes deben potenciar la mejora de la gestión de las variables de planificación de medios debido a su influencia directa en el recuerdo (Soberman, 2005). Si bien distintos estudios han abordado el efecto de las principales variables de planificación de forma individualizada son pocos los trabajos que aportan una perspectiva integrada de la relación entre recuerdo publicitario y planificación de medios. Entre estas variables, Newstead y Romaniuk (2009) señalan la importancia de estudiar la relación entre la eficacia del anuncio y la duración del mismo debido al creciente desarrollo de duraciones inferiores al estándar como consecuencia del incremento de los costes del espacio publicitario. Además, la relevancia de su estudio radica en que gran parte de la investigación se ha desarrollado previamente a la consolidación de spots con duraciones inferiores a 20 segundos. De hecho, en España se consolida la tendencia a planificar con spots de duración distintas a 20 segundos a partir de la entrada de la TDT en el año 2010, al pasar de 10 canales de televisión a 50 (Optimedia, 2012). Ello propició que las cadenas con mayor audiencia utilizaran spots de duración inferior a la media (20 segundos) para reducir el precio de la inserción, y que las cadenas nuevas ofreciesen duraciones superiores a 20 segundos a tarifas reducidas para captar anunciantes.

Con estos antecedentes, nuestro objetivo principal es analizar la relación directa entre el recuerdo espontáneo y la duración de un spot, controlando además el efecto directo de otras variables de la planificación de medios, como sugieren Pieters y Bijmolt (1997) y Moorman et al. (2005). No obstante, dado que en la práctica de la planificación de medios, el resultado de la eficacia de un anuncio depende de la interacción del conjunto de variables de la planificación más allá del efecto individual de cada una de ellas, en el presente trabajo se ha planteado explorar el efecto moderador que ejercen tales variable sobre la influencia de la duración en el recuerdo publicitario. La consecución de estos objetivos permitirá aportar indicadores para la optimización de la gestión publicitaria en televisión.

A partir de las sugerencias de Moorman et al. (2007) y Pieters y Bijmolt (1997), el presente trabajo se ha llevado a cabo en un entorno real, a diferencia de la mayoría de estudios realizados en un entorno de laboratorio. Estos autores señalan como limitaciones de los tests de laboratorio la fiabilidad de sus resultados, ya que los encuestados no se exponen a elementos distractores como sucede en un entorno real. Zhao (1997) se manifiesta

en este mismo sentido cuando afirma que los tests on-air también evitan los posibles sesgos derivados de la forma en la que los individuos son expuestos a los estímulos publicitarios. Adicionalmente, Hu et al. (2007) señalan que los tests on-air gozan de una mayor aceptación entre la comunidad publicitaria, ya que permiten evaluar los verdaderos efectos de la publicidad sobre el consumidor. Esta decisión de llevar a cabo el estudio en un entorno real ha supuesto la integración de dos fuentes de información, el panel de Kantar Media y un CATI, que han permitido obtener los niveles de recuerdo espontáneo ajustados a la audiencia real de un elevado número de spots publicitarios. De esta forma, se superan dos de las limitaciones metodológicas presentes en muchos trabajos consistentes en llevar a cabo el estudio en entornos de laboratorio y con tasas de recuerdo calculadas a partir de una muestra.

## 2. Estado de la cuestión e hipótesis

La duración del anuncio se define como su longitud medida en segundos (Alba y Chattopadhyay, 1986). El estudio de su efecto en la eficacia publicitaria, generalmente, se ha centrado en comparar los efectos derivados de un formato publicitario de mayor duración frente a uno de menor duración. De acuerdo con la hipótesis del tiempo total, en la que el nivel de aprendizaje es una función directa del tiempo empleado (Baddeley, 1990), los anuncios de televisión más largos dan una mayor oportunidad a los espectadores para atender y procesar el mensaje (Singh y Cole, 1993). También, Rossiter y Bellman (2005) sugieren que un anuncio más corto tiene una menor probabilidad de captar la atención de los espectadores, por lo que, según estos autores, cabe esperar un menor nivel recuerdo en los anuncios de menor duración. Las teorías procedentes de diferentes corrientes de investigación predicen que la duración de un anuncio tiene un impacto positivo en su capacidad para ser recordado (Alba y Chattopadhyay, 1986). Así, Mord y Gilson (1985), Patzer (1991) y Young (2008) sugieren que los anuncios de 30 segundos son más efectivos en general que los de 15 segundos en términos de recuerdo. Patzer (1991) cuantifica la diferencia de recuerdo entre la duración de un spot de 15 segundos y otro de 30, en un 20% superior a favor de la mayor duración. Por su parte, Newstead y Romaniuk (2010) afirman que el recuerdo generado por los spots de 15 segundos es el 80 % del generado por otro de doble duración (30 segundos) y atribuyen este escaso incremento a la mejora de los factores ejecucionales de la marca en los spots de corta duración.

Sobre la base de estos antecedentes, se formula la siguiente hipótesis:

*H1: Cuanto mayor es la duración del spot mayor es el recuerdo publicitario.*

Si bien los estudios citados coinciden en encontrar una relación positiva entre la duración del mensaje comercial y su recuerdo, no existe suficiente literatura respecto a otras variables de planificación de medios que pudieran moderar la relación esta relación. Esto hace necesario profundizar, mediante las hipótesis que se plantean a continuación, en las diferentes variables y en sus interacciones relacionadas con el proceso de planificación de medios que se considera pueden influir en el recuerdo y moderar la relación positiva entre la duración del anuncio y el recuerdo generado por el mismo. A este respecto, como se ha señalado, la escasa literatura, si bien justifica la relevancia de esta investigación, no ha permitido proporcionar los fundamentos teóricos necesarios que justifiquen todos los efectos de interacción. La necesidad de aportar evidencias empíricas al respecto, nos ha llevado a plantear proposiciones en aquellos casos en los que no es posible formular una hipótesis de trabajo. Concretamente, en este trabajo se han analizado las siguientes variables: (1) cadena televisiva, (2) posición del bloque publicitario respecto al programa, (3) presión publicitaria del bloque publicitario, (4) notificación de la duración del bloque publicitario, (5) notoriedad de marca, (6) día de la semana, (7) posición relativa del spot en el bloque (cociente entre la duración del bloque en segundos hasta el comienzo del spot y la duración total del bloque en segundos y (8) efecto primacía y recencia.

Comenzando por la primera variable, una cuestión de interés para los anunciantes es conocer si el recuerdo generado por un spot depende de las cadenas televisivas en las que se emita, ya que ofertan audiencias de similar perfil sociodemográfico, con una escasa diferenciación en su oferta de espacio publicitario y similares costes por GRP (Reinares y Reinares, 2013). A pesar de ello, las diferentes cadenas aportan estudios con objetivos comerciales y resultados dispares para argumentar los mayores niveles de recuerdo que una campaña en la misma puede conseguir respecto a otras cadenas. El interés de la praxis no ha tenido su reflejo en la literatura académica. No obstante, sí existen trabajos que han abordado la importancia del contexto en la planificación de medios. Este contexto en términos de programación o editorial ha sido ampliamente reconocido como factor relevante en las decisiones de selección del soporte publicitario por su influencia en la eficacia publicitaria (Shamdasani et al., 2001). Los estudios clásicos han demostrado que los diferentes soportes pueden generar distintos efectos comunicativos en una misma audiencia con los mismos anuncios (Shamdasani et al., 2001). La

investigación en los medios convencionales han contrastado que el contexto, o la programación o la editorial en la que se inserta un anuncio, puede tener efectos importantes sobre el procesamiento del mensaje (Yaveroglu y Donthu, 2008). Dentro de un medio, las personas que eligen un soporte determinado atribuyen más valor a la publicidad que se ajusta al entorno editorial de dicho soporte al considerar que se dirige a sus intereses particulares (Cannon, 1982). De hecho, un mensaje idéntico puede tener diferentes efectos dependiendo del contexto en el que se presenta (Yaveroglu y Donthu, 2008).

Trasladando las aportaciones de Gunter et al. (1997) realizadas en el contexto de un programa, se puede considerar que existe una relación entre el recuerdo de los spots y la implicación de las audiencias con la cadena; pues esta es, en definitiva, un conjunto de programas que, integrados, conforman un posicionamiento diferencial en el mercado de televisión. A partir de modernas técnicas de Neuromarketing, Peacock et al. (2011) aportan otra posible explicación a la influencia de la cadena en el recuerdo. Estos autores proponen el concepto de “engagement” para medir la eficacia publicitaria, definiéndolo como la capacidad de un medio para generar unos vínculos emocionales con la audiencia que influyen en el procesamiento de los anuncios. Esta implicación emocional de las audiencias (“mi cadena favorita”) puede también explicar que un spot consiga diferentes niveles de recuerdo en función de la cadena que lo emita. Por otra parte, en el trabajo de Arrazola et al. (2013), realizado en el mercado publicitario español, se demuestra que, en efecto, hay diferencias en el recuerdo generado por el patrocinio televisivo en función de la cadena que lo emita. Todo ello permite redactar la siguiente hipótesis en el sentido de:

*H2: La cadena de televisión influye en el recuerdo publicitario.*

Respecto al efecto moderador que puede ejercer la cadena de televisión en la relación entre la duración del spot y el recuerdo, la inexistencia de trabajos previos nos lleva a plantear la siguiente proposición:

*P1: La relación entre el recuerdo y la duración del spot está moderada por la cadena de televisión.*

En la planificación de las campañas, la colocación del bloque publicitario entre programas o en el intermedio es una decisión de gran relevancia por los efectos colaterales que tiene la implicación de la audiencia con los programas. La investigación psicológica sugiere que el material que rodea a un anuncio televisivo es determinante en el éxito de un mensaje (Norris y Colman, 1993). La cuestión de si la involucración de los espectadores con el programa afecta a la retención del mensaje publicitario ha sido abordada bajo diferentes perspectivas teóricas, dando lugar a resultados contrapuestos. En general, se asume que el recuerdo será mayor cuanto más alta sea la implicación de las audiencias con el programa que acompaña al mensaje publicitario (Lloyd y Clancy, 1991). Moorman et al. (2012) verifican que la implicación de las audiencias potencia el procesamiento de los mensajes publicitarios y, por lo tanto, mejora el recuerdo. Cabe esperar, por tanto, que la implicación de las audiencias con el programa disminuya al finalizar este y, por ello, los efectos esperados sobre el recuerdo son superiores en los bloques publicitarios situados dentro del programa frente a los bloques entre programas. De hecho, Krugman (1983), Chowdhury et al. (2007) o Moorman et al. (2007) coinciden en que el recuerdo que generan los anuncios es mayor cuando se insertan en el intermedio de un programa frente a su situación en un bloque publicitario al final del programa, debido a que, de acuerdo con Siddarth y Chattopahdyay (1998), cuando acaba un programa las audiencias emplean sus recursos cognitivos en la búsqueda de alternativas de nuevos programas afines a sus gustos. Por ello, la siguiente hipótesis propone:

*H3: La posición del bloque publicitario respecto al programa influye en el recuerdo.*

Al igual que en el caso de la cadena, la inexistencia de trabajos previos sobre el efecto moderador que puede ejercer la posición del bloque publicitario respecto al programa en la relación entre la duración del spot y el recuerdo, nos lleva a plantear la siguiente proposición:

*P2: La relación entre el recuerdo y la duración del spot está moderada por la posición del bloque publicitario respecto al programa.*

En un bloque publicitario convencional son numerosas las marcas que compiten por la atención y el posterior recuerdo de los consumidores, dando lugar al concepto de presión publicitaria, que se define habitualmente como un gran número de anuncios en un período determinado Riebe y Dawes (2008). Entre los diferentes paradigmas utilizados para analizar las respuestas de los consumidores a la publicidad, esto es, los enfoques de procesamiento estructural, funcional y de información (Ha y McCann, 2008), el estudio de la presión publicitaria se enmarca en el primero de ellos. Bajo este paradigma, Ha (1996) identifica la existencia de tres dimensiones en la presión publicitaria: cantidad, intrusismo y competitividad. La cantidad la define como el número de anuncios en el soporte. El intrusismo como al grado en el que los anuncios interrumpen el flujo de una unidad de contenido del soporte. Y, finalmente, la competitividad como el grado de similitud entre los productos

anunciados o mensajes publicitarios en el mismo corte publicitario. De estas tres dimensiones, la que ha gozado de una mayor atención, tanto en la práctica empresarial como en la literatura académica, es la cantidad, llegándose a la conclusión de que cuanto mayor sea la cantidad de anuncios en un bloque publicitario menor será el recuerdo publicitario (Ha y McCann, 2008). Esta conclusión se fundamenta en la creencia de que bajo estas condiciones de saturación, los anuncios recibirán menos atención por parte de los consumidores debido a que, por una parte, se irritarán, y consecuentemente, los evitarán, y por otra, no serán capaces de recordar los anuncios si son expuestos a un gran número de ellos al mismo tiempo debido a su limitada capacidad de memoria (Ha y McCann, 2008). Esta hipótesis ha sido confirmada por múltiples investigadores en cuyos trabajos se concluye que la presión publicitaria provoca menos atención de la audiencia a los anuncios al tiempo que aumenta la confusión del espectador (Jeong et al., 2011). Todo ello ha generado que en la actualidad exista un consenso en cuanto a que la presión publicitaria es un factor que reduce la eficacia publicitaria al provocar conductas evasivas e interferir en la memoria (Brown y Rothschild, 1993). Así, por ejemplo, Pieters y Bijmolt (1997) encontraron que tanto el recuerdo espontáneo como el sugerido de los anuncios de televisión disminuyen a medida que se incrementa el número de anuncios de un bloque. A pesar de este aparente consenso, autores como Hammer et al. (2009), destacan la necesidad de analizar los efectos de la presión publicitaria sobre el recuerdo dada la existencia de algunas inconsistencias en los resultados de los estudios realizados al respecto debido, probablemente, a la metodología utilizada (entorno de laboratorio *versus* entorno real), a las definiciones de presión publicitaria (centradas en cantidad, intrusismo o competitividad, por ejemplo) o a las medidas de respuesta utilizadas. De hecho, en el trabajo del propio Hammer et al. (2009), en el que se realizan varios estudios para comparar el efecto de la presión publicitaria sobre diferentes medidas de recuerdo, tanto en el medio televisión como radio, así como en el contexto real o de laboratorio, se concluye que aunque la presión publicitaria reduce el número de anuncios recordados, esta no parece afectar a la correcta identificación de las marcas que aparecen en bloques publicitarios con elevada presencia de marcas. Si bien este último resultado puede ser contrario a lo esperado, sus propios autores, en el caso de los estudios realizados en un entorno real, lo explican por el hecho de que en un entorno real algunos anuncios se repiten más que otros, afectando, por tanto, al recuerdo de marca. En coherencia con lo anterior, se plantea la siguiente hipótesis:

*H4: Cuanto menor es la presión publicitaria del bloque medida en número de spots mayor es el recuerdo publicitario.*

En lo que al efecto moderador de la presión publicitaria sobre la relación duración del anuncio-recuerdo se refiere, existen algunos trabajos, aunque muy escasos al respecto. Así, Mord y Gilson (1985) contrastan como el menor recuerdo de los spots cortos frente a los largos se potencia (disminuye) a medida que aumenta el número de anuncios del bloque publicitario. También Ward et al. (1989) demuestran, en un estudio comparativo de la eficacia de spots de diferentes duraciones, que la relación duración-recuerdo varía en función de la presión publicitaria en términos de duración total del bloque publicitario. Partiendo de estas escasas evidencias empíricas, la siguiente hipótesis es:

*H5: La relación entre el recuerdo y la duración del spot está moderada por la presión publicitaria del bloque.*

Actualmente es habitual que las cadenas, en aras de evitar el *zapping* publicitario, notifiquen a las audiencias la duración del publicitario. El trabajo de Yu et al. (2012) evidencia que, cuando la cadena avisa expresamente de la duración del bloque publicitario, los anuncios contenidos en el mismo se recuerdan más que si no se hubiera producido un aviso indicando el tiempo que resta de publicidad. Sin embargo, este recuerdo varía en función de si el aviso previo de la duración del bloque se refiere a bloques cortos o largos. Esta práctica puede reducir tanto la ansiedad que provoca no saber con exactitud la duración del bloque comercial, identificada por Rachman (1998), como la situación desagradable e incómoda que produce dicha incertidumbre, establecida por Bensi y Giusberti (2007). La Teoría de la eficiencia del procesamiento de Eysenck y Calvo (1992) propone que la ansiedad puede conllevar una reducción en la capacidad memorística. En esta misma línea, se manifiestan Leight y Ellis (1981) cuando señalan que tanto la ansiedad como la preocupación pueden dar lugar a un estado depresivo que lleva a una reducción de la actividad cognitiva de una persona afectando su capacidad de almacenar información. Por lo tanto, si se informa de la duración del bloque publicitario o del número de anuncios del mismo, la audiencia tiene una percepción más clara de la longitud del corte del corte publicitario, que lleva a un estado de motivación que puede mejorar su rendimiento (Smith, 1986).

Dado que parece existir consenso en que el aviso de la duración del bloque publicitario favorece la actividad cognitiva de la audiencia con respecto a los mensajes comerciales se propone la siguiente hipótesis:

*H6: La notificación de la duración del bloque publicitario incrementa el recuerdo.*

De la misma manera que en variables previas, el efecto moderador que puede ejercer la notificación de la duración del bloque publicitario sobre la relación entre la duración del spot y el recuerdo, la ausencia de literatura nos lleva a plantear la siguiente proposición:

*P3: La relación entre el recuerdo y la duración del spot está moderada por la notificación de la duración del bloque publicitario.*

Pieters et al. (2002), Kent y Allen (1994) y Keller (1993) señalan que la familiaridad de la marca para las audiencias (notoriedad previa) es una variable que influye en el recuerdo de los mensajes publicitarios. Una vez finalizada la campaña los niveles de notoriedad acumulados decrecen a lo largo del tiempo, aunque mantienen un efecto residual importante (Mela et al., 1997). Diferentes trabajos argumentan que las marcas notorias se ven afectadas en menor medida por los efectos negativos de un gran número de marcas que compiten por captar la atención de las audiencias. Kent y Allen (1994) concluyen que las marcas más notorias, en relación a los nuevos competidores, son más recordadas y resisten mejor los inconvenientes de un entorno publicitario saturado. Como corroboran Nelson-Field et al. (2013), las marcas notorias son menos vulnerables a los efectos de la presión publicitaria del bloque, debido a que su renombre hace que sea más fácil recordar su publicidad.

En línea con este discurso, parece coherente plantear que la notoriedad de marca, resultado de la presión publicitaria anterior, puede ejercer una influencia directa sobre el recuerdo, tal y como se plantea en la siguiente hipótesis:

*H7: La notoriedad previa de la marca anunciada incrementa el recuerdo.*

Fabian (1996) reconoce que el incremento que se produce en el recuerdo a medida que se aumenta la duración del spot, varía enormemente entre las diferentes campañas debido al efecto moderador que ejerce la notoriedad previa de la marca. En las marcas notorias con presencia continuada en el medio televisión, no hay diferencia en el recuerdo obtenido por el aumento de la duración del spot de 15 a 30 segundos. Sin embargo, si la marca es nueva o presenta una baja notoriedad para la audiencia del medio televisión, se produce un aumento del recuerdo al duplicar la duración del spot. Esto nos permite redactar la siguiente hipótesis:

*H8: La relación entre el recuerdo y la duración del spot está moderada por la notoriedad previa de la marca anunciada.*

A pesar de que el día de la semana no se considera una variable ejecucional en los planes de medios en televisión, Zigmond et al. (2009) señalan que las medidas de audiencia están altamente influenciadas por factores tangenciales como el día de la semana. Sin embargo, no existen evidencias empíricas que analicen su influencia en el recuerdo publicitario, aunque los datos de audiencia arrojan un comportamiento diferenciado de la audiencia los días laborables frente al fin de semana respecto al tiempo de visionado y el comportamiento de *zapping* (Kantar Media, 2013). A ello hay que añadir que el estado emocional de los espectadores difiere entre periodos de ocio, propios del fin de semana, y los laborables. Es por ello que en el presente trabajo se plantean las dos siguientes proposiciones al objeto de proporcionar alguna evidencia empírica preliminar al respecto:

*P4: El día de la semana en que se emite el spot influye en el recuerdo.*

*P5: La relación entre el recuerdo y la duración del spot está moderada por el día de la semana en que se emite el spot.*

A pesar de que pueda parecer obvio que la posición de un spot, en relación a la duración total del bloque publicitario, puede afectar al recuerdo, la investigación académica, salvo excepciones como los trabajos de Moorman et al. (2005) o Arrazola et al. (2013), ha obviado este efecto, considerando que el recuerdo de un spot quedaba explicado con variables ordinales (la posición que ocupa el anuncio en el bloque, generalmente medido mediante el efecto primacía) y el nivel de presión publicitaria dentro del bloque en que se inserta el spot (medido por la duración del bloque). Sin embargo, Pieters y Bijmolt (1997) consideran que si se reconoce la influencia de los programas y contenidos que rodean al spot en el recuerdo, dicha influencia puede disminuir a medida que el spot se aleja de los programas. Este fenómeno no quedaría recogido con el efecto primacía o recencia, pues el mismo sólo considera las primeras posiciones o últimas, y los spots tienen, en la actualidad, mayores posibilidades (dado la duración de los bloques publicitarios) de ocupar posiciones no preferenciales. En este sentido, el recuerdo que genera un spot debe estar afectado por el tiempo transcurrido desde que empieza el bloque publicitario. Esta influencia negativa sobre el recuerdo será más explícita en bloques de larga duración (Li, 2010). Por ello, trabajos como el de Singh y Cole (1993) consideran que el tiempo que transcurre desde que comienza el bloque tiene influencia en el recuerdo. Terry (2005) contrasta cómo un mismo anuncio genera

diferente recuerdo en función de las posiciones que ocupe en el espacio situado entre la primera y última posición. Mattes y Cantor (1982) analizaron un bloque largo (6 minutos), descomponiendo (como se ha hecho en nuestro trabajo) la duración del mismo en tres intervalos y demuestran que la situación de un spot en cada uno de los tres intervalos, genera diferentes niveles de recuerdo. En esta misma línea, un estudio realizado por Nielsen y el CTAB (2000) demostró que el recuerdo era mucho más alto para los anuncios colocados en las primeras posiciones y ligeramente superior para los colocados en las últimas posiciones en bloques publicitarios formados solo por cinco anuncios. Es por ello que Swaminathan y Kent (2013) recomiendan que este análisis se haga también para bloques publicitarios más largos, en los que la diferencia en los niveles de recuerdo entre los anuncios colocados en las primeras y últimas posiciones debería ser más acusada. A pesar de este aparente consenso, trabajos como el de Moorman et al. (2005) establecen que la posición del mensaje en el bloque no afecta al recuerdo, ya que es indiferente que el spot comience antes o después una vez transcurridas las primeras posiciones.

Dado que la mayoría de las fuentes consideran la influencia de la posición del anuncio en el bloque, se redacta la siguiente hipótesis que sintetiza como esta variable puede afectar al recuerdo:

*H9: La posición relativa del spot en el bloque publicitario influye en el recuerdo.*

Con respecto al posible efecto en el recuerdo del spot de la interacción entre la duración del anuncio y la posición relativa de este en el bloque publicitario Ward et al. (1989) afirman que la duración del spot es solo una de las variables de la ecuación que explicaría el recuerdo. Igualmente importantes serían la duración total del bloque y la duración de cada uno de los anuncios que aparecen en el bloque. Para explicar cómo la duración del anuncio afecta al recuerdo según la posición que este ocupa en el bloque Ward et al. (1989) afirman que la audiencia presta más atención a los spots situados al principio del bloque publicitario decreciendo la atención a medida que avanza el bloque, siendo significativo que esta no se recupera en los anuncios finales del bloque. Como explicación argumentan que al aumentar la duración del bloque las audiencias pierden la capacidad de anticiparse al comienzo del programa, que se había interrumpido por la publicidad, incrementando la atención en los anuncios finales del bloque. Según los autores la caída del recuerdo a medida que avanza el bloque sería todavía mayor si los spots son cortos frente a largos (15 s vs 30s). Por lo tanto, y a pesar de que los autores reconocen que el entorno experimental de su trabajo limita la validez de las conclusiones, se puede inferir que la relación entre la duración del spot y el recuerdo que genera esta moderada por la posición relativa del anuncio en el bloque publicitario. Sobre la base de lo anterior, se establece esta hipótesis:

*H10: La relación entre el recuerdo y la duración del spot está moderada por la posición relativa del spot en el bloque publicitario.*

Dado el elevado nivel de saturación publicitaria del medio televisión, otro de los factores que ha acaparado una gran atención por parte de los investigadores es el efecto del orden que ocupan los anuncios en el bloque publicitario (por ejemplo, primera, segunda, y última) (Pieters y Bijmolt, 1997; Singh y Cole, 1993; Zhao, 1997). Así, nos encontramos con numerosos trabajos que han intentado explicar cómo influye el orden que ocupa un anuncio sobre su eficacia desde una perspectiva psicológica. En general, los resultados de las investigaciones indican que los anuncios colocados en la primera y última posición son mejor recordados que los que aparecen en el medio (Brunel y Nelson, 2003; Burke y Srull, 1988; Pieters y Bijmolt, 1997). No obstante, es preciso señalar que respecto a la primera posición existe un consenso en cuanto a su influencia positiva en el recuerdo, no ocurriendo lo mismo con la última posición. Así, por ejemplo, Pieters y Bijmolt (1997), que analizaron los anuncios de televisión entre 1975 y 1992 emitidos en Holanda, encontraron que cuando el recuerdo de los nombres de marca de los anuncios no colocados en las posiciones extremas era del 100%, el nivel de recuerdo del primer anuncio del bloque era del 129%, mientras que el del último era del 101%. Sin embargo, en el trabajo de Terry (2005), dos spots de diferentes duraciones generan el mismo nivel de recuerdo al situarse en la primera o última posición del bloque. Y, por su parte, en los trabajos de Zhao (1997), Webb y Ray (1979) o Li (2010) la última posición no genera un mayor recuerdo, a diferencia de la primera.

Toda esta investigación ha dado lugar a los denominados efectos primacía y recencia, que se producen porque los primeros anuncios del bloque interfieren proactivamente en la retención de los últimos anuncios, produciendo el efecto primacía, y los últimos anuncios interfieren retroactivamente en la retención de los anuncios previos, produciendo el efecto recencia (Zhao, 1997). Así, Burke y Srull (1988) argumentan que los procesos de interferencia asociativos contribuyen a los efectos de primacía sobre el recuerdo y el reconocimiento de los anuncios de televisión porque los restantes estímulos inhiben la capacidad de los espectadores para recordar información persuasiva. A este respecto, Swaminathan y Kent (2013) señalan que, por lo general, los

espectadores empiezan a cambiar el canal al inicio del corte publicitario, dando al primer anuncio la oportunidad de una mayor exposición al mismo. Ahora bien, debido a que la longitud de los bloques publicitarios varía y a que los espectadores no son capaces de predecir su duración, los últimos anuncios del bloque pueden tener mejores puntuaciones porque los espectadores vuelven al canal en espera de la continuación o iniciación del programa que desean ver (Danaher, 1995). En esta misma línea argumental se manifiestan Swaminathan y Kent (2013) cuando afirman que si un bloque publicitario es relativamente corto, la diferencia en número de espectadores entre el primero y el último anuncio es mucho más elevada que cuando el bloque publicitario es más largo. De ahí, que estos autores recomienden a los anunciantes dar un mayor valor a la última posición del bloque cuando estos son relativamente largos. De hecho, señalan que el último anuncio de un bloque puede incluso llegar a tener un mayor impacto que el primero si el bloque publicitario se encuentra al inicio de un programa de gran impacto y viceversa. Partiendo de estas evidencias y de que en la actualidad el tamaño de los bloques publicitarios es muy elevado, se formulan las dos hipótesis siguientes relativas al efecto que ejerce el orden que ocupa un anuncio en el bloque sobre el recuerdo:

*H11a: La primera posición en el bloque publicitario genera mayor recuerdo.*

*H11b: La última posición en el bloque publicitario genera mayor recuerdo.*

En la literatura podemos encontrar estudios que han analizado el efecto moderador de la primacía y recencia en el efecto que, sobre el recuerdo, ejercen factores tales como el estado emocional y cognitivo de las audiencias, la motivación para procesar la información y la relevancia del mensaje (Jeong, 2007). Ahora bien, en cuanto al efecto moderador que pueden ejercer los efectos primacía y recencia sobre la relación entre la duración del spot y el recuerdo, la ausencia de literatura nos lleva a plantear las siguientes dos proposiciones:

*P6a: La relación entre el recuerdo y la duración del spot está moderada por la primera posición del spot en el bloque.*

*P6b: La relación entre el recuerdo y la duración del spot está moderada por la última posición del spot en el bloque.*

### **3. Método**

#### **3.1. Diseño metodológico**

En este trabajo se ha desarrollado una novedosa metodología que permite medir el recuerdo de los spots en un entorno absolutamente ajustado a las condiciones reales de audiencia de televisión. Esta aportación metodológica tiene su origen en el hecho de que las tasas de recuerdo obtenidas mediante la aplicación de una encuesta no consideran el efecto de un anuncio en términos de niveles de audiencia real, sino sobre la base del tamaño muestral definido. De esta manera, las tasas de recuerdo publicitario no contemplan el impacto real que ha generado un anuncio, ya que, por ejemplo, si un anuncio ha obtenido una tasa de recuerdo del 10% a partir de una encuesta, su tasa de recuerdo real será diferente en función de la audiencia real que haya tenido el bloque publicitario en el que se ha insertado el anuncio. Así, si la audiencia real ha sido del 80%, una tasa de recuerdo del 10% implica un menor impacto real en la audiencia que si estuviéramos ante una situación en la que la audiencia real fuese del 20%. La aplicación de la metodología propuesta tiene como objetivo obtener unas tasas de recuerdo ajustadas a las audiencias reales de cada spot. Para ello, se requiere la utilización conjunta de dos fuentes de información que habitualmente son utilizadas de forma independiente, (1) los datos de audiometría de la empresa Kantar Media y (2) los datos procedentes de una encuesta telefónica ad-hoc (CATI) que recoge el recuerdo publicitario. A partir de la integración de estos datos se obtiene un “coeficiente de ponderación” para cada spot, calculado como el cociente entre el porcentaje de recuerdo espontáneo obtenido a través de la encuesta telefónica y el porcentaje de audiencia del bloque publicitario en que se ha emitido el spot publicitario. De esta forma, es posible disponer de unas tasas de recuerdo ajustadas a la audiencia real, que se obtienen multiplicando dicho coeficiente de ponderación por los valores 1 ó 0 en función de si se ha producido o no el recuerdo en el entrevistado. Así hemos pasado de un recuerdo espontáneo de naturaleza dicotómica a una variable continua que, en nuestro trabajo, oscila entre 0 y 3,98.

Para llevar a cabo esta investigación se ha recogido la información necesaria durante dos meses consecutivos, obteniéndose un recuerdo real de la marca-producto (ej. Peugeot 306) de todos aquellos spots emitidos durante dicho periodo en el conjunto de cadenas generalistas de cobertura nacional que emiten en abierto en España. Ello ha supuesto la medición del recuerdo de 1.196 spots identificados a partir del sector de actividad y marca, que fueron emitidos en diferentes cadenas y programas, insertados en bloques de distinta duración y en posiciones diferentes y en distintos días de la semana, etc. Los spots analizados abarcan a 21 sectores y 400 marcas.

Para medir el recuerdo espontáneo de los spots emitidos durante el periodo considerado se utilizó una encuesta telefónica (CATI) mediante un cuestionario estructurado diseñado ad-hoc aplicado a una muestra de 2.000 individuos. La captación de los entrevistados se realizaba dos días antes de la emisión de los programas mediante el sistema *Random Digit Dialing*. Todos los entrevistados daban su consentimiento para ser entrevistados a una hora determinada mientras estaban viendo la televisión en casa. Se establecieron cuotas en función del género, edad, número de miembros de la unidad familiar y tamaño del municipio, al objeto de obtener una muestra fiable y representativa de la audiencia de televisión de edades comprendidas entre 16 y 65 años (véase Tabla 1).

Tabla 1

**Distribución de la muestra**

<b>Género</b>	<b>%</b>	<b>Miembros de la unidad familiar</b>	<b>%</b>
Hombres	39,2	Hogares unipersonales	16,7
Mujeres	60,8	Hogares de 1 a 3 miembros	32,6
<b>Edad</b>	<b>%</b>	Hogares de 4 a 7 miembros	41,5
16-19 años	12,9	Hogares con mas de 8 miembros	9,2
20-24 años	10,9		
25-34 años	15,4		
35-44 años	18,3		

El cuestionario se adaptó en cada entrevista mediante el sistema informático del Call-Center de forma automática a cada bloque/emisión publicitaria. Los elementos que se incorporaban a la entrevista en el momento de realizarla fueron: canal, horario, situación de emisión del corte publicitario y las marcas-productos que en el periodo testado habían emitido spots. Su duración final fue de 4 minutos como máximo. Cada entrevistado fue interrogado por su visionado televisivo (programas contemplados) en los 30 minutos previos a la llamada (como mecanismo de control) y por las emisiones publicitarias que se emitieron en el cuarto de hora anterior al periodo horario en el que realizó la entrevista. En la Tabla 2 se resume el proceso metodológico seguido en la aplicación del cuestionario.

Tabla 2

**Ficha técnica de la investigación**

<b>Universo</b>	Individuos de 16 a 65 años representativos del total audiencia Televisión
<b>Ámbito geográfico muestral</b>	España
<b>Método de recogida de información</b>	Encuesta personal mediante cuestionario estructurado aplicado por teléfono (CATI).
<b>Tamaño de la muestra</b>	2.000 entrevistas.
<b>Error muestral</b>	± 4 %.
<b>Nivel de confianza</b>	95 % Z = 1,96.
<b>Procedimiento de muestreo</b>	Estratificado (sexo, edad, número de miembros de la unidad familiar y tamaño municipio).
<b>Varianza máxima admitida</b>	P = q = 50 %.

Una vez realizado el trabajo de campo se procedió a la transformación del fichero de individuos en un fichero con 36.362 observaciones (cada spot valorado por un individuo que ha sido entrevistado se convierte en registro). Por tanto, si un individuo ha visto 20 spots habrá dado lugar a una entrevista y a 20 registros individuo-spot distintos. En este estudio la tasa de recuerdo espontáneo ha sido del 0,54% sobre el total de las observaciones.

### 3.2. Variables de estudio

El cuestionario estaba estructurado en dos bloques. En el primero de ellos, que se realizaba en una fase de captación previa del individuo, se recogían los datos sociodemográficos y hábitos de audiencia. En el segundo bloque, se formularon las preguntas relativas al recuerdo espontáneo, debiendo indicar además el programa/cadena visionado. Partiendo de esta información, se obtuvieron las tasas de recuerdo ajustadas para cada spot. Por otra parte, del panel de audimetría de Kantar Media se extrajeron, además de la audiencia de cada Spot, las variables recogidas en la Tabla 3.

Tabla 3

**Variables de estudio**

<b>Variables</b>	<b>Estados</b>
Duración del spot	1. Duración inferior a 20 segundos 2. Duración igual a 20 segundos 3. Duración superior a 20 segundos
Cadena	1. TVE1

	2. Antena 3
	3. Tele 5
Posición del bloque publicitario respecto al programa	1. Entre programas 2. Intermedio
Presión publicitaria del bloque publicitario	1. Bloque con baja presión publicitaria (entre 1 y 23 spots) 2. Bloque con media presión publicitaria (entre 24 y 43 spots) 3. Bloque con alta presión publicitaria (entre 44 y 49 spots)
Notificación de la duración del bloque publicitario	1. Normal 2. Volveremos en...
Notoriedad de marca	1. Marca notoria (la marca que aparece en el spot tiene una presencia publicitaria en el medio televisión, un 200 % superior al resto de marcas analizadas) 2. Marca no notoria.
Día de la semana	1. Laborables 2. Fin de semana
Posición relativa del spot en el bloque (cociente entre la duración del bloque en segundos hasta el comienzo del spot y la duración total del bloque en segundos)	1. Posición relativa temprana 2. Posición relativa media 3. Posición relativa tardía
Primacía	1. Primacía (primera posición) 2. Resto
Recencia	1. Recencia (última posición) 2. Resto

#### 4. Resultados

Como paso previo al análisis conjunto de la influencia de todos los factores de planificación considerados en el recuerdo espontáneo, se han realizado diez ANOVA para cada uno de estos factores de forma individual. Los resultados, recogidos en la Tabla 4, muestran que todas las variables consideradas, a excepción de la cadena televisiva en la que se planifica el spot, influyen en el recuerdo espontáneo del mismo. De ello se deriva que se logra un mayor recuerdo espontáneo al incrementar la duración del spot; al colocar el spot entre programas, en bloques de baja presión publicitaria, en posiciones relativas en el corte publicitario tempranas o tardías, ocupando la primera o última posición del bloque, preferiblemente la última, y en fines de semana; al notificar a la audiencia la duración del bloque publicitario y, finalmente, si se tiene una notoriedad de marca relevante.

Tabla 4  
Resultados ANOVA de un único factor sobre el recuerdo espontáneo

Fuentes de variación	Recuerdo espontáneo	
	F	P
Duración del spot	16,754	0,000
Cadena	2,146	0,117
Posición del bloque publicitario respecto al programa	11,300	0,001
Presión publicitaria del bloque publicitario	4,628	0,010
Notificación de la duración del bloque publicitario	11,334	0,001
Notoriedad de marca	64,446	0,000
Día de la semana	17,583	0,000
Posición relativa del spot en el bloque	3,697	0,025
Primacía	14,365	0,000
Recencia	29,703	0,000

Dado que en la práctica de la planificación de medios, el recuerdo espontáneo es el resultado de la interacción de todas estas variables, se procederá a contrastar las hipótesis de trabajo a través de un análisis univariante de la varianza de múltiples factores, donde la variable dependiente se corresponde con el recuerdo espontáneo y los factores fijos o variables independientes con las nueve variables de planificación analizadas en este trabajo, así como con las interacciones de la duración del spot con las restantes variables de planificación.

Como se desprenden de los resultados del ANOVA, que se recogen en las Tablas 5, la duración del spot y seis de las variables de planificación consideradas adicionalmente muestran diferencias significativas en el recuerdo espontáneo. De la Tabla 6 se desprende que los spots que más recuerdo generan son (1) de duraciones superiores a 20 segundos; (2) insertados en TVE1; (3) insertados en los cortes publicitarios en los intermedios de programa; (4) ubicados en bloques publicitarios con baja presión publicitaria, es decir, aquellos bloques con menos de 24 spots; (5) de aquellas marcas con notoriedad; (6) planificados en fin de semana frente a los días laborables, y (7) colocados en la última posición del bloque publicitario. De esta forma, se corroboran las hipótesis H1, H2, H3, H4, H7, P4 y H1 1b, y se rechazan H6, H9 y H1 1a.

	Media	0,002	0,042	0,004	0,069	0,007	0,104	0,004	0,069
	Tardía	0,003	0,069	0,005	0,073	0,013	0,120	0,006	0,083
Primacia	Primera posición	0,003	0,051	0,004	0,071	0,009	0,105	0,005	0,073
	Resto	0,006	0,069	0,013	0,105	0,014	0,117	0,013	0,107
Recencia	Última posición	0,003	0,051	0,005	0,073	0,008	0,102	0,005	0,073
	Resto	0,016	0,128	0,009	0,074	0,061	0,254	0,028	0,167
<b>Total</b>		<b>0,003</b>	<b>0,051</b>	<b>0,005</b>	<b>0,072</b>	<b>0,009</b>	<b>0,106</b>	<b>0,005</b>	<b>0,074</b>

En cuanto a los efectos interactivos de la duración del spot con las restantes variables de planificación, los resultados de la Tabla 5 indican que el efecto de la duración del spot sobre el recuerdo espontáneo está moderado por la cadena planificada, por la presión publicitaria del bloque publicitario en el que se inserta el spot, por el nivel de notoriedad de la marca anunciada y, finalmente, por el efecto recencia. Por tanto, se aceptan P1, H5, H8 y P6b, y se rechazan P2, P3, P5, H10 y P6a.

El efecto interactivo de la duración con la cadena sobre el recuerdo (véase Gráfico 1 de la Figura 1) se produce porque existen diferencias significativas en el recuerdo cuando los spots tienen duraciones superiores a 20 segundos ( $F=3,537$ ,  $p=0,029$ ); siendo TVE1 la que genera mayor recuerdo, seguida de Antena3 y, finalmente, Tele5. Este resultado no se observa en los spots de 20 segundos o menos, ya que no existen diferencias significativas.

Respecto al efecto interactivo de la duración con la presión publicitaria del bloque publicitario (véase Gráfico 2 de la Figura 1), los resultados son similares a los observados en la cadena, ya que solo se producen diferencias significativas en el recuerdo cuando los spots tienen duraciones superiores a 20 segundos ( $F=5,113$ ,  $p=0,006$ ); siendo los bloques con baja presión publicitaria los que generan mayor recuerdo.

El efecto interactivo de la duración con el nivel de notoriedad de marca (véase Gráfico 3 de la Figura 1) se produce porque existen diferencias significativas en el recuerdo para los spots de 20 segundos ( $F=28,021$ ,  $p=0,000$ ) y para los de más de 20 segundos ( $F=24,991$ ,  $p=0,000$ ), en los cuales las marcas con notoriedad

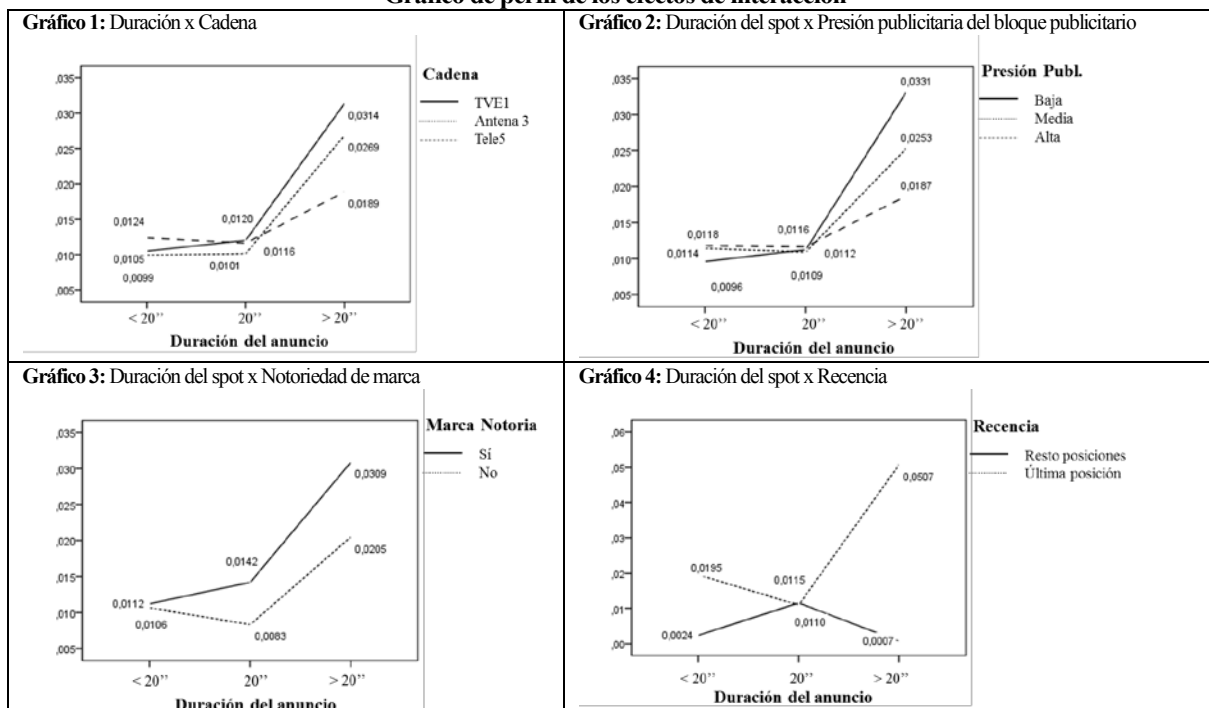

relevante son las que producen un mayor recuerdo. En los spots de menos de 20 segundos resulta indiferente sobre el recuerdo si se trata o no de una marca notoria.

Finalmente, el efecto positivo de la recencia sobre el efecto que genera la duración del spot en el recuerdo (véase Gráfico 4 de la Figura 1) se produce en aquellas duraciones distintas a 20 segundos ( $F=4,350$ ,  $p=0,037$  para duraciones inferiores a 20 segundos y  $F=24,765$ ,  $p=0,000$  para duraciones mayores de 20 segundos), siendo especialmente acusado en spots de más de 20 segundos.

### Gráfico de perfil de los efectos de interacción

## 5. Conclusiones

En la planificación publicitaria de televisión se precisa de una utilización creativa del medio para conseguir un mayor recuerdo. Una de las decisiones más importantes es la planificación adecuada de la duración del mensaje en función de los objetivos y su potencial eficacia. La literatura académica y profesional ha analizado ampliamente la eficacia de esta variable de forma individualizada. Sin embargo, existe una escasez de estudios sobre las variables que, de forma sistémica, pueden influir y moderar los efectos, en términos de recuerdo, de la duración de un mensaje. Esta carencia justifica la investigación integral de la influencia de esta variable sobre el recuerdo como se propone en este trabajo. De esta manera, se han podido aportar las necesarias evidencias empíricas para su desarrollo teórico y aportar sugerencias en la optimización de la planificación publicitaria en televisión para mejorar el recuerdo generado por los spots.

Tampoco se ha desarrollado suficientemente en este ámbito, posiblemente por su complejidad técnica, el análisis de estas variables de la planificación en un entorno real. En el presente trabajo hemos aplicado una metodología que integra dos fuentes de información diferentes para, por una parte, obtener niveles de recuerdo espontáneo ajustados a la audiencia real de un elevado número de spots publicitarios y, por otra, considerar de forma individual y conjunta todas aquellas variables que de forma fragmentada se analizan en la literatura como factores que afectan al recuerdo. Con esta metodología se ha pretendido superar las limitaciones identificadas en la literatura relacionadas con la habitual utilización de entornos de laboratorio y con tasas de recuerdo calculadas a partir de una muestra. De ahí que nuestros resultados permitan a los profesionales del medio tomar decisiones sobre este recurso de forma más adecuada y fiable.

Una de las primeras conclusiones tiene su origen en esta aportación metodológica. A pesar de que autores como De Pelsmacker et al. (2005) señalan que el recuerdo espontáneo es una medida más robusta de la memoria y, por ello, más difícil de obtener frente al recuerdo sugerido, es frecuente encontrar, especialmente en la *praxis* de las agencias, trabajos que sólo presentan cifras de recuerdo asistido y/o reconocimiento, dado los bajísimos niveles que genera el recuerdo espontáneo en entornos reales. En nuestro estudio esta tasa de recuerdo espontáneo se sitúa en un 0,54%, valor muy similar a los obtenidos en entornos reales por institutos de investigación que

trabajan con datos de audimetría y la imparcialidad necesaria en sus conclusiones, como es el caso de TNS (2007), que obtiene una tasa de recuerdo espontáneo del 0,5%. A su vez, si comparamos estas tasas de recuerdo espontáneo con las obtenidas en trabajos, principalmente del ámbito académico, desarrollados en entornos de laboratorio, las diferencias son notorias, ya que en estos trabajos se obtienen tasas muy superiores. Sobre esta base, una conclusión que se extrae es que una de las posibles causas de las discrepancias en las tasas de recuerdo espontáneo son las limitaciones metodológicas de algunos trabajos académicos, de ahí la necesaria prudencia a la hora de extrapolar los resultados.

Dado que en la práctica el resultado de la eficacia de un anuncio depende de la interacción del conjunto de variables de la planificación de medios, más allá del efecto individual de cada una de ellas, con esta metodología además de analizar el efecto individual de cada una de estas variables sobre el recuerdo espontáneo también se ha analizado el efecto conjunto, ya sea directo o moderado por la duración del spot, que tales variables ejercen sobre el recuerdo. En cuanto al efecto individual de estas variables de planificación sobre el recuerdo, nuestros resultados coinciden con el estado de la cuestión, a excepción de la influencia de la cadena de televisión, en contra de los habituales argumentos comerciales utilizados por las propias cadenas televisivas. Sin embargo, cuando todas estas variables son analizadas de forma conjunta, la influencia directa de la posición relativa del spot en el bloque publicitario y del efecto primacía sobre el recuerdo espontáneo no se producen como indica la literatura. Por otra parte, los resultados también indican que el efecto directo de la duración del anuncio sobre el recuerdo se encuentra moderado por la cadena de televisión, la presión publicitaria del bloque, la notoriedad de la marca y el efecto recencia. Estos efectos nos llevan a concluir la necesidad de llevar a cabo estudios adicionales que corroboren estos resultados y que a su vez permitan avanzar en el efecto conjunto que ejercen todas estas variables de planificación sobre el recuerdo espontáneo en aras de optimizar la gestión publicitaria en televisión, que debe ir más allá de la simple consideración de los efectos individuales que cada variable ejerce sobre el recuerdo.

La existencia de efectos interactivos entre la duración del anuncio y las restantes variables de planificación de medios consideradas nos permite plantear una serie de implicaciones prácticas orientadas a la optimización del recuerdo y la duración del anuncio. Si bien la decisión de la cadena donde planificar un spot no ejercía un efecto significativo sobre el recuerdo cuando se analizaba de forma individual, el análisis del efecto conjunto de todas las variables de planificación sobre el recuerdo indica que éste es mayor en la televisión pública y que además existe un efecto interactivo entre la cadena y la duración del anuncio. De esta forma, cuando la decisión requiere la utilización de spots con duraciones de 20 segundos o inferiores, la planificación en una cadena u otra resulta indiferente para mejorar el recuerdo; mientras que, si la decisión implica utilizar duraciones superiores a 20 segundos, la elección de la cadena afecta al recuerdo, siendo este mayor en la TVE1 y más bajo en Tele 5.

En cuanto a la posición que debe ocupar el bloque publicitario respecto a los programas, nuestros resultados son coherentes con los trabajos de Krugman (1983), Chowdhury (2007) o Morman et al. (2007), que ya demostraron que el recuerdo que generan los anuncios es mayor cuando se insertan en los bloques situados en los intermedios de programas frente a los situados entre programas. Aunque no existen evidencias empíricas sobre el papel moderador que puede ejercer la posición del bloque publicitario sobre la influencia de la duración del anuncio en el recuerdo, nuestros resultados indican que se trata de una decisión indiferente que no tiene ningún efecto sobre el recuerdo.

A pesar de que en la literatura existen resultados contradictorios acerca de la influencia de la cantidad de presión en el bloque publicitario, los resultados confirman que el mayor recuerdo se produce en los bloques con baja presión y viceversa. Respecto al efecto moderador de la presión publicitaria se trata de una decisión importante en aquellas duraciones de 20 segundos o más, siendo algo irrelevante sobre el recuerdo en spots de menos de 20 segundos.

Curiosamente, a pesar de que en la literatura se ha contrastado recientemente que la notificación de la duración del bloque publicitario influye en el recuerdo (Yu et al., 2012), como así se constata en nuestro trabajo, cuando se analiza conjuntamente con las restantes variables de planificación no se contrasta su influencia directa ni tampoco su efecto moderador en la relación existente entre la duración del spot y el recuerdo espontáneo.

Respecto a la notoriedad previa de la marca anunciada se ha contrastado su efecto directo de forma individual y conjunta sobre el recuerdo y, además, su efecto moderador en los spots con duraciones de 20 segundos o más, por lo que es preciso destacar como conclusión la importancia de la inversión en notoriedad para incrementar el recuerdo publicitario de campañas futuras.

La planificación publicitaria en función del día de la semana y su relación con el recuerdo no ha recibido ninguna atención en la literatura académica. Por este motivo resulta especialmente interesante resaltar el efecto directo que tiene sobre el recuerdo, tanto cuando se analiza de forma individual como conjunta, siendo los fines de semana los que obtienen mejores resultados. No obstante, no se observa ningún efecto interactivo con la duración del spot.

Una variable interesante del estudio relacionada con la presión publicitaria y la posición del anuncio en el bloque es la posición relativa del spot en el bloque. Si bien no existe un consenso, la mayoría de las fuentes indican que a medida que el anuncio se aleja de las primeras posiciones disminuye el recuerdo. Este efecto individual se ha contrastado en nuestro estudio, sin embargo, al interactuar con el resto de variables de planificación, el efecto directo desaparece y tampoco ejerce un rol moderador.

La literatura ha contrastado ampliamente el efecto primacía y, aunque con menor consenso, el efecto recencia. Nuestros resultados constatan la existencia de tales efectos sobre el recuerdo espontáneo cuando se analizan de forma individual. Sin embargo, cuando se analizan de forma conjunta con el resto de variables, sólo se contrasta el efecto directo y moderador de la recencia. Por tanto, cuando la decisión requiere la utilización de spots con duraciones diferentes a 20 segundos, la planificación en última posición es la que va a generar mayor recuerdo.

Finalmente, los resultados presentados en este trabajo no están exentos de limitaciones, de las que se pueden derivar futuros trabajos. Como se puede observar en la revisión teórica del estado de la cuestión, apenas existen estudios sobre algunas de las variables de la planificación de medios abordadas en este trabajo y sus relaciones interactivas. Ambas carencias han supuesto una limitación para el planteamiento de las hipótesis de trabajo que ha obligado a proponer unos objetivos exploratorios a través de la formulación de proposiciones de investigación. Como futuras líneas de investigación parece conveniente desarrollar, a partir de la metodología propuesta y de los resultados preliminares, nuevos estudios encaminados a profundizar en estas variables y analizar los efectos interactivos en el recuerdo de otras variables de la planificación de medios. Son numerosas las fuentes que consideran como variables moderadoras del recuerdo, el conocimiento previo de la marca, la exposición anterior de los individuos a la campaña o, la frecuencia previa de la campaña en cuestión. Dificultades derivadas del trabajo de campo en un entorno real han impedido, en esta ocasión, incorporar estas variables en el cuestionario. Aunque el diseño de la investigación ha permitido aislar razonablemente estas variables, es seguro que tienen la capacidad de moderar de alguna manera el efecto de la duración del spot en el recuerdo, por lo que en futuros trabajos de investigación resultaría interesante conocer qué efecto moderador pueden tener en el proceso.

## RESUMEN

*¿Qué reclamos deben usarse para mejorar la percepción del producto orgánico y ayudar, así, al consumidor a diferenciarlo del producto convencional? La confusión de los consumidores para con los productos orgánicos constituye una barrera importante a su consumo. Así, nuestro estudio se centra en el uso de reclamos en el envase distinguiéndolos según el grado de explicitud con que se expresan los principales beneficios asociados al producto orgánico, la protección del medioambiente y la salud. A través de un experimento de laboratorio probamos que la respuesta cognitiva del consumidor definida por las percepciones hacia el producto orgánico está condicionada por los reclamos empleados en los envases de los productos. Se observa que el uso de un solo reclamo influye positivamente en la percepción hacia el producto, pero el efecto positivo se anula al emplear más reclamos. Atendiendo a la temática del reclamo destaca lo que los autores llaman un Efecto de Alcance Temático: los mensajes sobre el medioambiente tienen mayor alcance influyendo fuertemente tanto en la percepción de medioambiente como en la de salud. Adicionalmente, los datos reflejan que los mensajes relacionados con el beneficio de salud mejoran la percepción en mayor medida cuanto más explícitamente se expresa el beneficio.*

## Palabras clave:

*Mercado de orgánicos, respuesta cognitiva, Teoría de Señales, reclamos en los envases, explicitud del mensaje, temática del mensaje.*

## 1. Introducción

Los productos orgánicos son aquellos bienes obtenidos de una agricultura que busca mantener y mejorar la salud de los suelos, los ecosistemas y las personas (International Federation of Organic Agriculture Movements - IFOAM, 2012). Estos productos constituyen, dentro del sector de la alimentación, una pieza clave para los minoristas (Bauer et al., 2012; Van Doorn y Verhoef, 2011; Van Nierop et al., 2012) debido a su creciente interés por las iniciativas de Responsabilidad Social Corporativa (Ailawadi et al. 2014; Bhattacharya y Sen, 2004; Groening, et al., 2009) y los mayores márgenes que tienen estos productos respecto a sus contrapartidas convencionales (Bezawada y Pawles, 2010).

El orgánico es un mercado atractivo dado su carácter creciente, incluso durante la actual crisis económica (BCG, 2011; Willer y Kilcher, 2012). No obstante, este mercado presenta todavía niveles bajos de consumo en relación al de sus contrapartidas (D'Souza et al., 2007; Gleim et al., 2012; Izagirre-Olaizola et al., 2013; Kollmus y Angyernan, 2002; Moraes et al., 2012; Peattie, 1999). Las barreras al consumo identificadas serían: los altos precios, la falta de confianza por parte del consumidor en las organizaciones relacionadas con este mercado (Bhaskaran et al., 2006; Gleim et al., 2012; Terrachoice Environmental Marketing, 2009) y la falta de disponibilidad (Gleim et al., 2012).

Otro obstáculo a la compra de los productos orgánicos es la confusión y la escasa diferenciación entre el producto orgánico y el producto convencional que percibe el consumidor (Chryssochoidis, 2000; Gleim et al., 2012; Ministerio de Medio Ambiente y Medio Rural y Marino, 2011). Esta situación se vería agravada por el escaso empleo de herramientas de marketing como las de comunicación en el mercado de orgánicos (Aertsens et al., 2011; Hughner et al., 2007; Krystallis et al., 2006; Ngobo 2011) dado que dichas herramientas buscan diferenciar los productos en el mercado (Boulding et al, 1994).

La literatura previa sobre percepciones de los productos orgánicos se ha centrado en las percepciones y creencias sobre los productos como determinantes de la respuesta conativa (e.g. Kim y Chung, 2011; Lin y Chang, 2012), en la sensibilidad al precio del consumidor (Van Door et al., 2011), o simplemente en la descripción de las dimensiones perceptuales sobre los productos orgánicos (e.g. Fotopoulos y Krystallis, 2002; Krystallis et al., 2006). Nuestro estudio sigue la línea del trabajo de Bauer et al. (2013) al tratar de explicar las percepciones de los orgánicos aunque, a diferencia de éste, nos centramos en la comunicación y no en las estrategias de marca.

El presente trabajo estudia el efecto de la comunicación en forma de reclamos o mensajes en los envases de los productos sobre las percepciones de los consumidores. Los mensajes en los envases son una estrategia de comunicación muy utilizada en los productos de consumo frecuente (Lado et al., 2012). Esto estaría justificado en el carácter no planificado de la mayoría de las compras, en concreto un 59% (Inman et al., 2009; Stillely et al., 2010), lo que provoca que los fabricantes estén prestando especial atención a los estímulos de comunicación dentro de las tiendas. Los mensajes en el envase podrían minimizar la confusión del consumidor sobre las propiedades del producto orgánico y, por tanto, mejorar su consumo.

Las percepciones sobre los atributos orientados hacia la preservación del medioambiente y de la salud de las personas (Essoussi et al. 2008 Kareklas et al., 2014), son los beneficios más frecuentemente atribuibles al alimento orgánico y que lo diferencian de su contrapartida convencional. Por ello, serán éstas las principales percepciones consideradas en el presente trabajo a la hora de evaluar cómo influyen en las mismas los mensajes que difieren en el beneficio expresado consecuentemente en términos de protección del medioambiente y de la salud.

Por otra parte, la forma en que se exprese el mensaje de comunicación en cuanto a su claridad afecta a la percepción. Nuestro estudio distingue dos tipos de mensajes: explícitos e implícitos. Los mensajes explícitos son aquellos que expresan los beneficios de forma clara y sin lugar a dudas. Los mensajes implícitos pueden entenderse de varios modos o admiten distintas interpretaciones. Así, el trabajo propone un efecto diferencial de los mensajes acerca de los beneficios atribuibles al alimento orgánico de tipo explícito versus implícito sobre las percepciones del bien. En resumen, se estudiarán los efectos que tiene sobre las percepciones los mensajes explícitos e implícitos, la combinación de ambos tipos de mensajes y la temática de los mismos, sobre el medioambiente o sobre la salud.

En el ámbito de la investigación gerencial de empresa, se distinguen dos estilos cognitivos al procesar información o evaluar estímulos, el estilo intuitivo y el estilo analítico (Allison y Hayes, 1996; Simon, 1987; Taggart y Valenzi, 1990). En el caso de los consumidores, existirían individuos más analíticos que realizarán un mayor esfuerzo consciente y explícito a la hora de evaluar estímulos llevando a cabo un análisis de paso a paso. Mientras que otros consumidores serían más intuitivos y desarrollarían un proceso más implícito al evaluar de forma holística y en un plano menos consciente los estímulos. Este estudio contribuye a la literatura previa al analizar también como el estilo cognitivo del consumidor afecta a la relación señal-percepción.

En los contenidos subsiguientes se aborda el marco teórico del estudio, realizando una revisión de las investigaciones previas conducentes a la argumentación de las hipótesis de trabajo. Seguidamente se describe el escenario del estudio y los datos. A continuación se detalla la metodología del análisis empírico y se presentan, interpretan y comentan los resultados alcanzados. En una última sección se sintetizan las principales conclusiones e implicaciones.

## **2. Marco teórico**

### ***2.1. Congruencia señal-percepción***

Según la teoría de economía de la información (Nelson, 1970, 1974) en el proceso de compra los consumidores tienen incertidumbre sobre los atributos y/o beneficios de los productos que desean adquirir. Dicha incertidumbre procede de la información imperfecta y asimétrica que caracteriza a la mayoría de los mercados de productos; es decir, las empresas se comportan de forma oportunista estando más informadas sobre sus propios productos que los consumidores. En esta situación las empresas tendrán que transferir información al consumidor y dar señales sobre su credibilidad (Erdem y Swait 1998).

La teoría de la utilización de señales (Olson, 1972) muestra que a la hora de realizar evaluaciones sobre un producto o una marca, el consumidor se vale de una serie de señales representadas por el conjunto de atributos relacionados con el bien en cuestión. Así, los consumidores podrán compensar la falta de conocimiento buscando expresamente información sobre los atributos del producto — productos de búsqueda— u obteniendo más información a través de la experiencia de compra del producto —productos de experiencia— (Nelson 1970, 1974). Darby y Karni (1973, p. 68-69) introducen un nuevo tipo de productos, los productos de creencia. En estos productos la calidad no puede ser evaluada con búsqueda de información previa a la compra o experiencia después de la compra, y, por tanto, son productos más difíciles de evaluar.

Dado que los alimentos orgánicos son considerados como productos de creencia (Karstens y Beltz, 2006; Loureiro et al. 2002), el problema de asimetría de información se agrava en el contexto del mercado orgánico. No obstante, el uso de mensajes en los envases es una señal informativa que puede ayudar a solucionar ese problema de asimetría de información y mejorar la evaluación de los productos (Larceneux et al., 2012; Loureiro et al. 2002; Roe y Sheldon, 2007). La evidencia previa muestra argumentos a favor de dicha propuesta. Kozup et al. (2003) revelan que los consumidores tienen una actitud más positiva hacia productos saludables que incluyen información nutricional o mensajes de salud frente a los que no los tienen. Mientras que, Bauer et al. (2012) y Larceneux et al. (2012) demuestran que el uso de mensajes como “orgánico” afecta positivamente a las percepciones del consumidor.

Este trabajo propone que los mensajes publicitarios en los envases constituyen una señal extrínseca que influiría de forma positiva en la percepción del producto. Por tanto,

**H1.** Los mensajes publicitarios en los envases de los productos orgánicos mejoran la percepción de este tipo de productos.

El proceso de inferencia a través del que se construyen las creencias y percepciones de los consumidores es un proceso altamente selectivo. De forma que, el consumidor usará unas señales y obviará otras, así como realizará sus asociaciones en función de las señales que ha recibido (Olson 1978). Por tanto, cabe esperar que el consumidor a la hora de establecer juicios sobre determinados atributos del producto se valga de las señales que asocia con el atributo en cuestión. De hecho, los

consumidores analizan la información de los productos con relación al beneficio o beneficios buscados (Haley, 1971) que en la compra de productos orgánicos son la salud (Baker et al., 2004; Bauer et al., 2012; Essoussi et al. 2008; Zanolí y Naspetti, 2002) y el cuidado del medioambiente (Bauer et al., 2012; Essoussi et al. 2008).

Ratneshwar et al. (1997) definen la prominencia de un beneficio buscado como la rapidez con que dicho beneficio es traída a la mente de un consumidor en relación a una categoría de producto. Así, al tener en cuenta que los reclamos y mensajes en los envases son una forma de captar la atención de los consumidores, un concepto clave en la comunicación en marketing y que tiene una naturaleza selectiva (Pechmann y Steward, 1990), proponemos que la inclusión de un mensaje sobre un determinado atributo hará más prominente la percepción asociada al mismo ya que el consumidor centrará más su atención sobre dicho atributo y, así, la percepción asociada será mayor.

**H2.** Existe congruencia entre el mensaje publicitario en el envase de los alimentos orgánicos y la percepción de los mismos, es decir, la percepción de protección medioambiental (de salud) está explicada principalmente por los mensajes sobre la misma dimensión, la protección medioambiental (sobre la salud).

## **2.2. Grado de explicitud del mensaje**

Investigaciones previas han analizado la efectividad del contenido de la comunicación y cómo la explicitud de los mensajes influye en la actitud hacia la publicidad y hacia el producto (Ahearne y Saxton, 2000; Sawyer y Howard, 1991). Sawyer y Howard, (1991) distinguen entre anuncios de composición abierta-implícitos (no contienen una conclusión específica y por tanto invitan al consumidor a formar su propia conclusión) y anuncios cerrados-explicitos (siguen un proceso de razonamiento deductivo y presentan una conclusión al consumidor). Ahearne y Saxton (2000) señalan que los mensajes implícitos son más efectivos que los mensajes explicitos a la hora de influenciar la actitud del consumidor en productos de baja complejidad pero no afecta el tipo de mensaje para los productos complejos. Sin embargo, en el área de los productos verdes las evidencias muestran que el tipo de mensaje influye en la respuesta del consumidor hacia dichos productos (Chan, 2009; Kronrod et al, 2012).

Según la legislación europea (CE 834/2007 del 28 de junio, artículo 23) los términos BIO y ECO sólo pueden ser empleados por los productos ecológicos que cumplan con la legislación y que hayan pasado el proceso de certificación para poder usar dichos reclamos. Este tipo de mensajes, por tanto, están restringidos legalmente y pueden ser considerados como mensajes implícitos dado que pueden entenderse de varios modos o admiten distintas interpretaciones. La incorporación de estos mensajes legales en el envase de los productos, es una señal de calidad y ofrece una garantía al consumidor. Sin embargo, dichos reclamos y el etiquetado legal no es reconocido por los consumidores, que tienen dificultades para identificar los productos orgánicos o ecológicos por sus etiquetas (Ministerio de Medio Ambiente y Medio Rural y Marino, 2011; Harbaugh et al., 2011).

Nosotros proponemos que cuanto más explícito sea el mensaje, es decir, cuanto más detalle se aporte en los mensajes de los envases sobre el beneficio asociado al producto, mejor será el entendimiento del producto por parte del consumidor y, en consecuencia, la valoración del mismo.

**H3.** Los mensajes publicitarios explicitos en los envases de los alimentos orgánicos mejoran la percepción de este tipo de productos en mayor medida que los mensajes publicitarios implícitos.

## **2.3. Combinación de mensajes explicitos e implícitos**

Con respecto al uso de más de un mensaje, la investigación de Shu y Carlson (2014) revela que el consumidor percibe el uso de varios reclamos como una estrategia de persuasión en vez de como una estrategia de transmisión de información y, siguiendo la línea del modelo del conocimiento de persuasión de Friestad y Wright (1994), cuando el consumidor percibe que el mensaje ha sido diseñado para persuadirle adopta una estrategia de enfrentamiento.

Aunque Shu y Carlson (2014) encuentran que tres es el número óptimo de reclamos para incrementar la impresión positiva hacia el producto, en un entorno como el del mercado de productos orgánicos, los cuales son productos de creencia y, por tanto, difíciles de evaluar, y donde existe confusión hacia

el producto en sí por parte del consumidor (Chrysochoidis, 2000; Gleim et al., 2012; Ministerio de Medio Ambiente y Medio Rural y Marino, 2011) nosotros proponemos que la inclusión de sólo un reclamo más, combinando un mensaje implícito con uno explícito, no resultará en una mejor impresión. De forma que, si el mensaje explícito tenía un mayor efecto positivo sobre la percepción que su análogo implícito, tratar de mejorar el efecto empleando de manera simultánea reclamos explícitos e implícitos no resultará en un efecto positivo más fuerte, es decir, no contribuirá a mejorar la percepción.

**H4.** La combinación de un mensaje explícito y un mensaje implícito en el envase de productos orgánicos no dará lugar a una mejor percepción del producto frente a la encontrada con sólo uno de los mensajes.

#### ***2.4. Papel del estilo cognitivo***

Bloch (1995) en su estudio sobre la influencia del diseño del producto en la respuesta del consumidor muestra como las formas de procesar la información por parte del consumidor condicionan su respuesta. Por un lado, habría individuos que ante un producto en concreto procesarían el conjunto de información o estímulos a los que están expuestos de un modo holístico, en general. Por otro lado, habría quienes ante ese producto analizarían toda la información de manera minuciosa o detallada.

La distinción de Bloch (1995) coincide con la empleada en los trabajos gerenciales que tratan de explicar la conducta organizativa (e. g. Hayes y Allison, 1994; Mintzberg, 1976). En relación a la forma de interpretar o la predisposición a un modo particular de procesar y evaluar datos e información, se diferencian dos estilos, intuitivo y analítico (Allison y Hayes, 1996; Simon, 1987; Taggart y Valenzi, 1990). Según Allison y Hayes (1996), los más analíticos son aquellos que realizan un esfuerzo consciente y deliberado para lograr entender. Estos individuos usan un análisis de paso a paso más detallado al centrarse de forma secuencial en los distintos elementos a los que se ven expuestos. Los más intuitivos serían aquellos que desempeñarían un proceso de aprendizaje más implícito evaluando de forma holística y realizando juicios inmediatos en base a una adopción de una perspectiva más global.

Si la relación entre el diseño del producto y la respuesta conductual y psicológica del consumidor está condicionada por el estilo cognitivo (Bloch 1995), cabe esperar que también dicho estilo cognitivo afecte a la relación entre los estímulos dados por los mensajes en los envases y la respuesta cognitiva del consumidor en forma de percepciones. Con base a la descripción de los estilos cognitivos, en concreto, se esperaría que los mensajes explícitos tuviesen un mayor efecto para los más analíticos puesto que al detallar expresamente más información y, así, ser más extensos son más propicios a un análisis más detallado y no a un juicio inmediato. Del mismo modo, los mensajes implícitos tendrían un mayor efecto para los intuitivos al ser más propicios de cara a un juicio inmediato pues suponen un menor detalle de información expresa.

**H5.** La relación estímulo-percepción en los productos orgánicos depende del estilo cognitivo de los consumidores de manera que los mensajes explícitos tienen un mayor efecto en los consumidores más analíticos y los mensajes implícitos tienen un mayor efecto en los consumidores más intuitivos.

### **3. Metodología**

Según un informe de Willer y Kilcher (2012), las mayores cuotas de producción en el mercado de orgánicos son las de Oceanía (2.9%) y Europa (2.1%) siendo en esta última región donde se observan las mayores tasas de crecimiento. Uno de los tres países europeos donde más fuerte ha sido el aumento ha sido España. No obstante, en dicho país el consumo de orgánicos sobre el gasto total en alimentación sigue siendo bajo, un 0.97% en 2009. Esto hace que dicho contexto geográfico sea interesante a la hora de analizar el mercado de productos orgánicos.

Con el fin de aportar evidencia empírica en torno a las hipótesis planteadas se realizó un experimento a sujetos responsables de la compra en el hogar o que participaban activamente en la misma. Además del experimento se solicitó su colaboración en la cumplimentación posterior de un cuestionario. Para el muestreo de la población se usó un muestreo no probabilístico por cuotas. El tamaño de la muestra es de 311 individuos y la recogida de información se realizó de abril a junio del año 2013.

### 3.1. Diseño experimental

Se realizó un experimento entre sujetos de tipo factorial 3 (categorías de producto: chocolate/ muesli/ yogur) x 3 (mensajes implícitos: ECO/BIO/ “sin mensaje”) x 3 (mensajes explícitos: Sin aditivos químicos ni pesticidas de síntesis, CUIDA DEL MEDIOAMBIENTE/ Sin aditivos químicos ni pesticidas de síntesis, CUIDA DE TI/ “sin mensaje”). Independientemente del grado de explicitud del mensaje, éstos versan sobre los dos beneficios típicamente asociados a los productos orgánicos: la protección del medioambiente (ECO/ Sin aditivos..., CUIDA DEL MEDIOAMBIENTE) y la protección de la salud del individuo (BIO/ Sin aditivos..., CUIDA DE TI).

Cada sujeto fue asignado aleatoriamente a cada una de las condiciones experimentales aunque controlados para asegurar un tamaño muestral similar a través de los tratamientos.

En cada condición experimental, se facilita al sujeto una imagen del producto que tiene que valorar frente a su correspondiente contrapartida convencional. Cada imagen difiere en los mensajes utilizados. Así pues, se crearon 9 imágenes: 1) sin mensaje, 2) sólo mensaje BIO, 3) sólo mensaje ECO, 4) sólo mensaje Sin aditivos químicos ni pesticidas de síntesis, CUIDA DEL MEDIOAMBIENTE, 5) sólo mensaje Sin aditivos químicos ni pesticidas de síntesis, CUIDA DE TI, 6) mensaje BIO y Sin aditivos químicos ni pesticidas de síntesis, CUIDA DEL MEDIOAMBIENTE, 7) mensaje BIO y Sin aditivos químicos ni pesticidas de síntesis, CUIDA DE TI, 8) mensaje ECO y Sin aditivos químicos ni pesticidas de síntesis, CUIDA DEL MEDIOAMBIENTE y 9) mensaje ECO y Sin aditivos químicos ni pesticidas de síntesis, CUIDA DE TI.

El sujeto sólo valoró una categoría de producto de las tres categorías analizadas. La finalidad del uso de distintas categorías de producto no es otra que la de aportar mayor validez al estudio dado que contamos con un producto de origen vegetal (la caja de cereales de desayuno tipo muesli), uno de origen animal (un pack de 8 yogures naturales) y uno de origen mixto (una tableta de chocolate con leche).

Para asegurar la pureza de los tratamientos, siempre se utilizó la misma marca, tanto para el producto convencional como para el producto orgánico. La marca seleccionada fue Carrefour. Ésta era la marca de alimentación con mayor notoriedad en 2012 (TNS, 2012) y cuenta con un producto orgánico y su contrapartida convencional en las categorías analizadas.

### 3.2. Medidas empleadas en el estudio

La percepción de los productos después de su visualización se cuantificó basándonos en la escala utilizada por Krystallis et al. (2006). Las respuestas fueron codificadas en una escala tipo Likert de siete puntos (1= “totalmente en desacuerdo” y 7 = “totalmente de acuerdo”). Cada ítem se expresa en términos relativos. Esto es, se comparaba al producto 1 (imagen del producto orgánico) con el producto 2 (imagen del producto convencional). De ese modo se pretende evitar el sesgo derivado de la afinidad que tenga el entrevistado con la categoría de producto utilizada y se obtiene su valoración sobre el tipo de producto en cuestión, el orgánico. La Tabla 1 detalla los ítems utilizados y resume los análisis realizados a las escalas.

TABLA 1  
Descripción de los ítems y análisis factoriales de las medidas perceptuales

	Factors	Item	M	S.D	Cargas factoriales				F.C.	A.V.E
					F1	F2	F3	F4		
<b>Análisis Factorial 1. Percepciones dimensionales del producto orgánico frente al convencional (V.E. = 0,845)</b>	<b>Percepción de protección medioambiental del producto orgánico (F1)</b>	“tiene menos componentes dañinos para el medioambiente”	4,443	1,232	0,921				0,927	0,864
		“es más responsable con el medioambiente”	4,566	1,165	0,938					
	<b>Percepción de salubridad del producto orgánico (F2)</b>	“es más puro”	4,222	1,434		0,916			0,918	0,850
		“es más saludable”	4,177	1,386		0,928				

	<b>Percepción hedónica del producto orgánico (F3)</b>	“es más sabroso”	2,209	1,251	0,809	0,837	0,721	
		“es más saciante”	2,531	1,124	0,887			
<b>Análisis Factorial 2. Percepción global del producto orgánico frente al convencional (V.E. = 0,797)</b>	<b>Percepción de calidad del producto orgánico (F4)</b>	“es mejor producto”	3,698	1,425		0,893	0,887	0,594*
		“es de calidad superior”	3,521	1,220		0,893		

Notas: M = media, S.D. = desviación estándar, V.E. = varianza total explicada, F.C. = fiabilidad compuesta, A.V.E. = varianza extraída media, \* Correlación de Pearson con  $p < .01$

Las percepciones fueron consideradas como constructos reflectivos. Se realizaron dos análisis factoriales de componentes principales para garantizar la validez de contenido. En el primero, se incluyeron los ítems que hacen referencia al medioambiente, la salud y el hedonismo del producto orgánico. Se utilizó la rotación promax dado que las dimensiones analizadas no tienen porqué ser estrictamente independientes. Tal y como se muestra en la Tabla 2, los resultados permiten asumir la tridimensionalidad de la escala. En el segundo análisis se consideran los ítems que hacen referencia no a determinadas dimensiones del producto sino a su evaluación global validándose la unidimensionalidad de dicha escala. Asimismo, los resultados en ambos casos muestran la fiabilidad de la escala (tanto la fiabilidad compuesta de cada factor como la varianza explicada en ambos análisis es también superior a 0,7).

También se midió el índice de estilo cognitivo (IEC) que caracteriza al sujeto cuando procesa información. La escala empleada se basó en la desarrollada por Allinson y Hayes (1996) pero se utilizó una versión reducida de seis ítems. Tres caracterizan el estilo analítico y otros tres el estilo intuitivo. Dado que, según los autores de la escala que tomamos de partida, el estilo cognitivo es una variable continua donde un individuo puede compartir características de un estilo intuitivo y un estilo analítico, se emplea una escala tipo Likert de siete puntos (1= “totalmente en desacuerdo” y 7 = “totalmente de acuerdo”). Los ítems “analíticos” puntúan siguiendo una línea ascendente (de 1 a 7) mientras que para los ítems “intuitivos” se puntúa siguiendo una línea descendente (de 7 a 1), es decir, se invierten las puntuaciones de los ítems expresados en un sentido intuitivo. La puntuación final de IEC se basa en la suma de las valoraciones dadas a los seis ítems de forma que cuanto mayor fuese IEC, más analítico sería el individuo y, en consecuencia, cuanto menor fuese IEC, más intuitivo sería el sujeto. La Tabla 2 detalla los ítems utilizados y resume los análisis realizados a la escala.

TABLA 2

**Índice de Estilo Cognitivo ó IEC (factor formativo)**

Ítem	M	S.D	Correlaciones bivariadas (Pearson)					
			I1	I2	I3	I4	I5	I6
I1: Trato de mantener una rutina regular en las tareas que emprendo en los distintos ámbitos de mi vida, profesional y personal	3,312	1,458	1	0,917**	0,163**	0,138*	0,215**	0,199**
I2: Suelo preferir la búsqueda de la variedad antes que la constancia (R)	3,142	1,446		1	0,164**	0,140*	0,233**	0,248**
I3: Tiendo a prestar atención a los detalles antes de llegar a una conclusión	3,312	1,447			1	0,846**	0,433**	0,431**
I4: Tomo muchas de mis decisiones en base a la intuición (R)	3,029	1,490				1	0,373**	0,436**
I5: Para comprender plenamente los hechos necesito una explicación precisa de las causas o antecedentes	3,010	1,583					1	0,892**
I6: Estoy más a gusto con ideas generales que con extensas argumentaciones (R)	2,772	1,593						1

Notas: M = media, S.D. = desviación estándar, R = ítem con puntuaciones invertidas, \*  $p < .10$ ; \*\*  $p < .05$ ; \*\*\*  $p < .01$ .

Además de la información perceptual y del IEC, se solicitó información relativa al perfil demográfico de los participantes. Básicamente, el sexo, la edad, el nivel de ingresos, el número de miembros que componen el hogar, si el hogar tiene niños menores de 6 años o si tiene niños de entre 7 y 12 años.

El sexo se midió como una variable dicotómica (0 = hombre; 1= mujer), contando finalmente con una población femenina representada por el 86,5 % de la muestra. La edad se midió como una variable de recuento y la media de los sujetos fue de 45,85 años (con una desviación típica de 12,06). El nivel de ingresos se midió como variable categórica: ingresos iguales o inferiores a los 20000 euros anuales (40,8% de la muestra), ingresos anuales de entre 20001 y 50000 euros (50,5 %) y sólo el 8,7% son hogares con ingresos superiores a los 50001 euros al año. Tanto el número de miembros que constituía el hogar como el número de niños menores de 6 años y de entre 7 y 12 años eran obtenidos mediante preguntas abiertas. El número de miembros del hogar, se mide con una variable de recuento: 19,6% (hogares con 1 miembro), 27,7% (2 miembros), 28,3% (3 miembros), 21,2%(4 miembros) y 3,1%(5 o más miembros). Un 10,6% de los encuestados tiene niños menores de 6 años y un 11,6% de la muestra tiene niños de entre 7 y 12 años.

#### 4. Análisis y resultados

Para contrastar las hipótesis propuestas se estiman modelos de regresión lineal. Concretamente, se utiliza la siguiente especificación para contrastar las hipótesis de la 1 a la 4:

$$P = \alpha + \sum \beta (VC) + \sum \gamma (CE) + \xi$$

donde P denota las percepciones de los individuos (percepción de protección del medioambiente, percepción de protección de la salud, percepción hedónica y percepción de calidad),  $\alpha$  es la constante a estimar del modelo, VC hace referencia al vector de variables de control empleadas en el estudio (género, edad, ingresos, número de miembros del hogar, número de menores de 6 años en el hogar y número de menores de entre 7 y 12 años en el hogar);  $\beta$  denota un vector de parámetros a estimar que recoge el efecto de las variables de control, CE es el vector de variables que hace referencia a las condiciones experimentales (ECO, BIO, “Mensaje promedioambiental”, “Mensajes prosalud”, “ECOxMensaje promedioambiental”, “BIOxMensaje prosalud”, “ECOxMensaje prosalud” y “BIOxMensaje promedioambiental”) y  $\gamma$  denota un vector de parámetros a estimar que recoge el efecto de las condiciones del experimento. Se ha contrastado la posible heterocedasticidad en los modelos de regresión lineal relacionados con las primeras cuatro hipótesis a través del contraste de Breusch-Pagan. Dicho contraste nos lleva a rechazar la homocedasticidad en una de las estimaciones, la correspondiente al modelo de percepción de calidad, por lo que, en dicho caso, se ha usado estimación robusta.

Tal y como se detalla en la Tabla 3 se ha procedido a realizar cuatro estimaciones, una para cada variable dependiente considerada. Tres de las percepciones son dimensionales, es decir, sobre determinados atributos del producto. Dos tienen carácter utilitario o, lo que es lo mismo, están enfocadas en la maximización de la utilidad por parte del consumidor y se relacionan con los principales beneficios asociados al producto orgánico (percepción de protección del medioambiente y percepción de protección de la salud). La tercera hace referencia a la percepción hedónica del consumo del producto, con atributos asociados al sabor y la saciedad. La última, la percepción de calidad, supone una evaluación global del producto.

TABLA 3

#### Influencia de los estímulos publicitarios en las percepciones de los productos orgánicos (coeficientes sin estandarizar)

\*  $p < .10$ ; \*\*  $p < .05$ ; \*\*\*  $p < .01$ .

La Tabla 3 resume los resultados de las estimaciones realizadas. Los efectos de los mensajes ECO, BIO, promedioambiental y prosalud son bastante consistentes a través de las distintas percepciones y todos salvo uno (BIO en el modelo de percepción promedioambiental) ejercen un efecto positivo y significativo sobre la percepción analizada. Por tanto, los resultados obtenidos aportan una fuerte evidencia a favor de la hipótesis H1: los mensajes publicitarios mejoran la percepción de los productos orgánicos.

Los resultados también muestran congruencia entre el mensaje publicitario y la percepción de protección del medioambiente: el efecto de los reclamos sobre el medioambiente tanto para los mensajes implícitos como para los explícitos parece ser mayor al de los reclamos sobre la salud. Cuando hablamos de la percepción de protección de la salud ocurre lo mismo para los mensajes explícitos: es mayor el efecto del mensaje centrado en la salud. Sin embargo, en el caso de los mensajes implícitos el resultado es contrario a lo esperado: el efecto de ECO es mayor que el de BIO. No obstante, los contrastes de diferencias entre los coeficientes de ECO y BIO y de diferencias entre el mensaje promedioambiental y el mensaje prosalud revelan que sólo en el caso de percepción de protección del medioambiente los mensajes implícitos tienen un efecto significativamente distinto en función de su temática con más de un 99% de nivel de confianza. Así pues, no podemos confirmar que existe congruencia entre la dimensión del mensaje y la percepción (H2). Una posible explicación a este resultado podría deberse a un efecto denominado Efecto de Alcance Temático, La protección del medioambiente o, en términos genéricos, el entorno del individuo supone un mayor alcance que la salud, la cual se asocia a una persona o conjunto de personas concretas. De esta forma, el sujeto podría formar percepciones de salud a partir no sólo de los mensajes sobre salud, sino también a partir de los mensajes sobre la protección del medioambiente. Por el contrario, para las percepciones de protección del medioambiente emplearía principalmente los mensajes de protección del medioambiente frente a los mensajes sobre la salud, principalmente, cuando se trata de reclamos implícitos, en cuyo caso la diferencia entre los coeficientes según su temática sí es significativa.

Por otro lado, observamos que los coeficientes de los mensajes explícitos son mayores que los de los mensajes implícitos, independientemente del tema sobre el que versen. Sin embargo, los contrastes de

diferencias entre parámetros según el grado de explicitud de los mensajes solo resultan significativos en el caso de los mensajes de salud y para todas las variables dependientes excepto para la percepción hedónica. En el resto de casos, si bien los coeficientes asociados a los reclamos explícitos son más elevados, las diferencias no son significativas. Así, los resultados parecen estar en línea con nuestra hipótesis H3, aunque solo son significativos en la dimensión salud. En consecuencia, H3 solo se acepta parcialmente: cuanto más explícito es el mensaje de salud, mejor es la percepción del producto.

Los resultados también aportan evidencias a favor de la hipótesis H4 sobre el efecto de la combinación de mensajes implícitos/explicitos frente al uso de un solo mensaje. Los coeficientes de las variables de interacción de mensajes implícitos y explícitos son en su mayoría negativos y significativos (de las 12 interacciones, 8 son significativas al 0,90%). Para contrastar formalmente dicha hipótesis realizamos un contraste que compara en cada modelo el valor absoluto de la diferencia entre el efecto de los mensajes combinados y el menor efecto de entre los mensajes directos, no observándose diferencias significativas en ninguno de los casos. Así, los resultados obtenidos nos llevan a confirmar que la combinación de mensajes no resulta en mejores percepciones en relación a las percepciones encontradas con sólo un mensaje. Esto podría deberse a la propia confusión manifestada por el consumidor con respecto a los productos orgánicos o a que el consumidor perciba el uso de varios reclamos como estrategias de persuasión por parte de la empresa y no de información.

Para contrastar la última de las hipótesis, se especificó el siguiente modelo:

$$P = \alpha + \sum \beta (VC) + \sum \gamma (CEMA) + \delta (IEC) + \sum \lambda (IECxCEMA) + \xi$$

las diferencias de este modelo respecto al anterior residen en que en este caso CEMA es el vector de variables que hace referencia a las condiciones experimentales sobre mensajes aislados (ECO, BIO, “Mensaje promedioambiental” y “Mensajes prosalud”),  $\gamma$  denota un vector de parámetros a estimar que recoge el efecto de las condiciones del experimento, IEC es la variable de índice de estilo cognitivo y  $\delta$  es el parámetro a estimar que recoge el efecto de la variable IEC, IECxCEMA es el vector de variables con las interacciones entre las condiciones experimentales aisladas y el IEC, siendo  $\lambda$  el vector de parámetros a estimar que mide el efecto de las variables de interacción. Al igual que en el modelo anterior, se ha contrastado la posible heterocedasticidad de los modelos a través del contraste de Breusch-Pagan y de nuevo sólo se rechaza la homocedasticidad en una de las estimaciones, la correspondiente al modelo de percepción prosalud, por lo que, en dicho caso, se ha usado estimación robusta.

Al igual que en el resto de hipótesis, hemos estimado cuatro modelos cuyos resultados se detallan en la Tabla 4. Los coeficientes para la moderación de IEC no resultan significativos ni para percepción hedónica ni para percepción de calidad. Con respecto a los temas relacionados, percepción promedioambiental y prosalud, no se observan resultados significativos de los mensajes explícitos. Sí que se observan, tal y como se proponía, dos efectos negativos y significativos entre los mensajes implícitos y el IEC, lo que supone evidencias a favor de que los mensajes implícitos tengan un mayor efecto en los consumidores más intuitivos. Por tanto, y aunque de forma más débil que en el resto de hipótesis, dicha hipótesis se confirma sólo parcialmente.

TABLA 4

**Influencia del estilo cognitivo en la relación estímulo-percepción (coeficientes sin estandarizar)**

## 5. Conclusiones e implicaciones para la gestión

En el mercado de productos orgánicos, los comerciantes apenas utilizan herramientas de marketing aún cuando el consumidor manifiesta confusión para diferenciar al producto orgánico frente a su contrapartida convencional. Por ello, el presente trabajo se ha centrado en analizar el efecto que sobre la respuesta cognitiva del consumidor tiene un tipo concreto de comunicación, los mensajes en los envases.

Los resultados empíricos de este trabajo indican que los mensajes publicitarios empleados en los envases de los productos orgánicos influyen en las percepciones inferidas por el consumidor acerca de los productos en cuestión. El uso de un solo mensaje mejoraría la percepción hacia el alimento orgánico, algo que no se vería reforzado al sumar un reclamo al envase. También se observa un mayor efecto de los mensajes explícitos, aunque sólo cuando expresan beneficios de salud. Por último, si bien el estilo cognitivo a la hora de procesar información teóricamente parece relevante cuando se trata de evaluar productos mediante el uso de señales, nuestros resultados sólo avalan el efecto moderador en el caso de la influencia del mensaje implícito sobre las percepciones asociadas a los productos orgánicos.

Los resultados obtenidos conducen a una serie de interpretaciones e implicaciones. Para aprovechar el potencial del mercado de orgánicos, los comerciantes deberían emplear mensajes en los envases que se asocien a los beneficios que los caracterizan, protección del medioambiente o salud. Con ello conseguirían potenciar la percepción de protección del medioambiente o salud que infiere el consumidor ayudándole a diferenciar al producto orgánico del convencional. No obstante, no se debería abusar del uso de reclamos en el envase puesto que combinar dos mensajes no mejoraría la percepción con respecto a la encontrada con solo un reclamo. Atendiendo a la temática-grado de explicitud del mensaje, la empresa debe expresar el mensaje con el mayor grado de explicitud posible si opta por un mensaje sobre la dimensión de salud para influir más fuertemente en las percepciones que el consumidor infiere. Es decir, mensajes del tipo “Sin aditivos químicos ni pesticidas de síntesis, CUIDA DE TI” muestran un mejor resultado sobre la percepción de salud que el mensaje “BIO”.

Asimismo, los comerciantes podrían utilizar distintos tipos de mensaje para captar la atención de distintos tipos de consumidores. Por ejemplo, podrían usar los mensajes implícitos (ECO y BIO) para mejorar las percepciones de medioambiente o de salud de los consumidores más intuitivos.

Este estudio no está exento de limitaciones que requieren investigaciones futuras. Los sujetos valoran percepciones de tres productos de alimentación. Aunque los alimentos son de distinto origen —

vegetal, animal y mixto—, futuras investigaciones podrían tratar de replicar el estudio en otras categorías alimentarias o en otras categorías más allá de los alimentos. Este trabajo ha realizado un experimento de laboratorio en el que el sujeto se enfrenta a fotos aisladas en lugar de a los expositores habituales en los establecimientos de alimentación. De manera que, las futuras investigaciones podrían encaminarse hacia el desarrollo de experimentos de campo para analizar la relación entre mensaje y percepción inferida. Adicionalmente, las futuras investigaciones se podrían centrar en analizar otras posibles moderaciones entre las percepciones y el mensaje, por ejemplo, la interacción entre el tipo de marca y el tipo de mensaje (Bauer et al. 2013).

## RESUMEN

*Las ferias representan una importante plataforma de comunicación para los expositores, cuyo uso se ha generalizado en todas las áreas económicas, pues supone la puesta en práctica de diversas herramientas de comunicación con las que hacer llegar la oferta al mercado y a un gran número de clientes con disposición favorable a la obtención de información. Pero también aporta ventajas a los visitantes, entre otras, les permite conocer la oferta y comparar precios.*

*Varios estudios han demostrado la utilidad de la participación en ferias, y utilizan para dicha evaluación diferentes indicadores como son el número de asistentes (tanto profesionales como particulares) y el número de expositores participantes.*

*El objetivo que persigue este trabajo es analizar la evolución de la actividad ferial en España en el periodo 2002-2010, para hacer frente a una cuestión relevante como es su eficacia y eficiencia como herramienta de comunicación.*

## Palabras clave:

Ferias comerciales, comunicación, indicadores, eficiencia.

## 1. Introducción

En los últimos años, los sistemas de comunicación han experimentado un gran desarrollo gracias a las tecnologías de la información y la comunicación, dando lugar a formas de comunicación más sofisticadas.

La comunicación en marketing se realiza principalmente por medio de cinco herramientas: publicidad, promoción de ventas, relaciones públicas, venta personal y marketing directo. Y la elección de una u otra dependerá de una serie de aspectos que determinan su adecuación o conveniencia, como son:

- Recursos disponibles.
- Tipo de producto a vender.

- Características del mercado.
- Tipo de estrategia de marketing utilizada.
- Etapa del proceso de decisión de compra.
- Etapa del ciclo de vida del producto.

Sin embargo, a pesar de ese desarrollo, formas de comunicación más simples que permiten una comunicación más personal y un contacto cara a cara se han seguido manteniendo, tal es el caso de las ferias.

El objetivo de este trabajo es analizar el uso de las ferias comerciales como variable de comunicación, su evolución durante el periodo 2002-2010 y el análisis de los principales indicadores de rentabilidad, que permitan determinar el estado en el que se encuentra esta herramienta de comunicación en el momento actual, su desarrollo en los últimos años y su situación en los diferentes sectores de actividad.

Con estos objetivos la principal aportación de este trabajo es dar continuidad a estudios previos que han analizado la evolución de la actividad ferial en los periodos: 1985-1989 (Mas, Munuera, Hernández y Ruiz, 1993), 1995-1999 (Cervera, Franco y Gracia, 2001), 1990-2000 (Jiménez, Cazorla y Linares, 2002), 1999-2003 (Triviño, 2006).

## **2. Ferias**

### **2.1. Concepto**

Una feria también conocida como salón, es un certamen de celebración periódica en el que empresas o entidades de una misma actividad comercial exponen sus productos y/o servicios al público asistente.

Las ferias representan el instrumento de comunicación más antiguo (Jiménez, Cazorla y Linares, 2002), cuyo origen se remonta a la civilización fenicia (2º milenio a.c.) en forma de mercados.

En cuanto a los usos de las ferias, se considera que es una herramienta importante de exhibición y comunicación de la oferta comercial, así como un instrumento de contacto frente al cliente (Gázquez y Jiménez, 2002); es decir, es una herramienta de comunicación empleada tanto en promoción de ventas como en venta personal.

Aunque otros enfoques (Rodríguez, De La Ballina y Santos, 1997) consideran que las ferias se emplean también como elemento para mejorar la imagen de la empresa y transmitirla al mercado, considerándolo así como una herramienta de relaciones públicas.

Por tanto, la utilización de las ferias como herramienta de comunicación se encuentra presente en tres de las cinco herramientas de comunicación: promoción de ventas, relaciones públicas y ventas personales; de manera que su uso permite alcanzar los objetivos perseguidos en cada herramienta de comunicación.

### **2.2. Características**

Las ferias proporcionan a las empresas participantes el desarrollo de una serie de funciones (Rubalcaba y Cuadrado, 1994):

- Función comercial: venta, creación y consolidación de redes de distribución comercial.
- Función expositiva: alternativa rentable a procedimientos publicitarios tradicionales.
- Función de comunicación: su finalidad es poner en contacto la oferta y la demanda.
- Otras funciones: incentivar la competencia entre las empresas y vehículo de difusión de las innovaciones.

La asistencia y participación en ferias se considera una acción de gran utilidad, porque en ellas se encuentra la mejor información del sector, porque representa un punto de encuentro entre empresas y clientes especializados, porque favorece el intercambio de tendencias y opiniones (Muñiz, 2010) y que permite al empresario introducirse, consolidarse o investigar mercados (Navarro, 2001).

Las ferias comerciales poseen una serie de diferencias con respecto al resto de actividades de promoción, que son (Jiménez, Cazorla y Linares, 2002):

- Es la única forma de promoción donde el comprador acude al vendedor, lo cual representa una ventaja consistente en contar con la predisposición del cliente a escuchar, ser atendido y obtener información.
- Permite el contacto con un número elevado de clientes en un tiempo reducido.
- Acceso a empresarios y clientes no accesibles en condiciones habituales de venta.
- Intervención simultánea de varias herramientas de comunicación: publicidad, promoción de ventas, venta personal y relaciones públicas, que incrementan la posibilidad de efecto de la comunicación.
- La intervención de otras variables de marketing: producto, precio y distribución, poniendo en uso todas las variables de marketing. De manera que la política ferial constituye una combinación de las diferentes políticas de marketing (Mas, Munuera, Ruiz y Hernández, 1993).

Por esta última característica, frente a la consideración tradicional de las ferias como herramientas de comunicación, se impone su carácter multidimensional por su contribución al resto de variables de marketing:

- Precio: existencia de un precio de feria inferior y ofrecimiento de descuentos para asistentes.
- Producto: se realiza la presentación de nuevos productos, demostraciones de los mismos, captación de ideas para la creación de nuevos productos en la visita a la feria.
- Distribución: la feria es un lugar de distribución, y también un lugar idóneo para establecer relaciones con intermediarios del canal de distribución.

Y la sinergia y complementariedad adecuada de todas las herramientas de marketing conducen al éxito de la estrategia ferial (Puchalt y Munuera, 2008).

Así, llegamos a una definición más actual de feria (Puchalt, 2001), en la que se confirma su carácter multidimensional, que la define como instrumento de marketing, cuya puesta en práctica permite a las empresas y profesionales que hacen uso del mismo, desarrollar diferentes funciones para lograr sus objetivos: comunicación, promoción, ventas, relaciones, intercambio de información, investigación, fidelización de clientes, posicionamiento, distribución, formación, test de mercado y producto, entre otras.

### **2.3. Resultados de su utilización**

Este mismo carácter multidimensional de las ferias se observa en las razones y/o objetivos que una empresa tiene para ser expositor, de manera que junto a la política de comunicación se indican también motivos de producto, precio y distribución, como (Gázquez y Jiménez, 2002):

- Aumento de la cuota de mercado: aumentar ventas y participación en el mercado.
- Prospección de mercado: conseguir nuevos clientes y ver la aceptación de los productos.
- Imagen: mejorar su posicionamiento y su percepción por el sector, y por los clientes.

Sin embargo, pese a los objetivos señalados, ante todo prima el criterio de rentabilidad (Jiménez, Cazorla y Linares, 2002).

La participación en ferias constituye un medio eficaz y de bajo coste para acceder a nuevos clientes, constituyendo así una herramienta con buena relación coste/eficacia. Así, se considera que durante la feria por término medio un vendedor mantiene relación directa y personal con más clientes, actuales y potenciales, que durante seis meses de trabajo habitual (Grupo Planner, 2010).

Pese a la evolución creciente que el sector ferial ha experimentado en los últimos años (Munuera, 2008), una cuestión que centra el interés de las investigaciones es la obtención de resultados en su participación, que sirva para justificar la inversión y el esfuerzo realizados.

Un estudio (Marketing News, 2006) se centra en el análisis de la rentabilidad de las acciones de comunicación a partir de la opinión de 700 directivos de Norteamérica, Europa y Asia. Los resultados globales (Tabla 1) muestran que la actividad ferial es considerada como la herramienta que ofrece mayor rentabilidad en las diferentes zonas geográficas analizadas, siendo el más valorado por los directivos de Asia, seguidos de los de Europa y por último Norteamérica.

TABLA 1  
Directivos que valoran más alto la rentabilidad de las acciones de marketing (%)

Herramientas de marketing	Total	América del norte	Europa	Asia-Pacífico
Ferias	23	19	23	32
Publicidad impresa	10	9	7	17
Publicidad no impresa	7	7	5	10
Promoción de ventas	9	8	11	10
Relaciones públicas	15	16	14	15
Marketing electrónico	12	17	13	5
Marketing directo	13	16	14	7

Fuente: Marketing News, 2006.

Otro estudio realizado en 2003 sobre 250 miembros de la asociación de profesionales de marketing de EEUU (Business Marketing Association Survey, 2003) analiza el nivel de inversión realizada en diferentes herramientas de marketing para apoyar la venta de productos. Los resultados mostraron en media que los directivos dedicaban la mayor parte de su presupuesto a la participación en ferias comerciales (18,6%), seguido del 13,8% a la publicidad en prensa especializada, 13,5% a Internet y otros medios electrónicos, 10,9% a la promoción de ventas, 10,8% a las relaciones públicas, 5,6% a merchandising, 4,1% a investigación de mercados, 3,2% a publicidad en prensa general y 19,6% a otras herramientas (Stevens, 2005).

En este contexto se plantean dos cuestiones (Molina y Cuestas, 2008): ¿siguen siendo las ferias un instrumento eficaz para comunicar la oferta comercial de la empresa? y ¿ha disminuido su poder para mantener o establecer nuevas relaciones a favor de las nuevas tecnologías? La respuesta a estas preguntas constituye el objetivo de este trabajo, para ello se persigue analizar diferentes indicadores y la posible relación entre ellos.

### 3. Metodología

Para la realización de este estudio se utilizará la información estadística facilitada por la Asociación de Ferias Españolas (AFE), que es la única fuente de datos a nivel nacional. Anualmente publica memorias estadísticas sobre los certámenes feriales organizados por sus asociados que pertenecen a todo tipo de sector empresarial, y que en la actualidad asciende a 58 socios, de los cuales 49 son organizadores feriales, tanto públicos como privados, y los 9 restantes son miembros colaboradores.

Se utilizará la información de los años 2002 a 2010 para determinar la evolución experimentada.

#### 3.1. Variables de interés

Para analizar la eficacia de la participación en ferias comerciales se van a prestar atención a las siguientes variables:

- Número de ferias: totales, generales, sectoriales y mixtas.
- Grado de especialización.
- Cifra de expositores.
- Público participante: total, general y profesional.
- Nacionalidad de los participantes.
- Lugares de celebración: ciudades e instituciones.
- Número de países participantes.
- Cifra de entradas vendidas.
- Cantidad de pases distribuidos.
- Superficie dedicada a la actividad.

Además, se estudiará la posible relación entre algunas de estas variables, como son los ratios de expositores y visitantes por evento, o el número de expositores indirectos sobre directos.

#### 4. Conclusiones

Indicar en primer lugar que se trata de un trabajo en curso y las conclusiones que en estos momentos se pueden plantear responden únicamente a aspectos teóricos destacables, cuya comprobación empírica se plantea realizar como siguiente paso para contribuir al conocimiento de la actividad ferial en España en los últimos años.

Como conclusiones señalar, en primer lugar, la consideración de la política ferial no sólo como una herramienta de comunicación, sino como una combinación de varias políticas (ventas, producto, comunicación, distribución e investigación de mercados), que maximiza el beneficio y la utilidad de los expositores para participar en las mismas. Pues permite no sólo dar a conocer su actividad, sino que además permite conocer las tendencias del mercado, lanzar nuevos productos e incluso venderlos.

La evolución de la actividad ferial mantiene un paralelismo con la situación económica nacional, pero también va a depender de la evolución del sector al que pertenece. Sin embargo, frente a la situación económica en la que se encuentra España el número de ferias celebradas no se ha reducido, lo que constituye un indicador de la confianza en esta plataforma de comunicación en el sector empresarial.

Por otro lado se observa también una tendencia al incremento del grado de especialización de las ferias (Purchalt, 2001), con el fin de facilitar el alcance de los objetivos de expositores y de asistentes.

Como principal limitación señalar que los datos utilizados dejan fuera la información sobre eventos organizados por instituciones no asociadas a AFE, siendo en su mayoría de carácter local; y, por tanto, hay que tener cuidado a la hora de generalizar los resultados.

## RESUMEN

*Los ejecutivos de marketing están bajo la creciente presión de demostrar el impacto financiero de sus decisiones ante la alta dirección, financieros y accionistas. La investigación previa ha demostrado el efecto del gasto en publicidad sobre el valor de la empresa. Sin embargo, se ha pasado por alto cuáles son las decisiones específicas de publicidad más adecuadas para incrementar el valor de la empresa. En esta investigación cubrimos este hueco analizando el impacto del gasto en el mix de medios sobre el valor de la empresa. Para ello analizamos el valor de la empresa y el gasto publicitario mensual en prensa, radio y televisión para 84 empresas utilizando un modelo de vectores autorregresivos. Los resultados preliminares sugieren que la prensa es el medio más eficaz a la hora de crear valor para la empresa, gracias a la aparición de sinergias cuando va acompañado de otros medios como la radio y la televisión.*

## Palabras clave:

Publicidad, mix de medios, valor de empresa.

## 1. Introducción

La publicidad es una de las actividades de marketing más visibles y costosas (Wang et al. 2009). No es de extrañar, por tanto, que los ejecutivos de marketing y publicidad necesiten medir y justificar cada vez más el valor creado por sus acciones ante la alta dirección, financieros y accionistas. Para lograr este objetivo, los ejecutivos de marketing deben emplear un lenguaje comprensible y sobre todo creíble, tanto para directivos como para financieros y accionistas. Tarea difícil, ya que los objetivos de marketing se han formulado tradicionalmente desde el corto plazo y en términos de impacto sobre ventas y actitud de los consumidores, empleando métricas como la notoriedad, crecimiento en ventas, fidelidad, satisfacción de cliente, repetición de compra, etc. (Ambler 2003). Métricas estas que bien por desconocimiento o por considerar que no son de interés para los accionistas de la empresa, más preocupados por la rentabilidad a largo plazo de sus inversiones, no han sido puestas en valor por directivos y financieros como indicadores válidos del esfuerzo de marketing. Esta situación obliga a los ejecutivos de marketing a adoptar un lenguaje financiero al evaluar e informar de sus acciones (McAlister, Srinivasan y Kim 2007).

En consecuencia, la eficacia del gasto publicitario ha sido ampliamente estudiada, más allá de su impacto en variables de negocio como las ventas y los beneficios (Hanssens, Parsons y Schultz 2001). Por ejemplo, algunos estudios han demostrado que el gasto en publicidad influye en métricas financieras, tales como la demanda de acciones, la liquidez y el valor de la empresa (Frieder y Subrahmanyam 2005; Huberman 2001; Joshi y Hanssens 2010). Por lo general, este tipo de estudios se han realizado a partir de datos agregados del gasto en publicidad, con independencia de cómo se distribuye el presupuesto entre los componentes de la publicidad, es decir, el copy del anuncio y el mix de medios (McAlister, Srinivasan y Kim 2007). Hasta donde sabemos, las consecuencias financieras de estos componentes no se han estudiado todavía.

En esta investigación pretendemos cubrir parcialmente este hueco. En particular, nos centraremos en el componente que suele consumir la mayor proporción del presupuesto publicitario – el mix de medios. Por tanto, el objetivo de esta investigación es analizar el impacto del mix de medios publicitario en el valor de la empresa. Los resultados de esta investigación tienen implicaciones tanto teóricas como de gestión. Desde una perspectiva teórica contribuye a aclarar cómo las decisiones del mix de medios contribuyen a aumentar el valor para los accionistas y, por tanto, establece una base para la investigación sobre el impacto de las decisiones de publicidad (creatividad del anuncio, mensaje, estrategia de medios, etc.) en el valor de la empresa. Para los profesionales de la publicidad y planificadores de medios los resultados de esta investigación permite extraer una mayor rentabilidad a sus planes de medios, lo que mejora la eficiencia de sus decisiones (McAlister, Srinivasan y Kim 2007).

## 2. Marco conceptual e hipótesis

La investigación publicitaria se ha centrado tradicionalmente en el estudio de los efectos de esta herramienta del marketing en los consumidores. Se han estudiado dos tipos de efectos: efectos intermedios, que se refieren a los cambios en las creencias y actitudes de los consumidores, y los efectos en el comportamiento, que se refieren a intención de compra y la elección de marca (Vakratsas y Ambler 1999). Gran parte de la literatura también nos indica que la publicidad influye en varias métricas de negocio, como las ventas (Leone 1995, Vakratsas y Ambler 1999; Hanssens, Parsons y Schultz 2001) y los beneficios (Erickson y Jacobson 1992).

Además, hay un grupo creciente de académicos que postula que la publicidad también tiene un impacto financiero en la compañía y analiza los efectos del gasto en publicidad en diferentes métricas de valor de la empresa. Grullon, Kanatas y Weston (2004) demuestran que el gasto en publicidad ofrece una mayor visibilidad de la empresa y aumenta la familiaridad del mercado de valores con la empresa, lo que aumenta la demanda del número de acciones y la liquidez (Frieder y Subrahmanyam 2005, Huberman 2001, Joshi y Hanssens 2010). Además, el gasto publicitario también afecta el valor de la empresa. Por un lado, tiene un impacto indirecto en valor de la empresa, a través de un aumento en las ventas y beneficios. Por otro lado, tiene un efecto directo, mediante la construcción de activos intangibles relacionados con la marca (Joshi y Hanssens 2010). Además, la publicidad que se mantiene

constante en el tiempo puede afectar a la percepción de los inversores sobre las ganancias esperadas y los flujos de efectivo futuros (Kim y McAlister 2011). También permite el aislamiento de la empresa de las turbulencias del mercado, disminuyendo así su riesgo sistemático (Veliyath y Ferris 1997; Osinga et al 2001).

Los estudios que analizan los efectos del gasto publicitario en las finanzas de la empresa generalmente emplean datos agregados - cifras anuales del gasto en publicidad, sin distinguir entre sus componentes. Entre ellos, el mix de medios que es clave a la hora de determinar la eficacia de la publicidad y que compromete un alto porcentaje del presupuesto de comunicación. En consecuencia, la elección del mejor mix de medios publicitario capaz de lograr la máxima eficacia es uno de los problemas más acuciantes para los profesionales de la publicidad hoy en día.

A pesar de su importancia, carecemos de evidencias para apoyar la influencia del mix de medios publicitario en el valor de la empresa. Sin embargo, algunos estudios sugieren que esta influencia existe. En primer lugar, investigaciones precedentes han demostrado como los medios de comunicación publicitarios no contribuyen por igual a la variación de las ventas. Por ejemplo, Tellis (2003) en un meta-análisis de 262 elasticidades publicitarias de marcas pertenecientes a 130 mercados diferentes demostró como la elasticidad de las ventas a la publicidad es mayor en prensa que en televisión. Teniendo en cuenta que la publicidad tiene un impacto indirecto en valor de la empresa a través de las ventas (Joshi y Hanssens 2010), podemos esperar que la combinación de medios de comunicación en los programas de publicidad también tenga un efecto sobre el valor de la empresa. En particular, los medios de comunicación que generan ventas más altas también podrían conducir a un aumento del valor de la empresa.

En segundo lugar, los efectos que los medios tienen sobre las actitudes de los consumidores no son homogéneos. Por ejemplo, la credibilidad de un medio de comunicación cuando se transfiere un mensaje modifica la forma en que se percibe la publicidad. La publicidad insertada en un medio de comunicación más creíble, como un periódico es percibida como más informativa, fiable y creíble que la publicidad colocada en un medio de menor credibilidad como la televisión (Bauer y Greyser 1968; Becker, Martino y Forasteros 1976; Larkin 1979). Del mismo modo, el impacto de los medios en algunas métricas de rendimiento de marketing, como la notoriedad y la familiaridad de marca tampoco es homogénea. La televisión es el medio más adecuado para aumentar la notoriedad de marca, seguido de cerca por las revistas. Sin embargo, las revistas son más apropiados que la televisión o los medios de comunicación on line para crear familiaridad de marca (Magazine Publishers of America 2008). Estas diferencias sugieren que algunos medios de comunicación podrían ser más apropiados que otros para crear activos intangibles relacionados con la marca – en particular, el valor de marca - que influye a su vez en valor de la empresa (Joshi y Hanssens 2010).

Por tanto, teniendo en cuenta que el mix de medios influye no sólo en las ventas de la marca, sino también en los activos de la marca, y que tanto las ventas como los activos están vinculados al valor de la empresa, podemos esperar que el mix de medios también influya en el largo plazo sobre el valor de la empresa.

*H1: El impacto de la publicidad en el valor de la empresa varía según el medio utilizado.*

Además, el efecto de cada medio en el valor de la empresa podría ser potenciado por la existencia de sinergias entre los medios de comunicación. El uso de distintos medios de comunicación en una campaña de publicidad favorece la aparición de sinergias, es decir, cada medio contribuye a potenciar el efecto del resto de medios empleados en la comunicación, de tal modo que la interacción entre medios produce un efecto mayor que la suma de sus efectos individuales. Estas sinergias afectan a las ventas de la marca de tal modo que el aumento de ventas ocasionado por un medio se ve reforzado por la presencia de otros medios de comunicación, haciendo así que el efecto combinado de los medios de comunicación supere la suma de sus efectos individuales (Naik y Raman 2003). Teniendo en cuenta su efecto sobre las ventas, es de esperar que estas sinergias también afecten valor de la empresa.

*H2: El impacto que la publicidad en un medio de comunicación tiene en el valor de empresa varía según la combinación de medios utilizada por la compañía.*

### 3. Metodología

Para lograr los objetivos de esta investigación empleamos un modelo vectorial autorregresivo con corrección de errores (VECM) en el que nuestras variables endógenas son valor de la empresa y el gasto publicitario realizado en tres medios de comunicación: prensa, radio y televisión. Estudiamos el comportamiento de estas variables sobre un conjunto de datos que contiene información financiera y de publicidad durante un periodo de 5 años (enero 2007 - diciembre 2011). Esta información procede de diversas fuentes. En cuanto a los datos financieros hemos recopilado información sobre el precio de las acciones de 84 empresas que operan en la Bolsa de Valores de Madrid. Del mismo modo, hemos recogido datos sobre la exposición a los medios de comunicación de estas empresas en España para el mismo periodo de tiempo. Todos los datos han sido analizados a nivel mensual.

### 4. Resultados

Nuestros resultados son preliminares pero confirman que el gasto en publicidad influye positivamente sobre el valor de la empresa, en consistencia con trabajos anteriores, y además sugieren que las decisiones sobre el mix de medios son importantes para el incremento del valor de la empresa. Así, cuando desagregamos el gasto en publicidad a través de los medios de comunicación empleados en una campaña, los resultados demuestran que la influencia de todos los medios sobre el valor de la empresa es diferente. En otras palabras, en promedio, algunos medios de comunicación parecen ser más apropiados que otros para aumentar valor de la empresa. En particular, se ha encontrado que la prensa es el medio más eficaz a la hora de generar valor para la empresa. Además, la eficacia de los medios se incrementa cuando estos se combinan con otros, gracias a la aparición de sinergias entre los medios que potencian su efecto sobre el valor de la empresa. Aquellas empresas que utilizan estrategias multimedia, combinando los tres medios analizados (prensa, radio y tv) consiguen que su publicidad tenga un mayor impacto sobre el valor de la empresa.

## RESUMEN:

*El rápido crecimiento de la tecnología móvil entre la población mundial ha llevado a muchas empresas a intentar aprovechar los dispositivos móviles como una herramienta de ventas. Este estudio compara algunos de los factores que determinan la aceptación del consumidor de los pagos móviles a través de SMS (Short Message Service), NFC (Near Field Communication) y QR (Quick Response). A partir del Modelo de Aceptación de Tecnología (TAM) se desarrolla un análisis multigrupo con un enfoque comparativo basado en la T-Student. Los resultados obtenidos en este estudio demuestran que hay diferencias en los factores que determinan la aceptación de cada uno de los sistemas, así como el nivel de la intención de uso. Por último, el trabajo muestra las principales implicaciones para la gestión y determina algunas estrategias para reforzar este nuevo negocio en el contexto de los nuevos avances tecnológicos.*

## PALABRAS CLAVE:

Mobile payment, SMS, NFC, QR, TAM, Intention to use.

Este estudio está siendo financiado con el apoyo financiero prestado por el proyecto de Investigación y Excelencia P10-SEJ-6768 de la Consejería de Economía y Ciencia de la Junta de Andalucía.

## 1. Introducción: Pagos móviles

En los últimos años, los dispositivos móviles como *smartphones*, PDAs (*personal digital assistants*), tabletas y ordenadores portátiles han sido utilizados para la transmisión de datos de todo tipo. Estos dispositivos también son cada vez más utilizados como herramientas facilitadoras de pagos de bienes y servicios a través de la transmisión de datos, conocidos como *mobile payments* o simplemente *m-payments*.

Según la Unión Internacional de Telecomunicaciones (UIT, 2013), el número total de suscripciones de teléfonos móviles alcanzó casi 7 mil millones a finales de 2012, lo que supone una penetración global del 95% (128% en los países desarrollados y el 89% en países en desarrollo). A la luz de estos datos, la mayoría de las empresas tecnológicas están centrando sus esfuerzos en aumentar el número de servicios disponibles en los mismos, incluyendo los pagos móviles.

Según el último informe publicado por el Banco Central Europeo (BCE), en 2013 en relación al número de transacciones de pago y su tipología en España en el año 2012, el 41,94% de las mismas se efectuaron mediante pagos directos, el 41,58% con sistemas de pago relacionados con las tarjetas bancarias, y el 14,60% mediante transferencias bancarias. Si revisamos la tendencia desde el año 2007, el sistema de pago que ha experimentado un mayor crecimiento ha sido el asociado a los medios de pago del tipo tarjeta con un crecimiento próximo al 25%, seguido de los pagos por transferencia bancaria con una variación positiva del 15,7% y, finalmente, los pagos directos (en efectivo) con un ascenso del 9,7%.

En lo que se refiere a los sistemas de pago más empleados en el mundo online, destacamos el liderazgo del pago con tarjeta bancaria (débito o crédito) con el 66,20%, el pago a través de PayPal con el 11,60% y el pago contra reembolso con el 10,70%.

**TABLA 1**

Evolución 2006-2012 del uso de medios de pago utilizados en compras por Internet (%)

Sistema de pago	2006	2007	2008	2009	2010	2011	2012
Tarjeta débito/crédito	48,30%	60,90%	54,00%	50,20%	64,60%	62,90%	66,20%
Contra reembolso	34,70%	25,70%	27,70%	29,10%	13,60%	11,30%	10,70%
Transferencia bancaria	13,40%	8,40%	11,70%	6,70%	9,20%	4,70%	3,90%
PayPal	1,30%	2,10%	4,50%	10,70%	5,00%	14,90%	11,60%
Tarjeta prepago	0,70%	0,00%	0,00%	0,00%	3,00%	7,20%	3,20%
Tarjeta del establecimiento	0,50%	0,40%	0,70%	0,10%	1,20%	1,00%	0,70%
Domiciliación bancaria	0,00%	0,60%	1,00%	1,80%	0,70%	1,30%	2,20%
Móvil	0,00%	0,20%	0,20%	0,00%	0,10%	0,10%	0,00%
Otros	0,80%	0,40%	0,00%	1,30%	1,00%	1,30%	2,00%
NS/NC	0,20%	1,20%	0,10%	0,10%	1,60%	1,30%	0,90%

Fuente: CMT (2013)

Como se observa en la tabla 1 los nuevos medios de pago han tenido un crecimiento considerable. Si bien es cierto que en el caso de Paypal el crecimiento que ha experimentado es notable, los pagos usando teléfonos móviles no se han consolidado en los últimos años. Según un reciente estudio de Mobile Life de TNS (2012) realizado en 58 países, el 15% de los usuarios españoles ha usado recientemente su móvil para comprar o buscar información previa a la compra, si bien es cierto que aún se encuentra a distancia de los sistemas de pago tradicionales.

A pesar de esta baja penetración como medio de pago, consideramos que estas tecnologías tendrán un crecimiento elevado, por diferentes motivos: en primer lugar, por la tasa de penetración que tiene la telefonía móvil en nuestro país próxima al 119% (CMT, 2013) y del 66% sobre el total de telefonía móvil en el caso de los teléfonos inteligentes o *smartphones* (comScore, 2013) lo que denota el elevado potencial con el que cuenta; en segundo lugar, por los diferentes intereses de los *stakeholders* de este negocio, tales como instituciones financieras, operadores de telefonía, proveedores de servicios tecnológicos, fabricantes, comerciantes y clientes (Liébana-Cabanillas et al., 2013); y, por último, por las diferentes ventajas que para las empresas y usuarios presenta este sistema de pago sobre otros sistemas de pago alternativos en Internet.

En general, cualquier actividad de carácter particular o empresarial en la que intervenga un soporte electrónico que permita la conexión a una red móvil para concluir con éxito una transacción económica (Liébana-Cabanillas, 2012) podrá ser considerada un pago móvil. Innopay (2013) clasifica los medios de pago móvil (MPM) de acuerdo con dos criterios: la proximidad y el modelo de negocio. Los pagos de proximidad se clasifican sobre la base de la ubicación física de un consumidor, por ejemplo, la proximidad en el mostrador de una tienda, o los pagos a distancia, como el pago en línea a través de un teléfono móvil. En segundo lugar, el modelo de negocio se caracteriza por las diferentes relaciones de consumo (*Peer to Peer –P2P–* o *Consumer to Consumer –C2C–*) o las relaciones entre empresas y clientes (*Business to Consumer, B2C*). En nuestra investigación analizaremos los MPM desde la perspectiva del B2C con la aplicación de las tres tecnologías principales sobre las que, tanto empresas como particulares, están centrando sus esfuerzos: los basados en SMS (*Short Message Service*), las comunicaciones de corto alcance o NFC (*Near Field Communication*) y los códigos QR (*Quick Response*). La primera de ellas (SMS) se caracteriza por ser a distancia, mientras que la segunda y tercera (NFC y QR) se consideran como de proximidad con el comercio.

El uso de SMS para el pago móvil requiere un protocolo de comunicación que permite el intercambio de mensajes cortos de texto entre dos dispositivos móviles (Valcourt et al., 2005); por otra parte, los pagos NFC se realizan con la presencia física en un comercio o ante un terminal compatible, en los que basta con acercarse al terminal móvil debidamente preparado y, finalmente, los códigos QR son sistemas de almacenamiento que utilizan una matriz de puntos o un código de barras bidimensional creado por Denso Wave que puede imprimirse o mostrarse en una pantalla y se interpretan por un lector especial (Denso Wave, 2000). En contraste con los sistemas de pago de SMS, tanto los pagos NFC y QR se hacen en persona en una tienda acercando el dispositivo móvil al receptor o realizando una lectura de un código en el comercio, la web de una empresa en una valla publicitaria, etc.

Dado el potencial de este nuevo mercado y la cantidad limitada de investigación científica publicada relevante, nuestro estudio pretende analizar los factores determinantes relacionados con la adopción de nuevas tecnologías o medios de pagos móviles (MPM), centrándose en los tres sistemas de pago anteriormente citados (SMS, NFC y QR). Para lograr este objetivo, hemos empleado el Modelo de Aceptación de Tecnología (TAM) para analizar los determinantes de la intención de uso de los nuevos MPM y contrastar las posibles diferencias que pudieran existir. A partir de los resultados de ajuste del modelo teórico propuesto, se aportan recomendaciones de índole empresarial para mejorar su adopción entre los potenciales usuarios mediante estrategias concretas.

## **2. La adopción de los sistemas de pago móvil: Hipótesis de la investigación.**

La mayoría de las investigaciones sobre adopción de servicios de pagos móviles o tecnologías móviles, se fundamentan en tecnologías ya existentes y en su uso posterior. El objeto de estudio de este trabajo compara los sistemas de pago QR, SMS y NFC en virtud de las relaciones previamente establecidas.

En resumen, el actual estudio propone que (1) las normas subjetivas pueden tener relación directa o indirecta sobre la intención de uso (2) la facilidad de uso determina la utilidad de las herramientas de pago y la actitud del usuario hacia las mismas, (3) la utilidad percibida del usuario potencial manifiesta una relación con la actitud y hacia la intención de uso de los MPM, y (4) la actitud hacia el nuevo sistema influye positivamente sobre el comportamiento futuro.

### **2.1. Normas subjetivas.**

Las influencias sociales en forma de normas subjetivas han sido empleadas en los modelos de aceptación de la tecnología y sus posteriores adaptaciones (Fishbein y Ajzen, 1975; Venkatesh y Bala, 2008), siendo definida como el grado por el cual un individuo percibe que las personas que son importantes para un individuo, piensan que éste debería usar un sistema o llevar a cabo una acción determinada (Fishbein y Ajzen, 1975; Venkatesh y Davis, 2000; Venkatesh y Bala, 2008). Este constructo se compone de dos factores subyacentes básicos, por una parte las creencias que el consumidor posee sobre las personas que considera de referencia, y de otra, la motivación que posee para comportarse de acuerdo a los deseos de dichas personas (Herrero et al., 2005). A partir de este planteamiento han sido muchos los autores que han identificado una relación positiva y directa entre las normas subjetivas y la facilidad de uso (Lu et al., 2005; Bhatti, 2007), la utilidad (Rouibah y Abbas, 2011; Zhang et al., 2011) y por supuesto sobre la intención de uso (Shih y Fang, 2006; Chung et al., 2012). Por tanto, se proponen las siguientes hipótesis:

*H1: Las normas subjetivas tienen un efecto positivo sobre la facilidad de uso del nuevo sistema de pago.*

*H2: Las normas subjetivas tienen un efecto positivo sobre la intención de uso del nuevo sistema de pago.*

*H3: Las normas subjetivas tienen un efecto positivo sobre la utilidad del nuevo sistema de pago.*

### **2.2. Facilidad de uso.**

La facilidad de uso se refiere a la percepción del individuo de que el empleo de un determinado sistema se encontrará libre de esfuerzo, o simplemente le resultará fácil su manejo (Davis, 1989), siendo por ello considerado uno de los atributos de mayor influencia en la adopción de una nueva tecnología. Para Davis et al. (1989), la facilidad de uso tiene un doble impacto; por una parte sobre la actitud, debido a la autoeficacia y la instrumentalidad, y por otro lado a través de la utilidad, como propone el TAM (Muñoz, 2008).

El efecto de la facilidad de uso percibida sobre la utilidad percibida se ha demostrado en múltiples investigaciones aplicadas a diferentes contextos (Aldás et al., 2011; Muñoz et al., 2012) así como la relación entre la facilidad de uso, actitud e intención (Chau y Lai, 2003; Hernández, 2010). Ante tales fundamentos se proponen las siguientes hipótesis:

*H4: La facilidad de uso del sistema de pago propuesto tiene un efecto positivo sobre la actitud hacia el mismo.*

*H5: La facilidad de uso del sistema de pago propuesto tiene un efecto positivo sobre la utilidad del mismo.*

### **2.3. Utilidad percibida.**

Según el TAM, la utilidad percibida es el grado en que una persona cree que el uso de un sistema en particular aumentará su eficacia y su rendimiento en el trabajo (Davis, 1993).

Diferentes investigaciones han demostrado como la utilidad mantiene una relación directa con la actitud (Wu y Chen, 2005; Muñoz et al., 2012), pero adicionalmente también con la intención de uso (Qi et al., 2009; Shin y Shin, 2011). En el contexto de nuestra investigación, entenderemos que la utilidad del sistema de pago influirá en la intención de uso a través de la actitud que mantiene el usuario hacia el sistema de pago, pero también de forma directa en virtud de los principios del TAM. Derivado de todo lo anterior se proponen las siguientes hipótesis:

*H6: La utilidad tiene un efecto positivo sobre la actitud hacia el sistema de pago propuesto.*

*H7: La utilidad tiene un efecto positivo sobre la intención de uso hacia el sistema de pago propuesto.*

#### **2.4. Actitud.**

Los estudios empíricos relacionados con la difusión de las innovaciones tecnológicas han ampliado el uso del modelo TAM para incluir a las actitudes, tal y como propone la Teoría de la Acción Razonada, TRA (Davis et al., 1989). Según Polatoglu y Ekin (2001) la actitud del cliente está compuesta por unas creencias sobre el objeto e importancia percibida de ese atributo en tomar la decisión a adoptar. En consecuencia, en los entornos online, se espera que la actitud facilite las transacciones y reduzca las barreras a la adopción de las relaciones de intercambio (Pavlou 2002a, 2002b) y en nuestro caso más concretamente que favorezca la intención de uso de los MPM (Schierz et al., 2010). En línea con los trabajos anteriores, se propone una relación similar en el caso de los nuevos sistemas de pago, objeto de esta investigación, estableciéndose, por tanto, la siguiente hipótesis:

*H8: La actitud hacia el sistema de pago propuesto tiene un efecto positivo sobre la intención de uso del mismo.*

### **3. Aspectos metodológicos.**

#### **3.1. *Ámbito de estudio y recogida de información.***

Para evaluar el modelo de comportamiento propuesto, se elaboraron tres cuestionarios auto-administrados que el usuario cumplimentaba tras la visualización de un vídeo explicativo de cada uno de los MPM. Además el cuestionario fue sometido a varias pruebas preliminares que verificaron su fiabilidad, total entendimiento y ausencia de errores en su cumplimentación.

Para el caso de los sistemas de pago SMS y QR empleamos un método de muestreo por cuotas en base a las características de los consumidores reflejados en la Encuesta sobre Equipamiento y Uso de Tecnologías de la Información y Comunicación en los Hogares del INE. La encuesta se realizó por primera vez entre enero y febrero de 2012 y, de nuevo, entre febrero y marzo de 2013. Las muestras asociadas a cada uno de estos medios de pago se compusieron de 287 y 168 encuestas válidas, respectivamente.

Para la encuesta del sistema de pagos NFC, se aplicó un muestreo no probabilístico por conveniencia. El estudio, se realizó entre julio y agosto de 2012, alcanzando un tamaño muestral final de 287 encuestas válidas.

#### **3.2. *Evaluación de la calidad de las escalas de medida utilizada.***

Las escalas de medida empleadas en el cuestionario se adaptaron a partir de investigaciones anteriores (véase Anexo 1). En concreto, las escalas utilizadas por Taylor y Todd (1995), Venkatesh y Davis (2008) y Schierz et al. (2010) fueron empleadas para medir las normas subjetivas acerca de los nuevos MPM. La escala de actitud hacia el uso la escala fue adaptada de

las investigaciones de Yang y Yoo (2004) y Schierz et al. (2010). La escala de utilidad percibida es una adaptación de la Bhattacharjee (2001), Van der Heijden (2003) y Schierz et al. (2010). La escala de facilidad percibida de uso fue adaptada de Bhattacharjee (2001), Davis et al. (1989), Taylor y Todd (1995), Venkatesh y Davis (2000) y Schierz et al. (2010). Por último, la escala de intención de uso fue adaptada de Davis (1989), Gefen et al. (2003), Venkatesh y Davis (2000) y Schierz et al. (2010).

Para comprobar la idoneidad de las escalas de medida se ha examinado su fiabilidad y validez a través de una serie de análisis tanto exploratorios (para los cuales se utilizó el programa SPSS 15.0) como confirmatorios (utilizándose AMOS 18).

### ***Análisis exploratorios.***

En primer lugar, para medir la fiabilidad de las escalas se utilizó el indicador *alpha* de Cronbach, considerando como valor de referencia 0,7 (Nunnally, 1978). En este caso todas las variables obtuvieron valores buenos o muy buenos ( $\alpha > 0,8$ ).

Posteriormente se procedió a realizar un Análisis de Componentes Principales para comprobar el grado de unidimensionalidad de las escalas. En este sentido se comprobó que el análisis era adecuado para las variables objeto de estudio, debido a:

- La proporción de la varianza que tienen en común las variables (a partir del coeficiente de Kaiser Meyer Olkin, KMO), superándose siempre el valor 0,5, considerando por tanto, que la adecuación muestral era correcta.
- La prueba de esfericidad de Barlett era significativa (sign.= 0,000), rechazando por tanto la hipótesis nula relativa a la ausencia de diferencias entre la matriz de correlaciones y la matriz identidad.
- Los coeficientes de correlación de la matriz de correlaciones anti-imagen fuera de la diagonal principal presentaba valores bajos.
- Por último, se verificó la existencia de altas comunales ( $> 0,5$ ) en las variables objeto de análisis, lo que implicaba que todas estaba muy bien representadas en el espacio de los factores y las cargas factoriales en los indicadores superaban el mínimo recomendado ( $R^2 > 0,5$ ).

Por tanto, se puede concluir que las escalas de medida presentaban una estructura unidimensional.

### ***Análisis confirmatorios.***

Para contrastar la validez convergente y divergente de las escalas se procedió a realizar un Análisis Factorial Confirmatorio (AFC) para cada uno de los grupos en que se dividió la muestra en base a la experiencia (análisis multigrupo). La validez convergente fue evaluada a través de las cargas factoriales de los indicadores. Se comprobó que los coeficientes eran significativamente distintos de cero, y además que las cargas entre las variables latentes y observadas eran altas en todos los casos ( $> 0,7$ ), una vez eliminada una de ellas del constructo facilidad de uso. Por tanto, se podía afirmar que las variables latentes explicaban de forma adecuada a las variables observadas (Del Barrio y Luque, 2012).

**TABLA 2**

Análisis de la fiabilidad compuesta (FC) y varianza extraída (VE)

Variable	Items	SMS			NFC			QR		
		$\alpha$	FC	VE	$\alpha$	FC	VE	$\alpha$	FC	VE
Normas subjetivas	3	0,92	0,92	0,79	0,93	0,93	0,82	0,91	0,92	0,8
Facilidad de uso	4	0,80	0,83	0,81	0,91	0,92	0,74	0,92	0,92	0,75
Utilidad percibida	4	0,92	0,93	0,76	0,87	0,88	0,65	0,88	0,88	0,65
Actitud	4	0,93	0,93	0,78	0,92	0,92	0,74	0,89	0,89	0,67
Intención de uso	3	0,94	0,94	0,83	0,93	0,93	0,82	0,94	0,91	0,78

Con respecto a la validez discriminante, se comprobó que las varianzas eran significativamente distintas de cero y que la correlación entre cada par de escalas no era superior a 0,8 (Flavián et al. 2004), lo que demuestra la existencia de cinco constructos individuales.

Nuevamente la fiabilidad de las escalas puede evaluarse a partir de una serie de indicadores extraídos del análisis confirmatorio (véase Tabla 2). Precisamente, la fiabilidad compuesta del constructo (FCC) y análisis de la varianza extraída (AVE) superaban el umbral utilizado como referencia: 0,7 y 0,5, respectivamente, así como otros indicadores de ajuste global para el modelo de medida (Del Barrio y Luque, 2012).

#### 4. Resultados.

##### 4.1 Modelo de ecuaciones estructurales

Una vez analizada la fiabilidad y la validez de las escalas de medida, se procedió a contrastar las hipótesis de investigación apoyadas en la revisión de la literatura. Para ello se desarrolló un modelo de ecuaciones estructurales multigrupo en función de cada uno de los tres MPM descritos anteriormente (SMS, NFC y QR), empleando el método de máxima verosimilitud con la técnica de remuestreo o *bootstrapping* (con 1.000 réplicas) por no cumplirse el supuesto de normalidad multivariante.

Antes de evaluar cada uno de los tres modelos con mayor profundidad y el examen de las diferencias entre ellos, se comprobó que el ajuste del modelo, evaluado a través de las medidas absolutas, incrementales y de parsimonia, era razonablemente bueno de acuerdo a los niveles recomendados por la literatura (Bollen, 1989; Lai y Li, 2005): RMSEA < 0,08 GFI y AGFI > 0,80, CFI y NFI > 0,90 (véase la Tabla 3).

**TABLA 3**

Análisis de la fiabilidad compuesta (FC) y varianza extraída (VE)

Coefficientes*	SMS	NFC	QR
RMSEA	0,06	0,06	0,07
X <sup>2</sup>	284,01	288,37	251,68
df	127	127	127
Bollen-Stine's p	0,00	0,00	0,00
NCP	157,00	161,37	124,69
GFI	0,90	0,87	0,86
AGFI	0,87	0,86	0,81
NFI	0,94	0,94	0,9
CFI	0,97	0,97	0,95
IFI	0,67	0,97	0,95

\*Nota: RMSEA, *root mean square error of approximation*; NCP, *noncentrality parameter*; RFI, *relative fit index*; GFI, *goodness-of-fit index*; AGFI, *adjusted goodness-of-fit index*; NFI, *normed fit index*; CFI, *comparative goodness of fit*; IFI, *incremental fit index*.

Para evaluar el modelo estructural se analizó la significación estadística de las cargas estructurales del modelo. Los resultados del análisis de ecuaciones estructurales así como los resultados de las hipótesis se muestran en la Tabla 4 y en la Figura 1.

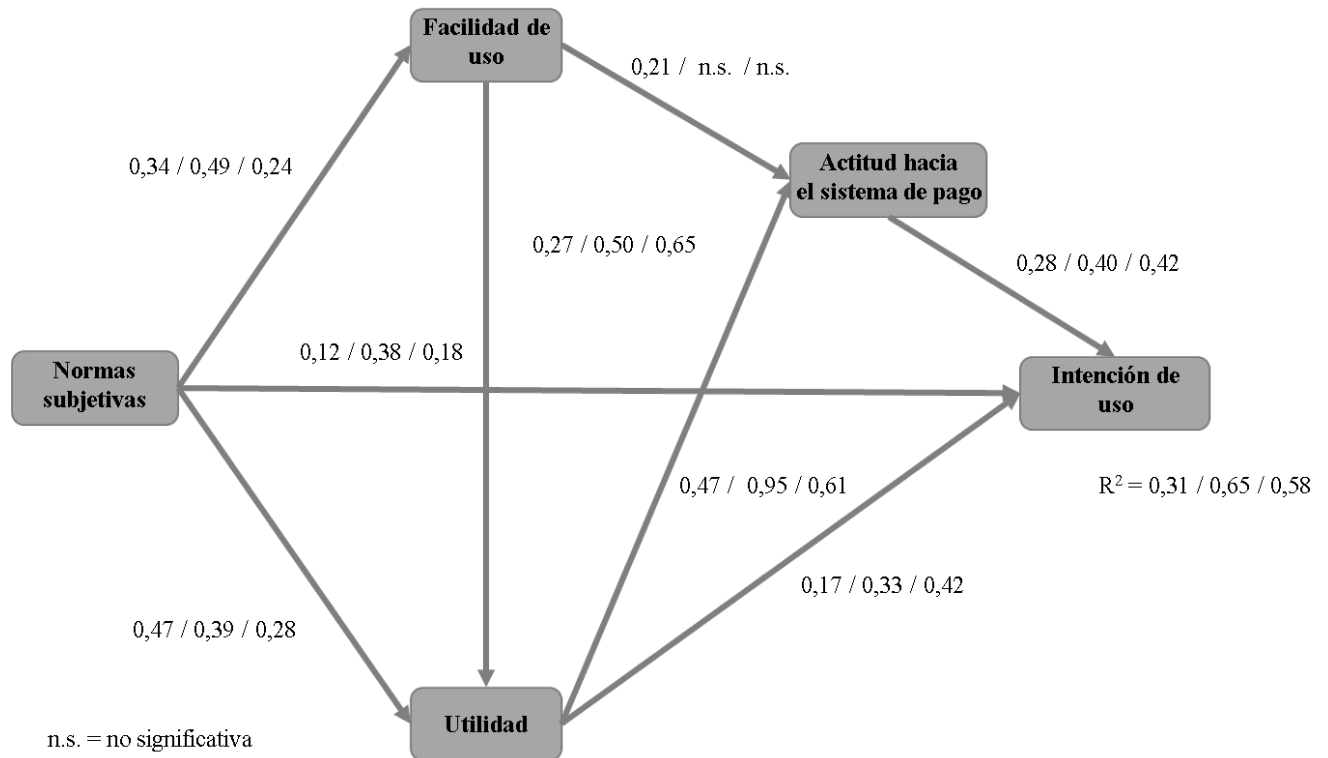

**TABLA 4**

Significación estadística de las cargas estructurales estandarizadas

Hipótesis	MPM	SMS			NFC			QR		
		$\beta_{sms}$	S.E.	Sig.	$\beta_{nfc}$	S.E.	Sig.	$\beta_{qr}$	S.E.	Sig.

**FIGURA 1**

Modelo de comportamiento (betas estandarizadas): SMS, NFC y QR

En primer lugar las hipótesis 1, 2 y 3 derivadas de las normas subjetivas no pudieron ser rechazadas ( $p < 0,001$ ). En este caso, las normas subjetivas presentan una influencia directa y positiva sobre la facilidad de uso ( $\beta_{sms} = 0,34$   $p < 0,001$ ;  $\beta_{nfc} = 0,49$   $p < 0,001$ ;  $\beta_{qr} = 0,24$   $p < 0,001$ ), sobre la intención de uso ( $\beta_{sms} = 0,12$   $p < 0,001$ ;  $\beta_{nfc} = 0,38$   $p < 0,001$ ;  $\beta_{qr} = 0,18$   $p < 0,001$ ) y sobre la utilidad ( $\beta_{sms} = 0,47$   $p < 0,001$ ;  $\beta_{nfc} = 0,39$   $p < 0,001$ ;  $\beta_{qr} = 0,28$   $p < 0,001$ ). Estos resultados son congruentes con los obtenidos por las investigaciones comentadas en los anteriores apartados.

En segundo lugar, las hipótesis derivadas del efecto de facilidad de uso (hipótesis 4 y 5) no pudieron ser rechazadas categóricamente. La relación entre la facilidad de uso percibida y actitud sólo pudo ser corroborada en el caso del sistema SMS ( $\beta_{sms} = 0,21$   $p < 0,001$ ;  $\beta_{nfc} = -0,07$   $p > 0,001$ ;  $\beta_{qr} = -0,01$   $p > 0,001$ ), mientras que se rechazaba en los otros dos casos. Estos resultados demuestran que los usuarios dan menos importancia de lo que la literatura sugiere a la relación entre la facilidad de uso percibida y la actitud (Lorenzo et al., 2011) y se presta mayor importancia a la utilidad percibida como un factor de uso previsto.

En tercer lugar, la relación entre la utilidad y la actitud e intención en las hipótesis 6 y 7 tampoco puede ser rechazada en ninguno de los casos propuestos. En este caso, la utilidad que los consumidores confieren al sistema de pago móvil tendrán un efecto directo tanto sobre su actitud hacia él ( $\beta_{sms} = 0,47$   $p < 0,001$ ;  $\beta_{nfc} = 0,95$   $p < 0,001$ ;  $\beta_{qr} = 0,61$   $p < 0,001$ ) como sobre la intención de utilizarla en el futuro ( $\beta_{sms} = 0,17$   $p < 0,10$ ;  $\beta_{nfc} = 0,33$   $p < 0,001$ ;  $\beta_{qr} = 0,42$   $p < 0,001$ ). Estas relaciones implican una relación directa y positiva entre el valor percibido de estos medios de pago y la actitud del usuario y la intención hacia su uso.

Finalmente, la hipótesis 8, que se refiere a la mejora de la intención de uso a partir de una actitud favorable hacia el sistema de pago y su uso previsto, no pudo ser rechazada ( $\beta_{sms} = 0,28$ ,  $p < 0,001$ ;  $\beta_{nfc} = 0,40$ ,  $p < 0,001$ ;  $\beta_{qr} = 0,42$   $p < 0,05$ ). Siguiendo la investigación de Ajzen y Fishbein (1980) y otros estudios posteriores, la actitud favorable del consumidor hacia una propuesta de instrumento de pago móvil mejorará la intención de adoptarlo. Aunque es difícil definir la actitud de un usuario potencial debido a la multidimensionalidad del constructo, esta relación se ha demostrado en investigaciones anteriores relacionada con la compra a través de los móviles (Aldás-Manzano et al., 2008), o con los sistemas de pago móviles (Shin, 2009; Liébana-Cabanillas et al., 2014), entre otros.

#### **4.1 Comparación de modelos**

Para demostrar la existencia de un modelo común para los tres sistemas de pago (SMS, NFC y QR) después de haber sido evaluados, se compararon los coeficientes de regresión o pesos en pares entre los modelos estructurales utilizando una versión modificada de la prueba T-Student para muestras independientes (Goodman y Blum, 1996; Chin, 2000).

Los resultados revelaron diferencias significativas (significación entre 0,01 y 0,05) en las relaciones entre ciertas variables de los tres modelos estructurales (véase la Tabla 5). Con respecto a la comparación entre los modelos NFC y SMS, las diferencias son especialmente pronunciadas en las relaciones existentes entre las normas subjetivas y la intención de uso (diferencia = -2,58,  $p = 0,00$ ), la facilidad de uso y la actitud (diferencia = 5,28,  $p = 0,00$ ), la facilidad de uso percibida y la utilidad percibida (diferencia = -2,70,  $p = 0,01$ ), y, finalmente, la utilidad percibida y la actitud (diferencia = -3,91,  $p = 0,00$ ). Las mayores diferencias se encuentran entre la facilidad de uso y la actitud, y entre la utilidad y la actitud percibida. Por tanto, la facilidad de uso tiene un peso más importante en la adopción de un sistema de pago por SMS debido a su fuerte relación con la actitud, mientras que la norma subjetiva y percepción de utilidad indican una mayor relevancia con el sistema de pago NFC, debido a su impacto en la actitud y la intención.

**TABLA 5**

Diferencias en los coeficientes no estandarizados de los modelos SMS, NFC, QR

	SMS-NFC	T (SMS-NFC)	Sig.	SMS-QR	T(SMS-QR)	Sig.	NFC-QR	T(NFC-QR)	Sig.
H1	-0,07	-0,79	0,43	0,10	1,06	0,29	0,17	<b>2,00</b>	<b>0,05</b>
H2	-0,26	<b>-2,86</b>	<b>0,00</b>	-0,06	-0,65	0,51	0,20	<b>2,03</b>	<b>0,04</b>
H3	0,09	1,14	0,25	0,20	<b>2,14</b>	<b>0,03</b>	0,11	1,20	0,23
H4	0,55	<b>5,28</b>	<b>0,00</b>	0,48	<b>5,39</b>	<b>0,00</b>	-0,06	-0,57	0,57
H5	-0,23	<b>-2,70</b>	<b>0,01</b>	-0,38	<b>-3,16</b>	<b>0,00</b>	-0,15	-1,14	0,25
H6	-0,48	<b>-3,91</b>	<b>0,00</b>	-0,14	-1,48	0,14	0,34	<b>2,51</b>	<b>0,01</b>
H7	-0,17	-1,29	0,20	-0,26	-1,56	0,12	-0,09	-0,49	0,62
H8	-0,12	-1,06	0,29	-0,14	-0,66	0,51	-0,02	-0,10	0,92

En la comparación entre los modelos de QR y SMS, también se descubrieron diferencias significativas, esta vez entre la norma subjetiva y la percepción de utilidad (diferencia= 2,14, p = 0,03), entre la facilidad de uso y la actitud la facilidad de uso (diferencia = -5,39, p = 0,00), y entre la facilidad de uso y utilidad percibida (diferencia = -3.16, p = 0,00). En esta ocasión las mayores diferencias se presentaron en las relaciones entre la facilidad de uso y la utilidad, siendo mayor en el caso de los sistemas de pago QR.

Finalmente, en la comparación entre los modelos para el caso del MPM NFC y el basado en QR, se observaron diferencias significativas en la relación entre las normas subjetivas y la facilidad de uso percibida (diferencia = 2,00, p = 0,05), entre las normas subjetivas y la intención de uso (diferencia= 2,03, p = 0,04) y entre la utilidad percibida y la actitud (diferencia = 2,51, p = 0,01). En esta última comparación las mayores diferencias se originan en la relación utilidad y actitud, con mayor fuerza en el caso de los sistemas de pago NFC.

### 5. Conclusiones e implicaciones para la gestión.

Si bien existen numerosos estudios que analizan la aceptación de las nuevas tecnologías, nuestra investigación es novedosa desde una doble perspectiva. En primer lugar, se presenta un análisis comparativo de los tres MPM principales utilizados en la actualidad por usuarios y empresas a nivel internacional y, en segundo lugar, esta investigación se llevó a cabo en un país en el que las tres tecnologías tienen un nivel de penetración incipiente, por lo que los resultados tendrán aplicaciones prácticas actualmente y en un futuro próximo.

El objetivo principal de esta investigación es analizar la aceptación del consumidor de los sistemas de pago móviles SMS, NFC y QR desde un punto de vista percibido, tratando de modelizar cuáles son sus factores constitutivos. En este sentido, los modelos explican la variación de la intención de uso en el 31,7%, 65,3% y 57,9%, respectivamente. Los resultados del estudio son consistentes con los de la literatura, a saber, que el TAM original vuelve a ser un modelo robusto y parsimonioso para el estudio de los MPM. En nuestro caso todas las relaciones del modelo de TAM se verifican en los tres sistemas, excepto la relación entre la facilidad de uso y la actitud en los sistemas de pago NFC y QR. Esto puede ser debido a la alta adopción por los usuarios de terminales móviles y a que entre los usuarios de la muestra no se plantean dificultades destacables en el manejo de estas herramientas, y, en consecuencia, la eliminación de inconvenientes para su adopción. Sin embargo, hay diferencias en los tres modelos en la definición final de la intención de uso del usuario potencial.

Por otro lado, vale la pena señalar que las diferencias detectadas entre los tres medios de pago analizados refuerzan la idea de que el comportamiento del consumidor difiere dependiendo del tipo de sistema de pago móvil, como se observa a través de la diferencia en la intensidad en las relaciones de las variables. En nuestro caso, hemos observado diferencias en los niveles entre

las normas subjetivas y facilidad de uso, normas subjetivas e intención de uso, normas subjetivas y utilidad percibida, facilidad de uso y actitud, facilidad de uso y utilidad percibida y utilidad percibida y actitud. En consecuencia, las únicas relaciones que no mostraron diferencias significativas fueron las existentes entre utilidad percibida e intención de uso y entre actitud hacia el sistema de pago e intención de uso. Esto nos sugiere que las normas subjetivas, la facilidad de uso y la utilidad son determinantes clave de la intención, aunque se presentan con diferente intensidad dependiendo del MPM.

Desde una óptica gerencial debemos destacar la importancia que suponen estos sistemas de pago en la sociedad actual, aunque será el dinamismo de los sistemas, la globalización, el perfil de los clientes y los competidores los que definirán el escenario futuro de los MPM. En virtud del análisis efectuado, el sistema de pago que ha manifestado una mayor intención de uso ha sido el NFC, seguido por el QR y finalmente por el SMS. Curiosamente los sistemas de pago más novedosos atraen en mayor porcentaje a los usuarios, lo que nos sugiere que las empresas deban de facilitar a los usuarios los sistemas de pago más novedosos para mejorar su adopción junto con la evaluación de la utilidad, actitud y normas subjetivas.

Como la mayoría de trabajos de investigación, éste presenta una serie de limitaciones que deben ser debatidas y de las que pueden derivarse futuras líneas de investigación. En primer lugar, al tratarse de un estudio comparativo en un país, somos conscientes de que el alcance del estudio es nuestra principal limitación. No obstante, consideramos que los resultados pueden generalizarse a países con un perfil similar al español e incluso realizar un análisis *cross-cultural* con el objetivo de verificar los resultados y analizar posibles diferencias entre países o regiones. Finalmente, con respecto al método de recolección de datos, se ha desarrollado una investigación de corte transversal lo cual impide analizar la evolución del comportamiento de los usuarios a lo largo del tiempo. Un enfoque longitudinal permitiría comprobar la robustez los efectos de las variables moderadoras analizadas a lo largo del tiempo. Por último, tan solo hemos valorado las variables propias del TAM por lo que futuras investigaciones podrían incluir nuevas variables e incluso analizar el efecto moderador de algunas variables como el género, la edad o la experiencia del participante.

## Anexo 1: Escalas empleadas

<b>Variable</b>	<b>Escala</b>
<b>Normas subjetivas</b>	La gente cuyas opiniones valoro aprobaría que utilizara el MPM para comprar algún producto
	La mayoría de personas a las que tengo en cuenta piensan que debería utilizar el MPM para comprar algún producto
	Las personas cercanas a mi estarían de acuerdo con que utilizara el MPM para comprar algún producto
<b>Facilidad de uso</b>	La interacción con la herramienta es clara y comprensible
	La interacción con la herramienta no requiere un esfuerzo mental
	Me parece que es fácil que la herramienta haga lo que quiero que haga
	En general la herramienta es fácil de usar
<b>Utilidad percibida</b>	Usar el MPM puede ayudarme a realizar las compras
	Usar el MPM puede incrementar mi eficacia a la hora de realizar compras
	Usar el MPM para mis compras en Internet puede incrementar mi productividad
	En general, los MPM pueden ser útil para mí a la hora de realizar mis compras
<b>Actitud</b>	Utilizar el MPM para realizar mis compras es una idea que... Me disgusta - Que me gusta
	Utilizar el MPM para realizar mis compras es una idea que... Absurda - Inteligente
	Utilizar el MPM para realizar mis compras es una idea que... Aburrida - Interesante
	Utilizar el MPM para realizar mis compras es una idea que... Desagradable - Agradable
<b>Intención de uso</b>	Asumiendo que tuviera acceso al MPM, tengo intención de utilizarlo para realizar mis compras
	Si tuviera acceso al MPM durante los próximos meses, considero que la usaré, en lugar de otro sistema alternativo
	Suponiendo que tuviera acceso al MPM, la usaría en los próximos meses

# BRANDING IN INTERACTIVE MEDIA: BRAND CONNECTION PLATFORMS AND THEIR INFLUENCE ON CUSTOMER ENGAGEMENT AND BRAND IMAGE

## ABSTRACT

*Branding in digital worlds has become a critical issue and is shifting from a firm-focused management to a customer-focused one. This is especially relevant in brand connection platforms, which are designed to promote customers' value-creating activities. This research aims to explore whether the active role of customers in brand connection platforms (BCPs) influences brand image and customer engagement. Building on the stimulus-organism-response (S-O-R) framework, we also explore the role of emotions as the drivers of the customer perceptions in these platforms. Multivariate and SEM analyses are used to test the hypothesized relationships. Our results corroborate that, during the interaction with the platform, customers experience emotions that influence their engagement. Brand image mediates the effects of emotions and customer engagement on his/her purchase behavior.*

## KEYWORDS:

*Brand image, Customer engagement, emotions, brand connection platforms*

## 1. Introduction

Branding digitally has become a challenge for marketers as it has evolved from a firm-focused perspective to a customer-focused one, due to the influence of the Internet and the sophisticated platforms that have emerged. These *brand connection platforms* (BCPs) are described as focal touch points beyond purchase that allow individuals to integrate resources and co-create value between them and with the firm (Breidbach, Brodie, and Hollebeek, 2013; Sawhney, Verona, and Prandelli, 2005). These kinds of platforms specifically focus on facilitating customer-brand interactions, including a variety of cues that offer customers greater interaction possibilities and foster their collaboration, promoting commercial exchanges from a more social approach (Fiore, Jihyun and Hyun-Hwa, 2005; Varadarajan et al., 2010; Wang et al., 2007). Likewise, BCPs create value through relationships, facilitate user-generated contents and enrich the experience, determining customers' decisions (Kim, Ju, and Jonson, 2009; Malthouse and Hofacker, 2010; Prahalad and Ramaswamy, 2004). Managing a brand in these computed-mediated environments implies that different types of interactions need to be considered, due to their potential influence on the customer brand-related perceptions (Leeflang et al., 2014; Libai et al., 2010; Yadav et al., 2014). Thus, branding becomes a dynamic activity, meaning that the brand evolves because "the fact that consumers buy and use brands, and share their experiences with others implies a constant state of change" (Ind, Fuller and Trevail, 2012). Despite the interest of BCPs, most research on this topic has implicitly assumed their potential benefits for firms and customers, so it has not proposed models to understand how these benefits can be obtained through extrinsic, platform-related characteristics and their potential to foster intrinsic, customer-related mechanisms such as the emotions elicited during the experience in the platform. Moreover, few works have analyzed how interactions in these platforms contribute to develop customer engagement, which constitutes a key factor to understand customer participation and behavior in interactive media.

Customer engagement has attracted a lot of attention in the recent marketing literature, being highlighted as a new approach to capture customer value and a key concept to understand contemporary marketing and branding dynamics (Verhoef, Reinartz, and Krafft, 2010). However, and in spite of the relevant pioneering studies, empirical evidence about this concept is still in its infancy and theoretical conclusions are not definitive to-date. Several gaps need to be addressed. First, the relationship between customer engagement and branding has not been analyzed in the first stages of the customer lifecycle (i.e. customers' acquisition and first interactions with the firm through the BCPs). Research related to the topic has mainly addressed situations in which the customers already know the brand and have previously interacted with it, so some level of engagement has been developed. While the potential risks on reputation and loss of control for well-established brands have been already pointed out, the potential benefits of managing brands digitally for new or less known brands has not been addressed (Leeflang et al., 2014; Verhoef, Beckers and Van Doorn, 2013). Second, research on the topic has focused in the non-transactional consequences of engagement (e.g. Mollen and Wilson, 2010; Van Doorn et al., 2010) and has ignored the potential transactional consequences that it may have, such as the influence of engagement on purchase intentions. Consequently, it is necessary to gain a better understanding about the influence of customer engagement and brand image in the customer transactional responses.

The present research fills these gaps by examining how BCPs promote customer engagement with the firm and positive brand image during the first purchase experience. It focuses on the new power of customers in interactive media and considers the online purchase experience as a context in which customer can participate and interact with the firm and other customers, instead of its mere consideration as a transactional situation to acquire resources (see, for example, Vargo and Lusch, 2004, 2008a). We explore two specific cues included in BCPs: (1) customer to customer interactions-related cues (C2C interactions-related cues), and (2) personalization-related cues. C2C interactions-related cues empower customers by allowing them to access to more information about the firm, the offering and previous experiences of other customers. Personalization-related cues enable customers to interact with the firm and design their own offering (Bendapudi and Leone, 2003; Etgar, 2008). Both kinds of cues serve as environmental prompts of the possibilities offered by the platform, promote the collaboration of customers and generate meaningful experiences, forming the starting point of behavioral processes (Wang et al., 2007).

Our objective is threefold. First, we analyze the existing relationship between customer engagement and brand image in BCPs, testing their effects in the customer purchase behavior. Customer engagement with the firm and brand image are developed from the first interactions in BCPs and are crucial for setting up long-lasting relationships and encouraging purchase behavior. Second, we empirically study whether cues included in BCPs improve customer engagement with the firm and brand image during the purchase experience. Third, we explore the influence of emotions elicited in BCPs on the customer non-transactional (i.e. customer engagement and brand image) and transactional (i.e. purchase intentions) responses. These objectives are addressed in the following research questions:

*RQ1: ¿Is there any relationship between entre customer engagement with the firm and brand image in brand connection platforms (BCPs)?*

*RQ2: How brand connection platforms influence customer engagement with the firm and brand image?*

*RQ2a: Which extrinsic factors influence customer engagement and brand image?*

*RQ2b: Which intrinsic factors influence customer engagement and brand image?*

*RQ3: ¿Does customer engagement with the firm and brand image influence purchase behaviour in brand connection platforms?*

We carry out two studies based on the Stimulus-Organism-Response (S-O-R) model (Merahblian and Russell, 1974). Study 1 adopts an experimental approach to analyze, on the one hand, the relationship between customer engagement with the firm and brand image in BCPs and, on the other, whether the mere exposure to certain cues in BCPs elicits positive customer responses related to his/her relationship with the firm and brand. Study 2 employs structural equations modelling (SEM) techniques to verify customer engagement and brand image relationship, check their influence on purchase intentions and explore the importance of the emotions elicited during the customer's interaction with the platform. Our findings contribute to the academic research in three ways. First, we provide insights into the relationship between customer engagement with the firm and brand image in BCPs, studying their pivotal role to improve customer purchase intentions. Second, we address the effect of cues included in BCPs to strengthen the customer engagement with the firm and brand image. Third, we demonstrate the role of emotions elicited in BCPs as intrinsic drivers of non-transactional and transactional customer responses beyond this context. Overall, the present research shows what the firm should manage in its BCP and what decisions have their roots in the individuals, resulting in behavioral changes. .

## **2. Brand image and customer engagement with the firm in BCPs**

The importance of branding in contemporary marketing has been highlighted in research from 1990s, specifically in the relationship marketing paradigm, which is focused on the influence of brand strategy on customer-firm relationships. Aspects related to how customers internalize brand information that the firm makes available to them have been broadly analyzed (Kapferer, 1992; Keller, 1993). In this regard, brand equity models (Aaker, 1996; Keller, 1993) reveal the importance of brands to create value and reflect the social image that the consumer desires, demonstrating that they can satisfy customer's symbolic and *internally* generated needs, such as self-enhancement and self-identification (Park et al., 1986). Overall, this research considers that the firm defines brand identity and transmits it to the customer during a dyadic process (Payne et al., 2009).

In recent years, academics are intensifying the attention directed towards understanding brand meaning and value, which is modifying the branding process logic (Schouten et al., 2007; Merz et al., 2009). The conceptualization of brand as a firm-provided attribute is no longer applicable, emerging a new brand logic that states the premise that brand value is co-created and built on experiences between the firm and its stakeholders (Payne et al., 2009; Vallaster and Von Wallpach, 2013). Branding has therefore shifted to a "collaborative, value co-creation activity of firms and all of their stakeholders" (Merz et al., 2009, p.329). Customers buy and use brands adopting an active role, so they collaborate with the firm and share their experiences with others through the variety of interactions that they are

able to establish. Likewise, instead of dyadic relationships, they form network relationships with brands, which imply interesting challenges for brand meaning creation and management (Aggarwal, 2004; Payne et al., 2009). In accordance to this, studies related to brand communities have shown how brand attributes and meanings are constructed dynamically through social interactions and have corroborated that brand value resides on the customers' and other interest groups' experiences with the brand (Schau, Muñiz, and Arnould, 2009; Vallaster and Von Wallpach, 2013). Consequently, traditional branding concepts should be revised (Arnould et al., 2006) and focused on brand experiences, consumer interactions and collaborative participation (Keller and Lehmann, 2006).

Brand image has achieved great relevance for managers in order to manage and design brand-related strategies. According to the *Associative Network Theory*, brand image is defined as a mental scheme formed by several concepts interconnected by linkages and associations (Anderson, 1983; Morrin, 1999; Martinez and Pina, 2009). Brand image symbolizes customer brand knowledge, it is developed from the first customer-firm interaction, and depends on his/her own experiences. It provides consumers with a meaning for the brand, differentiating the firm's offering from competition and forming affect-oriented relationships (Padgett and Allen, 1997). When the customers' mental scheme is coherent with the existing, firm-determined associations, customers will assimilate brand image with no significant alterations. On the contrary, if results substantially differ from the initial scheme, customers' perceived brand image changes and adapts to the new associations (Park et al., 1993). These adaptation or assimilation processes act as an *anchor* that influences customer behavior, adjusting to the new information and interactions. According to the latest trends on branding, brand image is also turning from a firm-determined aspect to an increasingly networked approach. Thereby, it refers not only to pieces of information that consumers hold about a particular brand from the results that they have obtained (Grohs and Reisinger, 2014) but also to the knowledge that other customers create and the experiences about the brand that they share. Brand image is an evolving concept that should be defined from a multi-dimensional perspective and contingent on the community experiences and the existing customer-customer and customer-firm relationships. In this context, customer engagement with the firm emerges as a key concept to understand customer's participation and brand image created through social interactions and experiences (Brodie et al., 2011).

Nowadays, customer engagement is taking a prime role in the marketing literature and is considered a driving force in contemporary consumer behavior research (Gambetti and Graffigna 2010). It has been posited as a central factor to describe individuals' specific interactions and contributes to understanding new dynamics related to customer experiences, post-purchase behavior and customer retention (Bowden 2009; Brodie et al. 2011b; Van Doorn et al. 2010). As can be observed in the literature, different subforms of engagement have recently emerged: customer engagement (Bijmolt et al. 2010; Brodie et al. 2011a; Verhoef, Reinartz and Krafft 2010; Vivek 2009), online customer engagement (Mollen and Wilson 2010), customer brand engagement (Hollebeek 2010, 2011a,b, 2012), customer engagement behavior (Van Doorn et al. 2010; Verleye et al. 2013), brand engagement (Sprott, Czellar and Spangenberg 2009) and advertising engagement (Calder, Malthouse and Schaedel 2008, 2009; Phillips and McQuarrie 2010). Some definitions stress emotional aspects (Hollebeek 2011; Mollen and Wilson 2010; Vivek 2009), while others take a behavioral approach (Bijmolt et al. 2010; Van Doorn et al. 2010). Despite the great interest of this concept, research on customer engagement is still fragmented, being no consensus regarding the conceptualization and dimensions of the concept.

We focus on customer engagement with the firm in interactive media such as BCPs. This concept is closely related to other marketing concepts but goes beyond them to reflect the importance of "interactive and co-creative experiences" (Brodie et al., 2011). Customer engagement is defined as a highly interactive concept, usually characterized as an individual's psychological state resulting from the interactions between a focal engagement subject (e.g. the customer) and an object (e.g. brand, product or firm) (Brodie et al. 2011a; Hollebeek 2013). We propose that it should be approached from an attitudinal perspective since it addresses emotional relationships that may result in transactional and non-transactional customer behaviors (Hollebeek, 2013). Moreover, it is highlighted that customer engagement has a contextual-dependent nature and is particularly relevant for understanding consumer experiences in technology-mediated environments (Bowden, 2009; Hollebeek, 2011; Mollen and

Wilson, 2010; Sawhney, Verona, and Prandelli, 2005). Consistent with Brodie et al. (2011a) and Mollen and Wilson (2010), we study BCPs as an online environment in which customer engagement with the firm may be encouraged, leading to meaningful relationships with the brand.

BCPs are developed by firms in order to support specific actor-to-actor interactions in the online environment, both customer-customer and customer-firm interactions. In contrast to traditional brand websites, they are geared to the co-creation process and promote customer active participation. Thereby, BCPs create a relaxed atmosphere through their interactive possibilities that aim to strengthen ties and go beyond the purchase. Following Wu and Fang (2010), we suggest that BCPs allow customers to actively participate and co-create their purchase experiences, which constitutes a relevant aspect in the engagement process. As a result of the positive co-creative experiences in the BCP, customers are engaged with the firm, increase their trust, and feel pride and passion for the brand (McEwen, 2001, 2004). Thus, the better brand experience customers enjoy, the more engaged they will be, and the more positive brand image they will perceive. Despite the importance of the relationship between engagement and brand perceptions, there are no studies that have empirically tested it in the first purchase context for new or less known brands (Leeflang et al., 2014; Verhoef, Beckers and Van Doorn, 2013). In this context, the customer has little information about and no relationship with the firm, so there is not other experience that conditions brand image. Considering that customer engagement with the firm is developed through interactive brand experiences in BCPs (Brodie et al., 2011), it is feasible to propose that positive brand image perceptions are a consequence of engagement development. We hypothesize the following relationship:

*Hypothesis 1: Customer engagement with the firm developed in the BCP positively influences brand image.*

### **3. Study 1: The role of extrinsic cues in BCPs**

#### ***3.1 Extrinsic antecedents: the role of cues in BCPs***

BCPs have been previously analyzed being defined in different ways, such as *engagement* platforms (Prahalad and Ramaswamy, 2004; Ramaswamy and Gouillart, 2010) or *connection* platforms (Malthouse and Hofacker, 2010). However, most definitions agree in considering visualization and dialogue as the two most prominent aspects to characterize them. Building on this, we consider the importance of including cues related to C2C interactions as a form of dialogue, and cues related to personalization, as a form of visualization (Ramaswamy and Gouillart, 2010). These cues can be considered a source of observational learning, so their mere presence influences customer decisions (Chen, Wang and Xie 2011; Libai et al., 2010). Furthermore, they offer interesting possibilities to integrate resources and to collaborate during the purchase, promoting customer value-creating activities and participation (Ramaswamy and Gouillart, 2010).

C2C interactions are defined as the active or passive interactions between customers during the purchase experience but also during pre- and post-purchase stages (Johnson and Grier 2011). They are closely related to customer social influence definition and encompass both verbal and non-verbal communications between customers that condition their preferences feelings and behaviors (Blazevic et al. 2013; Libai et al. 2010). BCPs promote online C2C interactions in two different ways. First, these platforms offer networking possibilities and foster interactions because customers can read other consumers' opinions, publish their own contributions and create new content, increasing customer connectivity and participation (Blazevic et al., 2013; Hennig-Thurau et al. 2010; Libai et al. 2010; Bolton et al., 2013). Second, BCPs provide opportunities for customers to see and learn from other customers' behavior (Chen, Wang and Xie 2011; Libai et al., 2010; Zhang 2010). Most of research in interactive media has focused on the former way, analyzing the effect of active interactions on aspects such as customer choices and sales (Libai et al., 2010). Nevertheless, how the mere customer exposure to C2C-related cues may influence customer behavior has been underexplored.

We focus on the role of C2C interactions-related cues in BCPs, as they serve as a signal of other customers' actions and behavior (Chen, Wang and Xie 2011; Libai et al., 2010). These cues reduce the problem of the lack of physical presence inherent to interactive media and elicit social responses that may condition consumers' behavior (Adjei et al., 2010; Moon, 2000; Trusov et al., 2009). Moreover,

exposure to C2C interactions-related cues may foster customer participatory behavior and generate more positive attitudes towards the firm and the brand (Berger and Fitzsimons 2008). Specifically, C2C interactions-related cues have been considered important to achieve “compelling engagement experiences” (Ramaswamy 2009) since they are one of the conceptual foundations of customer engagement (Lusch and Vargo 2010). According to Van Doorn et al. (2010), customer engagement results from motivational drivers like word-of-mouth and C2C interactions. We propose that C2C interactions-related cues constitute a source of connection for customers with other customers and with the firm, as the interactions that they can observe in the BCP makes them feel acknowledged and empowered, increasing their satisfaction with the experience. This satisfaction may result in tighter bonds with the firm, which improves customer engagement and brand image (Pralhad and Ramaswamy 2004b; Van Doorn et al. 2010; Brodie et al., 2011a; Ballantyne and Varey 2006; Wang et al., 2007). We hypothesize the following relationships:

*H2a. C2C interactions-related cues positively influence customer engagement with the firm in BCPs.*

*H2b. C2C interactions-related cues positively influence the brand image in BCPs.*

Personalization has been studied in various academic fields but there is still some confusion among researchers about what the term actually means (Kwon and Kim, 2012; Sunikka and Bragge, 2012). In the marketing arena, Vesanen (2007) proposes that personalization is a broad concept that encompasses execution, marketing outputs in the form of products/services, promotion/communication, price and delivery, and the creation of value for both the customer and the marketer. This concept implies the customers’ capacity for designing the offering that they are going to purchase, which has also been called co-design.

The inclusion of personalization-related cues in BCPs promotes customer participation in the purchase experience since they encourage the tailoring of each choice to his/her own preferences and the recognition of individualized needs (Füller and Matzler, 2007). Possibilities to design a product or service allows customers to obtain more information, open the black box of consumption, and anticipate the potential value derived from the future use of the offering, although they do not have direct contact with it. Moreover, according to Norton and Ariely (2007), customers value the offering they can produce more than the offering the firm supplies, even when the latter is objectively higher in value. Consequently, personalization cues also act as a source of observational learning and their mere presence may improve customer evaluations, which conditions his/her relationship with the firm and Brand perceptions (Pralhad and Ramaswamy, 2004). We propose that personalization-related cues included in BCPs improve brand image and the development of customer engagement with the firm (Cheung and To, 2011; Mohr and Bitner, 1991). If the BCP provides customers with cues to facilitate decision-making and to collaborate in the elaboration of the offering that they may purchase, they will perceive that they are taking an active role in the experience and are powerful actors (Bendapudi and Leone, 2003; Prahalad and Ramaswamy, 2004a). These cues give customers a better knowledge of the product and the firm, increase their loyalty beyond a transactional focus and build positive outcomes for their relationship with the firm and the brand (Auh et al., 2007; Bendapudi and Leone, 2003; Brodie et al., 2011a). Thus, we hypothesize the following relationships:

*H3a. Personalization-related cues positively influence customer engagement with the firm in BCPs.*

*H3b. Personalization-related cues positively influence the brand image in BCPs.*

Personalization has advanced greatly in conjunction with the evolution of interactive marketing (Lee et al., 2012), since implementing the possibility of personalizing the offering requires an environment that is information-rich and well-suited to the interactions between customers and with the firm (Malthouse and Hofacker, 2010; Montgomery and Smith, 2009). In this sense, C2C interactions-related cues benefit consumer decision-making and promote a more personalized marketing strategy. They permit the collection of information and expertise from other customers, cultivating an environment suitable for personalization activities (Auh et al., 2007; Montgomery and Smith, 2009; Yadav and Varadarajan, 2005). Moreover, observational learning derived from C2C interactions-related cues contribute to minimizing the information overload in online environments and the negative effects of an increasing variety of options that entail personalization strategies. C2C interactions-related cues allow customers to access and provide more pertinent data with less effort

and, hence, they receive personalized value in terms of services and information (Lee et al., 2012; Miceli et al., 2007; Montgomery and Smith, 2009).

Following these ideas, we propose the importance of the presence of both kinds of cues in BCPs for two reasons. First, C2C-interactions related cues reduce the uncertainty and complexity related to personalization cues, diminishing perceived risk and improving customer attitude. Second, the exposure to social information provided by C2C interactions-related cues is an important support for customers to also interact with the firm and personalize his/her product. Consequently, we hypothesize that the interplay between personalization and C2C interactions-related cues increase customer engagement and brand image during the purchase experience.

*H4a. The interplay of personalization-related cues and C2C interactions-related cues in BCPs increases customer engagement with the firm.*

*H4b. The interplay of personalization-related cues and C2C interactions-related cues in BCPs increases brand image.*

### **3.2 Instrument and experimentation process**

To test our hypotheses, an online platform was designed and a purchase situation simulated. The experimental design used was two-way factorial between subjects: two levels of C2C interactions-related cues (high and low) and two levels of personalization-related cues (high and low). First of all, the participant was requested to fill in a short online questionnaire which contained control variables related to individual features that could affect the further development of the experiment and the participant's subsequent behavior. These control variables were (1) individual innovativeness and (2) his/her frequency of Internet access. Then, each participant was randomly assigned to one of the four experimental scenarios and seated in a separate booth, ensuring that no interaction between subjects was possible during the experiment (Franke et al., 2009). They were asked to buy a pair of sneakers, performing different activities depending on the scenario provided. In order to ensure the same conditions in each scenario for all the participants, they were told to read all the instructions from the screen and an extra instruction sheet was provided. Moreover, the online platform did not allow the participants to continue with the experiment unless all the instructions were followed. In this way, we made sure that all the participants were aware of the available cues provided in the experienced scenario and could properly evaluate the analyzed variables.

In the two scenarios with high personalization-related cues, participants had to design the sneakers they wanted to buy selecting the colors and patterns for different parts of the sneaker. On the contrary, in the two scenarios with low personalization-related cues, participants did not have these possibilities and they could only select the sneaker they wanted to buy from the gallery. Moreover, participants in the scenarios with high C2C interactions-related cues were asked to interchange messages and information through several tools: e-mail, forums and social networks. They were also asked to vote for the most beautiful sneaker and comment on the designs that other customers had uploaded in the "most viewed" gallery. C2C interactions and personalization-related cues were obtained from research on the topic and from practice carried out by firms in the virtual environment (Ramaswamy, 2008; Song and Zinkhan, 2008; Wang et al., 2007). Subsequently, the respondents in the four scenarios were redirected to a second online questionnaire about their perceptions and experience with the platform and the purchase they carried out.

### **3.3 Scales and sample**

Previous to data gathering, the scenarios were pre-tested with a convenience sample of 30 individuals in each scenario, in order to improve the platform design as well as to refine the manipulations used and the measurement scales. In the experimentation process, we gathered a sample of 196 university students aged between 20 and 38 (109 females), who participated voluntarily. We consider that a population sample based on university students is an adequate choice for our research purposes due to their intensive usage of the Internet and social media. At the end of the experiment, the participants received a refreshment voucher. The experiments were carried out in the university computer labs over a seven-week period during May and June, 2010.

Control variables were measured as follows: (1) individual innovativeness: “If I heard about a new information technology, I would look for ways to experiment with it” and “Among my peers, I am usually the first to try out new information technology”, measured with a 7-point Likert scale, the lowest perception being scored with 1, and (2) Internet frequency access: “How often do you access the Internet?”, measured with seven ordinal answers ranging from “Never or almost never” to “Several times per day”, measured with a 7-point Likert scale, the lowest perception being scored with 1. There were no significant differences in any of these variables between participants in the scenarios analyzed, indicating that the random assignment to the four experimental scenarios was successful.

In the second questionnaire, participants were asked to score the personalization and C2C interactions-related cues in order to check that the manipulations were adequate. Moreover, they should value their engagement with the firm and brand image. All the variables were measured on a 7-point Likert scale, the lowest perception being scored with 1, and the items included in the survey were adapted from prior research. Brand image scale gathers items which attempt to assess functional and affective attributes and benefits (e.g. Martinez and Pina, 2009; Weiss et al., 1999). For the customer engagement scale, Medlin and Green's (2009) employee engagement and Calder, Malthouse and Schaedel's (2009) scales has been taken into account to manifest the interactive nature of this construct and the importance of the individual's proactive role. Moreover, Sprott, Czellar and Spangenberg's (2009) scale of brand engagement in self-concept (BESC) has allowed us to include the emotional aspects of customers' self-identification and connection with the firm. Taking as the starting point the works of these authors, we designed parsimonious scales, focused in the interactive media. Because our study is focused on a fictitious company, the responses are not biased by previous opinions about the firm.

### ***3.4 Validation of the measuring scales***

The measurement model was evaluated on the basis of the result of a confirmatory factor analysis through Structural Equation Modeling (SEM), using the robust maximum likelihood estimation method and the statistical software EQS, version 6.1. (Bentler, 1995). This analysis purifies measures and reduces possible confusions in interpretation (Anderson and Gerbing, 1988). First of all, we checked the criteria proposed by Jöreskog and Sörbom (1993): weak convergence, strong convergence and the explanatory coefficient ( $R^2 < 0.5$ ) (Steenkamp and Van Trijp, 1991) and we progressively eliminated, one by one, the indicators which did not satisfy one or more of them. The fourth item of the brand image factor (BRAN\_4) was excluded, as they did not attain a sufficiently high  $R^2$ . A continuación, los análisis fueron repetidos, alcanzándose aceptable valores for all the indicators tested. The goodness-of-fit indices exceeded the optimal levels recommended by Hair et al. (1999): SB  $\chi^2 = 59.30$ , d.f. 26, NFI: 0.956, NNFI: 0.965, CFI: 0.975, IFI: 0.975, RMSEA: 0.08, SB  $\chi^2 / df = 2.27$ .

Measurement properties of the final model were evaluated in terms of reliability and construct validity, which implies both convergent and discriminant validity (Churchill, 1979; Gerbing and Anderson, 1988). The reliability of the scales was tested using the Composite Reliability Coefficient (CRC) and the Average Variance Extracted (AVE). In all cases, the results achieved overcome the recommended limit of 0.6 (Bagozzi and Yi, 1988) and 0.5 (Fornell and Larcker, 1981) respectively, so we can state that the items used in each scale are measuring the same factor. As for convergent validity, the standardized loadings were higher than 0.5 and they were also significant at the 99% confidence level (Steenkamp and Van Trijp, 1991). Discriminant validity of the measures was established by calculating the 99 per cent confidence interval of the latent factor correlation matrix and verifying that 1 was not included (Anderson and Gerbing, 1988). Moreover, we checked that the AVE for each construct exceeded the shared variance between the two factors (i.e. the squared correlation) and no correlation between factors surpassed 0.8 points (Fornell and Larcker 1981). After the performed analysis, we conclude that customer engagement and brand image measures obtained evidence of reliability and validity.

### ***3.5 Relationship between customer engagement and brand image***

In order to analyze the influence of customer engagement with the firm on brand image, we applied SEM and the robust maximum likelihood estimation method. The results of the model obtained good

fit indexes: SB  $\chi^2=59.3$ , d.f.= 26,  $p= 0.00$ ; RMSEA= 0.079; NFI= .956; NNFI= .965; CFI= .975; IFI= .975; SB  $\chi^2/ df=2.27$  .

We find that customer engagement with the firm positively influences brand image ( $\beta_1= .753$ ;  $p<0.01$ ), so we corroborate the significance of the relationship and verify H1. The explanatory power achieved by the model is 57%.

### **3.6 The influence of cues: manipulation checks and experimental results**

In order to test the adequacy of the manipulations, independent-means t-test analyses were performed. For the C2C interactions-related cues manipulation, the means are  $M_{\text{high C2C}}= 5.84$  and  $M_{\text{low C2C}}= 3.57$  ( $t_{194}= 10.868$ ,  $p< .001$ ,  $r=.61$ ), showing that this manipulation is successful. Similarly, the personalization-related cues manipulation means are  $M_{\text{highpersonalization}}= 5.92$  and  $M_{\text{lowpersonalization}}= 2.98$  ( $t_{194}= 13.168$ ,  $p< .001$ ,  $r=.68$ ). These results show both significant different means and effect sizes of the manipulations applied in the experiment.

As we are testing the effects of manipulated variables on several dependent variables, multivariate analysis of variance (MANOVA) is the most appropriate method (Hair et al., 1999). Considering the large sample size and the robustness of MANOVA to departures from multivariate normality (Swait and Adamowicz, 2001), violations of multivariate normality are not expected to be severe. Moreover, as MANOVA assumes linear relationships between dependent variables in each scenario, we plotted the dependent variables and obtained a clear indication of linear relationships. Correlations between the two dependent variables were also significant. The multivariate effects of the C2C interactions-related cues (Wilks'  $\lambda= 0.876$ ,  $F= 13.547$ ,  $p< .001$ ) and personalization-related cues (Wilks'  $\lambda= 0.935$ ,  $F= 6.631$ ,  $p< .05$ ) are both significant.

Follow-up univariate analyses were used to test our hypotheses. The univariate results for the influence of the C2C interactions-related cues reveal that there are significant main effects for both the customer engagement ( $F_{1,192}= 23.634$ ,  $p< .001$ ,  $\omega^2=.31$ ) and brand image ( $F_{1,192}= 21.601$ ,  $p< .001$ ,  $\omega^2=.29$ ) factors, which supports H2a and H2b.

The main effects for the influence of the personalization-related cues on the dependent variables were also significant for both customer engagement with the firm ( $F_{1,192}= 13.263$ ,  $p< .001$ ,  $\omega^2=.20$ ) and the brand image ( $F_{1,192}= 6.831$ ,  $p< .001$ ,  $\omega^2=.10$ ), corroborating H3a and H3b.

Regarding the interaction effects of the stimuli on the dependent variables, this effect was not significant for the customer engagement factor ( $F_{1,192}= 1.885$ ,  $p> .1$ ), rejecting H4a. However, interaction effect was significant for the brand image ( $F_{1,192}= 3.832$ ,  $p= .05$ ,  $\omega^2=.05$ ), so H4b is corroborated. This result highlights that the presence of both stimuli in the platform increases the brand image compared to the one obtained for the stimuli separately.

## **4. Study 2: The role of emotions in BCPs Methodology**

### **4.1 Intrinsic antecedents: the role of emotions in BCPs**

Having corroborated the importance of the platform cues in Study 1, Study 2 focuses on the role of emotions in BCPs as antecedents of customer engagement and brand image and the potential transactional consequences for the customer behavior (i.e. purchase intentions).

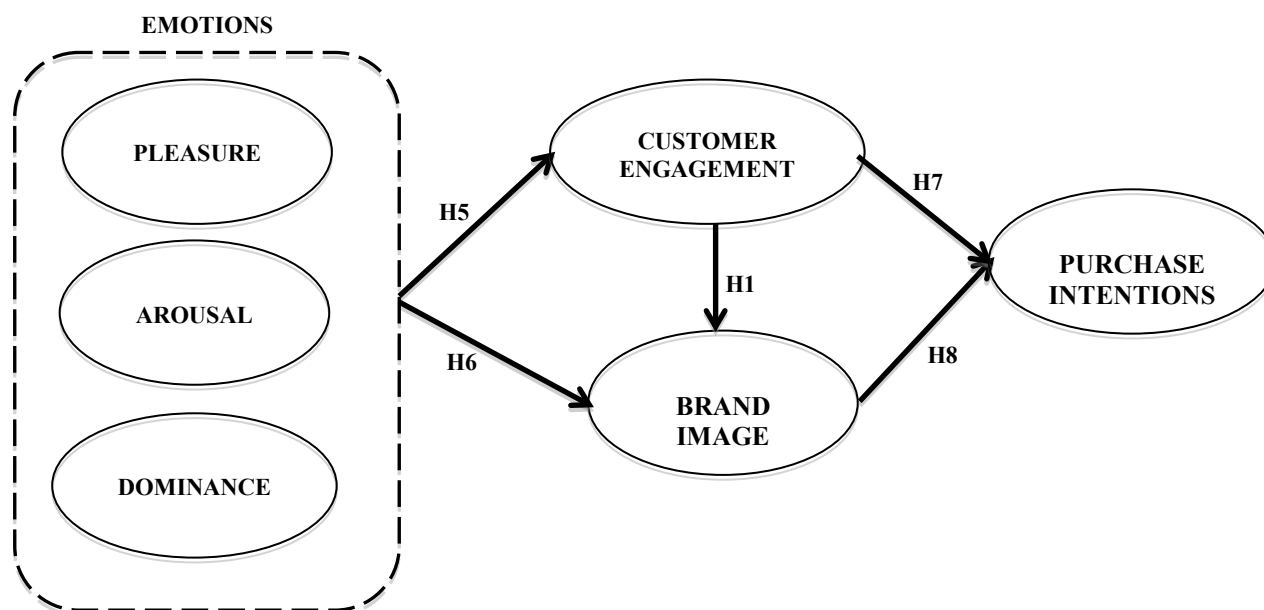

Individuals' emotional responses to the environmental factors is a broadly recognized aspect in psychology research, and it has been applied to research in marketing in areas such as advertisement or the customer purchase behavior (e.g. Batra and Holbrook, 1990; Westbrook, 1987). In the online environment, most of research is based on the Stimulus-Organism-Response (S-O-R) framework. This research studies how different stimuli contribute to elicit positive emotional responses on customers (Eroglu, Machleit, and Davis, 2003), influence cognitive evaluations about their experiences and encourage purchase intentions (Fiore, Ji Hyun, and Hyun-Hwa, 2005; Mazaheri, Richard, and Laroche, 2011; Nambisan and Baron, 2007). In this regard, one of the most used approaches to emotions has been the pleasure-arousal-dominance (P-A-D) model or dimensional approach. This model has been successfully applied to the analysis of aspects related to the interface design (e.g. colors, size and display of information, quantity of content, visuals...) and others related to interactivity (Fiore, Ji Hyun,

and Hyun-Hwa, 2005, Mummalaneni, 2005; Oh et al., 2008), checking their effects on customer emotions and further behaviors (Machleit y Eroglu, 2000; Machleit y Mantel, 2001).

As it was previously explained, BCPs are characterized by their potential to foster co-creative experiences, exchange-related activities and interactions between several agents. Through the platform's cues, customers are empowered and able to adopt an active role that conditions not only their emotional response to the experience but also the established relationship with the Brand and the firm. We propose that emotions elicited as a consequence of the customer interaction in the BCP are intrinsic drivers of customer responses, influencing customer engagement and brand image.

Figure 1 describes the conceptual model proposed for Study 2. This model is focused on the role of emotions as antecedents of customer engagement and subsequently, the customer purchase behavior.

**FIGURE 1.** Conceptual Model of Study 2

The definition of customer engagement as a cognitive and affective process derived from interactive and co-creative experiences implies the importance of emotions in its development. During these experiences, if customers feel pleasure and dominance, they will have positive perceptions about the product and the firm (Mazaheri et al., 2012). Moreover, co-creative experiences require a high level of activation in individuals, aspect that will also influence in their level of engagement (Brodie et al., 2011a; Hollebeek 2012; Vivek et al., 2012). Several conceptual research has proposed the key role of emotions and other emotional concepts, as flow and involvement (Hollebeek, 2011; Vivek, 2009), to define and develop customer engagement (Brodie et al., 2011; Hollebeek 2011; Mollen and Wilson, 2010). Nevertheless, and despite the apparent interest of this relationship, it has not been previously tested.

Regarding brand image, if emotions derived from the experience have been pleasurable and positive, it is plausible to think that they will reflect in the customer's brand perceptions (Drengner et al., 2008). Customers positively evaluate not only the experience but also the "cause" and responsible of it, that is the brand. Following de Chernatony's (2006) experiential definition of brand, we can consider that brand image encompasses a cluster of functional and emotional values related to the welcome experience lived by customers with the brand. Thereby, if customers live a collaborative experience with the firm during their purchase, customer emotional connection with the brand is likely to improve (Demirbilek and Sener, 2003).

According to this reasoning and consistent with research that builds on environmental psychology theories (Mazaheri, Richard, and Laroche, 2011; Wang et al., 2007), we propose that emotions experienced by

customers during their interaction in the BCP will influence customer engagement with the firm and brand image, formulating the following hypotheses:

*Hypothesis 5a: Pleasure experienced by customers in brand connection platforms positively influences customer engagement with the firm.*

*Hypothesis 5b: Arousal experienced by customers in brand connection platforms positively influences customer engagement with the firm.*

*Hypothesis 5c: Dominance experienced by customers in brand connection platforms positively influences customer engagement with the firm.*

*Hypothesis 6a: Pleasure experienced by customers in brand connection platforms positively influences brand image.*

*Hypothesis 6b: Arousal experienced by customers in brand connection platforms positively influences brand image.*

*Hypothesis 6c: Dominance experienced by customers in brand connection platforms positively influences brand image.*

#### **4.2 Transactional consequences: purchase intentions**

We consider that going through co-creative and interactive experiences in the BCP is critical to understand customer purchase intentions, so we test the importance of customer engagement and brand image as two pivotal factors in this context (Prahalad and Ramaswamy, 2004). Customer engagement is developed in any of the customer lifetime stages and is an important factor to evaluate the customer value both at a transactional and non-transactional level (Bijmolt et al., 2010; Kumar et al., 2010). So, if the customer experience in the BCP develops customer engagement with the firm, this engagement will influence his/her purchase intentions. Regarding brand image, it is remarkable that consumers buy products or brands not only because of their attributes and functional consequences, but also for the symbolic benefits associated with them (Padgget and Allen, 1997). Levy (1959, p. 118) states that people buy things both for what they can do and for what they mean. Consequently, brand image that has been created and modified during customer interactions in the BCP is likely to influence attitudes towards purchasing brand products (Teng and Laroche, 2007), which may result in sales for the firm (Suntornpithug and Khamalah, 2010). We formulate the following hypotheses:

*Hypothesis 7: Customer engagement with the firm developed during his/her interactions in the BCP influences purchase intentions.*

*Hypothesis 8: Brand image developed by customers during their interactions in the BCP influences purchase intentions.*

#### **4.3 Methodology**

We used the platform with high levels of both cues developed in Study 1 as our research context for this study. In order to make the purchase experience as realistic as possible, the participants were asked to navigate through the platform and carry out several activities related to the available cues. We followed a similar procedure than in study 1 and used the same control variables. Likewise, all the participants were going through a similar simulated purchase and the response variability was only dependent on the importance that each participant gives to the cues provided by the platform.

The study was carried out in a European university's computer labs. We obtained a sample of 332 students (135 males) aged between 20 and 38; all of them were experienced Internet and e-commerce users.

The participants first answered questions related to their innovativeness and previous Internet surfing experience. Then, they were asked to imagine that they wanted to buy a pair of sneakers, so they visited a fictitious company website called My Favorite Sneaker, performed different personalization and C2C interactions activities, and finalized the purchase. Finally, the participants were asked to complete a questionnaire about their experience, emotions, engagement with the firm, brand image and purchase intentions. All the variables were measured on a 7-point Likert scale, the lowest perception being scored with 1, and the items included in the survey were adapted from prior research.

Regarding customer engagement and brand image, the same scales from Study 1 were used to verify their convenience and stability across samples. The rest of variables were measured using scales that are frequently used in the literature. Before the validation of the measuring scales, we checked that the participants had perceived their interaction with the platform and the specific cues. They valued items related to C2C interactions and personalization with an average above 5.

Because our independent and dependent variables were obtained through survey data, our results could be affected by common-method bias. In order to deal with this issue, we used the procedural remedies suggested by Podsakoff et al. (2003). First, we guaranteed response anonymity and did not reveal the survey's exact goal to respondents. Second, the questionnaire items related to the dependent variables followed, rather than preceded, the independent variable and the questions were mixed (Chang, Van Witteloostuijn and Eden 2010). Lastly, we performed Harman's single-factor test. This technique consists of loading all the variables onto an exploratory factor analysis and examining the unrotated factor solution in order to determine the number of factors necessary to account for the variance of the data. Consequently, if there was a significant amount of common-method bias in the data, a single factor would emerge from the factor analysis or one general factor would account for the majority of the covariance among the measures (Morgan, Kaleka and Katsikeas 2004; Podsakoff et al. 2003). Unrotated factor analysis revealed five factors accounting for 75% percent of the variance, with the first factor accounting for only 25% percent, thus suggesting the absence of common-method bias.

#### ***4.4 Validation of the measuring scales***

In order to guarantee the psychometric properties of unidimensionality, reliability and validity of the measurement scales, a confirmatory factor analysis (CFA) has been carried out by Structural Equation Modeling (SEM), using the robust maximum likelihood estimation method and the statistical software EQS 6.1. (Bentler, 1995). We progressively eliminated, one by one, the indicators which did not satisfy one or more of the criteria proposed by Jöreskog and Sörbom (1993): weak convergence, strong convergence and explanatory coefficient ( $R^2 < 0.5$ ) (Steenkamp and Van Trijp, 1991). After excluding BRAN\_4, the results suggest that our measurement model provided a good fit to the data (Hair et al., 1999): SB  $\chi^2 = 455.51$ , d.f. = 237,  $p = 0.00$ ; RMSEA = .053; NFI = .924; NNFI = .956; CFI = .962; IFI = .962; SB  $\chi^2 / df = 1.9$ .

The reliability and validity of the constructs were analyzed (Churchill 1979; Gerbing and Anderson 1988). The reliability of the scales was tested using the CRC and the AVE. In all cases, the results achieved surpassed the limit of 0.6 (Bagozzi and Yi, 1988) and 0.5 (Fornell and Larcker, 1981), respectively.

Regarding validity, we analyze the construct validity, i.e. convergent and discriminant validity, and the nomological validity. For convergent validity, we check that the standardized loadings were higher than 0.5, significant at the 99% confidence level (Steenkamp and Van Trijp 1991). Therefore, we can conclude that the items that comprise each scale converge to the same measurement. Evidence for the discriminant validity of the measures was provided by checking that none of the 99 per cent confidence intervals of the latent factor correlation matrix contained a value of 1.0 (Anderson and Gerbing 1988). Moreover, we checked that no correlation between factors exceeded 0.8 points (Bagozzi 1994) and confirmed that the AVE for each construct did not exceed the variance shared with any other factor in the model (i.e. the squared correlation between the two factors) (Fornell and Larcker 1981).

In order to analyze the nomological validity, we undertook a  $\chi^2$  differences test to compare the revised measurement model (CFA) with the proposed theoretical model that posits the existing causal relationships between the factors, which is analyzed next. The theoretical model will attain nomological validity if there are no significant differences between the fit of the two models, which means that the scales used are able to establish predictive relationships with other variables that have similar goodness-of-fit indices (Anderson and Gerbing 1988). The  $\chi^2$  differences test consists of subtracting the measurement model's  $\chi^2$  from the theoretical model's  $\chi^2$  (in our model  $456,18 - 455,51 = 0,67$ ). The degrees of freedom (d.f.) for this test are the difference between the d.f. of the two models ( $238 - 237 = 1$ ). The critical value of  $\chi^2$  when d.f.=1 is 10.83 ( $p < 0.001$ ). Consequently, as  $0,67 < 10,83$ , we can confirm that the scales used attain nomological validity. The scales have been able to reveal relevant relationships between the factors that achieve the above-mentioned fit.

On the basis of these results, we can state that the measures in the study satisfy reliability and validity properties.

#### 4.4 Structural analysis

We tested the structural relationships existing between concepts using SEM. The results indicate that the data fit our conceptual model acceptably: SB  $\chi^2 = 456.19$ , d.f. = 238,  $p = 0.00$ ; RMSEA = .053; NFI = .924; NNFI = .956; CFI = .962; IFI = .962; SB  $\chi^2 / df = 1.91$ .

We find that customer engagement with the firm positively influences brand image ( $\beta_1 = .73$ ), so we corroborate the significance of the relationship, also found in the Study I, and verify H1.

Regarding emotions, pleasure, arousal and dominance positively influence customer engagement with the firm ( $\beta_{5a} = .28$ ;  $\beta_{5b} = .23$ ;  $\beta_{5c} = .14$ ), so H5a, H5b and H5c are supported. Nevertheless, for brand image, results demonstrate that only dominance ( $\beta_{6c} = .11$ ) has a significant effect, satisfying H6c and rejecting the influence of pleasure and arousal, i.e. H6a and H6b respectively.

Customer engagement and brand image positively influence customer's purchase intentions ( $\beta_7 = .48$ ;  $\beta_8 = .50$ ), so H7 and H8 are confirmed. It is remarkable that brand image channels the influence of customer engagement on the purchase intentions, reporting a total engagement effect of .85. Moreover, pleasure, arousal and dominance exert an indirect effect on brand image and purchase behavior through customer engagement. The explanatory power of customer engagement is 28%, the brand image is 61% and that of purchasing intentions is 38%.

## 5. Conclusions

In the last years, interactive media are rapidly developing, providing customers and firms with greater access to information and networking possibilities. These media favor the development of brand connection platforms, through which customers, firms and other stakeholders interact and create compelling experiences with brands. From our results, several key findings emerge for further discussion.

First, our results demonstrate the relationship between customer engagement with the firm and brand image in BCPs, showing that during the first purchase experience, brand perceptions are developed from the links created between the customers and the firm. BCPs allow customers to relate to others and jointly create co-creative experiences, developing customer engagement with the firm. This engagement not only depends on the customer's individual evaluation but also on the interactions that he/she undertakes in the platform, which positively influence his/her evaluation of the brand and the firm.

Second, our findings verify that extrinsic characteristics of the platform, as C2C interactions and personalization cues, empower customers and condition their relationship with the firm and the brand. The influence of these cues is especially important for brand image since there is an interaction effect between them that substantially improves customer perceptions regarding brand image. Therefore, the mere presence of these stimuli in BCPs can establish affective bonds beyond utilitarian purposes. C2C interactions- and personalization- related cues are a reliable source of information and learning through the actions and behaviors of others that inspire customers and condition their behavior.

Third, our research also obtains interesting results regarding the influence of customers' intrinsic mechanisms, as the emotions elicited during the interaction in BCPs, on their brand image and engagement. The more positive are the emotions that the customer experience, the more engaged the customer will feel and the better the brand image will be. So, brand image and customer engagement depend not only on the information provided by the firm but also on the customers' emotions derived from value-creating activities performed in the BCP. These emotions consequently influence long-term relationship with the firm and offer new possibilities to manage branding issues in online environments. It is interesting to highlight the main influence of arousal on customer engagement, which is aligned with previous works that consider activation as a main dimension of this concept. For brand image, dominance is the most important customer's emotion, which corroborates that customers create brand meanings through the interactions that occur in BCPs.

Finally, our findings state that customer engagement and brand image explains purchase intentions, which demonstrates the importance of these variables to foster not only non-transactional responses but also transactional ones. They play a pivotal role to manage the importance of customer emotions since act as a channel to achieve positive behaviors.

## RESUMEN

*Este trabajo se sirve del contexto bancario para investigar los factores comportamentales relativos a la lealtad de los clientes y el cross-buying que afectan a la adopción del canal online, en este caso, la banca online. Utilizando una base de datos de clientes bancarios cuyo comportamiento ha sido observado durante dos años, se analiza si la lealtad de los clientes, medida a través de las variables longitud de la relación, el trio de variables RFM y el cross-buying, medido a través de la diferencia en el número total de productos adquiridos por el cliente entre el periodo  $t$  y  $(t-1)$ , el nivel de uso de tales productos y el balance en activos y pasivos, afectan a la adopción del canal online. A partir de este trabajo se demuestra que, en líneas generales, la recencia en la compra, la recencia en la cancelación, la rentabilidad del cliente y el balance en productos de pasivo no favorecen al proceso de adopción de la banca online, mientras que aquellos clientes que utilizan un mayor número de productos y poseen un mayor balance en productos de activo adoptan el canal online más rápidamente.*

## PALABRAS CLAVE

*Banca online, Comportamiento del consumidor, Lealtad, Longitud de la Relación, RFM, Cross-buying, Nivel de uso de productos bancarios, Balance.*

## 1. Introducción

Este trabajo analiza los factores comportamentales relativos a la lealtad del cliente y la compra cruzada (*cross-buying*) que afectan a la adopción de la tecnología en las interacciones cliente-empresa, en particular nos referimos al canal online. Para ello, hacemos uso del contexto bancario, ya que la banca online se configura como un elemento fundamental en la estrategia de comercialización de cualquier entidad bancaria en la actualidad. Desde un punto de vista empresarial, la banca online ofrece la posibilidad de ahorrar costes e incrementar tanto los ingresos, como los ratios de retención de clientes (Campbell y Frei, 2010). Además, la banca online favorece el aumento del denominado *add-on selling* (formado por el *cross-selling*, *up-selling* y la adquisición por parte de los clientes de mayores cantidades del producto) (Sarel y Marmorstein, 2003). Por otro lado, desde el punto de vista del consumidor, el canal online y en particular, la banca online, también ofrece a los clientes numerosas ventajas, tales como facilidad de uso, mayor comodidad y más funciones a menor coste que la banca tradicional (Han y Baek, 2004).

Los bancos tienen una historia relativamente larga en la introducción de tecnologías destinadas a la reducción de los costes de interacción con el cliente. Por ejemplo, podemos mencionar los cajeros automáticos, los *call centers* o el *touch-tone banking*. Sin embargo, a pesar de que la banca online es una de las últimas tecnologías que se han integrado como un nuevo canal de distribución en el contexto bancario (Campbell y Frei, 2010), la realidad actual es que se ha convertido en un factor de competitividad clave para el futuro de cualquier entidad bancaria.

Investigaciones previas sobre la adopción y uso de la banca online se han centrado principalmente en analizar dimensiones sociales y técnicas que afectan a dicha adopción, por ejemplo, nos referimos a actitudes hacia las nuevas tecnologías, conocimiento o experiencia previa, acceso, conveniencia, usabilidad y temas relacionados con la seguridad, privacidad y confianza. Por tanto, la principal fuente de datos utilizada ha sido la encuesta. En este sentido, destaca el uso de Modelo de Aceptación Tecnológica (TAM), propuesto por Davis (1989), para predecir la aceptación de la banca online, o en general, del canal online por los clientes (e.g., Cheng *et al.*, 2006; Chong *et al.*, 2010; Lichtenthein y Williamson, 2006). Aunque estos estudios son capaces de considerar una amplia variedad de antecedentes de la adopción de la banca online, tienen ciertas limitaciones (Xue *et al.*, 2011), en particular: (i) analizan un conjunto de datos de *cross-section* o de corte transversal, no pudiendo examinar factores o variables que varían con el tiempo, y (ii) se basan en percepciones de los clientes en lugar de en datos observados, hecho que introduce error de medida y limita los resultados del estudio a aquellos que son perceptibles por los clientes (i.e., utilizando esta aproximación no podríamos investigar, por ejemplo, si la rentabilidad del banco aumenta con la adopción del canal online). Otras investigaciones fuera del marco del TAM han detectado las diferencias a nivel de rentabilidad y retención entre clientes que usan la banca online y la tradicional (Hitt y Frei, 2002), o las consecuencias a nivel de costes, ingresos, rentabilidad y retención que el uso de la banca online por parte de los clientes puede reportar al banco (Campbell y Frei, 2010). En general, se ha demostrado que los clientes que utilizan la banca online son más leales, rentables y valiosos que el resto de clientes (Xue *et al.*, 2011). A este respecto se ha detectado en la literatura cierta carencia de estudios que analicen los determinantes comportamentales que afectan a la adopción de la banca online. Por ello, el principal objetivo de este trabajo persigue detectar si los clientes que utilizan la banca online, de quienes, como hemos señalado anteriormente, se ha demostrado que son más leales, rentables y valiosos que el resto de clientes, ya lo eran antes de adoptar la banca online o por el contrario estas ventajas se consiguen a partir del uso de la banca online. En definitiva, las empresas necesitan comprender adecuadamente los factores que influyen la elección de canales de los consumidores a lo largo de las diferentes etapas que conforman el proceso de decisión de compra (Neslin *et al.*, 2006), con objetivo de poder definir mejor y de forma más precisa su estrategia.

Por tanto, utilizando una base de datos compuesta por un total de 1.357 clientes bancarios cuyo comportamiento ha sido observado durante un total de 24 meses (desde Diciembre de 2010 hasta Noviembre de 2012), se analiza si la lealtad de los clientes, medida a partir de variables como la longitud de la relación y el trio de variables RFM, y la compra cruzada o *cross-buying*, medida a partir de la diferencia en el número total de productos adquiridos por el cliente entre el periodo  $t$  y  $(t-1)$ , el nivel de uso de productos bancarios y el balance en activos y pasivos, influyen en la adopción del

canal online. Los resultados derivados de este trabajo tienen interesantes implicaciones para la gestión, ya que se analiza en profundidad qué componentes de la lealtad de los clientes y el *cross-buying* afectan a la adopción del canal online, obteniendo un diagnóstico preciso sobre si tales comportamientos afectan o no a su proceso de adopción. Debido a que la inversión que una empresa debe realizar para implementar un canal online es alta, especialmente para una entidad bancaria, es importante comprender si esta estrategia añade o no valor. De esta forma en primer lugar hemos demostrado si la lealtad y el *cross-buying* son factores que influyen en la adopción de la banca online, es decir, si los clientes más leales y que presentan mayores niveles de compra cruzada ya poseían tales características antes de adoptar la banca online. En segundo lugar, los resultados de esta investigación pueden ayudar a las empresas a conocer qué clientes son más propensos a utilizar este tipo de canales y diagnosticar si en su caso la puesta en práctica de una estrategia online tiene o no sentido.

El resto del trabajo se organiza como indicamos a continuación. En la sección 2 revisaremos la literatura más relevante sobre los determinantes de la adopción de la banca online y formularemos la hipótesis de investigación. A continuación, se describen los datos, las variables utilizadas en este estudio, así como la metodología utilizada. Seguidamente se señalan los principales resultados. Finalmente, se hace una reseña de las principales contribuciones, limitaciones e implicaciones para la gestión derivadas de este estudio.

## **2. Determinantes de la adopción de la banca online: lealtad del cliente bancario y *cross-buying***

### **2.1. Lealtad**

Jacoby y Kyner (1973 p.2) definen la lealtad del cliente a través de seis condiciones necesarias y conjuntamente suficientes de la siguiente forma: “*La lealtad del cliente es (1) la respuesta comportamental (e.g., compra), (2) sesgada (no aleatoria), (3) expresada a lo largo del tiempo, (4) por alguna unidad de toma de decisiones, (5) con respecto a una o varias marcas alternativas de un conjunto de tales marcas y que (6) es función de procesos psicológicos (i.e., toma de decisiones, evaluación)*”. Jacoby y Kyner establecen que el proceso de evaluación compuesto por estas seis etapas se lleva a cabo por aquellos individuos que desarrollan compromiso hacia una marca. Más tarde, Oliver (1999 p.34) define la lealtad como un comportamiento de elección de marca repetido desarrollado de una forma consistente (es decir, a pesar de las influencias situacionales y esfuerzos de marketing que tienen el potencial de causar un comportamiento de búsqueda). Cuando un cliente es leal, este continuará comprando la misma marca, tenderá a comprar más y recomendará la marca a otros (Hepworth y Mateus, 1994).

Desde las primeras investigaciones sobre lealtad del cliente, al menos tres han sido las perspectivas propuestas para definir y operar con el concepto, en particular se trata de: (i) el enfoque actitudinal, (ii) el enfoque comportamental y (iii) el enfoque compuesto (Jacoby y Chestnut, 1978). En primer lugar, respecto al (i) enfoque actitudinal, este va más allá de la conducta manifiesta y expresa la lealtad en términos de fuerza de afecto de los consumidores hacia una marca (Backman y Crompton, 1991; Bennett y Rundle, 2002). Las actitudes se relacionan con comportamientos, aunque es importante diferenciar que el individuo puede mantener una actitud favorable hacia la marca, pero no realizar compras repetidas por la opción comparable o superior que ofrecen otras marcas (Dick y Basu, 1994). De forma similar, Sharp *et al.* (2002) sugieren que la actitud no es relevante para determinar la lealtad a la marca, ya que ésta contradice los principios epistemológicos básicos, no es una medida estable (añade otro factor de incertidumbre, en lugar de contribuir a explicar y poseer capacidad predictiva), y existe cierta contradicción en las explicaciones causales existentes que relacionan la actitud y la lealtad a la marca en diversas disciplinas, entre ellas el marketing. El segundo enfoque define a la lealtad estrictamente desde una (ii) perspectiva comportamental. La principal asunción implica que la compra de repetición capturará la fidelidad de un consumidor hacia la marca de su interés (Hughes, 1996a; Farley, 1964). Y finalmente, el (iii) enfoque compuesto define a la lealtad como un conjunto de compras repetidas impulsadas por una fuerte predisposición positiva interna que lleva al cliente a realizarlas (Day, 1969; Dick y Basu, 1994; Pritchard y Howard, 1997; Schijns y Schröder, 1996). Este último enfoque engloba las dimensiones comportamental y actitudinal.

En la investigación empírica, el enfoque actitudinal para medir la lealtad no es tan utilizado como el enfoque comportamental (Uncles *et al.*, 2003). Esto es así porque las medidas de lealtad comportamental son más fácilmente observables que las medidas sobre lealtad actitudinal. Además, para medir la lealtad es más adecuado trabajar con los datos de la base de datos de la compañía (Wong y Chung, 2008), como es nuestro caso con una base de datos de un banco, ya que los registros de compras e interacciones con el cliente grabados en este tipo de bases de datos recogen la lealtad comportamental real y observada de los mismos. Por tanto, para el desarrollo de esta investigación consideraremos el segundo enfoque de lealtad: el enfoque comportamental.

Para identificar a los clientes leales desde una perspectiva comportamental, las empresas típicamente analizan aquellos comportamientos de los clientes que dan respuesta a las siguientes preguntas (Kumar *et al.*, 2006):

- a) ¿Durante cuánto tiempo ha estado activo el cliente? (Colgate y Lang, 2001; Reichheld, 1996)
- b) ¿Con cuánta regularidad compra el cliente? (Farley, 1964; Massey *et al.*, 1970)
- c) ¿Cuál es la puntuación RFM de cada cliente? (Hughes, 1996a; Kahan, 1998)

Para esta investigación hemos seleccionado tanto la longitud de la relación, como la triada RFM para medir la lealtad comportamental de una forma completa (Chang y Tsay, 2004; Kumar *et al.*, 2006; Li *et al.*, 2011) y comprobar si afectan al proceso de adopción de la banca online.

### ***Longitud de la relación cliente-empresa***

Existe evidencia en la literatura de que el uso de la banca online se asocia con mayores ratios de retención de los clientes (Hitt y Frei, 2002; Xue *et al.*, 2007), pero no se ha demostrado si estos resultados se derivan de que precisamente es el segmento de los clientes leales el seleccionado por la empresa como usuarios del canal o por el contrario estos mayores ratios de retención se derivan del propio uso del canal online (e.g., por un incremento en los costes de cambio, una mejora en la calidad del servicio, menores costes, más conveniencia) (Campbell y Frei, 2010). Al mismo tiempo, cuando un cliente se plantea la adopción de una nueva tecnología de auto-servicio, éste asume los costes implícitos derivados de aprender a utilizarla, así como los costes derivados de establecer una relación con la empresa a través de un nuevo canal (Klemperer, 1987; Chen y Hitt, 2002), es por ello que, si el cliente no lleva suficiente tiempo operando con el banco, o se plantea abandonar la entidad en el corto plazo, es probable que no le interese asumir esos costes indirectos de adoptar el canal online. Por tanto,

**Hipótesis 1:** Una mayor longitud de la relación se asocia con una más rápida adopción de la banca online.

### ***RFM***

Uno de los principales motivos que impulsan a los clientes a adoptar los canales online es que estos les generan conveniencia (Childers *et al.*, 2001; Kumar y Ruan, 2005). En particular, tanto la conveniencia, como una efectiva gestión de las finanzas personales, son dos de las mayores ventajas que reporta el uso de las innovaciones basadas en tecnologías en el contexto de los servicios financieros (Lee *et al.*, 2003). Así mismo, tanto el control percibido, como el ahorro de tiempo derivados del uso de los canales de autoservicio también se consideran motivaciones relevantes del uso de tales canales (Ding *et al.*, 2007). Consecuentemente, en esta investigación perseguimos demostrar que si un cliente no interacciona (i.e., para adquirir o cancelar productos) con el banco, es decir, tiene una alta recencia en la adquisición y en la cancelación de productos del banco, la adopción de la banca online, a priori, no le reportará ventajas derivadas de poder interactuar con el banco cuando y donde quiera. Por tanto,

**Hipótesis 2a:** Una mayor recencia en la adquisición de productos bancarios se asocia con una más lenta adopción de la banca online.

**Hipótesis 2b:** Una mayor recencia en la cancelación de productos bancarios se asocia con una más lenta adopción de la banca online.

Del mismo modo, si un cliente adquiere productos del banco de manera frecuente, la adopción de la banca online le podrá reportar las ventajas derivadas de poder hacerlo desde prácticamente cualquier lugar y en cualquier momento utilizando su propio ordenador o dispositivo móvil sin tener que desplazarse a la sucursal física. Por tanto,

**Hipótesis 3:** Una mayor frecuencia de adquisición de productos bancarios se asocia con una más rápida adopción de la banca online.

De igual modo que ocurre con los ratios de retención, existe evidencia en la literatura que indica que los clientes que utilizan el canal online tienden a ser más rentables que los clientes que utilizan el canal tradicional (Hitt y Frei, 2002; Xue *et al.*, 2007). Sin embargo, no se ha demostrado si estos resultados se derivan de que precisamente es el segmento de los clientes rentables el seleccionado por la empresa como usuarios del canal o por el contrario este cambio comportamental es causado por su adopción (Hitt y Frei, 2002). Adicionalmente, y aludiendo de nuevo a las ventajas de conveniencia, control percibido y ahorro en costes que le reportan al cliente la adopción del canal online (Ding *et al.*, 2007; Lee *et al.*, 2003), si este es un sujeto activo en su relación con la empresa, con uno o más productos y un saldo medio mantenido por producto (consecuentemente un cliente rentable), la adopción del canal online le reportará las ventajas derivadas de poder interactuar con el banco cuando y donde quiera. Por tanto,

**Hipótesis 4:** Una mayor rentabilidad del cliente bancario se asocia con una más rápida adopción de la banca online.

## 2.2. Cross-buying

Tanto el *cross-buying* (desde el punto de la demanda) como el *cross-selling* (desde el punto de vista de la oferta), persiguen conseguir la adquisición por parte de los clientes actuales de un mayor número de productos de la empresa procedentes de múltiples categorías (Gupta y Zeithaml, 2006). Mientras que el *cross-selling* es una acción de la empresa que se emplea para ampliar relaciones con los clientes, el *cross-buying* se refiere a la propensión de un cliente para hacer compras cruzadas (Reinartz y Venkatesan, 2008). El *cross-buying* o compra cruzada ha sido asociado con mayores niveles de retención de los clientes, mayores ingresos y lealtad. En particular, Donkers *et al.* (2003 p. 21) evidenció que los clientes eran más propensos a permanecer en la empresa cuando compraban más productos (en particular, más pólizas de seguro). Al examinar la relación ente el *cross-buying* y la lealtad comportamental, Reinartz *et al.* (2008) descubrieron que el *cross-buying* es realmente una consecuencia y no un antecedente de la lealtad comportamental, ya que dicha lealtad impulsa tanto el número de categorías de las que una persona compra como el nivel de dispersión del gasto a través de esas categorías. Por lo tanto, los directivos cada vez más reconocen que la retención del cliente no es suficiente para tener éxito y muchos están tratando de mejorar el valor de sus clientes mediante la ampliación de la gama de productos y servicios que compran de la empresa (Blattberg y Deighton, 1996; Rust *et al.*, 2000 p.46). De esta forma, y siguiendo las sugerencias de Reinartz *et al.* (2008), para esta investigación hemos seleccionado tanto el nivel de uso de productos bancarios, como el balance en activos y pasivos para el medir el *cross-buying*. Así mismo, utilizamos como medida del *cross-buying* la diferencia en el número total de productos que adquiere el cliente entre el período  $t$  y  $(t-1)$  (Verhoef *et al.*, 2001). De esta forma se analiza si estos factores comportamentales afectan al proceso de adopción de la banca online.

### ***Diferencia en el número total de productos adquiridos entre el periodo $t$ y $(t-1)$***

De acuerdo con el Modelo de Aceptación Tecnológica (TAM), la facilidad de uso percibida se define como el grado en el cual el posible adoptante espera que el proceso de adopción de la nueva tecnología se desarrolle libre de esfuerzo (Davis, 1989). Se ha demostrado que la facilidad de uso tiene un efecto positivo en el proceso de adopción de la banca online (Chong *et al.*, 2010). Además de la facilidad de uso, se ha demostrado que el ahorro de tiempo que le supone al cliente el uso de canales de autoservicio es uno de los factores más importantes para su adopción (Ding *et al.*, 2007). En este sentido, si un cliente presenta cierta tendencia a adquirir más productos del banco entre un periodo temporal y el siguiente, la facilidad de uso y el ahorro de tiempo que le reporte el hacerlo utilizando la banca online puede ejercer un efecto motivador para adoptarla. Por tanto,

**Hipótesis 5:** Una mayor adquisición de productos bancarios, se asocia con una más rápida adopción de la banca online.

#### ***Nivel de uso de productos bancarios***

Se ha demostrado que la adopción del canal online influye en el nivel de uso de productos, ya que en promedio, los clientes de la banca online utilizan más productos que los clientes tradicionales (Hitt y Frei, 2002). Del mismo modo que la facilidad de uso y el ahorro en tiempo se han propuesto como elementos motivadores de la adopción de la banca online (Chong *et al.*, 2010; Ding *et al.*, 2007) considerando el nivel de adquisición de productos, si un cliente utiliza diversos productos del banco, la facilidad de uso que le reporte el poder interactuar con el banco utilizando la banca online puede ejercer un efecto motivador para adoptarla. Por tanto,

**Hipótesis 6:** Si el cliente utiliza un mayor número de productos bancarios la adopción de la banca online será más rápida.

#### ***Balance en activos y pasivos***

Haenlein *et al.* (2007) definen dos condiciones bajo las cuales un cliente se considera activo (o por el contrario inactivo) en un contexto bancario, en particular: (condición 1) todos los clientes que poseen un producto de ahorro, un producto de financiación de una vivienda, un préstamo o un seguro, se definen como activos debido a los flujos de ingresos regulares (e.g., ahorro, pago de intereses, cuotas de seguros) como resultado de cualquiera de estos productos; y (condición 2) todos los clientes que poseen cuentas corrientes y depósitos se definen como clientes activos cuando estas cuentas muestran un saldo positivo de un mínimo de 100 euros o al menos una transacción se ha realizado durante los tres últimos meses (en el caso de las cuentas corrientes) o últimos doce meses (en el caso de los depósitos). En este sentido, tanto el balance en productos de pasivo como el balance en producto de activo ofrecen información sobre el nivel de actividad de los clientes con la empresa (Haenlein *et al.*, 2007). Por tanto, siguiendo con la argumentación utilizada anteriormente sobre la conveniencia y la facilidad de uso que le reporta la adopción del canal online al cliente (Lee *et al.*, 2003), si este es un sujeto activo en su relación con la empresa, la adopción del canal online le reportará las ventajas derivadas de poder interactuar con el banco cuando y donde quiera. Por tanto,

**Hipótesis 7a:** Cuanto mayor es el balance en productos de activo, la adopción de la banca online será más rápida.

**Hipótesis 7a:** Cuanto mayor es el balance en productos de pasivo, la adopción de la banca online será más rápida.

### **3. Metodología de la investigación**

#### **3.1. Datos**

Un banco español ha provisto la base de datos para realizar el presente estudio (véase Tabla 1). Originalmente la base de datos estaba compuesta por una muestra aleatoria de clientes del banco, con observaciones mensuales relativas a la propiedad y al uso de los productos que ofrece el banco, así como determinadas variables sociodemográficas de los clientes. Se realizó una primera etapa de pre-procesamiento de datos, eliminando aquellos registros no necesarios para el presente estudio. Así mismo, se llevó a cabo un completo análisis de datos perdidos. En particular, se ha seleccionado la técnica de imputación múltiple (utilizando el software SPSS v.21) para imputar valores a aquellos registros que aparecían como perdidos. De esta forma se consiguió una muestra compuesta por un total de 1.357 clientes, con 24 meses de información de cada uno de ellos (en particular, el periodo de observación de datos comprende desde Diciembre de 2010 hasta Noviembre de 2012), obteniendo un total de 32.568 registros de datos.

Tabla 1. Descripción de la base de datos

<b>Datos</b>	Panel
--------------	-------

<b>Categoría de productos</b>	Capital social, tarjetas de crédito y débito, seguros de ahorro, de hogar, de vida, cuenta corriente, cuenta vivienda, depósito, fondo de inversión, plan de pensión, valores, préstamo consumo, hipoteca, crédito
<b>Contexto</b>	Entidad bancaria que opera a nivel nacional
<b>Periodo</b>	2 años: Diciembre 2010 - Noviembre 2012
<b>Clientes</b>	Clientes no empresariales que empezaron su relación con el banco al comenzar el periodo de observación (Diciembre 2010)
<b>Tamaño</b>	1.357 clientes, 24 meses para cada cliente = 32.568 registros

### 3.2. Medida de las variables de la investigación

#### 3.2.1. Medición del evento en el tiempo: Adopción de la banca online

La variable adopción de la banca online se mide utilizando una variable binaria para cada cliente  $i$  y cada periodo temporal  $t$ . En particular, la variable adopción de la banca online toma el valor de 1 si el cliente  $i$  adopta la banca online en el mes  $t$  o toma el valor 0 para los meses en los que el cliente no ha adoptado el canal online (Campbell, 2006; Campbell y Frei, 2010).

#### 3.2.2. Variables explicativas

##### 3.2.2.1. Lealtad

**Longitud de la relación.** Se define como el periodo de tiempo transcurrido entre la entrada del cliente en la empresa y el final del periodo de observación de datos (Glady *et al.*, 2009). Para medir la longitud de la relación utilizamos una variable continua que indica la longitud de la relación (en meses) de cada cliente  $i$  en la base de datos (Reinartz y Kumar, 2003 p.88). Algunos clientes en la muestra acaban su relación con el banco antes de que finalice el periodo de observación, para este caso se registran un total de 179 clientes.

Para medir la recencia, incluimos dos variables continuas: (1) recencia en la adquisición o compra de productos y (2) recencia en la cancelación de productos. En primer lugar, la **recencia en la compra de productos** mide el número de periodos (meses) que transcurren entre la última adquisición de producto/s del banco y la siguiente. En segundo lugar, la **recencia en la cancelación de productos** mide el número de periodos (meses) que transcurren entre la última cancelación de producto/s del banco y la siguiente. Donkers *et al.* (2007) midió estas dos variables como binarias, pero para esta investigación hemos seguido la definición estricta de recencia (Pfeifer y Caraway, 2000), definiendo la recencia en la compra como la diferencia en meses entre la última adquisición y la siguiente y la recencia en la cancelación como la diferencia en meses entre la última cancelación y la siguiente. Por tanto, utilizamos dos variables continuas que varían con el tiempo en lugar de dos variables binarias (como es el caso de Donkers *et al.*, 2007).

**Frecuencia de adquisición de productos bancarios.** Para medir la frecuencia de adquisición de productos bancarios, utilizamos una variable que recoge el número total (relativo a todas las categorías de producto) de nuevas adquisiciones que el cliente  $i$  ha realizado en cada periodo temporal  $t$  (Khajvand y Tarokh, 2011; Reinart *et al.*, 2008). Se trata de una variable continua que varía con el tiempo.

**Valor monetario.** Para el valor monetario de cada cliente, utilizamos una medida de contribución al margen para cada cliente  $i$  y cada periodo  $t$ . En particular, se trata de una variable continua que contiene información relativa a la diferencia entre el devengo de intereses-comisiones cobrados al cliente y el coste-ingreso que para el banco suponen los fondos invertidos o captados del cliente en el Mercado Interbancario (Kumar y Shah, 2009).

##### 3.2.2.2. Cross-buying

**Diferencia en el número total de productos entre el periodo  $t$  y  $(t-1)$ .** Siguiendo las sugerencias de Verhoef *et al.* (2001), una medida de *cross-buying* se obtiene calculando la diferencia en el número de productos comprados-cancelados (de todas las categorías de producto) de la empresa entre el periodo  $t$  y  $(t-1)$ . Nótese que la diferencia puede ser también negativa (en caso de las cancelaciones). En este sentido, consideramos conjuntamente estas puntuaciones positivas y negativas, ya que tanto el incremento como el decremento del número de servicios que posee el cliente implica llevar a cabo el mismo proceso de decisión (Bolton y Lemon, 1999; Verhoef *et al.*, 2001). En definitiva, esta variable se ha considerado porque ofrece una manera de cuantificar el número real de productos que cada cliente adquiere (si la variable toma un valor positivo) o cancela (si la variable toma un valor negativo). Por su parte, las variables recencia en la compra y en la adquisición nos dan una información limitada acerca de si ha ocurrido una cancelación o una compra, ya que no cuantifican el número real de productos que son adquiridos o cancelados.

**Uso de productos bancarios.** Esta variable recoge la cantidad total de productos (de todas las categorías) que cada cliente  $i$  utiliza en cada periodo temporal  $t$  (Bolton y Lemon, 1999; Venkatesan *et al.*, 2007 p. 585).

**Balance.** En este caso se han considerado dos variables continuas (medidas en euros) y que varían con el tiempo: (1) **Balance medio mensual en activos**, en un contexto bancario se consideran activos los créditos, préstamos o las deudas en cuentas corrientes (Prinzle y Van den Poel, 2006; Reinart *et al.*, 2008), es decir, se consideran clientes de activo a aquellos clientes sobre los que el banco tiene derechos de cobro. (2) **Balance medio mensual en pasivos**, en un contexto bancario se consideran pasivos los productos de ahorro e inversión (Prinzle y Van den Poel, 2006; Reinart *et al.*, 2008), es decir, se consideran clientes de pasivo a aquellos clientes sobre los que el banco tiene una serie de obligaciones de pago. Aunque estas dos variables vienen caracterizadas por su dimensión continua en el tiempo, son registradas en la base de datos en momentos discretos, por ejemplo, a final de mes en el caso de cuentas corrientes, o anualmente en el caso de los seguros.

### 3.2.3. Variables de control

Campbell y Frei (2004) subrayan la importancia de considerar variables sociodemográficas en un contexto bancario por su influencia en la rentabilidad de la entidad, así como en los patrones de consumo de los clientes. Por ejemplo, señalan que los clientes de mediana edad tienden a ser más rentables que los más jóvenes porque tienden a mantener mayores balances y es más probable que tengan hipotecas. En general, Campbell y Frei (2004 p.110) indican que los bancos estadounidenses gastan entre 1 y 2 millones de dólares anuales para obtener más información sociodemográfica de sus clientes de fuentes externas al banco. En este sentido, en este trabajo se han considerado varias variables sociodemográficas como son la **edad** del cliente (variable continua medida al final del periodo de observación de los datos), **género** (variable dicotómica que toma el valor 1 para los hombres y el valor 2 para las mujeres, medida al principio de la relación entre el cliente y el banco) y finalmente **ingresos** (variable continua que indica el salario medio que cada cliente recibe cada mes).

### 3.3. Modelo empírico

Para testear las hipótesis propuestas sobre los factores que influyen en la adopción del canal online, utilizamos el denominado análisis de supervivencia. Esta metodología relaciona a las variables explicativas (incluyendo variables individuales y *time-varying*) con el momento del tiempo en el que el cliente adopta la banca online. Cada uno de los sujetos de la base de datos existe para el análisis de supervivencia hasta que el evento ‘adopción de la banca online’ ocurre o el cliente abandona el banco.

Existen diferentes modelos de supervivencia, entre ellos aquellos en los que el resultado es un evento en el tiempo (denominados *accelerated failure time* o *AFT models*) o aquellos en los que el resultado es un ratio *hazard* (denominados *proportional hazard* o *PH models*). Así mismo, dentro de cada uno de estos dos grupos de modelos, pueden asumirse diferentes funciones relativas al evento de adopción y sus características correlacionadas. Para esta investigación, cuyo objetivo es analizar la influencia en el tiempo de determinadas variables sobre el proceso de adopción, se utiliza un modelo de supervivencia paramétrico. Esta elección viene determinada porque se trata de modelos estadísticamente más eficientes en este tipo de escenarios que los no paramétricos o los semi-paramétricos (Hosmer y Lemeshow, 1999; Tellis *et al.*, 2003; Cleves *et al.*, 2004). Por tanto, siguiendo

la literatura sobre difusión de innovaciones (Tellis *et al.*, 2003), ajustamos el modelo de adopción seleccionado utilizando un *AFT model* basado en una distribución log logística. En particular, los *AFT models* relacionan el evento en el tiempo ( $t_i$ , en nuestro caso, la adopción de la banca online), a un conjunto de variables ( $x_i$ , véase apartado 3.2.) y un término de error ( $e_i$ ), y estima un conjunto de parámetros para las variables ( $\beta_i$ ).

$$\ln(t_i) = x_i\beta_i + e_i$$

En nuestro caso:

$$\ln(\text{adopción banca online}_i) = \text{longitud de la relación}\beta_1 + \text{recencia compra}\beta_2 + \text{recencia cancelación}\beta_3 + \dots$$

### 3.4. Resultados

Los parámetros del modelo se estiman por máxima verosimilitud con un estimador de varianza robusto (comando STREG para el software STATA v.12). En la Tabla 2 se señalan los resultados del modelo. En particular, en la primera columna se indican los coeficientes de regresión obtenidos por el modelo, a los que hemos denominado *log-time* ( $\beta_i$ ), mientras que en la segunda columna se adjuntan los resultados *en tiempo normal* (aplicando la transformación  $e^{\beta_i}$ ), ofreciendo estos últimos una más fácil interpretación. Un coeficiente *log-time* negativo o un coeficiente *en tiempo normal*  $< 1$ , indica una adopción más rápida.

Tabla 2. Resultados *AFT model* (\*)

	<b>Coficiente <i>log-time</i></b>	<b>Coficiente <i>en tiempo normal</i></b>

(\*) Error estándar entre paréntesis; \* resultado significativo al 0,05; \*\* resultado significativo al 0,1.

Longitud de la relación: Los resultados no muestran que la longitud de la relación afecte de forma significativa a la adopción de la banca online ( $\beta = -0,003$ ,  $p > 0,05$ ) no pudiendo dar soporte a la hipótesis 1.

Recencia en la compra: Los resultados muestran que un cliente con una mayor recencia en la compra adopta el canal online más lentamente ( $\beta = 0,307$ ,  $p < 0,05$ ), corroborando la hipótesis 2a. En

particular, cada mes que se añade en la recencia en la compra, el tiempo que el cliente tarda en adoptar la banca online se incrementa en un 30,7% ( $p < 0,05$ ).

Recencia en la cancelación: Los resultados muestran que un cliente con una mayor recencia en la cancelación adopta el canal online más lentamente ( $\beta = 0,147$ ,  $p < 0,05$ ), corroborando la hipótesis 2b. En particular, cada mes que se añade en la recencia en la cancelación, el tiempo que el cliente tarda en adoptar la banca online se incrementa en un 14,7% ( $p < 0,05$ ).

Frecuencia de adquisición: Los resultados no muestran que la frecuencia de adquisición de productos afecte de forma significativa a la adopción de la banca online ( $\beta = 10,763$ ,  $p > 0,05$ ), no pudiendo dar soporte a la hipótesis 3.

Rentabilidad: Los resultados muestran que un cliente con una mayor rentabilidad adopta el canal online más lentamente ( $\beta = 9,84e^{-4}$ ,  $p < 0,05$ ), corroborando la hipótesis 4 pero en sentido inverso. En particular, cada euro que se añade en la rentabilidad, el tiempo que el cliente tarda en adoptar la banca online disminuye en un 0,0984% ( $p < 0,05$ ).

Diferencia de productos entre  $t$  y  $(t-1)$ : Los resultados no muestran que la diferencia de productos entre  $t$  y  $(t-1)$  afecte de forma significativa a la adopción de la banca online ( $\beta = -10,335$ ,  $p > 0,05$ ), no pudiendo dar soporte a la hipótesis 5.

Uso de productos: Los resultados muestran que un cliente que utiliza un mayor número de productos adopta el canal online más rápidamente ( $\beta = -0,223$ ,  $p < 0,05$ ), corroborando la hipótesis 6. En particular, por cada producto más que utiliza el cliente, el tiempo que este tarda en adoptar la banca online disminuye en un 22,3% ( $p < 0,05$ ).

Balance activos: Los resultados muestran que un cliente con un mayor balance en activos adopta el canal online más rápidamente ( $\beta = -2,12e^{-7}$ ,  $p < 0,05$ ), corroborando la hipótesis 7a. En particular, por cada euro más que el cliente tenga en su balance de activos, el tiempo que este tarda en adoptar la banca online disminuye en un 2,12e<sup>-5</sup>% ( $p < 0,05$ ).

Balance pasivos: Los resultados muestran que un cliente con un mayor balance en pasivos adopta el canal online más lentamente ( $\beta = 8,47e^{-6}$ ,  $p < 0,05$ ), corroborando la hipótesis 7b pero en sentido inverso. En particular, por cada euro más que el cliente tenga en su balance de pasivos, el tiempo que este tarda en adoptar la banca online aumenta en un 8,47e<sup>-5</sup>% ( $p < 0,05$ ).

Respecto a las variables sociodemográficas, los clientes más mayores adoptan la banca online más lentamente ( $\beta = 0,003$ ,  $p < 0,05$ ), en particular, por cada año más que posee el cliente, el tiempo que este tarda en adoptar la banca online aumenta en un 0,3% ( $p < 0,05$ ), mientras que los clientes con mayores ingresos adoptan la banca online más rápido ( $\beta = -4,18e^{-6}$ ,  $p < 0,05$ ), en particular, por cada euro más de ingresos del cliente, el tiempo que este tarda en adoptar la banca online disminuye en un 4,18e<sup>-4</sup>% ( $p < 0,05$ ).

#### 4. Conclusiones

En este trabajo se analizan los factores relativos a la lealtad y al *cross-buying* del cliente que influyen en la adopción de la banca online. Para ello se ha utilizado una muestra de clientes bancarios españoles de los que se dispone de dos años de datos. Se ha demostrado que los clientes con una mayor recencia en la compra y en la cancelación adoptan el canal online más lentamente (dando soporte a las hipótesis 2a y 2b), los clientes con una mayor rentabilidad adoptan el canal online más lentamente (corroborando la hipótesis 4 pero en sentido inverso), los clientes que utilizan un mayor número de productos adoptan el canal online más rápidamente (soportando la hipótesis 6), y finalmente, los clientes con un mayor balance en activos adoptan el canal online más rápidamente (corroborando la hipótesis 7a), mientras que los clientes con un mayor balance en pasivos adoptan el canal online más lentamente (corroborando la hipótesis 7b pero en sentido inverso).

Las implicaciones para la gestión derivadas de este trabajo pueden ayudar a las empresas a conocer qué clientes son más propensos a utilizar este tipo de canales y diagnosticar si en su caso la puesta en

práctica de una estrategia online tiene o no sentido. En particular, el uso de un mayor número de productos bancarios es un factor influyente en el proceso de adopción, así como el balance en productos de activo (en un contexto bancario se consideran activos los créditos, préstamos o las deudas en cuentas corrientes). El resto de variables o bien no demuestran tener un efecto significativo en el proceso de adopción, o bien en lugar de acelerarlo, lo ralentizan.

Una de las limitaciones de este trabajo está ligada a disponer de una base de datos con información de dos años. Otros trabajos previos utilizan periodos temporales más amplios para llevar a cabo este tipo de análisis, por ejemplo 4 o 5 años (e.g., Xue *et al.*, 2011). Para investigaciones futuras sería deseable disponer de más histórico de datos y replicar el análisis. Adicionalmente, se propone como futura línea de investigación el testear otras distribuciones en las que basar el *AFT model*, además de la log logística, así como analizar los resultados aplicando un modelo de supervivencia no paramétrico y comparar los resultados. Finalmente, la introducción en el modelo de variables de uso de producto diferenciando entre categorías se configura como otra futura línea de investigación.

## ABSTRACT

*The aim of this paper is to contribute to the research field which studies the consumer behavior model in mobile social commerce, starting from the evolution of the concepts of electronic commerce, mobile commerce and social commerce: It also identifies the main factors that influence intention to use, through the classical TAM model and subsequent extensions and the inclusion of the perceived risk. Consequence of all we proposed the Mobile Social Commerce Acceptance Model (MSCAM).*

*To carry out this research, we created a survey answered by 353 social network users who had previously watched a video explaining the functioning of this new online commercial format.*

*The results confirm the relevance of the relationships proposed, highlighting the influence of subjective norms on usefulness and attitude, except for the relationship between perceived risk and intention to use.*

## Key Words:

E-commerce, mobile-social-commerce, technology acceptance model (TAM), perceived risk, intention to use

## 1. Introduction

The emergence of mobile telephones and the rise of social networks constitute unprecedented landmarks. In the first place, the large number of features that help make daily life easier can explain the widespread, growing use of mobile phones. The increasing number of smartphones in the mobile market is also a clear example of this trend (Allen et al., 2010; Calzada and Estruch, 2011). Generator Research (2013) estimates that by 2015 there will be over 1,500 million smartphone users, representing 24.8% of active SIM cards, leaving no doubt that the smartphone market presents a strategic opportunity for many companies as they attempt to profit from the distribution of their services and multiple marketing programs (Sheehy, 2011). Secondly, ENISA (2010) computes the number of worldwide users of social networks by means of mobile devices by 2011 as 554 million, corresponding to 13.3% of mobile phone users. Actually, in Spain the penetration rate for SNS is over 79 % and the 70% of these users access by mobile phone (IAB, 2014).

Gómez and Otero (2011) argue that the future of Facebook, the most popular national and international social network, must pass through the path of social commerce (S-commerce) as a tool that complements advertising and the integration of Social Networks (SN) in the real world via other parallel technologies such as Quick Response (QR) codes or implementing RFID technology (Radio Frequency Identification). From our perspective, social commerce is at an emerging phase and will be one of the main tools for sale in the coming years.

Sun (2011) reveals that although the terms social commerce or social shopping are considered analogous by most authors, some regard them differently. In this sense, some researchers believe that social commerce refers to the perspective of the company that sells the product, while social shopping refers to the perspective of the consumer (Stephen and Toubia, 2010). Both concepts are actually similar and only differ, in the first case, from whether the perspective is that of the seller or consumer. For this reason we apply the term indiscriminately.

Social commerce is an electronic commerce that involves using social media, online media that supports social interaction, and user contributions to assist in the online buying and selling of products and services. In a more direct way this would be put into place in the same manner as the applications that combine online shopping and social networks (Tedeschi, 2006) in the line that Stephen and Toubia (2010) defined as the integration of social network characteristics in the functions of basic e-commerce web sites so as to "... allow people to participate actively in the marketing and selling of products and services in online marketplaces and communities."

Following the principles established by Shen (2008), we can define social commerce as "an extension of Business-to-Consumer E-commerce where consumers interact with each other as a main mechanism in conducting online shopping activities, such as discovering products, aggregating and sharing product information, and collaboratively making shopping decisions."

Based on this initial approach, our work presents the following objectives: 1) to analyze the theoretical evolution of the concepts of electronic commerce (e-commerce), mobile commerce (m-commerce) and social commerce (s-commerce), 2) to establish a pattern of behavior following the principals and modifications of the classic TAM model on the question of the social shopping experience, and 3) to define strategies of action for companies that choose to implement s-commerce based on the results achieved.

Our study is structured in six sections. Following this introduction, in section 2 we provide a theoretical framework aimed at examining e-commerce, m-commerce and s-commerce. In section 3, we establish the research hypotheses and the behavioral model proposed. In section 4, we describe the methodology used in our research. In section 5 we analyze and discuss the results. Finally, we draw the main conclusions and discuss some implications and limitations of the study in section 6

## 2. Theoretical framework: e-commerce, m-commerce and s-commerce

The evolution of our society has been marked by innovation since its very beginning. For many, the sudden rise of ICT has brought about a revolution similar to that of the emergence of electricity or the invention of printing.

Although investments in technology have been limited for some years in Spain, as shown by the innovation indicators in the European Union (EU) and the resources invested (Cotec Foundation, 2011), it appears that since 2008 there has been a change in this trend and the level of investment in Spain, compared to that of the rest of the EU countries, has reached equal proportions.

In spite of all this, the economic activity is undergoing an important transformation process, marked by a triple interaction: 1) a process of technological revolution, led by the investment in and the massive use of ICT; 2) a dynamic of temporal and spatial enlargement of the factors and products markets, also known as the globalization process; and 3) new patterns of consumer demand and of the investment of companies and households (Torrent-Sellens et al., 2010). These factors were confirmed in the last report of the Spanish Corporate Association for Electronics, Information and Communications Technologies (AMETIC, 2010), which verifies the high level of technological acceptance in the Spanish business sector.

In recent years, developments in the field of information and communications technologies (ICT) and the important business applications derived from them, have created significant economic progress in terms of profitability, productivity, competitiveness and economic growth for both companies and countries (Dehning and Strapoulos, 2003; Lafuente, 2005).

Trade on the Internet today is the most important potential tool for companies. This means a revolution in both the buying habits of consumers and consumer-business relationship formulas (Sharma and Sheth, 2004). Currently over 90% of total OECD companies have access to Internet. Though in Spain that number is only 86.6%, the evolution of recent years shows signs of it catching up with the average of OECD countries (AMETIC, 2010).

Different formulas have been identified in the scientific literature to define e-commerce (Vilaseca et al., 2007). For Treese and Stewart (1998), this represents "the use of global Internet for the purchase and sale of products and services, including post-sale service and support". Kalakota and Whinston (1996) define e-commerce as "the modern method of doing business that takes into account the needs of organizations, merchants and customers to reduce costs by improving the quality of goods, services and distribution".

E-commerce is now an essential tool for the business development of many companies and has many advantages, including (Poong et al., 2009; Armesh et al., 2010): continuous accessibility; increased quantity and quality of information; direct contact between customers and producers to facilitate interaction; multimedia access to companies' contents; the creation of new products and services; open markets; cost reductions; time savings; the immediacy of interaction; the personalization and globalization of offers of markets. These advantages will only be enhanced with the integration of web 2.0 in online marketing activities in the near future (Hannah and Lybecker, 2010).

In this context, m-commerce is an online trading model where mobile devices perform the classic functions of trade, for example, assisting in information searches, facilitating contact between the consumer and business and completing transactions. M-commerce is strategically important for companies because it promotes online sales using a support system that already takes advantage of varied marketing activities, and therefore reinforces the channel itself.

In today's society, the mobile phone has proven itself to be a vital tool in any personal or professional activity, with a very high level of acceptance by consumers (Masamila et al., 2010).

The main similarities between e-commerce and m-commerce are (Liébana-Cabanillas, 2012): 1) the maturity of the former and the growth potential of the latter, 2) the greater penetration of e-commerce,

3) the increased accessibility of m-commerce, 4) analogous users, 5) the similar levels of personalization available; and finally 6) the diversity of buying motives.

On the other hand, s-commerce is a new wave of e-commerce in which traditional e-commerce is mediated by social media and social networking services in order to promote online transactions and shopping-related information exchanges (Wang and Zhang 2012). Social commerce can be defined as word-of-mouth applied to e-commerce (Dennison et al. 2009) or as a type of trade supported by social media and social network services (SNS) (Curty and Zhang, 2013). S-commerce generates two advantages which improve any other previous form of commerce (Zhang, 2009). First of all, it facilitates interactions between network users, enabling direct interaction for sharing opinions, purchase advice and experiences (participatory environment and word of mouth, see Wallace et al., 2009). Secondly, it allows surfing and getting to know a variety of products, which in the offline context would be impossible to reach (unlimited access). Apart from these two advantages, we would like to add two more: the third one would be the technological accessibility, since this allows access to this type of commerce from different types of modern technological devices (conventional mobile phones, smartphones, tablets, etc.), and lastly, the payment facilities that some social networks are already providing or will provide in the future.

As claimed by different authors (Castelló, 2011; Huang and Benyoucef, 2013), s-commerce is going through an introductory phase. This means that it has not taken off yet in our country. However, after consulting several sources, we have detected a promising background, with many probabilities of success (Kumar and Benbasat, 2006; Hsiao et al., 2010; The Cocktail Analysis, 2013): a notable acceptance of social networks, a lower rejection of advertising on social networks, a higher level of the activity of social network users, a high access rate to social networks from mobile phones, better results of online purchases based on the opinion of other users, etc.

The emergence of s-commerce reflects the new power users have nowadays, removing sellers' bargaining power and replacing it by the consumers themselves (Wei, Straub and Poddar, 2011; Gu et al., 2012). This has reached the point that their behavior is recognized within that network and the visibility of their actions has a greater personal and social impact.

For all of the above, we consider that s-commerce will be crucial for future commercial activity. Hence, we define a behavioral model to verify the intention to use, based on Davis' (1989) classical model and subsequent adaptations, adding the risk that the user might perceive in purchase transactions on social networks.

### **3. Research proposal: antecedents of intention of use with mobile social commerce**

The objective of this research is, from a holistic perspective, to develop a behavior model to define the intended use of a social commerce among population users. Our Mobile Social Commerce Acceptance Model (MSCAM) integrates factors from different existing models and theories (Hajli, 2012) to respond to the acceptance of this new commerce system.

In the scientific literature, numerous models have been used to measure technology acceptance. However, we will focus on the TAM, as it is the most widely used model in the scientific literature concerning commercial mobile services (Wei, Xinyan and Yue, 2011). Most models mentioned in the reviewed scientific literature are based on the TAM model for analyzing the acceptance of innovation, although with some limitations. Based on the classical TAM (Davis et al., 1989), our model is completed with the inclusion of risk as a relevant element in the adoption of social commerce.

The TAM model, as stated by Alcántara (2012), does not include subjective norms, as is the case in the TRA (Fishbein and Ajzen, 1975). Davis et al. (1989) "recognize the importance of social influence, but they exclude it from their model because of the problems it entails, for not being able to distinguish

whether the behavior of use is caused by the influence of reference groups or by attitudes, mainly due to the fact that subjective norms are significant when subjects have little experience with technology". In our research, we have taken this variable into account due to the importance of this influence for the adoption of innovations (e.g. Venkatesh and Bala, 2008; Kim, Chol and Han, 2009). Subjective norms are defined as the extent to which an individual perceives that people who are important to them think they should or should not use a certain system or perform a certain action, etc. (Hsu and Lu, 2004; Venkatesh and Bala, 2008).

Therefore, subjective norms will have an impact on the ease of use (Lu et al., 2005; Bhatti, 2007) and on usefulness (Scheepers and Wetzels, 2007; Zhang et al., 2011; Chang et al., 2011; Kim, Kim and Shin, 2009; Teh and Ahmed, 2011; Yang et al., 2012; Chung et al., 2012). We therefore propose the following research hypotheses:

H1: Subjective norms have a positive effect on the ease of use of s-commerce

H2: Subjective norms have a positive effect on the perceived usefulness of s-commerce

H3: Subjective norms have a positive effect on the intention to use s-commerce

On the other hand, the ease of use refers to the individual's perception that using a certain system is effortless or simply easy to do (Davis, 1989, Taylor and Todd, 1995). For this reason, it is considered to be one of the qualities of greatest impact on the acceptance of a new technology (Moore and Benbasat, 1991). Particularly in e-commerce, Vijayarathy (2004) defines it as "the extent to which a consumer believes that online purchasing would be free of effort". Therefore, this concept is closely linked to the structure of the website, its content, its ease of use, etc.

The impact of the perceived ease of use on the perceived usefulness has been proved in numerous research studies applied to different contexts, as for example in the use of online services (Liao et al., 2007), the acceptance of e-commerce (Sánchez-Franco and Roldán, 2005), online purchase intention (Hernández-García et al., 2011), technology in teaching (Chang et al., 2011), mobile payment (Liébana-Cabanillas, 2012) and even in s-commerce (Teh and Ahmed, 2012). On the other hand, Lai and Li (2005), Sánchez-Franco et al. (2007), Fadil (2009), Qi et al. (2009) and Schierz et al. (2009) prove that the perceived ease of use has a positive impact on the user's attitude and perceived usefulness.

Considering these circumstances, we propose the following hypotheses:

H4: Perceived ease of use positively influences the attitude towards the intention to use s-commerce

H5: Perceived ease of use positively affects usefulness in the adoption of s-commerce

Davis et al.'s (1989) original model established an indirect relationship between the belief of usefulness and the behavioral intention, based on the idea that users will form their intentions towards certain behaviors when they believe they will improve their performance. This way, usefulness will affect behavior and therefore the use of the s-commerce analyzed below. Different research studies have proven how usefulness is directly related to attitude (Hsu et al., 2013), but also to the intention to use. In line with this idea, we would like to highlight the studies carried out in the context of tourism (Luque et al., 2007), social network games (Shin and Shin, 2011), 2.0 travel tools (Muñoz-Leiva et al., 2012; Ayeh et al., 2013), mobile commerce (Aldás-Manzano et al., 2008) and mobile payment (Liébana-Cabanillas, 2012), among others. In the context of our research, we understand that the usefulness of s-commerce will influence the intention to use through the user's attitude toward the purchase, but also directly, according to the principles of the TAM. In the light of these circumstances, we propose the following hypotheses:

H6: Perceived usefulness has a positive effect on the intention to use s-commerce.

H7: Perceived usefulness has a positive effect on the attitude toward the use of s-commerce.

Finally, the relationship between the attitude toward technological innovation and the intention of use has been empirically supported by research in different fields of study, such as using an information

system (Bhattacharjee and Premkumar, 2004), the intention of online auctions (Huang et al., 2011) and mobile payment systems (Schierz et al., 2009), etc. We therefore propose the following hypothesis:

H8: Attitude toward the intended use is an antecedent of intention to use s-commerce

### 3.1. Extensions of the TAM

Bauer (1960) starts an analysis of perceived risk through two components: uncertainty (consumers' lack of knowledge regarding what might happen when they make a purchase) and the eventual negative consequences of the purchase. Later, this same author stated that all consumer behavior entails a risk, since the consequences derived from it cannot be anticipated with certainty (Bauer, 1967). Gupta and Kim (2010) define it as "a consumer's perception about the uncertainty and the adverse consequences of a transaction performed by a seller".

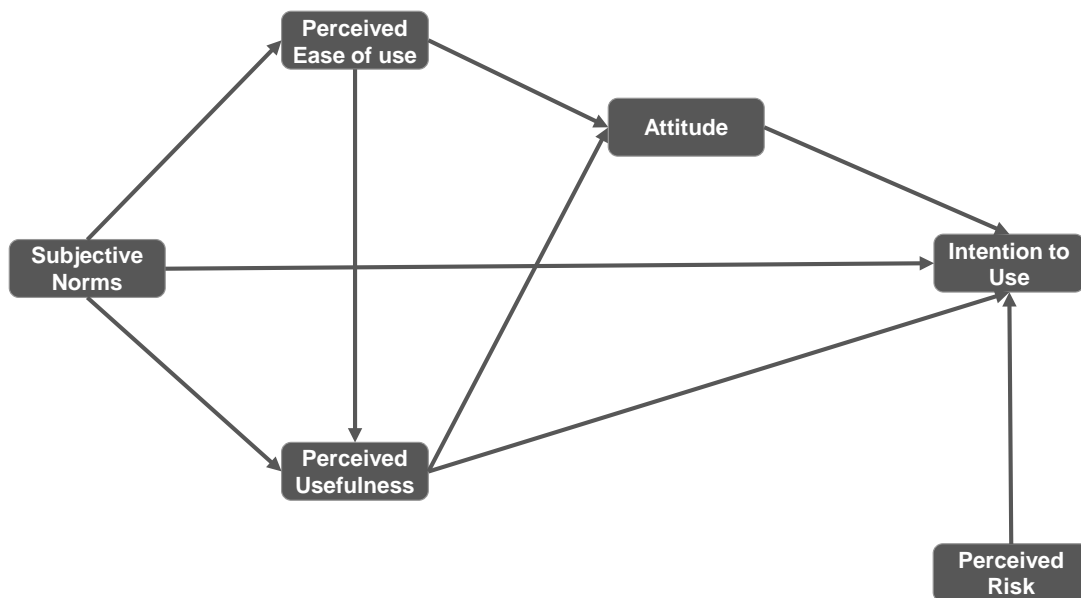

Perceived risk is a multidimensional construct consisting of different factors, which together explain the global risk associated with the adoption of a given product - in the present case, s-commerce (Featherman and Pavlou, 2003; Lee et al., 2012).

Some authors suggest that the perceived risk in online exchange relationships is a factor that limits the development of e-commerce (Culnan and Armstrong, 1999; Reichheld and Scheffer, 2000). From our point of view, the perceived risk associated with s-commerce is higher than the risk of any other online purchase (Gupta and Kim, 2010; San Martín and López, 2010), since the abovementioned multidimensionality increases due to the risk of being exposed to the social network on which the purchase will take place. Considering these arguments, we propose the following hypothesis:

H9: The perceived risk negatively influences the intention to use s-commerce.

The final model proposed is summarized in Figure 1.

FIGURE 1  
Model proposed: Mobile Social Commerce Acceptance Model (MSCAM)

### 4. Research methodology and data collection

The aim of this study was to analyze the adoption of social commerce by users of social networks. The study subjects were students of the Business Management and Administration degree course at a southern university of Spain. We developed a questionnaire based on our research model to measure the variables. The questionnaire was completed in class. Following a pre-test, some questions were rewritten for clarification.

The questionnaire was made up of two sections: the first one was a group of questions which analyzed the students' socio-demographic profile, as well as their level of technological innovation and presence on social networks (see Table 1); the second one was a group of questions matching the constructs of our model. The students had access to the questionnaire after having watched a video explaining s-commerce. The constructs analyzed were measured on the basis of an adaptation of the scales proposed - listed in Annex 1.

The questionnaire was completed by 378 students during May and June 2013, of which 353 completed questionnaires (93 per cent) were deemed valid.

The sample profile of participants appears in Table 1, which shows that 52.69 per cent of those surveyed were women and 47.31 per cent were men.

TABLE 1  
Demographic and technological information of the participants

	Frequency	Percentage
<b>Sex</b>		
<b>Male</b>	167	47.31%
<b>Female</b>	186	52.69%
<b>TOTAL</b>	353	100%
<b>Age</b>		
<b>19</b>	45	12.75%
<b>20</b>	134	37.96%
<b>21</b>	99	28.05%
<b>22</b>	75	21.25%
<b>TOTAL</b>	353	100%
<b>Social Network users</b>		
<b>Yes</b>	353	100%
<b>No</b>	0	0%
<b>TOTAL</b>	353	100%

### 5. Results: reliability and validity of measurement items

First, to measure the scales' reliability, we applied the Cronbach alpha indicator (see Table 2), with 0.6 as the reference value (Malhotra, 1997), and 0.7 to be more restrictive (Nunnally, 1978). A Confirmatory Factorial Analysis was also conducted to compare the scales' convergent and divergent validity.

The convergent validity was evaluated through the indicators' factorial loads. We verified that the coefficients were significantly far from zero and that the loads between the latent and observed variables were high in all cases ( $\alpha > 0.7$ ). It could therefore be confirmed that the latent variables adequately explained the observed variables (Hair et al., 1995).

In terms of discriminative validity, we confirmed that the variations were significantly far from zero and that the correlation between each pair of scales was 0.9 (Hair et al., 1995).

The scales' reliability can be evaluated based on a series of indicators extracted from the confirmatory analysis. Specifically, the factor's compound reliability (CR) and extracted variance analysis (EVA) surpassed the reference threshold, 0.7 and 0.5, respectively, as well as other indicators of global adjustment for the corresponding models of individual measurements (Hair et al., 1995).

TABLE 2  
**Convergent validity and reliability of the internal consistency**

Variable	Item	Stand. Coef.	Cronbach's Alpha	CR	EVA
Subjective Norms	SN1	0.891	0.93	0.9	0,76
	SN2	0.898			
	SN3	0.82			
	SN4	0.78			
Ease of use	EOU1	0.63	0.88	0.86	0,61
	EOU2	0.913			
	EOU3	0.482			
	EOU4	0.897			
Perceived Usefulness	US1	0.915	0.94	0-.94	0,8
	US2	0.892			
	US3	0.916			
	US4	0.854			
Attitude	AT1	0.809	0.92	0.92	0,76
	AT2	0.89			
	AT3	0.916			
	AT4	0.857			
Intention of use	IU1	0.907	0.96	0.96	0,88
	IU2	0.961			
	IU3	0.944			
Perceived Risk	PR1	0.907	0.9	0-91	0,71
	PR2	0.845			
	PR3	0.697			
	PR4	0.897			

After analyzing the reliability and validity of the initial measurement scales, we tested the research hypotheses in the literature review using the structural equation model (SEM). Considering the absence of normality of the variables, we opted for the maximum likelihood estimation method and bootstrapping technique (or bootstrap learning samples) for 500 consecutive steps or samples, and a significance level of 95 percent. The maximum likelihood is preferable in the case of small samples, as opposed to generalized or weighted least squares (West et al., 1995). In the bootstrapping technique we used the Bollen-Stine's corrected p-value, testing the null hypothesis that the model is correct. Through re-sampling, this technique permits the standard error of the constructs to be corrected.

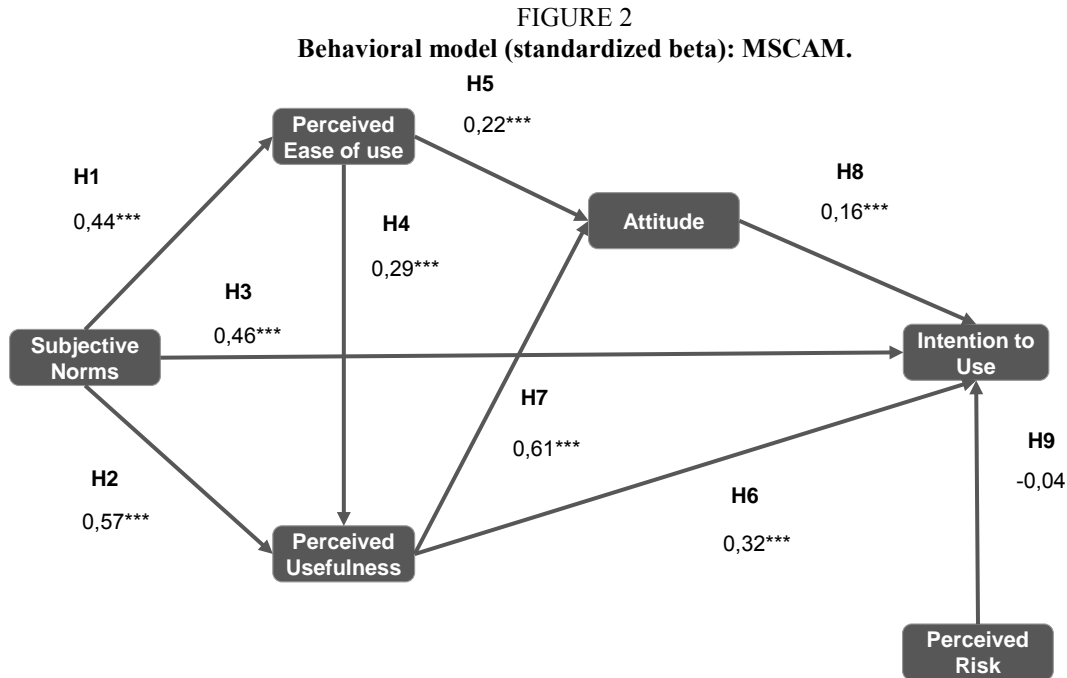

TABLE 3  
**Statistical summary of the model's goodness-of-fit.**

Goodness-of-fit index	Recommended value	Results in the study
$\chi^2$ /degrees of freedom	<3	2.4
Goodness-of-fit index (GFI)	>0.90	0.88
Adjusted goodness-of-fit index (AGFI)	>0.80	0.85
Comparative fit index (CFI)	>0.90	0.96
Normed fit index (NFI)	>0.90	0.93
Root mean square error of approximation (RMSEA)	<0.08	0.06

Adjusting the model with absolute, incremental and parsimonious measurements verified that the model's adjustment was reasonably effective. Table 3 shows that the goodness-of-fit of all the statistics is within an acceptable range (Hu and Bentler, 1995; Hu et al., 1999).

The results of the structural model are shown in Figure 2.

Note: \*\*\*  $p < 0.001$

The results of the SEM analysis and the results of the hypotheses are shown in Table 4. All the hypotheses were considered significant except hypothesis 9. The results for H9 reveal that the relation between perceived risk and intention to use is not significant ( $\beta = -0.04$ ,  $p > 0.001$ ), although there is a negative and small value relationship between them. This situation could be explained by the profiles of the survey respondents (Akman and Mishra, 2010), that is, students with an average age of 20.5. Age is a risk inhibitor in the adoption of certain technologies (Liébana-Cabanillas, 2012). This means that younger users have minor problems in the adoption of technology (Phang et al., 2006).

On the other hand, hypotheses 1, 2 and 3 could not be rejected ( $p < 0.001$ ), thus proving the importance of subjective norms in s-commerce. It is precisely subjective norms which establish the most significant relationship with the intention to use ( $\beta = 0.45$ ,  $p < 0.001$ ), as a consequence of the environment in which the purchase is carried out (a social network). This somehow conditions the users' potential behavior (Liébana-Cabanillas, 2012). For this reason, we have found out that through subjective norms, users will improve their perception of the ease of use ( $\beta = 0.37$ ,  $p < 0.001$ ) and usefulness ( $\beta = 0.54$ ,  $p < 0.001$ ).

Furthermore, our hypotheses regarding the effect of the ease of use (H4 and H5) could not be rejected either. The ease of use is directly and positively related to perceived usefulness ( $\beta = 0.32$ ,  $p < 0.001$ ) and attitude ( $\beta = 0.21$ ,  $p < 0.001$ ), according to the literature analyzed previously.

Additionally, the relationship between usefulness and intention and attitude in H6 and H7 cannot be rejected either. On this occasion, the usefulness the user gives to s-commerce directly affects both the intention of future use ( $\beta = 0.33$ ,  $p < 0.001$ ) and the user's attitude towards it ( $\beta = 0.52$ ,  $p < 0.001$ ).

Lastly, H8, which relates the users' favorable attitudes towards s-commerce and their intention, cannot be rejected either ( $\beta = 0.18$ ,  $p < 0.01$ ), although it has a lower value than the other variables associated with intention of use.

In the model all the relationships turned out to be significant, except for the one between perceived risk and intention to use. The percentage corresponding to the variable 'intention to use' attained 70.7%. The intention to use is positively related to subjective norms ( $\beta = 0.46$ ), usefulness ( $\beta = 0.32$ ) and attitude ( $\beta = 0.16$ ), and negatively related to perceived risk ( $\beta = -0.04$ ).

TABLE 4  
Non- standardized coefficients ( $\beta$ ) of the model

Hypotheses	Effect	$\beta_{sc}$	S.E.	Sig.	Valuation
1	SN $\rightarrow$ PEOU	0.373	0.05	0.000	Accepted

## 6. Conclusion and future research directions

The technological advances of recent years have modified the way clients carry out their purchases. From the classic concept of e-commerce, the implementation of mobile technology and the emergence of social networks, human behaviors have had to adapt to the environment. With the emergence of social commerce, the technology and socialization of purchases have come together, strengthening the user's presence on the network. This becomes even stronger with the massive penetration of mobile phones.

Social commerce is increasingly drawing the attention of the professional and academic world. As we have already mentioned in this paper, the evidence of the data analyzed and of previous studies shows that social commerce is a new phenomenon which needs deeper analysis in terms of economic and social consequences.

Given the importance of this new commercial format and the massive penetration of mobile phones in society, there has been a proposal of a review of the intention to use in the Spanish context, in which this type of activities is still at an embryonic stage. The model selected to this end was the TAM model. TAM has been widely used in our research and it is considered a highly validated model in a large number of technological innovations - hence our decision to use it, including some subsequent modifications.

The results of our research significantly confirm the classic relationships of the TAM. The variables 'subjective norms', 'usefulness' and 'attitude' establish a significant relationship with the intention to use. We highlight the case of subjective norms as the most important determining factor for the intention to use social commerce, precisely because of the environment in which the eventual purchase is carried out. This leads us to suppose that the user will be aware of the importance of his/her actions on the network, being influenced by them at the same time, and to some extent promoting the mobile social word of mouth (M-S-WOM). However, the relationship established between risk and intention does not attain the necessary significance, although this is a negative relationship, as expected. This suggests that the risk among the selected population (young users) is not as important as we theoretically expected it to be at the beginning, since younger users have fewer difficulties in the adoption of a new purchase system.

The inclusion of social networks in the business activity of companies -based on the domestic use of SNS- represents a great opportunity both for companies and consumers.

Traditional sales systems are adopting the new trends existing in the market, with a special emphasis on social commerce as a trading system which includes the use of social networks in the transactions carried out by their users. Although this activity is going through an expansion phase in some countries, in Spain it is still at an embryonic stage. This reduces the chances of success in light of the data analyzed. Therefore, it could be interesting to explore new lines of research related to the social web/network on which the purchase is carried out, as well as to the activity of purchasing.

Concerning the website on which the purchase takes place, we need to further the analysis of website functionalities, the different existing methods (Storefront, social commerce store and smart commerce store, among others), as well as the website operating level.

With regard to the activity of purchasing, we have to analyze the influence of social commerce at each stage of the purchasing process, including the review of the Elaboration Likelihood model (ELM). Taking into account the ELM, it would be interesting to analyze users' behavior in the central route, in which users assess the information provided in an active, cognitive and assiduous way, as well as in the peripheral route, in which users will have less experience and their behavior will be influenced by secondary aspects, such as the organization of the website itself, the order on the website (functional aspects or aspects that determine the perception of the ease of use) and other elements related to the format (color, images, etc.).

With regard to technology, we should conduct comparative analyses to find out if the use of mobile phones, tablets or similar devices can modify the results of our research, thus enhancing a better adoption of the mobile social commerce.

Finally, we believe it is crucial to analyze the eventual impact of virtual brand communities, as well as the impact of the existing social networks and how their users' profile and nature will affect the results of the social commerce activities (Facebook commerce, Pinterest commerce, etc.).

# SMART CARDS CONSOLIDATION FROM A CITIZEN ORIENTED PERSPECTIVE: AN EMPIRICAL STUDY

---

## ABSTRACT

*Despite public administration efforts to develop smart card technology and to spread its use, smart cards are not always well accepted by citizens. This research analyzes the determinants of continuance intentions to use smart cards in post-adoption stages. Specifically, we propose that smartcard continuance intentions depends on its usefulness and the personal demand of local services. Three citizens' concerns related to smart cards features (i.e. ease-of-use, security, and privacy issues) are also proposed as determinants of continuance intentions. Results support most of the hypothesis, except for the influence of privacy, and confirm usefulness as the most relevant antecedent of continuance intentions.*

## Keywords:

*Smart Cards; Continuance Intentions; Perceived Usefulness; Privacy Concerns; Security Concerns; Demand of Local Services*

## 1. Introduction

Urban population is continuously increasing and nowadays more than half of the world's population lives in bigger and bigger cities, which complicate citizens' daily life in urban areas but also the public management of local infrastructures and services (Chourabi *et al.*, 2012). In this context, smart cities emerge to better fulfill citizens' needs and demands in the local level by increasing interactivity with citizens and making an intensive use of IT as a mean to improve the city quality of life and its social, health, economic and environmental welfares (Aldana-Nalda *et al.*, 2012). In initial stages of smart cities implementation, as it is the case of most projects worldwide, smart cards represent a crucial innovation to advance on local services' integration and citizen interaction with the surrounding infrastructures (Deakin and Al Waer, 2011). Essentially, smart cards are based on radio frequency identification (RFID) technology and facilitate user's identification, access to local facilities, and payment of small fees in basic services such as public transport (Chan *et al.*, 2010; Bunduchi *et al.*, 2011). Among multiple advantages, card-holders make use of public services with shorter transaction times and greater convenience (Truman *et al.*, 2003). Despite public administration remarkable efforts to develop smart card technology and to spread its use, smart cards are not well accepted by citizens (Smith, 2005). Empirical evidence in previous studies confirm that the introduction of this innovation in some cities has ended in failure because of citizens' perceptions of complexity as well as privacy and security concerns (e.g. Truman *et al.*, 2003; Bailey and Caidi, 2005). Therefore, because the system needs to achieve a critical mass of users to attain efficiency in the medium term (Tung and Rieck, 2005) and to move into further stages in the development of smart cities, there is a managerial need to understand the factors that may affect the continued use of smart cards by citizens.

Due to the increasing interest in launching smart cards by many different public organizations, literature has started to focus on this topic in the last decade. Most of these studies have analyzed smart cards adoption processes (e.g. Plouffe *et al.*, 2001; Lee *et al.*, 2003; Chan *et al.*, 2010), proposed launching strategies (e.g. Wonglimpiyarat, 2004), or just described smart cards from a system perspective (e.g. M'Chirgui, 2005). However, given the initial costs of RFID technology implementation for the public sector (Bunduchi *et al.*, 2011), the viability and success of this kind of technology-based services in the medium term depend on its continued use rather than on its adoption (Bhattacharjee, 2001). Therefore, to move on this topic, this work focuses attention on the analysis of citizens' continuance intentions to use a smart card.

To be precise, we first consider that continuance intentions may be determined by smart card functional benefits; that is, their perceived usefulness by citizens. This is consistent with previous literature on acceptance of innovations that mainly relies on deterministic frameworks (e.g. Arts *et al.*, 2011). Second, since the smart card provides access to some conventional and frequently necessary public services for many citizens, the personal demand frequency of these services for daily tasks may determine continuance intentions too. Third, the features of smart cards present them as a payment system dealing with private information to access many services regularly. Thus, several potential citizen concerns related to the basic attributes of the innovation (i.e. perceived ease-of-use, privacy and security) are also proposed as antecedents of continuance intentions. Finally, socio-demographic characteristics of the individuals and the kind of payment associated to the card are also included in our framework as control variables.

More specifically, this work presents the following contributions to this emerging body of literature: (a) our research focuses on continuance intentions to use smart cards from a user oriented perspective, (b) the research model integrates essential functional perceptions, citizens' concerns regarding smart card use, and the personal demand of local services, and (c) we control the effect that specific characteristics of users or payment system may have on continuance intentions. To do that, we focus on the smart card service of Zaragoza (a north-eastern city in Spain) launched in 2009, which is gradually introducing this service as an essential element to evolve in a broader smart city plan. This scenario provides an appropriate context for analyzing the continued use of the smart card.

Taking into account the previous considerations, this work is structured as follows. First, we briefly describe the main characteristics of the smart card service in Zaragoza. Second, we explain the main citizens' concerns and barriers that endanger the success of smart card initiatives. Next, we develop a

research model to explain continuance intentions of smart card use and formulate the hypotheses of the study. Then, we describe the methodology employed and the processes of data collection and measures validation. After that, we present the results obtained in the empirical analysis. Finally, we discuss the main conclusions and managerial implications, and expose the limitations of the study that open new avenues for future research.

## **2. Theoretical Development**

### ***2.1. The smart card use in Zaragoza***

In the last years, like many cities around the world (Chourabi *et al.*, 2012), the City Council of Zaragoza is implementing a plan to gradually become a smart city. This strategy involves several initiatives such as the creation of a technologic and innovative district with residential and business areas or the launching of e-government services such as those based on open government information (e.g. traffic information on mobile applications). As a valuable instrument to join citizens to this plan and in order to better satisfy citizens' daily needs, public managers launched a smart card service in 2009. City residents voluntarily obtained their personal cards for free in municipal offices or by means of an online request. Similarly to other smart cards worldwide (Chan *et al.*, 2010; Truman *et al.*, 2003), the Zaragoza smart card accomplishes three purposes: (1) Identification by means of the name and a picture of the card-holder appearing on the front of the card, (2) access to public facilities as a member card by mean of contactless RFID technology, and (3) payment of small fees to access public services also through RFID. Related to the payment systems, the service functions either as a prepaid card with up to 100€ credit or as a postpaid card with payments charged in a bank account monthly. This multiple function card can be employed in a long list of public and private services linked to the urban area such as the public transport system, indoor and outdoor car parks, sport and cultural facilities (e.g. swimming pools, theaters, etc.), municipal WIFI, cloud computing storage service, taxis, old people homes entrance, and similar services that has been added progressively. It is important to note that this innovation does not substitute already existing systems such as specific IDs, cards or payments in cash, but unify the benefits of all of them in just one card. After three and a half years from launching, around 170,000 inhabitants (which represent around 25% of the total population) hold a personal smart card to interact with Zaragoza local services according to City Council records.

### ***2.2. Citizen's concerns regarding the use of smart cards***

Previous literature on smart card adoption has focused mostly on adoption and relayed on standard frameworks or list of antecedents leading to adoption (e.g. Plouffe *et al.*, 2001; Lee *et al.*, 2003; Chan *et al.*, 2010). In this respect, researchers have relied on well-known theories such as the Technology Acceptance Model (Davis *et al.*, 1989) or the Diffusion of Innovation Theory (Rogers, 1995). However, in spite of their explanatory power, these frameworks are very deterministic and mainly focus on the functional benefits of adoption, ignoring many other aspects such as users' personal characteristic and habits that may affect decision making (Bagozzi, 2007). Also users' perceptions of the technological innovation as a threat may influence adoption, specifically in uncertain or risky contexts such as e-government (Belanger and Hiller, 2006). It could be also the case of the smart card services which deals with citizens' private information and which use implications may worry some citizens (Bailey and Caidi, 2005). Indeed, smart cards represent a payment method that also deals with users' personal identity and records of services used. However, little effort has been done by previous literature to analyse and empirically confirm to what extent privacy and security concerns are relevant to explain smart card users' behaviors. In order to develop our research model, we describe below the main citizens' concerns regarding smart cards in order to identify the crucial aspects that may affect the use of these cards.

First, privacy is a great concern for users of technology-based public services that hardly know who and how manage and handle their personal information (Belanger and Hiller, 2006). Perceived privacy is defined as the extent to which a potential user believes that his or her personal information is protected and will not be used without authorization (Casaló *et al.*, 2007). For example, privacy worries for internet users are related to the fact that companies might transfer personal data to others

without express consent, or hackers might steal personal information. Also, there is a perception of citizens' personal information mismanagement by public administration (Layne and Lee, 2001), and this awareness may be even enhanced due to recent news about government data safety failures and secret programs to collect user's private information in collaboration with important firms (The Guardian, 2013). Since smart cards include personal information about the card-holder that is recorded and managed by public administration (Bailey and Caidi, 2005), we expect that citizens' perceived privacy of the technology might be a critical concern to be included in our research framework.

Second, security of payment systems is the aspect that usually most worry innovation users (e.g. Flavián and Guinalú, 2006). Perceived security represents a barrier to use innovations and refers to the extent to which a potential customer believes that a system has the technical guarantees for completing transactions and transmitting sensitive information in a secure manner (Casaló *et al.*, 2007). This means that security does not only refers to the system as a mean of a payment but also as a mechanism for storing and transmitting information securely (Kolsaker and Payne, 2002). Since smart cards are employed as a payment and information exchange system to interact with many public services (e.g. facilities entrance, bicycle rental), we expect that the perceived security of the smart card may be a critical concern of many citizens that need to be integrated in our research model. Indeed, security concerns have been a common issue when providing public services, as previous studies suggest that many e-government sites were vulnerable to security attacks (Zhao and Zhao, 2010).

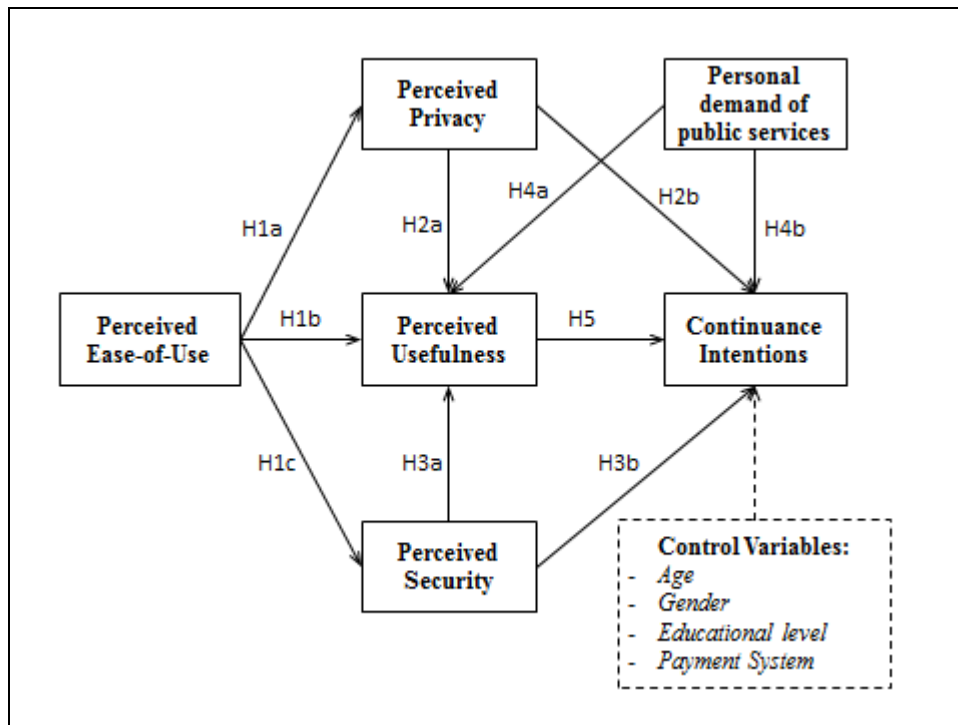

From a different approach, smart cards allow access to a great number of public services. Since public services have a wide range of users in terms of socio-demographic characteristics (age, educational level, etc.), smart cards are therefore directed to all city dwellers, which exhibit different levels of knowledge and ability to use innovations (Belanche *et al.*, 2012). Indeed, previous research recognizes that the level of complexity in the understanding and use of the smart card diminishes smart card acceptance (Truman *et al.*, 2003). To facilitate the use of smart cards to a wide range of citizens, ease-of-use must be a priority (Plouffe *et al.*, 2001). Perceived ease-of-use has been traditionally considered a relevant aspect in the acceptance of many technological innovations. Based on Davis (1989), we define perceived ease-of-use as the belief that using the smart card will be free of effort. Because ease-of-use is one of the most clearly observable characteristics of smart card technology, we consider it as an initial relevant factor that affects other variables in our framework.

To complete our research proposal, we also consider perceived usefulness as the principal factor determining the continued use of smart cards. Perceived usefulness refers to a person belief that using a particular system would enhance his or her activity performance (Davis, 1989). Basically, a citizen would not use a service that is perceived as useless; this explains why usefulness is the belief that most consistently influences users' intentions both at pre and post adoption stages of information systems use (e.g. Bathacherjee, 2001). Finally, since smart cards provides access to different public services (public transport, car parks, sport and cultural facilities, etc.), we consider that the citizens' demand frequency of these local services may be also a crucial aspect to continue using the smart card.

### **3. Formulation of Hypotheses**

In this section, the relationships among the variables included in the research model are justified. Specifically, we consider that: (H1) perceived ease-of-use positively influences perceived privacy, security and usefulness; (H2) perceived privacy positively influences perceived usefulness and continuance intentions; (H3) perceived security positively influences perceived usefulness and continuance intentions; (H4) personal demand of local services positively influences perceived usefulness and continuance intentions; and (H5) perceived usefulness positively influences continuance intentions. Finally, we also include both socio-demographic (age, gender, educational level) and innovation characteristics (payment system) as control variables. With the inclusion of socio-demographic characteristics of participants and payment system as control variables we aim to clearly differentiate to what extent the citizen's continuance intentions are determined by our proposed hypotheses or whether they may depend on control variables. To sum up, Figure 1 presents our proposed framework.

FIGURE 1.  
Proposed model including control variables.

### 3.1. Effects of perceived ease-of-use

Many authors suggest that perceived ease-of-use of a new service exerts a positive effect on perceived usefulness because improvements in perceived ease-of-use contribute to increase performance and help perceive benefits derived from use (e.g. Davis *et al.*, 1989). For example, as Davis *et al.* (1989) note, a person could complete more tasks due to effort saved thanks to improvements in perceived ease-of-use. Therefore, this relation has been confirmed in several contexts including the provision of new public services (e.g. Belanche *et al.*, 2012). As well, improvements in perceived ease-of-use reduce the likelihood of error and simplify processes, which are crucial aspects of public services provision (Belanche *et al.*, 2012). An easy to use system may help citizens better comprehend the service and increase their self-confidence when using it. All these may help increase the levels of perceived security of the service (Casaló *et al.*, 2007). Perceived ease-of-use may also positively affect perceived privacy since a well-explained and easy to understand technology alleviates user uncertainty and reduces perceived risks when using the service (Featherman *et al.*, 2010). Indeed, one of the major privacy concerns of a public service that involves the exchange of personal data is the use of this information. In this respect, perceived ease-of-use makes exchange processes more transparent and favors interaction between both parties (Casaló *et al.*, 2007), which may help increase perceived privacy of the service. Taking all these into account, our first hypothesis proposes that perceived ease-of-use positively affects perceived privacy, usefulness and security of the service:

*H1a: Perceived ease-of-use of the smart card has a positive effect on its perceived privacy.*

*H1b: Perceived ease-of-use of the smart card has a positive effect on its perceived usefulness.*

*H1c: Perceived ease-of-use of the smart card has a positive effect on its perceived security.*

### 3.2. Effects of perceived security and perceived privacy

Several studies suggest that customer privacy concerns may diminish the perceived benefits of a service; therefore, assuring privacy is crucial to enhance the perceived benefits by users (e.g. Lee and Cranage, 2011). As well, increasing perceived privacy may help reduce perceived costs (Li, 2012). Given that perceived usefulness refers to the belief that using the system will be helpful (Davis, 1989) –that is, that the innovative service is advantageous in terms of benefits and costs–, higher privacy perceptions of a system may increase its perceived usefulness. Similarly, privacy is also related to use

intentions in previous literature (Phelps *et al.*, 2001; Dinev *et al.*, 2008). In this sense, privacy has been traditionally considered a key barrier to the development of services that involve the exchange of personal information. Research about online transactions suggests that the perception of lower levels of privacy reduce behavioral intentions in order to minimize the negative outcomes of performing a transaction (e.g. Hoffman *et al.*, 1999, Liao *et al.* 2011). Therefore, we expect that an improvement in perceived privacy may favor continuance intentions to use a smart card since the negative outcomes of using the card will be reduced. In sum, we propose in our second hypothesis that perceived privacy positively affects perceived usefulness and continuance intentions:

*H2a: Perceived privacy of the smart card has a positive effect on its perceived usefulness.*

*H2b: Perceived privacy of the smart card has a positive effect on citizen's continuance intentions to use it.*

In turn, a consumer that perceives high levels of security when using a service may infer that the service provider has the intention to fulfill the requirements for a successful relationship and diminish perceived risks (Kim *et al.*, 2008a). Perceived security is related to the belief that a transaction will be concluded securely and, in this situation, it will be easier for the consumer to think that using a service will be useful (Lallmahamood, 2007). Therefore, we expect a positive link between perceived security and perceived usefulness of the smart card. As well, previous literature suggests that consumers continue using an innovative service, like online services, when they perceive high levels of security (e.g. Chang and Chen, 2009). This is especially relevant when monetary transactions are involved, like it is the case of smart cards. In a similar way, security concerns are found to negatively affect the internet banking use (Yoon and Steege, 2013). Therefore, we propose in our third hypothesis that perceived security positively affects perceived usefulness and continuance intentions:

*H3a: Perceived security of the smart card has a positive effect on its perceived usefulness.*

*H3b: Perceived security of the smart card has a positive effect on citizen's continuance intentions to use it.*

### **3.3. Effects of the personal demand of local services**

The personal demand of local services refers to the actual citizen's needs of use of public services that can be accessed with the smart card (i.e. public transport, car parks, sport and cultural facilities, etc.). Therefore, the greater the demand of these public services, the most useful the smart card will be because the innovative service provide access to all these services. Indeed, smart card can be used to replace different services' systems such as specific IDs, previous RFID transport cards or payments in cash, unifying the benefits of all of them in just one card (Lee *et al.*, 2003). At the same time, citizens that need to use local services frequently in their daily interaction with the city would tend to employ the smart card innovation as a way to access public local services. Therefore, we propose that:

*H4a: The personal demand of public services has a positive effect on perceived usefulness of the smart card.*

*H4b: The personal demand of public services has a positive effect on citizen's continuance intentions to use the smart card.*

### **3.4. Effects of perceived usefulness**

Previous literature proposes that perceived usefulness directly influences use intentions, because people may form their behavioral intentions according to the expected productivity associated with that behavior (e.g., Davis *et al.*, 1989). The usefulness-intention link is also based on cognitive decision rules that are invoked unconsciously in this kind of behavioral contexts. Thus, although this relationship was originally proposed in the acceptance context, it is also commonly applied to subsequent continuance stages (Bhattacharjee, 2001). The positive effect of perceived usefulness on continuance intentions has been empirically confirmed in several innovative services like the electronic commerce (Bhattacharjee, 2001) or the provision of new public services (Hu *et al.*, 2009). Adapting this relationship to our specific context, we propose our last hypothesis:

*H5: Perceived usefulness of the smart card has a positive effect on citizen's continuance intentions to use it.*

### **3.5. Control variables**

Finally, for the sake of completeness, we also include both socio-demographics and payment system as control variables directly affecting continuance intentions in our research framework. First, previous studies suggest that socio-demographic characteristics of individuals may influence the intentions to use technology-based products or services (e.g. Arts *et al.*, 2011). In this regard, many researches recognize that the use of innovations may depend on individual's age, gender, or educational level (Sun and Zhang, 2006); therefore, we include these variables in our framework. Second, beyond general perceptions about the innovation, the specific characteristics of the innovation may also affect usage intentions (Fang *et al.*, 2005). The most relevant characteristic of the smart card in Zaragoza is that there are two payment alternatives: (a) a prepaid or (b) postpaid system. Thus, we also include the payment system as a control variable directly affecting continuance intentions to use the innovation.

## **4. Methodology**

### **4.1. Data collection**

Data were collected in municipal buildings as a part of a longer collaboration project with the Zaragoza City Council. Sample was randomly selected from different groups of citizens according to their socio-demographic profile. The questionnaire was presented as an opinion survey about the smart card service and was targeted to smart card-holders that were at municipal facilities carrying out administrative matters or participating in community activities. For this purpose, we design a questionnaire including all constructs and information required in the research that each respondent had to answer individually. All the variables of the study were measured by reflective constructs based on 7-point Likert scales (being 1 "totally disagree", and 7 "totally agree"). Exceptionally, the personal demand of local services was measured by a formative construct using a 5-point scale of frequency of use (from 1 "never" to 5 "several times a day") of the main services that can be accessed with the smart card. In addition, we also gather some basic information such as the type of payment system selected by participants and sample demographics. This method provided us with a sample of 398 valid responses, after the removal of incomplete and atypical cases. Based on socio-demographic information, the sample is representative of the smart card-holders and residents of the city in terms of age, gender and level of education. In addition, in our sample, 68,8% of participants use the prepayment card and 31,2% use the post-payment card, which is also similar to the proportion of smart card-holders that use the pre or post-payment system according to the City Council records (79,9% and 20,1% respectively).

### **4.2. Measures validation and analytical procedure**

To operationalize the constructs of the research model, measurement scales were adapted from previous studies targeted to users of services and information systems. Specifically measures of perceived ease-of-use and perceived usefulness were borrowed from Davis *et al.* (1989), Venkatesh and Davis (2000), and Bhattacharjee (2000); security scale was taken from Cheung and Lee (2001), and Kim *et al.* (2008a); privacy items were based on the scale of Flavián and Guinaliú (2006), and Kim *et al.* (2008a); and finally, continuance intentions scale was adapted from Bhattacharjee (2001), and Wu and Chen (2005). Each of these scales consisted of 3 items except for continuance intentions, which was measured by 2 items. Alternatively, the personal demand of local services was measured by a 5-item formative construct referring to the respondent's request for the key municipal services that can be accessed with the smart card (public urban bus transport, municipal bicycles rental, sports facilities, public car parks, and public libraries). Specifically, we used a measurement of demand frequency adapted from Fransoo and Wouters (2000). Socio-demographic information and card payment system were considered as control variables in the research model. Specifically, gender and payment system were operationalized as dummy variables (Gender: man=1, woman=0; Payment system: post-pay=1, prepay=0). As an initial validation of measurements, content validity was ensured by the extensive review of the literature we undertook to identify suitable scales.

In line with a growing number of researchers, we used Partial Least Square (PLS) as the estimation procedure. Unlike other estimation methods based on Structural Equation Modeling (SEM), PLS can handle at the same time both reflective and formative factors (Chin, 1998), as it is the case of our research. PLS is particularly convenient because it employs a component-based estimation method and, in addition, it makes no assumptions regarding the underlying distribution of the data and does not require large sample sizes (Chin and Newsted, 1999).

Data analysis was carried out using SmartPLS software version 2.0 (Ringle and Wende, 2005). First, we analyzed data to check validity of measures. A confirmatory factor analysis corroborates the initial factor structure with all items loading scores around 0,9 on their respective construct, highly above the recommended benchmark of 0,7 (Henseler *et al.*, 2009). As well, composite reliabilities of all reflective constructs are higher than 0,9, proving their internal consistency. As an additional indicator of convergent validity, average variance extracted (AVE) values are also higher than 0,8 for all reflective constructs (again highly above the benchmark of 0,5 [Fornell and Larcker, 1981]). Table 1 shows the composite reliability and AVE values for each reflective construct in the model. To confirm discriminant validity, we checked that the value of the square root of the AVE was greater than the shared variance among constructs (correlations) (Fornell and Larcker, 1981). All pair of constructs satisfy this criterion, supporting discriminant validity of measures. Table 1 also shows the square root of the AVE value for reflective constructs (diagonal elements in bold), and correlations among all measures in the study (off-diagonal elements).

TABLE 1.  
Construct reliability, convergent validity and discriminant validity for reflective constructs.

	1	2	3	4	5	6	7	8	9	10	$\rho_c$	AVE
1. Perceived Ease-of-use	<b>0,910</b>										0,936	0,829
2. Privacy	0,402	<b>0,926</b>									0,948	0,857
3. Security	0,525	0,740	<b>0,914</b>								0,939	0,836
4. Perceived Usefulness	0,583	0,473	0,619	<b>0,943</b>							0,960	0,890
5. Continuance intentions	0,538	0,448	0,613	0,716	<b>0,980</b>						0,979	0,960
6. Demand of local services	0,292	0,300	0,435	0,430	0,452	-					-	-
7. Gender (Man=1)	-170	-0,222	-0,209	-0,123	-0,053	-0,100	-				-	-
8. Age	-0,078	0,094	0,069	-0,065	-0,023	-0,017	-0,269	-			-	-
9. Education level	0,131	0,004	0,047	0,041	0,104	0,138	-0,072	-0,060	-		-	-
10. Payment System (Postpay=1)	-0,084	-0,040	-0,115	-0,133	-0,152	-0,076	-0,072	0,205	-0,098	-	-	-

Notes:  $\rho_c$  = Composite Reliability, AVE = Average Variance Extracted.

Following Henseler *et al.* (2009), the validity of the formative construct was confirmed by the application of four criteria referring to theoretical content, nomological validity, significance of weights and multicollinearity. Table 2 explains this validation process in detail.

TABLE 2.  
Formative construct validity.

Criterion	Variable: Demand of local services
Theoretic content and expert opinion (Rossiter, 2002)	A first examination of the validity of formative constructs should be based on the use of theoretical rationale and expert opinion. The variable refers to the demand of use of the five most demanded local services that can be accessed with the smart card according to municipal records. Additionally, ten experts identified each measure of the construct as representative of each of the five relevant local services (Zaichkowsky, 1985).

Nomological validity (Henseler <i>et al.</i> , 2009)	The formative variable should be related to other constructs in the model, which are sufficiently well known through prior research. Our results are in line with previous research findings linking demand of public services with usefulness perceptions or continuance intentions related variables (Andreasen, 1995; Michalos and Zumbo, 1999).		
Significance of weights (Chin, 1998)	Estimated weights of formative measurement models should be significant to guarantee that each indicator delivers a contribution to the formative index. All the indicators present significant weights on the formative construct, with the exception of DEM2 which represents the demand of public bicycle rental service. However, insignificant weights should not be discarded automatically, and could be maintained as long as it is conceptually justified (Henseler <i>et al.</i> , 2009). We maintain the item because it is one of the most demanded services among some groups of citizens.		
Multicollinearity (Diamantopoulos and Winklhofer, 2001)	Multicollinearity should be assessed by means of the variance inflation factor (VIF) for each of the indicators of the formative construct. All VIF values were lower than the benchmark of 10 and were very close to 1, which indicates low multicollinearity (Henseler, <i>et al.</i> , 2009).		
<b>Items of the formative construct:</b>			
<b>Demand of local services</b> (Mean=2.40, s.d.=.62) <sup>a</sup>	<b>Weight</b>	<b>t-value</b>	<b>VIF</b>
DEM1. I demand the use of urban bus transport	0,304	1,65	1,06
DEM2. I demand the use of municipal bicycles rental	0,045	,25	1,08
DEM3. I demand the use of sport facilities	0,325	1,72	1,11
DEM4. I demand the use of public car parks	0,584	4,11	1,12
DEM5. I demand the use of public libraries	0,361	2,01	1,13

Note: <sup>a</sup> 5-point scale (1 never, 2 hardly ever, 3 several times per month, 4 several times per week, 5 several times a day)

Once measures were validated, the model was estimated and hypotheses tested using PLS. To estimate the effects proposed in the model and their significance we used the recommended bootstrap of 500 iterations (Chin, 1998). Findings obtained in the causal model are disclosed in the next section.

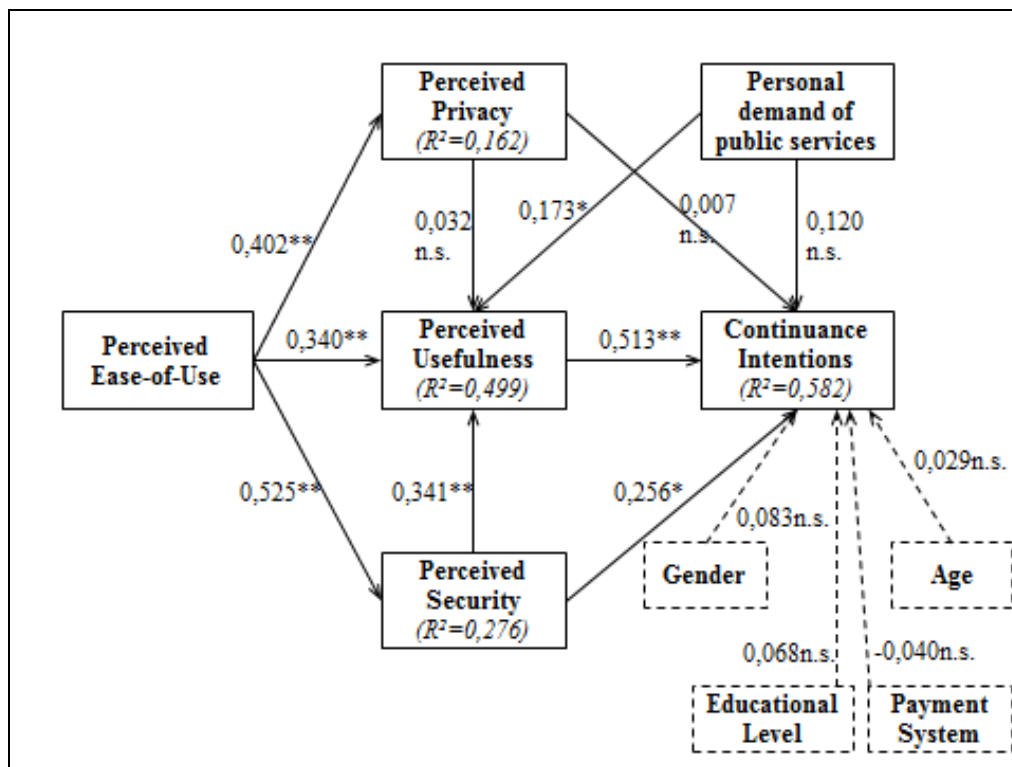

## 5. Results

Results of the estimated model are presented in Figure 2. Results of the proposed model reveal that smart card ease-of-use has high and positive impacts on perceived privacy ( $\beta=0,402$ ,  $p<0,01$ ), usefulness ( $\beta=0,340$ ,  $p<0,01$ ), and security ( $\beta=0,525$ ,  $p<0,01$ ), in support of hypotheses H1a, H1b, and H1c respectively. Ease-of-use thus plays a determinant role in continue using the smart card by favoring the perceptions of a secure, private and useful service. Contrary to our expectations, the effects of privacy on usefulness perceptions ( $\beta=0,032$ ,  $p>0,05$ ) and continuance intentions ( $\beta=.007$ ,  $p>0,05$ ) are both non-significant; therefore, H2a and H2b are not supported. On the other hand, the effects of security on perceived usefulness ( $\beta=0,341$ ,  $p<0,01$ ) and continuance intentions ( $\beta=0,256$ ,  $p<0,05$ ) are positive and significant, supporting hypotheses H3a and H3b. In support of H4a, the personal demand of local services significantly influences the perceived usefulness of the smart card ( $\beta=0,173$ ,  $p<0,05$ ). Nevertheless, the positive impact of the demand of local services on continuance intentions is less strong ( $\beta=0,120$ ,  $p>0,05$ ). Thus, while H4a is confirmed, H4b is not supported. Finally, H5 is also supported given the high and positive effect of perceived usefulness on continuance intentions ( $\beta=0,513$ ,  $p<0,01$ ).

In turn, the estimation of the effects of control variables (gender, age, education level, and payment system) on continuance intentions revealed that all of them are non-significant. Remarkably, neither card-holders' socio-demographic characteristics nor the kind of prepaid or postpaid system chosen influence the continuance intention to use the smart card. In any case, the inclusion of these control variables reinforces the support to the proposed model.

FIGURE 2.  
PLS Results of estimated coefficients and significance.

Notes: \* coefficients significant at the 0,05 level; \*\* coefficients significant at the 0,01 level; n.s. coefficients are not significant. Control variables in dashed lines.

Finally, in terms of explained variance, the proposed model presents high levels of  $R^2$  for the two key dependent variables: perceived usefulness ( $R^2=0,499$ ) and continuance intentions ( $R^2=0,582$ ). As an additional assessment of the models' predictive capability we examined the Stone-Geisser's  $Q^2$  (Stone, 1974; Geisser, 1975). The Stone-Geisser's criterion assess the model capability to predict the endogenous latent variable indicator (in our model: continuance intentions to use the smart card) using the blindfolding technique (Tenenhaus *et al.*, 2005).  $Q^2$  indicator reaches a value of .544, highly above zero, which means that observed values are well reconstructed as a sign of models' predictive relevance (Henseler *et al.*, 2009). Consequently, the analysis of Stone-Geisser's  $Q^2$  indicator corroborates the suitability of our proposed model in terms of predictive relevance.

## 6. Conclusions

Our research has proposed a conceptual framework to better understand the key determinants of the continued use of smart cards among citizens that already hold the card. This is especially relevant because the long-term viability and success of smart cards relies on their continued use by a majority of citizens rather than on its initial adoption (Bhattacharjee, 2001). Indeed, although smart card is an innovative RFID-based service that gathers numerous advantages (such as identifying the card-holder, providing access to local services and allowing payments of small customary fees), some failed launchings have already occurred (Truman *et al.*, 2003). As well, the continued use of the smart card represents an opportunity to latter expand the number of services and applications linked to the card.

First, perceived ease-of-use is one the main advantages of smart cards. Although citizens may ignore the technical issues of the technologic service, they clearly realize that it is an easy to use system contributing to their daily welfare because the card simplify payments and access to services facilitating many routine processes. Results of our study verify the principal role of this variable in the research framework since ease-of-use positively influences perceived privacy, security and usefulness. As well, our research framework proposes three main antecedents of continuance intentions to use the smart card associated to the three basic features of this innovation:

- *Privacy* is associated to the personal information that the card holds both in the front and embedded in the card. Nevertheless, results of our study do not support our hypotheses linking privacy to perceived usefulness and continuance intentions. Probably, given that the personal information appearing in the card is very limited, card-holders do not worry about the privacy issues related to smart card use. Citizens could be also familiarized with showing their name and photograph in an ID given the existence of a mandatory national ID. As well, the fact that local services are usually managed by the local administration could diminish privacy worries associated to other similar private managed services (e.g. shopping centers fidelity cards that usually employ personal information for commercial purposes).
- *Security* could be associated to the card since it can be used as a payment instrument to make transactions. A safe system is needed to guarantee that transactions are made without troubles. The results of this research corroborate the positive influence of security on perceived usefulness and continuance intentions. Our findings suggest that citizens perceive the smart card as a payment system and thus, public managers and smart card developers need to guarantee smart card security in order to make the service useful and worthy of use for citizens. In this line, public resources should be invested in human resources, technological equipment, and security protocols to ensure the reliability of smart cards payment systems.
- *Perceived usefulness* linked to card convenience to access many valuable local services is also a key antecedent of continuance intentions. Confirming the theoretical rationale that relates usefulness to the benefits and increments of productivity associated to the technology, perceived usefulness exerts a high positive impact on continuance intentions to use the smart card. Usefulness also represents a central factor in the model, which is affected by perceptions of ease-of-use and security, and by the demand of local services made by card-holders. In line with previous research (Belanche *et al.*, 2012), results corroborate that smart card usefulness is the most relevant feature for the success of this innovation. Public administration should therefore acknowledge not only the costs but also the advantages of implementing the RFID smart card service (Bunduchi *et al.*, 2011), and communicate these benefits to the citizenry through marketing campaigns from a user oriented perspective.

In addition, our framework contemplates that the demand of local services may act as an antecedent of smart card perceived usefulness and continuance intentions. This concept –largely ignored by previous works– assumes that the demand of local services varies among citizens (e.g. some citizens show higher demand because they need to use public transport every day while others not). The measurement of this variable as a combination of the demands of different services required a formative construct. Data analysis revealed that the demand of local services effectively influences usefulness perceptions, but its direct effect on continuance intentions is not supported. The lack of this direct influence could be explained by the existence of alternative systems to access local services. In sum, results suggest that those citizens that demand local services more frequently perceived a higher usefulness of the card but do not necessarily use it because they can also use other specific cards or in-cash payment methods. In this sense, public administration strategy should seriously consider whether to favor and promote the use of smart card instead of alternative systems (even substitute them) to better achieve public management objectives.

Finally, control variables are also considered in the framework to reinforce the validity of the proposed effects. Results reveal that socio-demographic characteristics do not affect continuance intentions to use the smart card. This lack of significance emphasizes the initial objective of this public management initiative designed to be used by a wide-range of citizens, independently of their age, gender or educational level. On the other hand, this is not an unexpected result given that the smart card can be used to access a high number of services for different collectives in the urban area (e.g. young people, the elderly, etc.), and that almost every citizen needs to access local services and pay their corresponding small fees quite often. This finding, together with the relevance of ease-of-use, suggests that the design of a citizen oriented innovation, such as the smart card, should focus on a high number and wide-range of users. On the other hand, the kind of payment system does not influence continuance intentions either. Attending to the study results, the preference for prepaid or postpaid smart cards does not represent a determinant of smart card continuance. Probably, this result can be

explained due to the fact that citizens use the smart card only for small payments, so that they tend to assimilate both systems to a prepaid card instead of a credit card. In sum, the lack of socio-demographics and payment system effects reinforce the conclusions that smart cards should be oriented to all kind of citizens.

### **6.1. Limitations and further research lines**

Our research also involves several limitations that open new research avenues for future studies. Our theoretical framework has been only tested in a single city, which could be considered as a case study. Although the selected city and sample of respondents satisfy the requirements to carry out an empirical research focused on post-adoption stages, the study should be replicated in other cities. This further research in other places could be employed to both corroborate our hypotheses in a different context and to explore the possible differences that might appear as a consequence of local or cultural differences. As well, another research line could explore the different groups of smart card users to identify the different interpretations and kind of uses that citizens attribute to the smart card (e.g. perceived as an ID, as a payment system, etc.). In addition, the successful implementation of a smart card service may be studied from many perspectives (technical, administrative, etc.). Our research has focused on the determinants of continuance intentions from a citizen perspective. However, other approaches could complement the findings of our study.

# WEBSITE DESIGN AS MODERATING FACTOR OF ONLINE USER BEHAVIOR

---

JUAN MIGUEL ALCANTARA PILAR  
SALVADOR DEL BARRIO GARCÍA

*Universidad de Granada*

## ABSTRACT

*It is widely assumed that online user behaviour is mainly utilitarian, although hedonic motivations such as enjoyment have also been found by recent research to have a marked influence on such behaviour. The present study explores the influence of website design (utilitarian motivation) on online user behaviour, in the context of a site promoting a tourist destination. The results underline the importance of utilitarian aspects for the effectiveness of online information-processing and the formation of perceived risk online. It is recommended that websites should reflect this type of motivation so as to make browsing useful for the online consumer.*

## KEYWORDS:

*Website design, usability, browsing time, perceived risk online*

## 1. Introduction

Thanks to the arrival of digital media, firms and institutions have changed how they communicate with their stakeholders. While this communication used to be one-way only and largely functional in nature, it is now two-way, reflecting a more integrated, relational approach. In this regard, Duncan & Moriarty (1998) assert that it is interactivity, rather than mere persuasion, that forms the basis of relations between firms and their stakeholders, and that such relations are therefore difficult to achieve without interactive media.

The development of information and communications technologies (ICT) has led to greater diversity in the contexts within which relationships based on exchange may evolve. The passivity shown by consumers in traditional markets may largely be attributed to the impossibility of interacting with firms, rather than to their lack of interest in doing so (Pels, 1999). By contrast, the tremendous scope for interactivity offered by the Internet has led to an increase in consumers' involvement with the brand and its promotional messages, and thus in their brand receptivity. This brings with it greater participation in the firm's marketing initiatives, leading to the concepts of 'reverse marketing' (Giannakis & Croom, 2004; Miceli, Ricota & Costabile, 2007; Sharma & Sheth, 2004; Sheth & Sharma, 2005), consumer-centric orientation (Drews, 2009; Klein & Laczniak, 2013; Sheth, Sisodia & Sharma, 2000; Stellefson & Eddy, 2008) and relationship marketing (Patsioura, Vlachopoulou & Manthou, 2009; Rafip, Fulford & Lu, 2012; Wang, Head & Archer, 2000).

Meanwhile, Ramey (2000) highlights the importance of personal motivation in the user's development and skill-acquisition in the digital environment. Motivations can be classified as utilitarian (extrinsic) or hedonic (intrinsic) (Childers, Carr, Peck & Carson, 2001; Scarpi, 2012; Wolfenbarger & Gilly, 2001, 2003).

Amongst the key aspects of utilitarian benefits are comfort, ease of access to products and services, time-saving and reduction of errors committed during purchase, and sensation of control – all of which are related to the usability dimension of the website design. This latter aspect is related to the sense of insecurity experienced by some users, which some authors have measured as perceived risk (Belanche, Casaló & Guinalú, 2012). Meanwhile hedonic factors include: surprise, excitement and uniqueness; social benefits; the search for online bargains; involvement with a product or service category; the corresponding information available on the website; and the flow achieved by the user whilst browsing (Belanche *et al.*, 2012; Bolton & Saxena-Lyer, 2009; Bridges & Florsheim, 2008; Childers *et al.*, 2001; López & Ruiz, 2011; Overby & Lee, 2006; Turel, Serenko & Bontis, 2010).

From this perspective, website design – measured in terms of usability – would be related to utilitarian motivation, thanks to its connection to attributes such as functionality, perceived usefulness and ease of use (Chiu, Chang, Cheng & Fang, 2009; Coursaris & Kim, 2011; O'Brien, 2010; Schaik & Ling, 2008, 2009, 2011).

In view of these factors, the present work seeks to examine mainly the effect of website design (utilitarian motivation) on perceived risk online and on site effectiveness during the browsing process – the latter being measured in terms of the number of errors committed by the user while selecting an online purchase, together with the length of time spent browsing to complete the selection.

## 2. Literature review

### 2.1. *The effect of website design on site effectiveness*

In the sphere of electronic commerce – both business-to-customer (B2C) and business-to-business (B2B) – a firm's website represents its image in the digital environment. The site acts as an interactive shop window via which the firm can attract clients and display its online product catalogue – rather like an intermediary with potential customers. In this regard it operates both as a virtual shopping cart and also as a means of closing the sale. As such, the usability of a firm's website is a key success factor. Usability refers to the speed and ease with

which users are able to carry out their tasks via a given website (Nielsen, 1993). A website with good usability is one that: is well organized (Nielsen, 2005); shows and explains the products and services clearly and concisely (Greiner, 2007); makes the registration process as simple as possible (Nielsen & Norman, 2000); downloads quickly; (Nielsen & Coyne, 2001); is easy to use (ibid.); and fosters positive experiences for the user (Nielsen & Norman, 2000).

Achieving usability therefore involves focusing on the potential users of a site so as to structure it around their needs, organizing the navigation such that it facilitates the information-search process. The key strategy that should inform the entire process of site design, then, is to draw on the needs of users and the requirements of potential customers as a reference point.

Many authors have based their work on that of Shackel (1991), which is particularly notable for its focus on the user, to measure website usability using various methods (Han, Yun, Kwahk & Hong, 2001; Huang & Cappel, 2012; Kay, 2009; Koohang, 2004; Lin, Lin & Roan, 2011). Shackel (1991) proposes that the practical acceptance of a system is determined by four factors: (1) effectiveness, in terms of achieving tasks during the interaction, as measured by processing time and errors committed; (2) learnability, which refers to the time required by the novice to learn to use the system properly; (3) flexibility, in terms of adaptability of tasks to specific requirements (different sectors or target publics, for instance); (4) and attitude, referring to acceptable levels of human costs, such as tiredness, unease, frustration, and personal effort. Nielsen & Loranger (2007) also make an important contribution to the literature in their work on website design. They explore what is considered by some to be a key factor in usability, namely site effectiveness when carrying out tasks online, which is directly related to the speed with which users can learn to navigate the system, learnability, and effectiveness of use. Following the recommendation of Macleod & Rengger, (1993) in their Diagnostic Recorder for Usability Measurement (DRUM), the researchers decided to measure speed by the time spent, and effectiveness of use by the number of errors committed by the user during the purchasing process. Other authors have also used time spent and number of errors as a way to measure effectiveness; for example, Hussain & Kutar (2009) for mobile phone application, Huang & Strawderman (2011) for multiple device systems (UPMDS); and Seffah, Donyae, Kline & Padda (2006) in their model for usability measurement and metrics.

In light of these works, the following hypothesis is proposed:

*H<sub>1</sub>: Site effectiveness, measured in terms of user browsing time during the purchasing process, will be significantly greater amongst sites that are perceived to be usable than amongst those that are not.*

*H<sub>2</sub>: Site effectiveness, measured in terms of the number of errors committed by the user during the purchasing process, will be significantly greater amongst sites that are perceived to be usable than amongst those that are not.*

## *2.2. The effect of website design on perceived risk online*

Usability and appearance are two of the indicators that represent the utilitarian aspects of a website. Those websites with high usability of design enable users to carry out their tasks coherently and achieve the results they expect (Palmer, 2000). This sensation of control during browsing is inversely related to the sense of insecurity and vulnerability experienced by the user (Diamantopoulos & Winklhofer, 2001; Featherman & Paulou, 2003; Mayer, Davis & Schoorman, 1995; Roth, Straub & Richter, 2005). Perceived risk online is a key element in the initial interaction between user and website, on which users base their assessment of the site (Beldad, Jong & Steehouder, 2010; Chang, Cheung & Tang, 2013; Klaus, 2013; Koufaris & Hampton-Sosa, 2003; Zhang *et al.*, 2011). On the one hand, Belanche *et al.* (2012) analysed the moderating role played by perceived risk in website usability, finding that the effect of usability on consumer satisfaction is moderated by perceived risk. Following on from the work of Belanche *et al.* (2012), Ting, Chen & Lee (2013) confirmed the importance of perceived risk online in users' acceptance of websites. On the other hand, Green & Pearson (2011) found that website design (measured via usability) influences confidence, perceived risk and intention to use, and demonstrated that the usability of a website influences several outcomes that are

important for businesses endeavouring to attract and retain customer. In this same vein, Herrero & Rodriguez (2010) and Kim, Kim & Shin (2009) affirm that perceived risk is also a critical factor that exerts a significant influence on the user's decisions when visiting or revisiting a site.

In view of these assertions, the following hypothesis is proposed:

*H<sub>3</sub>: Perceived risk will be significantly lower amongst websites that are perceived to be usable than amongst those that are not.*

### 3. Research Methodology

#### 3.1. Experimental design and sample

In order to achieve the research objectives a between-subjects experimental design was conducted, in which the website design type was the independent variable.

With regard to the site design, in order to manipulate this, the works of Moss (2004) and Nielsen (1993, 1999, 2004, 2009) were followed as a guide (see Table 1), with two treatments being established: (1) website design with high usability (V1) and (2) website design with low usability (V2).

Table 1  
Design factors for the website

Factor	V1: Website with high usability	V2: Website with low usability
Invisible browsing options	In this version all the options will be visible, with no need to pass the mouse pointer over the screen.	In this version, multiple options will appear as the mouse pointer passes over the screen.
Inconsistent browsing	The information conveyed to users via icons, links and images will be easy to use.	Icons will not be recognized as commonly used on the Internet, and the menu may appear to the right of the screen rather than the left, or divided in two, horizontally and vertically.
Menu option style	The main options, icons and symbols etc. will be those commonly found on the Internet.	The length of each page will be excessive, especially in terms of image and font size.
Page length excessive	The length of each page will be normal.	The site will carry pop-ups.
Pop-ups	There will be no pop-ups on the site.	The product information will be presented in unbroken narrative text.
Product information	The product information will be organized in tabular form.	The different pages will be designed in such a way that the user has to browse using the scroll bar, either horizontally, because the images are too big, or vertically.
Scroll bar	The pages will be separated by category and adjusted so as to avoid the user having to use the scroll bar.	The site will be badly structured, with poorly designated categories, and it will be more extensive than V1 in terms of number of pages, but they will be of no use to the user.
Design of the structure	Recommended guidelines for designing the site will be applied, with information structured around where the user finds themselves. The site will be divided into categories but not overly so.	

*Source: Own elaboration, based on Moss (2004) and Nielsen (1993, 1999, 2004, 2009)*

A website for a fictitious tourist destination called Buyuada was used as the framework for the experiment. The reasoning behind choosing the tourism sector as the focus for the research was that the World Tourism Organization (WTO) has declared that the key to success in this medium as a source of tourism information is to swiftly identify consumers' needs and establish direct contact with tourists. Furthermore, the WTO has asserted that websites should offer tourists information that is comprehensive, personalized and up-to-date (Vich-I-Martorell 2004). The Internet is one of the main sources of information used by tourists when making travel plans (Buhalis & Law 2008; Wu, Wei & Chen, 2008).

A fictitious location was devised with a view to avoiding a scenario in which subjects' previous awareness of, or attitudes towards, the destination might affect the results. In this same regard, Dahlén, Friberg & Nilson (2009) used fictitious brands to minimise the possibility of differences between subjects, as using real brands could have meant that some individuals had preconceived representations and associations. Similarly, Nelson, Yaros & Keum (2006)

recommend using fictitious brands as this gives the researcher greater control over the possible effects of subjects' past experiences.

The experiment itself required a professional website to be purpose-built, with its own domain name, providing information on the fictitious tourist destination (www.buyuada.org). The site was hosted via a domain pertaining to the researchers, enabling them to simulate natural browsing conditions at all times for the subjects. Two versions of the site were created: V1 (site with high usability) and V2 (site with low usability) (see Figure 1).

FIGURE 1.

Site with high usability (V1) on the left and low usability (V2) on the right

The subjects were selected by an external company commissioned to establish an online survey panel for the experiment. The company made email contact with each panel member, following the gender and age quotas that had been pre-established: 240 individuals (planned sample size) (120 V1; 120 V2).

The subjects were sent a link to the appropriate version of the website (V1 or V2), together with instructions (see Figure 3 and its translation in Table 2).

Figure 3

Instructions given to the user (original Spanish version)

**Buyuada**

A continuación, visitará una página web relativa a un destino turístico durante un tiempo mínimo de 2 minutos. Concretamente, se trata de la isla de Buyuada situada en el mar Mediterráneo.

Buyuada está surgiendo como un destino cada vez más demandado por parte de los turistas.

Su tarea consistirá en simular una situación en la que usted tiene pensado ir de vacaciones en los próximos meses durante **temporada media** para lo cual deberá diseñar un paquete de turístico en Buyuada que incluya lo siguiente:

- Un vuelo de ida.
- Un vuelo de vuelta.
- Un hotel donde alojarse.
- Un restaurante.
- Una actividad o excursión a realizar.

Para contratar estos servicios debe seleccionar la alternativa deseada, pulsar el botón "añadir a la cesta" y finalmente confirmar la reserva a través del carro de la compra.

**Tenga en cuenta que entre las alternativas que encontrará hay una que es mejor que las demás en relación calidad - precio. Todos aquellos participantes en el estudio que hayan respondido a las preguntas del cuestionario y al final hayan seleccionado la mejor opción en términos de calidad-precio, entrarán en el sorteo de un iPod-Touch que se celebrará el día 15 de enero de 2011. Para ello, deberá proporcionarnos al final del cuestionario su dirección de email.**

Gracias por su colaboración.

Table 2

Instructions given to the user (text translated into English)

*Next, you will visit a web site relating to a tourist destination – namely, the island of Buyuada in the Mediterranean. The visit will last a minimum of 2 minutes.*

*Buyuada is becoming increasingly popular as a tourist destination.*

*Your task is to imagine a situation in which you are thinking of going on holiday in the next few months, during mid-season. To this end, you need to design a tourist package on Buyuada that includes the following:*

- *An outward flight*
- *A return flight*
- *A hotel for your stay*
- *A restaurant*
- *An activity or excursion*

*To book these services you must select the options of your choice, press the button 'add to basket' and confirm your bookings using the shopping trolley icon.*

*Please bear in mind that, amongst all the alternatives you will find, there is one option that is superior to the others in terms of quality/price.*

*All those participating in the study who have responded to the questionnaire and who have chosen the best option in terms of quality/price will be entered into a draw to win an iPod-Touch. The draw will take place on January 15<sup>th</sup>, 2011. If you wish to be entered, please provide your email address at the end of the questionnaire.*

*Thank you very much for your collaboration.*

*Enter the website*

The users were thus invited to browse through the website and put together their own tourism package based on an outward flight, a return flight, hotel accommodation, and a restaurant, from

the multiple options on offer. In line with the recommendations of several authors (Muñoz-Leiva, Sánchez-Fernández, Montoro-Rios & Ibañez-Zapata, 2010), subjects were offered an incentive to achieve the optimum result for the task and complete the subsequent questionnaire, in the form of a free prize draw to win an iPod Touch.

Once they had completed the task and browsing was complete, subjects were redirected to a questionnaire.

A representative sample of the population was obtained using data issued by the Spanish Association for Media Research (AIMC, 2010) relating to the socio-demographic profile of internet users between the age of 18 and 64. The final sample size was 227 Spanish users: 110 browsing V1 and 117 browsing V2. Overall, the subjects were highly experienced in the Internet medium, with 66.08% going online for more than 10 hours a week. The minimum age was 18 and the maximum was 64, giving an average age of 38.66 years.

### *3.2. Measures*

In line with the proposed hypotheses, the four dependent variables in the present study were: perceived risk online; the total browsing time and the number of errors committed during the purchasing process. The questionnaire consisted of closed questions for the constructs, seven-point Likert scales, and socio-demographic data (see Annex 1).

Perceived risk online was measured using the scale proposed by Wakefield and Whitten (2006).

Browsing time was measured in terms of the number of seconds it took subjects to browse the experimental website and complete the task assigned to them. As regards capturing the number of errors committed by users during the purchasing process, when selecting their tourism package, for each of the four components (flight, accommodation, restaurant, and excursion) there was always one option that was preferable to the rest in terms of the relationship between quality and price. Those instances in which the subject failed to select the optimum option were thus considered to be errors for the purposes of the research. On this basis, each subject was assigned a score of between 0 and 4, depending on the number of errors they committed during the process of selecting and purchasing their tourism package. In other words, those who correctly identified the best option for all four components of the package were given a score of 4, while those who failed to do so for any of the components received a score of 0.

Perceived usability of the site, according to the subjects, was also measured, with a view to subsequently checking to ensure correct manipulation of the independent variable 'website design'. This control variable was measured from the user's perspective by applying the Website Analysis and Measurement Inventory (WAMMI) scale proposed by Kirakowski, Claridge & Whitehand (1998) and adapted by Flavián, Guinalú & Gurrea (2006a, 2006b).

Finally, other variables were also measured to classify the subjects: gender, age in years, and level of online experience, based on the number of hours spent each week on the Internet.

## **4. Results**

### *4.1. Analysis of the psychometric properties of the scales*

Prior to testing the hypotheses it was necessary to examine the reliability and validity of the multi-items scales used in the present study. For this purpose a multi-group confirmatory factorial analysis (CFA) was used, according to website design (V1 vs. V2), which demonstrated that the different scales all presented sound psychometric properties as all the standardized coefficients were significant and very close to one, while the individual reliability of each indicator was above the recommended limit of 0.50 (see Table 3). The overall goodness-of-fit indices and the Composite Reliability and Average Variance Extracted indices were also, in all cases, well over the recommended values (Hair, Anderson, Tatham & William, 1995; Del Barrio and Luque, 2012; Kline, 2011).

Table 3

Analysis of the psychometric properties of the scales (non-standardized parameters)

Items	V1				V2			
	Param. (t-value)	R <sup>2</sup>	Composite reliability	Variance extracted	Param. (t-value)	R <sup>2</sup>	Composite reliability	Average Variance Extracted
<b>RISK1</b>	1.00 (p.f.)*	0.81	0.94	0.85	1.00 (p.f.)*	0.82	0.94	0.85
<b>RISK2</b>	1.06 (29.15)	0.88			1.02 (28.66)	0.88		
<b>RISK3</b>	1.05 (25.84)	0.87			1.07 (30.40)	0.88		
<b>USAB1</b>	1.00 (p.f.)*	0.75	0.97	0.79	1.00 (p.f.)*	0.75	0.96	0.82
<b>USAB2</b>	0.91 (22.33)	0.79			1.16 (23.22)	0.82		
<b>USAB3</b>	0.92 (19.50)	0.79			1.10 (19.81)	0.80		
<b>USAB4</b>	0.98 (23.45)	0.91			1.08 (18.40)	0.79		
<b>USAB5</b>	0.94 (21.37)	0.88			1.15 (19.15)	0.80		
<b>USAB6</b>	0.97 (18.95)	0.86			1.13 (18.31)	0.77		
<b>USAB7</b>	0.95 (19.84)	0.81			1.08 (18.52)	0.83		

Note (\*): Value not calculated since the parameter was established at 1 in order to set the scale for the latent variable

#### 4.2. Manipulation check

As the CFA had demonstrated that the scale of perceived usability presented good psychometric properties, an index variable was calculated as the sum of the seven indicators of the WAMMI scale (min: 7/max: 49). To check the correct manipulation of the ‘website design’ independent variable, a t-test was carried out to test the difference in averages of this index variable for each of the two experimental conditions (V1 and V2). The results showed that the perceived usability was significantly greater for V1 than for V2 ( $p < 0.05$ ), which endorsed the correct manipulation of the independent variable between-subjects (see Table 4).

Table 4

Test for differences in perceived usability by website design type (all indicators)

Items	V1	V2	p-value	Items	V1	V2	p-value
USAB1	5.70	4.92	0.00	USAB5	5.94	4.97	0.00
USAB2	5.84	4.97	0.00	USAB6	5.82	4.86	0.00
USAB3	5.80	4.98	0.00	USAB7	5.77	4.91	0.00
USAB4	5.86	4.96	0.00				

#### 4.4. Testing the hypotheses

To test the hypotheses, a number of variance analyses (ANOVA) were carried out, using the following depending variables: browsing time; number of errors performed during the online purchasing process; and the perceived risk online. The experimental factor, website design (V1 vs. V2), is the independent variable. As the scales presented good psychometric properties, prior to testing the hypotheses an indicator for each dependent variable was calculated, as the sum of the items from the original scales.

H<sub>1</sub> and H<sub>2</sub> proposed that site effectiveness when the user browses the site and performs online tasks – measured in browsing time and the number of errors committed while performing these tasks – would be significantly greater amongst those websites that are perceived to be usable than amongst those that are not.

After testing to ensure that all the assumptions of the ANOVA were fulfilled, the data analysis demonstrated that the website design had a significant main effect on browsing time ( $F=29.46$ ;  $p < 0.01$ ), such that when users browsed V1 of the site they took less time to put together their

tourism package ( $\text{Time}_{V1}=344.72$  seconds) than when they browsed V2 ( $\text{Time}_{V2}= 633.35$  seconds). Therefore  $H_1$  cannot be rejected (see Table 5). These findings echo those of other authors (Nielsen & Loranger, 2002; Shackel, 1991).

Table 5  
Effect of website design on browsing time (ANOVA)

Variable	Treatment	Mean	SE	F	p-value
Website design	V1	344.72	19.38	29.46	0.00
	V2	633.35	49.11		
Normality		Homoscedasticity			
No major deviations observed		Levene's test: $p<0.05$			

According to  $H_2$ , effectiveness of website performance – measured in terms of the number of errors committed by the user during the purchasing process – will be significantly better in those websites perceived to be usable than in those perceived not so (that is, there will be fewer errors). To test this hypothesis, once again an ANOVA was carried out. The results demonstrated that when browsing V1 of the website, users registered significantly fewer errors ( $N^{\circ}\text{Errors}_{V1}=2.30$ ) than when browsing V2 ( $N^{\circ}\text{Errors}_{V2}=2.67$ ) ( $F=6.354$ ;  $p<0.01$ ). Together, these findings confirm  $H_2$  (see Table 6).

Table 6  
Effect of website design on number of errors committed (ANOVA)

Variable	Treatment	Mean	SE	F	p-value
Website design	V1	2.30	0.10	6.354	0.01
	V2	2.67	0.10		
Normality		Homoscedasticity			
No major deviations observed		Levene's test: $p\geq 0.10$			

A further ANOVA was performed to test  $H_3$  and establish whether perceived risk online was moderated by website design type. It demonstrated that website design type exerted a significant effect on perceived risk online, in the expected direction ( $F=7.30$ ;  $p<0.01$ ). Users exposed to the more usable version of the website generated a lower perceived risk online ( $\text{Risk}_{V1}=9.80$ ) than those browsing the less usable version ( $\text{Risk}_{V2}=11.36$ ), meaning that  $H_3$  can be confirmed (See table 7).

Table 7  
Effect of website design type on perceived risk online (ANOVA)

Variable	Treatment	Mean	SE	F	p-value
Website design	V1	9.80	0.40	7.30	0.00
	V2	11.36	0.41		
Normality		Homoscedasticity			
No major deviations observed		Levene's test: $p\geq 0.10$			

The ANOVA results indicate that both the effectiveness of website performance (measured in terms of user browsing time and number of errors) and perceived risk online should be considered utilitarian variables.

## 5. Discussion

### 5.1. Conclusions

The present work has examined the extent to which the functional design of the website (representing utilitarian motivations) affect their purchasing behaviour and how they process information when browsing the site.

The key contribution is the approach taken in the present study, namely to examine the effect of website design (as a utilitarian aspect) on the user's response. The findings of the present work point to the conclusion that when a firm is aiming to maximise the browsing time of users and thus reduce bounce rate, or to significantly reduce the number of user errors when performing

associated tasks on the website, it should place greater emphasis on the utilitarian aspects of the site design.

Of particular interest the work lies in its original use of professional design in creating two parallel websites hosted under one single domain name (buyuada.org), each with different objectives in terms of usability. This approach is in line with the recommendations of Moss (2004) and Nielsen (1993, 1999, 2004, 2009). To date, the majority of studies examining the role of website design on online user behaviour have used subjective measurements of usability (Belanche *et al.*, 2012; Lee & Koubek, 2010; Wahab, Jusoff, Al Momani, Mohd & Mohd, 2001). The present methodology thus represents an important advancement in understanding the moderating effect of website design on online information-processing and, more specifically, on the effectiveness of the site's performance when the user is carrying out tasks while browsing. Data analysis demonstrated that a website with good usability will significantly reduce the subject's browsing time and the number of errors they commit during the purchasing process, and will also lower the perceived risk online.

## **5.2. Implications**

A number of interesting implications for management arise from the present work. Firstly, investing in a good website design is shown to be a prerequisite for improving the interest shown by users during browsing, which will, in turn, reduce the bounce rate and increase the length of time spent on processing the website information. This issue needs to be taken into account in particular by those firms and institutions offering e-commerce (particularly those operating in the tourism-related field, such as hotels, tour operators, travel agencies, and public bodies), since consumers report important functional and utilitarian benefits when browsing a site they perceive to have high usability compared to one they consider to have low usability. Such benefits include greater effectiveness in performance and a lower perceived risk online. As also demonstrated by Wood (2004), it is important to remember that website design is not an end in itself, but is rather a means of facilitating purchase and information-search on the part of the user.

In this regard, when designing a website it is not sufficient to follow the recommendations of Nielsen (1993, 1999, 2004, 2009) by simply drawing on heuristic lists of features for usability. It is also essential to base the site design on the user, for example by seeking their views on its usability via different questionnaires. For this purpose, the present study employed the WAMMI questionnaire (Kirakowski *et al.*, 1998). Another invaluable technique that is widely employed by firms when designing their websites, so as to ensure the design is centred on the user, is card sorting. In a card sorting session, participants organize topics from a website into categories that make sense to them. Participants may also help to label these groups. Card sorting may involve physical cards or pieces of paper, or it may be accomplished with one of several online card-sorting software tools. It can help firms ascertain their users' expectations and understanding of topics central to the firm. Knowing how users group information can also help the firm to build the structure for its website, decide what to put on the homepage, or label categories and navigation effectively. There are different types of card sorting techniques, including in-person sessions with an observer, concurrent in-person sessions, and computer-based sessions.

The firm's choice of approach will depend on factors such as the available budget, the type and size of the organisation, and the complexity of their website. There are numerous examples of firms that have improved profits by investing in user-centred website design. For example, in the late 1990s IBM increased its e-commerce sales by 400% thanks to improving the usability of ibm.com (Tedeschi, 1999), while Dell achieved an increase of 33 million dollars in its daily online sales following an initiative to enhance the usability of dell.com (Black, 2002).

The present work reveals that it is important, therefore, to build elements into the site design desired. In this regard, the requirements of usability can give clues as to how to make the browsing experience even more pleasurable, such as the use of simpler menus, bullet points, bold and italic fonts, text in different sizes and colours, hypertext, images, and search tools.

Meanwhile, social networks are changing how users and consumers share the information they derive from the Internet, and how they interact with others. To improve the user's experience it is essential to foster interactivity by including features such as widgets, buttons and plug-ins from the main social networks (that is, Twitter, Facebook, G+, LinkedIn and so on). Other means such as contact and complaint forms, forums, chat-rooms, handy tools such as personal calculators (for weight, heart rate/risk, intelligence, emotional state, for instance), or virtual assistants can be of enormous use in achieving a greater level of enjoyment for the user. This approach will undoubtedly lead to an enhanced brand image and reputation.

The results of the present study offer some interesting implications for those website managers who operate in the tourism field (hotels, tour operators, travel agencies, public bodies, and so on). Firstly, it has been clearly demonstrated that investment in good website design is critical for all firms active in e-commerce and tourism, where consumers often search online to research and compare destinations and services. They browse a site that consider as having a good level of usability. This brings a number of important benefits over a site with poor usability, such as lower perceived risk. A good site design is the very basis of the online marketing strategies developed by tourism firms. If the design is such that the user not only finds the site easy to browse, but also enjoys with it because he/she doesn't have to lose a lot of time to get the right information, it will help also to develop loyalty towards the service on offer (Alcántara-Pilar & Del Barrio-García, 2014).

Further research is therefore needed to investigate whether the hedonic motivations moderate the results of the present study.

#### Appendix 1: Items used on the scale from the empirical study

Dimensions	Items
Perceived risk online	<p>Whilst I was browsing this website, and due to its characteristics I felt that:</p> <p>RISK1. There is a high risk of loss if I make a reservation via this site</p> <p>RISK2. There is a major risk involved in making a reservation via this site</p> <p>RISK3. Making tourism reservations via this site is risky</p>
Perceived usability	<p>Please assess the website you have just browsed...</p> <p>USAB1. Everything on this website is easy to understand</p> <p>USAB2. This website is simple to use even for the first time</p> <p>USAB3. Finding the information I need on this website is simple</p> <p>USAB4. The content structure on this website is easy to understand</p> <p>USAB5. It's easy to find your way around this website</p> <p>USAB6. The way in which the content on this site is organized enables me to know where I am when I browse through the different pages</p> <p>USAB7. When I am browsing this site I feel in control of what I can do</p>

# COMERCIO SOCIAL VS COMERCIO ELECTRÓNICO: ¿INFLUYEN LOS ESTÍMULOS SOCIALES EN EL COMPORTAMIENTO DEL INDIVIDUO?

## RESUMEN

*Las redes sociales suponen un reto para la gestión de los clientes, que se convierten en agentes activos en las relaciones comerciales. Su integración en las webs de las empresas y la posibilidad de utilizarlas a nivel comercial han dado lugar al denominado comercio social o social commerce, una ramificación del comercio electrónico que se apoya en el uso de redes y medios sociales para fomentar la compra-venta de productos. El objetivo del presente trabajo consiste en profundizar en el concepto de comercio social frente al comercio electrónico “tradicional”. En este contexto, proponemos un modelo que recoge el efecto que los estímulos sociales incluidos en la plataforma ejercen en el estado de flujo experimentado por el cliente y en el comportamiento realizado. Este modelo será testado mediante metodología experimental que comparará dos escenarios: comercio social vs comercio electrónico. Los resultados obtenidos pondrán de manifiesto la importancia de los estímulos sociales y permitirán concluir si este tipo de comercio ofrece nuevas oportunidades de negocio.*

## Palabras clave:

Comercio social, Estado de flujo, Comportamiento del cliente, Interacciones sociales, Comercio electrónico.

## 1. Introducción

En los últimos años, el desarrollo y la creciente popularidad de medios y redes sociales como LinkedIn, Facebook y Twitter y su integración en la web tradicional han dado lugar a sofisticadas plataformas y entornos interactivos que han modificado el modo en que las empresas y los individuos interactúan y se comunican entre sí (Labrecque, 2014). Estos medios ofrecen nuevas fuentes de información, promueven el papel activo del cliente y, en definitiva, incrementan su poder en las relaciones comerciales (Wang et al., 2012; Zhang y Daugherty, 2009). Así, el comercio electrónico “tradicional” (*e-commerce*) ha evolucionado hacia un nuevo concepto, dejando de ser simplemente un intercambio diádico empresa-cliente, en el que la empresa controlaba la información y tomaba sus propias decisiones, para adoptar una estructura dinámica de red donde diferentes agentes forman parte del proceso, integran recursos y participan en la relación (Godes et al., 2005; Libai et al., 2010). Tal y como afirman Shankar y Malhotra (2007: 3), “Internet ha dado poder a los clientes para interactuar con las empresas en sus propios términos, permitiéndoles a su vez comunicarse con otros clientes”.

En este contexto, surge un nuevo tipo de comercio denominado comercio social o *social commerce*, el cual se define como una ramificación del comercio electrónico que se apoya en el uso de redes y medios sociales para fomentar la compra-venta de productos. Este tipo de comercio conjuga la participación activa del cliente y las interacciones sociales, aplica una orientación basada en la co-creación de valor, y pretende ir más allá de los objetivos meramente transaccionales. Las plataformas online con un enfoque social promueven la integración de recursos y el intercambio de información entre diferentes agentes, dando lugar a nuevos modelos de negocio que pueden conllevar importantes oportunidades para aquellas empresas que sepan gestionarlos. Según Forrester Research (Anderson et al., 2011), las plataformas online vinculadas al comercio social generarán alrededor de 30.000 millones de dólares de beneficio en 2015. Sin embargo, a pesar del interés de este nuevo tipo de comercio, la mayoría de las empresas han optado por continuar aplicando políticas de marketing orientadas exclusivamente al cliente individual y han ignorado las posibilidades que ofrece el enfoque social. Así, se pone pues de manifiesto la necesidad de profundizar en el ámbito del comercio social debido a la novedad del fenómeno, la escasez de estudios empíricos existentes en la materia, y el cambio de paradigma que supone frente a las teorías clásicas centradas exclusivamente en cuestiones económicas y en las decisiones tomadas por la empresa (Yadav et al., 2013).

El objetivo del presente trabajo en curso consiste en profundizar en el concepto de comercio social, analizando el estado de flujo y el comportamiento del cliente durante su interacción en una plataforma comercial con este enfoque. Para ello, llevamos a cabo una exhaustiva revisión de la literatura y proponemos un modelo teórico basado en la experiencia del cliente. Así, consideramos que el estado de flujo puede ser alcanzado a partir de las interacciones que el individuo lleva a cabo directa y/o indirectamente en la plataforma, las cuales influyen también positivamente en su comportamiento. El concepto de flujo ha sido medido a partir del trabajo de Agarwal y Karahanna (2000), recogiendo las siguientes dimensiones: Disociación temporal, Inmersión focalizada, Disfrute, Control y Curiosidad. Por otro lado, el comportamiento del cliente se analiza a partir de las intenciones de compra, de participar activamente en el proceso, y de hablar positivamente sobre la empresa que respalda la experiencia (WOM) (ver Figura 1).

FIGURA 1  
Modelo conceptual propuesto

La base teórica del presente trabajo en curso descansa en dos pilares fundamentales. Por un lado, las nuevas teorías de creación de valor surgidas en los últimos años, las cuales ponen de manifiesto la importancia del papel activo del cliente a la hora de establecer relaciones estables y duraderas (Malthouse y Hofacker, 2010; Prahalad y Ramaswamy, 2004). Por otro lado, las teorías sobre el estado de flujo y su relevancia para generar experiencias positivas en entornos online y motivar comportamientos positivos transaccionales y no transaccionales (Hoffman y Novak, 2009). Los análisis que pretendemos realizar se apoyan en metodología experimental, a partir de la cual se compararán dos escenarios: (1) una plataforma de *e-commerce*, la cual no permite al cliente comunicarse con otros clientes y (2) una plataforma de *social commerce*, la cual incluye herramientas que posibilitan llevar a cabo interacciones directas e indirectas. Los resultados obtenidos pondrán de manifiesto la importancia de las interacciones entre clientes que el individuo puede llevar a cabo en una plataforma de comercio social. De este modo, pretendemos cubrir el hueco existente en la literatura relativo a las diferencias que surgen en el comportamiento del individuo cuando éste tiene la posibilidad de interactuar socialmente durante el proceso de compra.

## 2. Marco teórico

### 2.1 *Social commerce vs e-commerce*

El comercio social se origina a partir de la conjunción de otros dos fenómenos comerciales que surgieron en la década de los 90: el boca-oído electrónico (eWOM) y el comercio electrónico (IBM, 2009). Apoyándose en estos conceptos, el comercio social combina aspectos propios de un entorno comercial (compra-venta, distribución, etc.) con otras propiedades de corte social que hasta ahora habían pasado desapercibidas (relaciones con la comunidad, influencia de la red, etc.). A pesar de sus evidentes puntos en común, el comercio social presenta importantes diferencias y beneficios respecto al comercio electrónico.

En primer lugar, destacaríamos un cambio en el **tipo de interacción dominante**. Mientras que en el comercio electrónico la relación fundamental es aquella que se establece entre la empresa y los clientes, el comercio social considera que las interacciones entre clientes son una fuerza de mercado clave, tanto si se llevan a cabo de manera directa (diálogo) como si se efectúan indirectamente (aprendizaje observacional) (Blazevic et al., 2013). Estas interacciones emergen como una fuente de información que condiciona el comportamiento del consumidor y que le permite acceder a las valoraciones, recomendaciones, comentarios y experiencias vividas por otros consumidores y comunidades virtuales (Godes et al., 2005).

En segundo lugar, señalaríamos que el **tipo de intercambio** que se establece en el ámbito social deja de tener carácter diádico empresa-cliente, característico del *e-commerce*, para adquirir un enfoque de red (Aggarwal, 2004; Payne et al., 2009). Así, la empresa pierde el control del que había gozado tradicionalmente en los intercambios comerciales y surge un tipo de inteligencia colectiva también denominada *sabiduría de masas* (O'Reilly, 2005). En tercer lugar, identificaríamos un cambio en el **tipo de relación** que se establece. Mientras que el comercio electrónico tradicional potencia las relaciones unidireccionales, iniciadas por la empresa en la búsqueda de clientes, el comercio social persigue lograr una respuesta activa del cliente. Esta respuesta se alcanza a partir del aumento de la **conectividad** y de la emergencia de herramientas sociales 2.0 (redes sociales, blogs, webs de opinión, etc.), las cuales dan lugar a nuevas opciones de interacción, incrementan la posibilidad de relacionarse con otros clientes y generan plataformas que van más allá del sitio web del vendedor (Hennig-Thurau et al., 2010; Libai et al., 2010). Igualmente, debemos destacar que el comercio social también modifica la **orientación** aplicada por la empresa, desapareciendo el enfoque centrado en un objetivo concreto vinculado con la transacción, y emergiendo una orientación que trata de optimizar la experiencia vivida por el cliente.

Por último, debemos destacar un cambio en el tipo de **métricas utilizadas** para evaluar el valor generado por el cliente. Mientras que el comercio electrónico se apoya en medidas vinculadas con aspectos transaccionales, las cuales trataban de recoger el valor generado por el cliente a partir de los retornos económicos generados (ej. *Customer Lifetime Value*) (Blattberg et al., 2001; Kumar y Reinartz, 2006), el comercio social señala la importancia de abordar aspectos no transaccionales, como sería el *Customer Engagement Value* (CEV) (Kumar et al., 2010). Este tipo de medidas centran su atención en la importancia de profundizar en el valor de las interacciones realizadas por el cliente, en su influencia sobre otros consumidores, y en el conocimiento que aporta dicho cliente a la empresa.

Teniendo en cuenta estos aspectos, el presente trabajo en curso propone testar empíricamente el efecto que los atributos de una plataforma orientada al comercio social ejercen sobre el estado de flujo experimentado por el individuo durante su interacción y sobre el comportamiento realizado.

## **2.2 El estado de flujo en el ámbito online**

A lo largo de las dos últimas décadas, el concepto de flujo (*flow*) ha sido una de las variables que mayor éxito ha alcanzado en la investigación sobre el comportamiento tecnológico del cliente (ej. Skadberg y Kimmel, 2004; Smith y Sivakumar, 2004). Así, frente a los modelos teóricos basados en las percepciones y la cognición del individuo, este concepto pretende explicar las sensaciones experimentadas por el cliente durante su interacción con una determinada tecnología, considerando que aspectos intrínsecos relacionados con la diversión, la concentración o el control de la situación ejercen un papel fundamental en su comportamiento.

El concepto de flujo se definió inicialmente como aquel estado holístico que una persona experimenta cuando lleva a cabo una actividad con total implicación, ignorando cualquier otra cuestión que surja en ese momento (Csikszentmihalyi, 1990). Dicho estado pretende ir más allá del objetivo inicialmente buscado por el individuo cuando emplea una tecnología y suele vincularse a las experiencias óptimas que éste puede vivir durante su interacción (Davis et al., 1992; Hoffman y Novak, 1996). Estas experiencias generan emociones y sensaciones placenteras, que trascienden la plataforma y que empujan al individuo a tratar de repetir las en el corto plazo, pudiendo generarse relaciones afectivas estables con la empresa (Luna et al., 2002).

A partir de la revisión de la literatura llevada a cabo, el presente trabajo plantea que las interacciones que el individuo puede realizar en una plataforma de comercio social originan un mayor estado de flujo durante su experiencia. Para definir el concepto, seguimos la recomendación de Hoffman y Novak (2009) de aplicar una perspectiva multidimensional y estudiamos cinco dimensiones del concepto (Agarwal y Karahanna, 2000): (1) disociación temporal o la incapacidad del individuo de registrar el paso del tiempo mientras está realizando la interacción; (2) inmersión focalizada o experiencia de implicación máxima, durante la cual el cliente ignora otros aspectos que demandan su atención; (3) disfrute o captura del placer de la interacción; (4) control o percepción del usuario de ser responsable de la interacción; y, por último, (5) curiosidad. Así, proponemos las siguientes relaciones:

**H1: La posibilidad de interactuar con otros clientes durante una experiencia de compra social influye positivamente en el estado de flujo experimentado por el individuo.**

*H1a: La posibilidad de interactuar con otros clientes durante una experiencia de compra social influye positivamente en la disociación temporal experimentada por el individuo.*

*H1b: La posibilidad de interactuar con otros clientes durante una experiencia de compra social influye positivamente en la inmersión focalizada experimentada por el individuo.*

*H1c: La posibilidad de interactuar con otros clientes durante una experiencia de compra social influye positivamente en el disfrute experimentado por el individuo.*

*H1d: La posibilidad de interactuar con otros clientes durante una experiencia de compra social influye positivamente en el control experimentado por el individuo.*

*H1e: La posibilidad de interactuar con otros clientes durante una experiencia de compra social influye positivamente en la curiosidad experimentada por el individuo.*

## **2.3 Comportamiento del cliente**

Dado el carácter participativo y comercial del comercio social, este trabajo se centra en tres conceptos diferentes para medir el comportamiento del cliente: intenciones de participar activamente, intenciones de hablar positivamente sobre la empresa que respalda la plataforma social (WOM) e intenciones de compra.

El concepto de participación del cliente ha sido analizado de forma extensiva desde diferentes puntos de vista, convirtiéndose en un aspecto crítico de estudio en el marketing contemporáneo (Grönroos, 2008). En los últimos años, la creciente importancia alcanzada por dicho fenómeno, así como los avances de la tecnología han influido en su conceptualización y en las líneas de investigación que lo abordan (Heinonen et al., 2010; Prahalad y Ramaswamy, 2004; Vargo y Lusch, 2004). Así, el cliente

deja de ser un agente pasivo en su relación con la empresa para convertirse en un agente activo y fundamental en la creación de valor (Grönroos, 2008; Prahalad y Ramaswamy, 2004; Vargo y Lusch, 2004). Los individuos ya no demandan ofertas prefabricadas, sino que prefieren personalizar sus compras, compartir sus opiniones con otros consumidores y colaborar activamente (Prahalad y Ramaswamy, 2004). En el contexto del comercio social, la participación del cliente durante el proceso de compra emerge como un aspecto fundamental al recoger la posibilidad del cliente de aplicar sus propios recursos, vendiendo, comparando, comprando y compartiendo información sobre productos y servicios (Zhou et al., 2013). De este modo, el comercio social permite tomar decisiones de compra más precisas, desarrollar experiencias adaptadas a cada situación y generar relaciones entre los clientes y con la empresa (Edvardsson et al., 2011; Prahalad y Ramaswamy, 2004). En esta línea, proponemos la siguiente hipótesis:

*H2a: La posibilidad de interactuar con otros clientes durante una experiencia de compra social influye positivamente en la intención del cliente de participar activamente durante el proceso.*

La intención de hablar positivamente a otros clientes (WOM) se define como la intención del cliente, real o potencial, de realizar afirmaciones positivas sobre un producto, una empresa o una experiencia. Este tipo de comportamiento es especialmente relevante cuando los comentarios se realizan en medios sociales online, ya que el número de individuos y el alcance geográfico logrado es mucho mayor (Hennig-Thurau et al., 2004). Así, la información vertida en estos medios se convierte en una fuerza principal del mercado, capaz de enriquecer las experiencias vividas por otros individuos y de condicionar sus decisiones de compra (Schau et al., 2009; Vallaster y Von Wallpach, 2013). Respecto al comercio social, analizar este tipo de comportamiento nos permitirá determinar si el hecho de interactuar con otros agentes a través de una plataforma social hace que, posteriormente, el individuo tenga mayores intenciones de hablar positivamente sobre la empresa y su experiencia, generando a su vez nuevas opiniones y un mayor conocimiento.

*H2b: La posibilidad de interactuar con otros clientes durante una experiencia de compra social influye positivamente en la intención del cliente de hablar positivamente sobre la empresa que respalda dicha experiencia.*

Por último, estudiaremos la intención de compra del cliente ya que ha sido una de las principales variables relativas al comportamiento que han sido analizadas en el ámbito del comercio electrónico (ej. Chiu et al., 2014). En el contexto del comercio social, Yadav et al. (2013) también pone de manifiesto su relevancia, destacando el efecto que los atributos sociales pueden ejercer en cada una de las fases del proceso de compra realizado por el cliente: reconocimiento de necesidades, actividades previas a la compra, decisión de compra y actividades post-compra. Así, el conocimiento compartido por los clientes a través de las interacciones sociales realizadas en la plataforma reduce el esfuerzo y el riesgo relativo a la toma de decisiones, incrementando la probabilidad de que el cliente finalice la compra (Yadav et al., 2013). En esta línea, proponemos la siguiente hipótesis:

*H2c: La posibilidad de interactuar con otros clientes durante una experiencia de compra social influye positivamente en la intención del cliente de comprar el producto.*

### **3. Metodología propuesta: diseño de la plataforma y proceso experimental**

Para llevar a cabo el estudio, se aplicará una metodología experimental mediante la cual se compararán dos escenarios: (1) una plataforma de comercio social y (2) una plataforma de comercio electrónico tradicional. Ambos escenarios simularán una experiencia online vinculada a la compra de un par de zapatillas deportivas, planteando como principal diferencia entre ellos la inclusión de herramientas sociales en el primero. Las herramientas sociales incluidas en la primera plataforma permitirán a sus usuarios interactuar con otros clientes, intercambiando mensajes e información a través del email, foros y redes sociales. Además, estos usuarios podrán votar por el par de zapatillas que más les guste de la galería y comentar los diferentes diseños que otros clientes han subido a la plataforma. La elección de estas herramientas se basará en otros trabajos anteriores y en la observación de prácticas empresariales reales realizadas en el ámbito online.

El planteamiento del experimento será el siguiente. En primer lugar, todos los participantes deberán cumplimentar un cuestionario online, en el cual se les preguntará por sus características personales.

Estas características permitirán llevar a cabo cierto control sobre la muestra analizada. Una vez respondido este cuestionario, cada participante será asignado de manera aleatoria a uno de los dos escenarios, asegurándonos de que no exista ningún tipo de contacto entre los participantes durante la realización del experimento. A continuación, se solicitará a los participantes de ambos escenarios que compren un par de zapatillas y que lleven a cabo diferentes acciones en función de la plataforma que les haya sido asignada. Con el objetivo de asegurar las mismas condiciones para todos los participantes, se facilitará una hoja de instrucciones en la cual se explicarán todos los pasos que tendrán que seguir. Además, el diseño de la plataforma no permitirá continuar realizando el experimento a menos que las instrucciones sean correctamente cumplimentadas. De esta manera, nos aseguraremos que todos los participantes experimentan las posibilidades de su plataforma (electrónica o social) y de que son conscientes de las posibilidades que aporta, pudiendo valorar a continuación la experiencia de compra vivida.

#### 4. Conclusión

Durante los próximos meses, se pretende testar los datos recogidos. En primer lugar, se validarán las escalas de medida y se comprobará que las manipulaciones realizadas en ambos escenarios experimentales han sido correctamente realizadas. Para ello, se obtendrán los alfas de Cronbach para cada escala y se realizarán test t de medias. En segundo lugar, se contrastarán las hipótesis propuestas mediante dos análisis multivariante de la varianza (MANOVA), uno para estudiar el comportamiento del individuo y otro para testar las variables relativas al flujo.

Los resultados obtenidos pondrán de manifiesto la influencia que las posibilidades ofrecidas por el comercio social ejercen sobre el estado de flujo experimentado y el comportamiento del cliente. Así, podremos concluir si el comercio social realmente ofrece nuevas oportunidades de negocio frente a otras formas tradicionales de distribución (Zhou et al., 2013) y estableceremos aquellos cambios vinculados a una orientación social, que una empresa debe realizar para incentivar el comportamiento del cliente, transaccional y no transaccional.

## ABSTRACT

*Twitter es la red social elegida por muchas empresas para crear comunidades de marca. Uno de los objetivos de estas comunidades es que se hable bien de la marca. La identificación de líderes de opinión en estas comunidades puede ayudar a que se genere debate sobre la marca, pero si el líder de opinión no es leal a la marca puede provocar el efecto contrario al deseado. Este estudio tiene por objetivo ayudar a la empresa a identificar líderes de opinión que sean leales a la marca. Esta identificación permitirá seleccionarlos en sus campañas de difusión de la marca. El estudio realizado concluye que la identificación de un líder de opinión leal en una comunidad de marca se ha de hacer atendiendo a tres criterios: la información del perfil del individuo, su número de seguidores y el número de personas o páginas a las que esa persona está siguiendo.*

**PALABRAS CLAVE:** *Líder de opinión, lealtad hacia la marca, seguidor, Twitter, comunidad de marca*

## **1. Introducción**

Las redes sociales están cada vez más presentes en nuestra vida diaria. El 72% de usuarios de Internet tiene un perfil en al menos una red social (Princeton Survey Research Associates International, 2013), y pasa una media de dos horas diarias en estas plataformas (Nielsen, 2012). Facebook, Twitter y Google+, las tres redes sociales más importantes a nivel mundial, tienen más de dos billones de usuarios (Search Engine Journal, 2013). Además, un estudio realizado a empresas de todo el mundo revela que invertir en redes sociales genera mejores resultados que asistir a ferias, hacer marketing directo o contratar publicidad online (Hubspot, 2013). Tanto consumidores como marcas pueden crear cuentas en redes sociales. Una empresa puede crear una cuenta con el objetivo de desarrollar una comunidad de marca en la que los consumidores y la marca puedan interactuar e intercambiar información y sensaciones. Los consumidores se pueden unir a las páginas de marca en cualquier momento y empezar a formar parte de la comunidad. En la actualidad, más del 80% de las grandes empresas ya tiene una comunidad de marca en alguna red social (Medialuna, 2013).

Estudios previos han demostrado que una de las ventajas más importantes de una comunidad de marca es la generación de conversaciones sobre la marca (Carlson et al., 2008). A pesar de que se pueda hablar sobre la marca fuera de la comunidad, el hecho de tener una comunidad propicia que buena parte del debate generado en torno a la marca se produzca en el seno de la comunidad. En este contexto, la influencia de las opiniones que se expresan sobre productos o marcas depende de quién las emita. Por ello, los esfuerzos de las empresas se están centrando en identificar a personas que tengan cierta influencia en las redes sociales, denominadas líderes de opinión. La identificación de estos líderes se considera necesaria para poder desarrollar campañas de promoción de la marca exitosas. Sin embargo, que un líder de opinión sea miembro de una comunidad de marca no asegura que hable bien de la misma. La probabilidad de que hable bien depende sobre todo de su lealtad hacia la marca (Carpenter y Fairhurst, 2005). Los individuos leales son aquellos que están comprometidos con la marca y que además tienen intención de comprar o seguir comprando esa marca (Chaudhuri y Holbrook's, 2001). Pero, ¿cómo puede la empresa saber si un líder de opinión es leal a la marca?

Para dar respuesta a esa pregunta, este estudio tiene como objetivo identificar a líderes de opinión que sean miembros de la comunidad de marca y que además sean leales hacia la misma. Las empresas pueden crear comunidades de marca en redes sociales como Facebook, Twitter, Google+, Instagram o Pinterest. Sin embargo, investigaciones recientes (Burson-Marsteller, 2012) indican que prefieren crearlas en Twitter. Además, Twitter es la red social con mayor crecimiento y con mayor número de páginas de marca (Globalwebindex, 2013), por lo que se ha elegido esta red social para realizar el estudio. El trabajo es de interés para la práctica empresarial en la medida que facilita la identificación de líderes de opinión leales que puedan ser utilizados en campañas de de la marca. Concretamente, proponemos que esta identificación se puede realizar a través de información que está disponible a todas las empresas que tienen creada una comunidad de marca en Twitter.

## **2. Revisión de la literatura y desarrollo de hipótesis**

Las comunidades de marca se definen como comunidades especializadas, sin localización geográfica, basadas en las relaciones sociales entre usuarios de una marca (Muñiz y O'Guinn, 2001, p. 412). Una comunidad de marca está formada por consumidores que comparten interés sobre la misma marca. En estas comunidades los miembros comparten vivencias y opiniones sobre la marca, interactúan con la misma e incluso pueden participar en actividades organizadas por la marca o por los miembros de la comunidad (Algesheimer et al., 2005). Las primeras comunidades de marca en internet se desarrollaron en la propia web de la empresa (Jang et al., 2008). Actualmente, dada la importancia que están adquiriendo las redes sociales para los consumidores, las comunidades de marca se están trasladando a estas plataformas (Laroche et al., 2012). Para el consumidor es muy fácil unirse a la comunidad de marca. Un solo click es suficiente. Por ejemplo, en Twitter habría que pinchar en "seguir" a la marca. De esta manera, al igual que ocurre con las comunidades de marca tradicionales, los consumidores pueden recibir información sobre la marca e interactuar con otros individuos a los que les gusta la misma marca.

Una de las principales ventajas de la creación de una comunidad de marca es la generación de boca a boca (Carlson et al., 2008). Una opinión favorable sobre una marca escrita por un consumidor en una

red social puede ser vista por individuos de todo el mundo que siguen a la marca a través de esa red social (Laroche et al., 2012). En la actualidad, es clave que las empresas puedan obtener rentabilidad de esas opiniones favorables. Muchas de las estrategias online de las marcas están orientadas a que se hable bien de ellas, fomentando las conversaciones entre consumidores. Sin embargo, no todos los seguidores de la marca son leales a la misma ni ejercen el mismo grado de influencia (Smith et al., 2012), por lo que la empresa necesita saber cómo identificar los seguidores que pueden ser a la vez influyentes y leales a la marca.

Para identificar a aquellos consumidores más influyentes puede servir de ayuda el concepto de líder de opinión. Los líderes de opinión son individuos con mayor conocimiento, experiencia, implicación y familiaridad con la categoría de producto que los individuos que no son líderes de opinión (Goldsmith et al., 2003). Son individuos con una gran actividad social, que tienen un gran número de contactos en diferentes grupos (Valente, 1996). Al tener un mayor conocimiento de la categoría de producto suelen desarrollar un pensamiento más crítico y elaborado sobre las posibles alternativas. Además, los líderes de opinión tienden a querer sentirse diferentes del resto de consumidores, por lo que no actúan como los demás (Chan y Misra, 1990). Son más arriesgados e innovadores, lo que les lleva a comprar marcas y productos nuevos (Myers y Robertson, 1972). Estas características del líder de opinión hacen que sus opiniones ejerzan una gran influencia en la decisión de otros consumidores (Van Eck et al., 2011).

A pesar de que los líderes de opinión tienen un enorme potencial para actuar como posibles embajadores de la marca, que un líder de opinión siga a una marca no garantiza que vaya a hablar bien sobre la misma. De hecho, se ha observado que muchos líderes de opinión utilizan su influencia para hablar mal o desprestigiar a ciertas marcas. Un ejemplo de esto lo encontramos en el lanzamiento por parte de Apple del iPhone 5S, modelo muy criticado en redes sociales incluso por miembros de la comunidad Apple. Teniendo en cuenta la facilidad con la que un individuo puede hacerse miembro de una comunidad de marca en una red social como Twitter, el mero hecho de estar en la comunidad y seguir a la marca no implica que al individuo le guste realmente esa marca. Por tanto, para poder llevar a cabo campañas o acciones exitosas con eco/difusión en las redes sociales hay que identificar a individuos con dos requisitos: 1) que sean líderes de opinión y 2) que sean leales a la marca. Que sean líderes hace que la información que transmiten pueda propagarse muy rápidamente, es decir, asegura impacto y difusión. Por su parte, que sean leales implica que el individuo prefiera esa marca respecto a otras, es decir, que tengan una actitud hacia la marca más favorable que aquellos que no son leales y que la probabilidad de hablar bien de la marca sea mayor (Chaudhuri y Holbrook, 2001; Carpenter y Fairhurst, 2005). Por lo que si además de ser líder, el individuo es leal a la marca la empresa se asegura una elevada difusión de boca a boca positivo sobre su marca.

La red social Twitter ofrece información que permite a las empresas identificar a posibles líderes de opinión. Cualquier individuo con un perfil en Twitter puede “seguir” a otro o a una marca en esta red social. Si un consumidor sigue a una marca implica que todo lo que escriba la marca podrá ser visto por ese consumidor. Lo mismo ocurre cuando un consumidor sigue a otro, todo lo que publique este último podrá ser visto por su “seguidor”. Si un individuo sigue a otro suele implicar que está interesado en lo que esta persona publica. Por lo que si una persona tiene muchos seguidores es porque sus publicaciones resultan interesantes. El número de seguidores se ha convertido en el principal indicador de éxito en esta red social y, por esta razón, a las personas con más seguidores se les suele considerar líderes de opinión en Twitter (Choi et al., 2010; Westerman et al., 2012). Sin embargo, si solo atendemos al criterio de seguidores podemos equivocarnos a la hora de clasificar a ese individuo como líder de opinión. Estudios previos han establecido que un líder de opinión es líder en una categoría de producto, no en todas (Marshall y Gitosudarmo, 1995). Por ejemplo, una persona experta en moda con muchos seguidores puede estar en la comunidad de marca de un producto tecnológico, pero eso no quiere decir que sea líder de opinión de tecnología ni que sus opiniones sobre tecnología tengan una gran influencia. Por lo que además del número de seguidores, la empresa debe tener en cuenta más información para identificar su implicación con la categoría de producto. Como la empresa puede ver tanto los mensajes previos que ha escrito el individuo (*tweets*) como la información de sus perfiles, deberá utilizar toda la información disponible para identificar con mayor precisión cuántos líderes de opinión reales hay en su comunidad.

Existe cierta controversia respecto a la relación que hay entre ser líder de opinión y ser leal a la marca. El gran conocimiento que tiene un líder de opinión sobre la categoría de producto puede llevarle a que sea más leal a la marca por el hecho de tener más criterio que otros individuos para seleccionar el producto que más satisfaga sus necesidades (Chan y Misra, 1990). De hecho, Stokburger-Sauer y Hoyer (2009) demostraron que los líderes de opinión son más leales que los individuos que no lo son. Sin embargo, el líder de opinión también puede querer comportarse de forma diferente al resto de miembros, lo que le llevaría a una actitud más cambiante y menos leal (Chan y Misra, 1990). Además, dada la facilidad con la que un individuo puede ser miembro de una comunidad de marca en redes sociales y la necesidad del líder de opinión de estar informado sobre la categoría de producto (Goldsmith et al., 2003), los líderes de opinión pueden hacerse miembros de las comunidades de marca con el objetivo de obtener información sobre productos de distintas marcas, no porque les gusten, o sean leales a las mismas. Además, muchos líderes de opinión lo son por tener un juicio crítico con las marcas, por lo que no se puede decir que sean leales a ninguna de ellas (Gnambs and Batinic, 2012; Goldsmith et al., 2003). Por tanto, la tendencia actual parece favorecer una relación negativa entre el grado de liderazgo de un individuo y su lealtad a la marca. En consecuencia, cuanto más propensión tenga el individuo a ser líder, menor será su grado de lealtad, por lo que planteamos la siguiente hipótesis:

**H1: La propensión que tiene un individuo a ser líder de opinión influye negativamente sobre el grado de lealtad hacia una marca a la que sigue en Twitter**

Otro dato de interés que se puede obtener del perfil de los usuarios de Twitter es a cuántas personas y marcas sigue esa persona (indicador “siguiendo”). Como hemos dicho anteriormente, un individuo seguirá a otro o a una marca si le interesa lo que éstos publican. Por lo que un individuo que sigue a muchas personas y marcas en Twitter estará más informado de lo que publican otros que un individuo que sigue a pocas personas o marcas. Este comportamiento está asociado a un comportamiento de búsqueda activa de información (Westermana et al., 2012), también denominado comportamiento de “merodeador” en el contexto de las comunidades de marca (Ridings et al., 2006). En comunidades de marca creadas en redes sociales, se trata de personas que suelen leer y estar al tanto de todo lo que acontece en la red social. Estudios previos han mostrado que aquellos que suelen tener este comportamiento de merodeador suelen ser leales a la marca de las comunidades a las que pertenece (Lin et al., 2011). Por lo tanto, consideramos que aquellas personas que tienen un comportamiento de merodeador en Twitter serán más leales a las comunidades de marca a las que sigue en esta red social que aquellos que aquellos que no son merodeadores. Siguiendo este razonamiento proponemos la siguiente hipótesis:

**H2: El número de cuentas a las que sigue un individuo influye positivamente sobre el grado de lealtad hacia una marca a la que sigue en Twitter**

Sin embargo, el número de cuentas a las que sigue un individuo puede afectar de manera diferente en la lealtad de aquellos que son líderes de opinión. Un líder de opinión es más crítico que el resto de consumidores (Goldsmith et al., 2003), por lo que si un líder sigue a pocos individuos/marcas, será porque aquellos le proporcionan información relevante. Si entre ellos se encuentra la página de la marca, los mensajes que escriba la misma y otros miembros de la comunidad serán leídos por el líder de opinión, lo que le puede generar lealtad hacia la misma, dado que la exposición a estímulos de una marca puede llevar a tener una mayor preferencia por la marca (Kanetkar et al., 1992). Sin embargo, los líderes de opinión que sigan a muchas personas y marcas, recibirán también más mensajes de otras marcas, pero dada la ingente cantidad de información que reciben no podrán procesarla ni leerla toda. Además, en este grupo se encuentran los individuos que siguen a otros en Twitter para que los sigan a ellos y así aumentar el número de seguidores que tienen, por lo que, en este caso, no serán miembros de la comunidad de marca porque les interese realmente la marca ni los mensajes que escriba la misma en la comunidad, sino para aumentar su propio número de seguidores. Por lo tanto, proponemos la siguiente hipótesis:

**H3: La propensión que tiene un individuo a ser líder de opinión modera la relación entre el número de cuentas a las que sigue un individuo y la lealtad hacia la marca de la que es seguidor en Twitter.**

**H3a: Para niveles altos de liderazgo de opinión, el número de cuentas a las que sigue un individuo influye negativamente sobre el grado de lealtad hacia la marca a la que sigue en Twitter.**

**H3b: Para niveles bajos de liderazgo de opinión, el número de cuentas a las que sigue un individuo influye positivamente sobre el grado de lealtad hacia la marca a la que sigue en Twitter.**

### 3. Metodología

Se seleccionaron para el estudio comunidades de marca de cámaras fotográficas. La población objeto de estudio son los seguidores de estas comunidades en Twitter. Concretamente se eligieron las comunidades de Canon, Lomo y Leica. Con esta elección se pretendía obtener una muestra de individuos pertenecientes a comunidades de marca de diferentes tamaños y características. En este sentido, Canon tiene una comunidad de marca en Twitter compuesta por más de 150.000 seguidores, Lomo tiene más de 85.000 seguidores, mientras Leica no llega a los 63.000. Asimismo, la notoriedad de la marca Canon es mayor que la de Lomo y Leica.

Debido al propósito del estudio, para formar parte de la muestra los individuos debían estar interesados o implicados con la categoría de producto. Muchos individuos escriben en su perfil en Twitter que son fotógrafos o amantes de la fotografía. Observando si en sus últimos tweets hablan sobre fotografía también se puede averiguar su implicación con esta categoría de producto. Incluso las fotos de fondo o la de perfil puede servirnos como indicador de la implicación con el producto. Realizar esta pre-selección nos garantizaba que los participantes estuvieran implicados con la categoría de producto y conocieran realmente la marca. Una vez cumplido este requisito previo se seleccionó de forma aleatoria a los individuos participantes en el estudio.

Para la recogida de información se creó un cuestionario online cuyo link fue enviado mediante un mensaje (*tweet*) donde se mencionaba al individuo y se le invitaba a contestar el cuestionario. El mensaje enviado fue el siguiente: “@cuenta de Twitter” que eres seguidor de “nombre de la comunidad de marca” ayúdame contestando este breve cuestionario “link”. Más de 2000 mensajes fueron enviados a los miembros las tres comunidades de marca mencionadas anteriormente siguiendo este procedimiento. Se contactó con el mismo número de individuos en cada comunidad de marca. Siguiendo este procedimiento se obtuvieron 318 cuestionarios, alcanzando una tasa de respuesta del 15,9%. En el cuestionario se midió la lealtad hacia la marca que tenía el individuo utilizando la escala de tres ítems de Chaudhuri y Holbrook (2001). Los individuos tenían que indicar su grado de acuerdo con las siguientes afirmaciones en una escala de 7 puntos: (1) La próxima vez que compre una cámara de fotos compraré la misma marca que la que tengo actualmente; (2) Intentaré seguir comprando la misma marca de cámara en un futuro; (3) Estoy comprometido con mi marca actual de cámara. Además, se les preguntó por su edad, género y país de origen. Al finalizar la encuesta se pedía a los participantes que escribieran su cuenta de Twitter.

Cuando finalizó la recogida de datos accedimos a las cuentas de Twitter de los participantes para obtener el número de seguidores y número de marcas y personas a los que seguía cada individuo. Dado que algunos usuarios proporcionaron cuentas de Twitter falsas o inexistentes, los cuestionarios válidos fueron finalmente 269. 80 individuos de la comunidad de marca de Leica, 88 de Lomo y 101 de Canon.

### 4. Resultados

Para ayudarnos a averiguar qué factores explican la lealtad a una marca de los seguidores de una comunidad en Twitter hemos realizado un análisis de regresión lineal. En este análisis se plantea que la lealtad a la marca depende del número de seguidores que tiene el individuo, de las personas/marcas que está siguiendo y de la posible interacción que exista entre estos dos factores. Como podemos observar en la **Tabla 1**, la propensión de un individuo a ser líder de opinión (medido a través del número de seguidores) afecta negativamente a la lealtad hacia la marca seguida ( $\beta_1 = -0,911$ ;  $p < 0,01$ ),

por lo que los líderes de opinión no serán leales a la marca, aceptando H1. Con respecto al indicador “siguiendo”, los análisis indican que a cuantas más personas y marcas siga el individuo, más probable es que éste sea leal hacia la marca seguida ( $\beta_2=0,111$ ;  $p<0,10$ ). Es decir, aquellas personas que siguen a más individuos y marcas en esta red social suelen ser más leales que aquellos que siguen a menos individuos y marcas. Sin embargo esta relación es significativa al 10%, por lo que aceptamos parcialmente H2.

**Tabla 1: Resultados**

<b>VD: Lealtad hacia la marca</b>	<b><math>\beta</math> estandarizada</b>	<b>t</b>	<b>Significatividad</b>
Seguidores $\beta_1$	-0,911	-2,719	0,007
Siguiendo $\beta_2$	0,108	1,671	0,096
Interacción: Seguidores x siguiendo $\beta_3$	-0,765	-2,275	0,0024

Una vez que hemos observado que estos dos factores tienen efectos distintos sobre la lealtad a la marca necesitamos saber si entre ellos hay algún tipo de relación que permita matizar los efectos anteriores y que sirva de ayuda al propósito de identificación de líderes de opinión leales. Para testar H3 es necesario examinar el efecto interacción que existe entre el indicador “seguidores” y el indicador “siguiendo”. Los resultados de este análisis revelan un efecto interacción negativo entre estas dos variables ( $\beta_3=-0,835$ ;  $p<0,05$ ). Para interpretar el efecto interacción se han calculado las ecuaciones de regresión para dos niveles de la variable seguidores: para individuos con pocos seguidores (desviación típica por debajo de su valor medio) y para individuos con muchos seguidores (desviación típica por encima de su valor medio). Los resultados obtenidos en este análisis se muestran en la **Tabla 2**. El efecto interacción nos indica que aquellos individuos con muchos seguidores (es decir, los potenciales líderes de opinión) serán más leales hacia la marca seguida cuantos menos individuos o marcas sigan en esta red social. Por lo tanto aceptamos H3a. Además, podemos ver que aquellos individuos que tienen pocos seguidores tendrán una mayor lealtad a la marca conforme más cuentas sigan en esta red social, por lo que podemos aceptar H3b.

**Tabla 2: Lealtad a la marca en función de los indicadores “siguiendo” y “seguidores”**

<b>VD: Lealtad hacia la marca</b> <b>VI: Siguiendo</b>	<b><math>\beta</math> estandarizada</b>	<b>t</b>	<b>Sig.</b>	<b>t (cambio en <math>\beta</math>)</b>	<b>Sig.</b>
Individuos con muchos seguidores (potenciales líderes)	-0,73	-2,09	0,037	-2,27	0,024
Individuos con pocos seguidores (no líderes)	0,95	2,38	0,018		

## 5. Conclusiones

Las redes sociales ya forman parte de la vida diaria del consumidor (Princeton Survey Research Associates International, 2013). Las empresas, conscientes de este hecho, han pasado de crear comunidades de marca en sus propias páginas web a hacerlo en estas plataformas (Laroche et al., 2012). Una de las ventajas de crear comunidades de marca en redes sociales es tener acceso a información sobre los seguidores de estas marcas, lo que nos ha permitido averiguar quiénes son los líderes de opinión leales dentro de una comunidad. Los resultados establecen que, a priori, los potenciales líderes de opinión son menos leales a las marcas que siguen, confirmando a los estudios que sugieren que el líder de opinión es más cambiante y menos leal (Chan y Misra, 1990; Gnambs and Batinic, 2012). Sin embargo la lealtad de los potenciales líderes de opinión depende del número de cuentas a las que siga en Twitter. Los líderes de opinión más leales serán aquellos que siguen a pocas cuentas. Al recibir menos información será más probable que lea lo que escribe la marca en su comunidad, generando mayor lealtad hacia la marca por la mera exposición a los mensajes de la marca y pudiendo transmitir dicha información a sus seguidores. De esta forma la empresa conseguirá que sus campañas dirigidas a generar conversaciones sobre la marca sean más efectivas. El mensaje tendrá una gran difusión e impacto reduciendo el riesgo de que se hable mal sobre la marca.

Por otra parte, hemos demostrado que aquellos que no son líderes de opinión y tienen muchos seguidores también presentan niveles altos de lealtad hacia la marca. De esta forma, si la empresa es muy conservadora y no quiere arriesgarse a seleccionar para sus campañas a líderes de opinión a pesar de ser leales por miedo a que hablen mal sobre la marca, sugerimos una estrategia alternativa. Estas empresas podrían identificar a aquellos individuos más leales dentro de la comunidad para estar totalmente seguros de que no se generan opiniones negativas sobre la marca. En este caso, se seleccionarían individuos que tienen pocos seguidores, es decir, individuos que no son potenciales líderes de opinión y que, además, siguen a muchas personas y marcas en Twitter. Esta estrategia generaría un menor impacto y difusión, dado el pequeño número de seguidores de estos individuos. Sin embargo, es menos probable que se genere boca a boca negativo dado el gran nivel de lealtad de los individuos seleccionados.

## RESUMEN

*El social commerce, caracterizado por la participación activa de los usuarios en la navegación, presenta un importante desafío para el marketing relacional. Este tipo de comercio en línea no está únicamente centrado en las relaciones, sino también en las experiencias de los usuarios. Por ello, se plantea la utilización de la teoría del flow, proveniente de la psicología positiva, en la que se persigue el alcance de la experiencia óptima. Se presenta un modelo conceptual con el fin de analizar si el estado de flow hace que los usuarios de las páginas de s-commerce encuentren la experiencia de navegación gratificante, influyendo positivamente en la intención de compra, en la satisfacción del usuario y en la intención de eWOM.*

## PALABRAS CLAVE

*flow, experiencia óptima, social commerce, eWOM, intención de compra, satisfacción,*

## 1. Introducción

La presencia de Internet y de las TIC en los usos y costumbres de nuestra sociedad es indudable y una muestra de ello es la cada vez mayor aceptación del *e-commerce*, tanto por volumen de negocio como por porcentaje de compradores. Las razones de este crecimiento son de sobras conocidas (ONTSI, 2013): básicamente, aumenta el número de internautas compradores y suben las compras realizadas en movilidad. Además, uno de los estímulos más importantes en los últimos años ha sido el desarrollo de las redes sociales, dando lugar a lo que se ha denominado *social commerce* o *s-commerce*. Éste ha sido definido como un medio donde los usuarios, además de comprar productos, pueden compartir información, intercambiar opiniones, recibir el consejo de individuos de confianza (Zhou et al., 2013) e incluso realizar compras grupales (Kim, 2013). Es una forma de negocio basada en la interacción B2C y C2B2C (Pralhad y Ramaswamy, 2004), que cambia el rol del consumidor, ya que ahora genera y comparte la información, formando parte del proceso comercial. A diferencia del *e-commerce*, el *s-commerce* se caracteriza por resaltar la importancia de las interacciones entre usuarios y empresas, de ahí que sea de gran interés conocer cuáles son los factores que favorecen este tipo de relaciones. Es decir, el *s-commerce* está orientado a fortalecer los vínculos con los potenciales clientes, y eso implica ir más allá en el paradigma relacional, para centrarse en la experiencia del usuario e involucrarlo en la compañía de forma que se considere un miembro más. Una forma de lograr esta relación es generando una experiencia óptima de navegación para el usuario, es decir, que se sienta a gusto, que fluya en la Red; esto ha sido denominado estado de *flow*.

El objetivo de este estudio es analizar si alcanzar el estado de *flow* hace que los usuarios de las páginas de *s-commerce* encuentren la experiencia de navegación gratificante, influyendo en la intención de compra, en la satisfacción del usuario y en la intención de eWOM. La investigación puede ayudar a las empresas a centrarse en la importancia de las web de *s-commerce*, y cómo éstas deben ser diseñadas, con especial atención al fomento de las interacciones con los usuarios, con el fin de ofrecer una experiencia óptima que facilite el establecimiento de relaciones productivas y duraderas con los clientes.

## 2. Marco teórico

### 2.1. La teoría del *flow* en el *social commerce*

El *flow* es un estado que puede ocurrir en cualquier momento y en cualquier lugar (Csikszentmihalyi, 1975). Y, efectivamente, la teoría del *flow* se ha aplicado en diversos contextos tan variados como el trabajo, el deporte, la educación, la navegación... algunos próximos al marketing, como el comportamiento del consumidor, otros vinculándolos con el uso de nuevas tecnologías de comunicación, como los entornos mediados por ordenador o el *m-commerce*. El concepto de flujo o *flow* fue presentado por primera vez por Csikszentmihalyi (1975) para describir el estado de experiencia óptima. De esta manera, el *flow* se define como “la sensación holística que la gente siente cuando actúa con total implicación” (Csikszentmihalyi, 1975). Y para ello, el requisito previo es lograr un equilibrio entre los desafíos percibidos y las habilidades de las que una persona disponga. Posteriormente, Chen et al. (2000) realizan una nueva conceptualización e incluyen otros factores; así, describen el *flow* como una experiencia óptima y extremadamente agradable que se alcanza cuando el individuo se compromete en una actividad con *total implicación, concentración y diversión, y experimenta un interés intrínseco y una distorsión temporal*. Por tanto, el *flow* aparece cuando el individuo está centrado en el proceso, en lugar de concentrarse en los resultados, ya que la experiencia de *flow* es autotélica o intrínsecamente gratificante, de ahí que provea su propia motivación (Csikszentmihalyi, 1975). En otras palabras, el *flow* es una experiencia temporal o *peak performance* (Privette, 1983). Por ello, una vez experimentado el *flow* los individuos buscan repetir esta sensación. De ahí que la teoría del *flow* sea de gran interés en investigaciones relacionadas con el *e-commerce*, ya que el retorno a la web puede conllevar un incremento de la intención de compra; sin embargo, apenas ha sido contrastada en entornos *s-commerce*.

## 2.2. Modelo Conceptual

Hasta la fecha autores como Koufaris (2002) o Shin (2006), entre otros, proponían modelos para explicar el comportamiento de navegación de los usuarios basados en la teoría del *flow* con variables como las habilidades, los desafíos o la diversión de los usuarios. Sin embargo, los nuevos entornos *online* demandan una atención hacia las relaciones, por lo que las herramientas de las páginas web que fomenten la interacción e intercambio de información y opiniones, pueden afectar la experiencia del usuario. Por ello, se plantea un modelo que, aunque se apoya en la teoría del *flow*, introduce nuevos antecedentes y consecuencias vinculadas al *s-commerce*.

## 2.3. Antecedentes al estado de *flow*

Como antecedentes para alcanzar el estado de *flow* se proponen aquellas variables relacionadas con las relaciones sociales que puedan tener influencia en la generación de la experiencia óptima. En primer lugar se han seleccionado las tres características del *s-commerce* utilizadas por Hajli (2012): los sistemas de recomendaciones y referencias, los foros y comunidades virtuales y los ratings y las reseñas. En su investigación utiliza estas tres variables como antecedentes de la confianza y analiza su influencia sobre la intención de compra, es decir, demuestra que los componentes propios de las páginas web de *s-commerce* pueden provocar un clima de confianza que se traduzca en un aumento de la intención de compra. El autor ha demostrado que un usuario, con las *habilidades* necesarias para navegar y hacer frente a los *desafíos* que se encuentre en este tipo de páginas web, cuenta con más información para su navegación, por lo tanto, dicha información aporta una *sensación de control* al individuo. Así, existe similitud entre las percepciones previas del usuario en el estudio de Hajli (2012) y los antecedentes de la teoría del *flow*, por lo que podemos considerar que la información que se ofrece al individuo, gracias a estas tres variables vinculadas al del *s-commerce*, ayuda también a la consecución del estado de *flow*. De ahí, se plantean las siguientes hipótesis:

- H1a: La información proveniente de las recomendaciones y referencias de otros usuarios afecta positivamente al alcance del estado de *flow* en entornos *s-commerce*.
- H1b: La información aportada en los foros y las comunidades virtuales afecta positivamente al alcance del estado de *flow* en entornos *s-commerce*.
- H1c: La información sobre los ratings y reseñas de los usuarios afecta positivamente al alcance del estado de *flow* en entornos *s-commerce*.

Por otro lado, y puesto que la comunicación que se establece en el *s-commerce* da gran importancia al papel activo del usuario y a las relaciones, se incluyen las variables interactividad y presencia social. En el caso de páginas de *s-commerce*, las herramientas que facilitan la comunicación entre usuarios y empresas es fundamental, de ahí que la interactividad sea uno de los aspectos claves en los enfoques de marketing relacional. Una de las contribuciones literarias más relevantes en este campo es la Teoría de la Interactividad. El concepto interactividad ha sido caracterizado por una comunicación con un flujo de información bidireccional y simultáneo, donde las partes ejercen un control activo (Rafaeli, 1988; Kim, 2011). Kim (2011) añade que la socialización del individuo puede conllevar mayores niveles de implicación por parte del usuario, que pueden traducirse en una experiencia de compra más divertida y entretenida. Igualmente Rafaeli y Sudweeks (1997) destacan que la interactividad puede influir en el *engagement* del usuario y, por ende, en su socialización. El concepto presencia social ha sido definido por Gefen y Straub (2003) como la percepción de interacción con otro ser humano. Por tanto, cuando se trata de entornos *online*, la búsqueda de presencia social trata de cubrir la carencia de contacto humano que sí se obtiene *offline*. Por su parte, en la teoría del *flow* autores como Hoffman y Novak (1996) han utilizado como antecedentes la interactividad y la telepresencia, entendida como la sensación que experimenta el usuario cuando navegando por una web siente que su presencia forma parte de la acción. De todo ello se deduce que la interactividad afecta positivamente al estado de *flow*. Por otro lado, al tratarse de un entorno *s-commerce*, consideramos conveniente utilizar el concepto presencia social, es decir, que la sensación que experimente el usuario sea de contacto humano. De ahí que se formulen las siguientes hipótesis:

- H2a: La interactividad afecta positivamente al alcance del estado de *flow* en entornos *s-commerce*.
- H2b: La presencia social afecta positivamente al alcance del estado de *flow* en entornos *s-commerce*.

#### 2.4. Consecuencias de alcanzar el estado de *flow*

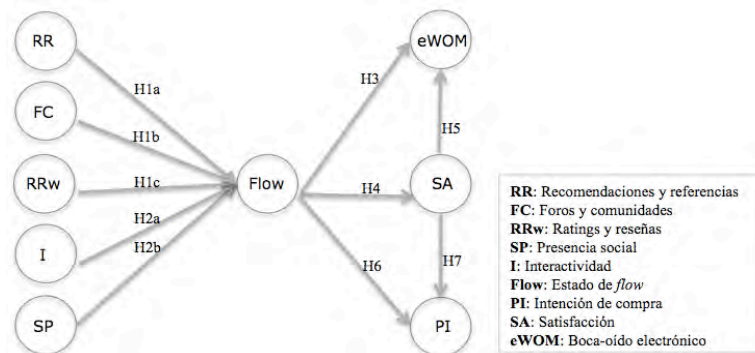

En el presente estudio se incluye como consecuencia novedosa el efecto del *flow* sobre el eWOM. Zhou y Lu (2011) demuestran cómo la experiencia de *flow* influye positivamente en la satisfacción del usuario, y Ha e Im (2012) consideran que la satisfacción puede afectar positivamente el eWOM:

- H3: El estado de *flow* en entornos *s-commerce* afecta positivamente a la intención de realizar eWOM positivo.
- H4: El estado de *flow* en entornos *s-commerce* incrementa la satisfacción.
- H5: Mayores niveles de satisfacción incrementan la intención de realizar eWOM positivo en entornos *s-commerce*.

En varios estudios sobre la teoría de *flow* aplicada al comportamiento de compra, entre los que podemos destacar las investigaciones de Kim y Han (2014) y Hausman y Siekpe (2009), se demuestra el efecto positivo que tiene el *flow* sobre la intención de compra. Además, un usuario satisfecho aumentará su intención de compra, puesto que si está contento y complacido con su experiencia de navegación estará también más predispuesto a la compra (Yoon, 2002). Por tanto, se plantea también el efecto que puede tener la satisfacción sobre la intención de compra:

- H6: El estado de *flow* en entornos *s-commerce* afecta positivamente a la intención de compra.
- H7: La satisfacción en entornos *s-commerce* afecta positivamente a la intención de compra.

FIGURA 1  
Modelo conceptual sobre la influencia de los entornos social commerce en el *flow*.

#### 2.5. Metodología

La técnica utilizada para la recogida de datos será la encuesta *online* a usuarios habituales de una conocida web de *s-commerce*. Para analizar el modelo planteado se utilizarán las siguientes escalas: para los constructos recomendaciones y referencias, foros y comunidades y ratings y reseñas, Hajli (2012); para la variable presencia social, Gefen y Straub (2003); para interactividad, Kim (2011); para la satisfacción, Flavián et al. (2006) y Ha e Im (2012); para analizar la intención de compra, Kim y Park (2013) y Gefen y Straub (2003); y para estudiar el eWOM, Kim y Park (2013) y Ha e Im (2012). El estado de *flow*, centro de la investigación, es un concepto multidimensional de cuatro dimensiones (concentración, diversión, telepresencia y *engagement*), para su medición se emplearán escalas de Koufaris (2002) y Shin (2006).

### 3. Conclusiones

Se confía que los resultados esperados ayuden a entender cómo las características del *s-commerce*, la interacción y la presencia social a través de la web estimulan el estado de *flow*. Una vez alcanzado dicho estado de experiencia óptima se supone que el usuario se sentirá tan a gusto que fluirá por la web, incrementará su intención de compra y se sentirá tan satisfecho con su navegación que aumentará su intención de realizar eWOM positivo.

*Universidad de Zaragoza*

## RESUMEN

*Con la creciente expansión de Internet, cada vez más empresas incluyen en sus páginas de venta online un espacio virtual donde los usuarios comparten información. Este trabajo en curso pretende estudiar las características de las recomendaciones publicadas por los usuarios como antecedentes de la intención de recompra online a través la confianza en el vendedor online y en la utilidad percibida de la tienda virtual. Para testar el modelo se utilizarán ecuaciones estructurales en una muestra de 252 consumidores online. Los resultados permitirán ofrecer evidencias empíricas sobre el grado de importancia que cada una de estas características del boca-oído electrónico tienen en la respuesta del cliente (confianza y utilidad percibida) y su repercusión en la intención de repetir la compra. También se analiza el efecto moderador ejercido por el nivel de implicación de los consumidores en la compra online sobre las relaciones establecidas en el modelo.*

## Palabras clave:

Boca-oído electrónico, comercio electrónico, confianza, implicación en la compra, intención de recompra online.

## 1. Introducción

Estudios recientes confirman la utilidad de Internet como herramienta que pone al alcance de los consumidores una serie de plataformas virtuales donde compartir opiniones y acceder a un gran volumen de datos (Kim y Park, 2013; Luo *et al.*, 2013). En España, el 73,5% de los usuarios de Internet afirma consultar valoraciones de otros usuarios antes de tomar su decisión de compra, y un 46,8% confía en dichas recomendaciones (AIMC, 2012). Este comportamiento ha sido denominado por los investigadores del marketing como boca-oído electrónico -Electronic Word-of-mouth o EWOM- (Henning-Thurau *et al.*, 2004), y ha provocado que cada vez sean más las empresas que ofrezcan en sus propias páginas web un espacio virtual en el que los usuarios pueden publicar sus opiniones e intercambiar experiencias.

A pesar de que investigaciones previas han examinado las características del boca-oído electrónico de forma separada, y otros estudios han incorporado la confianza en el vendedor online y la utilidad de la página web como variables importantes en el comercio electrónico (Cheung *et al.*, 2008; Kim y Park, 2013), un número limitado de ellas han explorado su influencia en la intención de recompra desde una perspectiva holística. Así, el principal objetivo de este trabajo persigue proponer un modelo que analice cómo las diferentes características del boca-oído electrónico -en concreto la cantidad, credibilidad y diferentes dimensiones de la calidad de la información- determinan, en última instancia, la intención de recompra online. Este estudio también incorpora la implicación del consumidor en la compra como variable moderadora de las relaciones propuestas. Se espera que los resultados obtenidos determinen el efecto de cada una de las características del EWOM en la respuesta del cliente (confianza y utilidad percibida) para volver a comprar en la misma tienda online, además de su variación según el grado de implicación del consumidor.

Este trabajo en curso se estructura del siguiente modo: en primer lugar, se presenta el marco teórico y el modelo propuesto, incluyendo las principales variables a estudiar; y, en segundo lugar, se explica la metodología que se utilizará en la investigación.

## 2. Marco teórico y modelo propuesto

### 2.1. Las características del EWOM y su influencia en la utilidad percibida de la página web

El desarrollo de Internet y las propias características del medio han brindado a los consumidores la oportunidad de aumentar sus opciones de búsqueda y difusión de información, permitiéndoles publicar sus propias valoraciones y experiencias sobre los productos y servicios adquiridos (Zhu y Zhang, 2010). Este fenómeno, conocido como EWOM, ha sido definido por Henning-Thurau *et al.* (2004) como *“cualquier opinión positiva o negativa realizada por consumidores actuales, potenciales o pasados sobre un determinado producto o empresa y que es puesta a disposición de multitud de personas y organizaciones a través de Internet”*.

Con respecto a las características del EWOM, la cantidad hace referencia al número de comentarios difundidos a través de una página web. Este volumen de recomendaciones online resulta especialmente importante para los usuarios que visitan la página web, dado que les permite obtener una idea más amplia del producto o servicio, lo que en definitiva representa su popularidad (Park *et al.*, 2007). De hecho, la existencia de un elevado número de recomendaciones en la web del vendedor puede considerarse un elemento identificativo del grado de utilidad percibido por el usuario, permitiendo a los consumidores disponer de una mayor cantidad y variedad de información (Park *et al.*, 2007). Ello mejorará la utilidad percibida de la plataforma online, concebida en este estudio como *“el grado según el cual una persona confía en que el uso de una nueva tecnología mejorará el desempeño de su trabajo”* (Davis, 1989) y facilitará el proceso de decisión de compra.

La credibilidad de la información está formada por el conjunto de creencias del usuario acerca de la veracidad de los comentarios leídos en Internet (Cheung *et al.*, 2008). El papel de esta variable es determinante en el grado de influencia que las recomendaciones de otros consumidores pueden tener en el receptor de la información, ya que los consumidores identificarán una mayor autenticidad y realismo, y por tanto una mayor utilidad, en aquellos comentarios publicados por otros usuarios que consideran más sinceros e imparciales (Henning-Thurau *et al.*, 2004).

De acuerdo con Cheung *et al.* (2008), la calidad del EWOM está formada por cuatro dimensiones: actualidad, precisión, relevancia y comprensión. Así, la actualidad de las recomendaciones hace referencia a la novedad de los comentarios publicados en este tipo de plataformas y al hablar de relevancia se alude a la importancia y significatividad de estas valoraciones online. La precisión de la información constituye el grado de exactitud y corrección en el EWOM y la comprensión incluye la amplitud y profundidad de las recomendaciones. En el comercio electrónico, los consumidores no pueden obtener información completa de los productos ofertados en la red, quedando limitada a los datos difundidos por el vendedor (Kim *et al.*, 2008). En este caso, resulta de vital importancia que el contenido de las publicaciones sea lo suficientemente amplio, completo y actualizado para los usuarios que las consultan, aportando información relevante que les ayude en su proceso de decisión de compra (Park *et al.*, 2007). Teniendo en cuenta estas ideas, se plantea que la cantidad, la credibilidad y las dimensiones de la calidad del EWOM influirán en la utilidad percibida de la página web del vendedor:

*H<sub>1</sub>: La cantidad de EWOM tiene un efecto positivo y directo en la utilidad percibida de la web.*

*H<sub>2</sub>: La credibilidad del EWOM tiene un efecto positivo y directo en la utilidad percibida de la web.*

*H<sub>3</sub>: La actualidad del EWOM tiene un efecto positivo y directo en la utilidad percibida de la web.*

*H<sub>4</sub>: La precisión del EWOM tiene un efecto positivo y directo en la utilidad percibida de la web.*

*H<sub>5</sub>: La relevancia del EWOM tiene un efecto positivo y directo en la utilidad percibida de la web.*

*H<sub>6</sub>: La comprensión del EWOM tiene un efecto positivo y directo en la utilidad percibida de la web.*

## **2.2. Las características del EWOM y su influencia en la confianza en el vendedor online**

La confianza es un concepto ampliamente estudiado en literatura de marketing debido a su importancia en las relaciones comerciales entre clientes y vendedores, especialmente en el entorno virtual (Kim y Park, 2013). Este trabajo centra su estudio en la confianza en el vendedor online, o “*la expectativa de que otros individuos o empresas con las que se establece interacción, se comportarán de manera no abusiva*” (Gefen *et al.*, 2003).

La existencia de un elevado número de comentarios en la página web del vendedor permitirá a los consumidores racionalizar sus decisiones de compra y reducir el riesgo percibido (Park *et al.*, 2007), ayudando el hecho de que otros muchos usuarios hayan utilizado o adquirido previamente el mismo producto o servicio. Así, la cantidad de EWOM puede contribuir al desarrollo de la reputación de la empresa, dado que los consumidores depositarán una mayor confianza en el vendedor online que ofrezca un gran volumen de información elaborada por los usuarios (Sparks y Browning, 2011).

Los datos procedentes de los propios consumidores son más creíbles que los aportados por los vendedores (Henning-Thurau *et al.*, 2004), lo cual puede redundar en una mayor confianza entre los receptores del mensaje. De esta manera, la credibilidad del EWOM puede suponer un determinante directo de la decisión de compra online, al reducir la incertidumbre en estas transacciones y favorecer una actitud más confiada hacia el vendedor que posee dicha plataforma (Awad y Ragowsky, 2008).

Los usuarios tienden a confiar más en las empresas que ofrecen información de forma eficiente y completa, dado que les ayuda a reducir el riesgo inherente en las transacciones online (Kim y Park, 2013). Por tanto, si los compradores consideran que la plataforma online presenta información precisa, fiable, correcta y actualizada, también percibirán que el vendedor se esfuerza por mantener estos niveles de calidad (Kim *et al.*, 2008), aumentando su confianza en la empresa que está detrás de esa plataforma. En base a esto, se plantean las siguientes hipótesis:

*H<sub>7</sub>: La cantidad de EWOM tiene un efecto positivo y directo en la confianza en el vendedor online.*

*H<sub>8</sub>: La credibilidad del EWOM tiene un efecto positivo y directo en la confianza en el vendedor online.*

*H<sub>9</sub>: La actualidad del EWOM tiene un efecto positivo y directo en la confianza en el vendedor online.*

*H<sub>10</sub>: La precisión del EWOM tiene un efecto positivo y directo en la confianza en el vendedor online.*

*H<sub>11</sub>: La relevancia del EWOM tiene un efecto positivo y directo en la confianza en el vendedor online.*

*H<sub>12</sub>: La comprensión del EWOM tiene un efecto positivo y directo en la confianza en el vendedor online.*

### **2.3. La utilidad percibida y la confianza como antecedentes de la intención de recompra online.**

La intención de recompra se define como la “*disposición del individuo para realizar otras compras de la misma compañía, basadas en su experiencia previa*” (Hellier *et al.*, 2003) y es considerada en la literatura del marketing como una manifestación de la lealtad del cliente.

Las características de las páginas web cobran especial relevancia en el entorno virtual, al ser el primer elemento visible que representa al vendedor online. Si la web del vendedor cuenta con un elevado contenido informativo, generará mayor utilidad para los usuarios que la visitan, contribuyendo a mejorar el sentimiento de confianza hacia la tienda online (Koufaris y Hampton-Sosa, 2004). Además, si el sitio web es percibido como una herramienta útil en la búsqueda de información, puede favorecer la predisposición del usuario a volver a visitar la tienda online (Gefen *et al.*, 2003), manifestando una intención de comportamiento más favorable hacia las empresas en las que confía, al reducir el esfuerzo y los costes de búsqueda de información, pudiendo generar la repetición de la compra (Chiu *et al.*, 2012). Consecuentemente, se propone que:

*H<sub>13</sub>: La utilidad percibida de la web tiene un efecto positivo y directo sobre la confianza en el vendedor online.*

*H<sub>14</sub>: La utilidad percibida de la web tiene un efecto positivo y directo sobre la intención de recompra online.*

*H<sub>15</sub>: La confianza en el vendedor online tiene un efecto positivo y directo sobre la intención de recompra online.*

### **2.4. El efecto moderador de la implicación del consumidor en la compra online.**

La implicación en la compra hace referencia a la importancia personal que un consumidor da a un determinado producto o servicio (Zaichkowsky, 1985). Así, cuando la implicación del consumidor en la compra es alta, dicho usuario estará más motivado a realizar búsquedas intensivas de información en Internet, consultando los comentarios y valoraciones con mayor detenimiento y exhaustividad. El nivel de implicación en la compra puede afectar al comportamiento del cliente (Novak *et al.*, 2000), moderando su percepción sobre la confianza en el vendedor online y la utilidad percibida del sitio web, que será más elevada para los usuarios con una alta implicación, así como a la intención de recompra online, que también será mayor. Teniendo en cuenta estas ideas, se propone que:

*H<sub>16</sub>: La implicación con la compra modera la influencia de las características del EWOM en (a) la utilidad percibida de la página web y (b) la confianza hacia el vendedor online.*

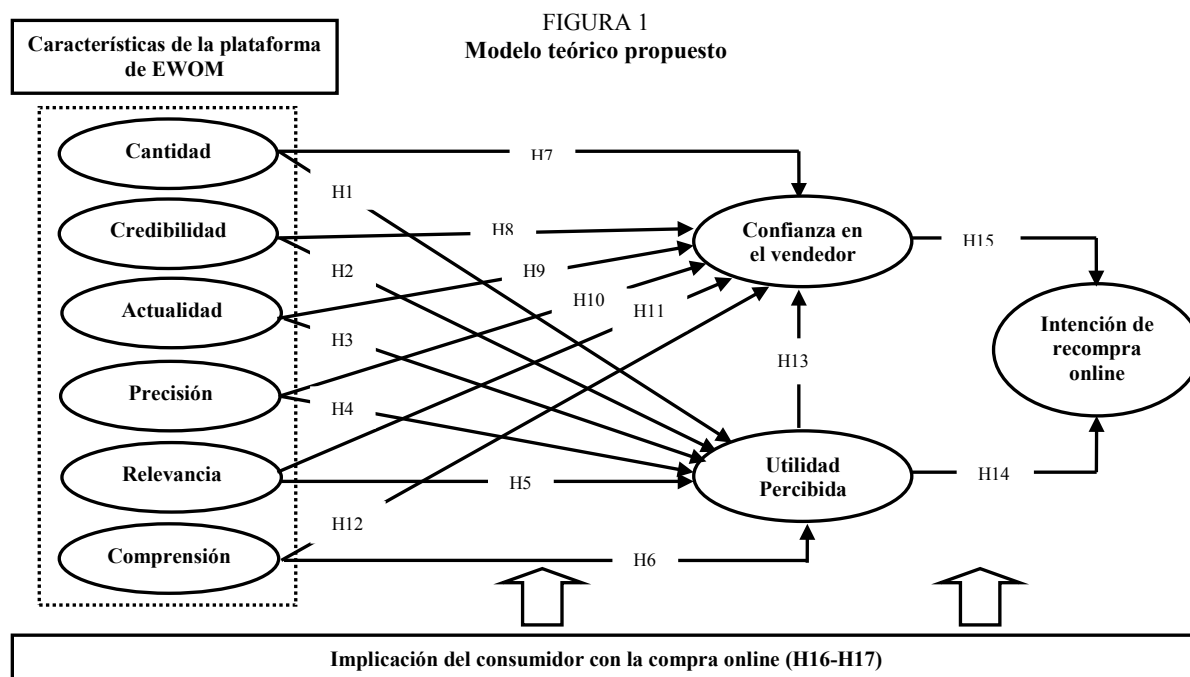

*H<sub>17</sub>: La implicación con la compra modera la influencia de (a) la utilidad percibida de la página web y (b) la confianza hacia el vendedor online, en la intención de recompra online.*

## **3. Metodología**

Para alcanzar los objetivos propuestos se ha realizado un estudio cuantitativo mediante un cuestionario dirigido a usuarios de Internet y difundido en las redes sociales. Los encuestados debían facilitar el nombre de una web en la que previamente habían realizado alguna compra o reserva online, tras leer las recomendaciones de otros usuarios publicadas en la propia web de la tienda, contestando siempre de acuerdo con esa experiencia previa de compra. La muestra cuenta con 252 cuestionarios válidos.

Todas las variables incluidas en este trabajo han sido medidas por ítems extraídos de la literatura previa, utilizando escalas tipo Likert de 7 puntos. Para medir la cantidad de boca-oído electrónico se utiliza una escala adaptada de Park *et al.*, (2007). La credibilidad se basa en el trabajo de Luo *et al.* (2013). La actualidad, relevancia, comprensión y precisión se miden cada una de ellas por tres ítems respectivamente, originarios de los trabajos de Wixom y Todd (1995) y Citrin (2001). Las tres dimensiones de la confianza (honestidad, benevolencia y competencia) se han medido a partir del trabajo de Doney y Cannon (1997). La utilidad percibida se basa en el estudio de Gefen *et al.* (2003) y la intención de recompra online en el trabajo de Chiu *et al.* (2012). Por último, la escala de implicación del consumidor con la compra es adaptada del trabajo de Zarchkowsky (1985).

Para testar las hipótesis propuestas, se está utilizando un modelo de ecuaciones estructurales mediante la técnica Partial Least Squares (PLS) y los programas informáticos *SmartPLS 2.0* y *SPSS 17.0*. La figura 1 recoge las relaciones que subyacen entre las distintas variables del modelo.

## **ABSTRACT**

*Blogs have experienced an increasing importance as a source of eWOM in last years. Consumers judge blogs as more credible than other media such as TV or newspapers and they have more influence on consumers' purchases than eWOM in other social media platforms. Thus, companies are more and more interested in engaging bloggers in order to create eWOM about their products and brands. However, it is not clear how to encourage bloggers to spread the word. In this working paper we show that most techniques to approach bloggers to spread the word may be effective. However, not all of them are equally successful. Giving money to bloggers has no impact on the intention to write a post about the product. However, giving a product to bloggers enhances the likelihood of posting about it. The highest intention to post about the product is observed when bloggers can keep the product.*

## **KEYWORDS**

*Blogs, eWOM, monetary incentive, non-monetary incentive, bloggers*

## **1. Introduction**

Blogs have experienced an increasing importance in last years. They are defined as social media platforms with a form of diary where individuals, called bloggers, provide information with journal style entries in a reverse chronological order (Thevenot, 2007; Wenger, 2008). Bloggers post information about several topics on a frequent basis (Zhu and Than, 2007). Nowadays, there are more than 180 million of blogs around the world, up from 36 million only five years earlier (Nielsen, 2012). Blogs reached 58 millions of unique visits in 2012 (Nielsen, 2012). Interestingly, there are blogs that have more audience than some online newspapers (Kanlli, 2012). The most visited blog in the world (The Huffington Post) has 46 million U.S. unique visitors monthly and 78 million global unique visitors (ComScore, 2013), while the online publication of one of the most popular newspapers in US, The New York Times, has “only” 31 million unique visitors each month (New York Times, 2013).

Blogs are not just relevant for the great audience they have but also for the influence they exert on consumers (Hsiao and Lu, 2013). Consumers judge blogs as more credible than other media such as TV or newspapers (Johnson and Kaye, 2004). Blogs and their readers may talk about products and brands generating electronic word of mouth (eWOM). Besides the higher influence of eWOM over firm-generated sources of information (Bickart and Schindler, 2001), eWOM in blogs has shown more influence on consumers purchases than eWOM in other social media platforms (Technorati, 2013). In fact, bloggers have been related with opinion leaders (Droge et al., 2010). According to a survey developed by Technorati (2013) using 2.5 million of people that exert influence on others over the average, 86% of influencers have a blog. As a consequence of their potential influence, companies are more and more interested in engaging bloggers in order to create eWOM about their products and brands (Carr and Hayes, 2014; Kozinets et al., 2010).

However, it is not clear how to encourage bloggers to spread the word. Previous studies have shown that monetary incentives increase the intention to generate both traditional WOM (Ryu and Feick, 2007; Wirtz and Chew, 2002) and eWOM (Hansen and Lee, 2013; Hennig-Thurau et al., 2004). However, this result may not be valid for bloggers because they could lose their reputation if their readers knew that they are recommending a product due to a monetary incentive. To the best of our knowledge, the use of monetary incentives has been previously studied in referral programmes (e.g. Ruy and Feick, 2007; Verlegh et al., 2013) and in sales promotions (Palazón and Delgado-Ballester, 2013) but not in blogs. Non-monetary incentives may be also used to enhance WOM (Libai et al., 2013). However, very little is known about the effects of using non-monetary incentives to enhance eWOM in a blog context. Thus, companies may use products or information about them as non-monetary incentives with the aim of engaging bloggers in eWOM. Therefore, this study analyses the effects of monetary incentives on bloggers' behaviour and contributes to WOM marketing literature by showing how to increase the probability of engaging bloggers in eWOM. The results obtained will be useful for companies in order to approach bloggers to spread the word about their products. They will provide valuable information about the strategies that best work with these consumers.

## **2. Literature review and hypotheses development**

Blogs serve as a channel for the blogger to express his/her own opinions and experiences (Zhu and Than, 2007). Bloggers have a duty with their audience, the readers. As readers can post comments and interact with the blogger; the blogger may develop contents looking for interaction with readers, thereby facilitating the formation of bloggers-readers relationships (Tan et al., 2009). As a result, it is very likely that a community will be built around the blog composed of its readers and other bloggers (Kozinets et al., 2010; Nardi et al., 2004). Thus, when bloggers are approached by a company, a great tension may appear between the blogger and the company (Kozinets et al., 2010). Therefore, it is very important to carefully consider how to approach bloggers for commercial purposes.

Companies can motivate bloggers to spread the word about their products using several strategies. Giving a monetary incentive to bloggers in reward for blogging about the product could be the most salient and aggressive strategy to encourage eWOM. Companies can pay bloggers in exchange for posting about the product, while no reward will be obtained if they do not write anything. Thus, this strategy can be seen as a mean of buying bloggers' opinions about products. When bloggers write a post

due to a company approach, readers may receive the text-based advertisement in an intimate, friendly, engaging, and relatively informal way, probably without realizing that it is an advertisement or a marketing message (Zhu and Than, 2007). Thus, bloggers are acting against the implicit norms of the community that are built around trust and friendship. Since this action goes against the expectation of readers, it is likely that bloggers perceive some kind of negative reactions from their readers (Burnkrant and Cousineau, 1975). A backlash may be expected from readers when they feel that the contents in the blog cross the line into traditional advertising. The audience may feel they are being 'fooled'. The blogger may then expect that readers will no longer trust the blog as it contains ulterior commercial motives and serves as a marketing tool instead of as a personal motivation (Zhu and Than, 2007). Thus, bloggers will perceive that their readers could react against them if they write a post in exchange for a monetary incentive. On the basis of the above reasoning, we propose the following:

**H1: Bloggers will perceive a more negative reaction from their readers when a monetary incentive is offered than when it is not.**

Given the salience of paying for opinions, it is likely that bloggers resist to the persuasion of the company. In fact, the payment in exchange for a post could be considered a bribery as a bribe implies reciprocity (Tanzi, 1998). Thus, bloggers can suffer from the "bribe effect". This effect may occur when people feel they are being bought off and/or perceive that it is morally inappropriate (Elster, 1992; Gerrard, 1994). According to the bribe effect, people will reject a monetary compensation when they perceive the bribery as larger than the benefit obtained (Claro, 2007). In a bloggers' context, the lost in reputation that may occur when accepting the participation in this type of campaign may be higher than the benefits obtained with it. As credibility and reputation are related with the independence and honesty of bloggers (Huang et al., 2007; Wright 2006), they can lose credibility and reputation by writing a post in exchange for money (Tan et al., 2009). In such a case, the cost assumed would not compensate the money received. Therefore, bloggers can feel both the risk of reputation lost and the feeling of being bribed when the company offers them a monetary incentive. Thus, we propose:

**H2: Bloggers will show a lower intention to generate eWOM when a monetary incentive is offered than when it is not.**

Once bloggers decide to write a post about a product motivated by a monetary incentive, they may reveal they have obtained a monetary incentive or not. This action is called as disclosure (Tuk et al., 2009). When bloggers receive a monetary incentive, a conflict of interest may arise. Conflict of interests occurs when individuals' professional responsibilities diverge from their personal interests (Cain et al., 2005). Individuals face a conflict of interests between their professional ethic and their personal gains (Dana and Loewenstein, 2003). Bloggers could face a conflict of interests when they are trying to maintain their professionalism as bloggers offering their independent opinion and a company offers them a monetary incentive for writing a post. Bloggers may reduce this conflict by giving information to their readers, that is, by disclosing they have been approached by a company. In fact, the most important response to conflicts of interests is disclosure (Cain et al., 2005). As people are averse to being viewed as biased, individuals are motivated to avoid conflict of interests disclosing that they have been contacted by a company (Sah and Loewenstein, 2013). Disclosure may reduce the perceived immorality of giving possible biased advice by signaling that bias is widespread and therefore less aberrant (Schultz et al., 2007). Based on this reasoning, we can infer that bloggers will show a higher propensity to disclose that they have been approached by a company when a monetary incentive is offered than when it is not. Therefore, we propose:

**H3: Bloggers will show a higher intention to disclose when a monetary incentive is offered than when it is not.**

Companies can also give bloggers some information about products or even the product in order to spread the word about it. When companies follow the strategy of giving the product to bloggers, they have two options. They can either allow bloggers to keep it, or ask them to return it once they have tried it.

A common practice of bloggers is searching for information susceptible of being in their blogs (Huang et al., 2007). According to Technorati (2011), bloggers use several sources of information such as other bloggers, conversations with friends, print media and social media. Thus, companies may facilitate the

bloggers' job by offering them information about their products or even the product itself. Bloggers very much value this type of information and product trials, especially if products have not been launched yet into the market (Kanlli, 2012). Thus, bloggers could feel proud to receive information about products or even the product itself. In addition, bloggers can feel that they are performing a service for their community because they offer some information and their own opinion about a new product (Kozinets et al., 2010). They do not feel that this behavior may be punished. Offering a product could be seen as less ethical by readers than offering information about the product. When the company sends the product to bloggers, it could be seen as an incentive. However, this strategy allows bloggers to try the product and write a more accurate review. Thus, this marketing technique allows readers to be aware of new products and the opinion of bloggers about them. Therefore, bloggers may feel that readers will not react against the blogger if they write about a product when they have received either information or a product as a non-monetary incentive. Thus, we propose:

**H4: Bloggers will perceive a similar negative reaction from their readers when receiving a product than when receiving only information about the product.**

When the company gives a product to the blogger they can choose between allowing the blogger to keep it or asking the blogger to return it. Both giving a product to bloggers and allowing them to keep it can be seen as rewarding them but not as a bribe. For example, Tanzi (1998) suggests that a bribe implies reciprocity while a gift should not. Similarly, Okada (2005) demonstrates that passively receiving rewards does not require the same justification than receiving money that is more difficult to justify. In addition, people are deterred from bribery because the society signals that this behavior is unacceptable. In contrast, giving and receiving gifts are seen as good things to do (Ben-Ner and Putterman, 1999). Thus, bloggers will not perceive that their readers can react against them when they write a post about a product that a company has given them as a gift. Since gifts are well considered, their reaction will not differ from a strategy in which they have to return the product. Therefore, we propose:

**H5: In case of a product seeding campaign, bloggers will perceive a similar negative reaction from their readers when they can keep the product and when they have to return it.**

If bloggers receive some information about the product, the post about the product will be limited to this information. However, if the company sends the product to them, they will be able to try it and post their experience with the product with a more accurate point of view. Previous studies have shown that as the confidence in one's ability to provide interesting or useful information to others increases, individuals will have a higher intention to share information (Lu and Hsiao, 2007). Thus, the blogger will have a higher intention to share information in the blog when the company gives the product to them than when it sends only information about it. Besides being able to post a more accurate opinion about the product, bloggers may perceive more social risk in giving an opinion based just on information than in expressing their opinion based on a product trial. Previous literature has consistently shown that product trial reduce perceived risk (Smith, 1993). If a reader buys the product as a result of a blog post and it is not what he/she expected, the relationship between blogger and reader will suffer (Folkes 1984; Stephen and Lehman, 2009). According to normative influence (Wooten and Reed, 2004), this punishment will try to be avoided by bloggers. Thus, it is more likely that bloggers write about the product in the blog when the company gives the product to them than when only information is sent them:

**H6: Bloggers will show a higher intention to generate eWOM when receiving a product than when receiving only information.**

Initially, as bloggers may not consider the product as an incentive, their intention to blog should be the same regardless of the strategy used in a product seeding campaign. However, previous studies have demonstrated the difficulty showed by individuals in taking a neutral and objective perspective when they have a personal interest in arriving at a specific behaviour (Babcock et al., 1995). This issue has been broadly studied in the relationship between medical practitioners and pharmaceutical industry when pharmaceutical industry rewards the prescription of products (Dana and Loewenstein, 2003). Previous studies in this context have shown that medical practitioners view that gifts do not influence them (Hume, 1990). However, research has shown that when individuals try to be objective, their

judgments are subject to an unconscious and unintentional self-serving bias. When individuals have a stake in reaching a particular behaviour, they weigh arguments in a biased fashion that favors a specific conclusion (Babcock et al., 1995; Loewenstein et al., 1992). Individuals are generally unaware of the bias that generate the gifts, so they do not make efforts to correct for them (Dana and Loewenstein, 2003). A similar reasoning may be applied to bloggers. When a company allows bloggers to keep the product, they may perceive they are free to decide if posting about it or not. Nevertheless, they unintentionally and unconsciously will succumb to bias showing a higher intention to spread the word when they can keep the product than when they cannot. Therefore, we propose:

**H7: In case of a product seeding campaign bloggers will show a higher intention to generate eWOM when they can keep the product and when they have to return it.**

As we have explained before, bloggers mainly blog by satisfying their need of self-expression, self-fulfillment (Nardi et al., 2004; Herring et al. 2005; Huang et al., 2007; Papacharissi, 2004) and social interactions (Huang et al., 2007). Thus, they will desire to create a high community around their blog. This community is based on honesty and trust (Wright 2006). Therefore, they may not want to assume any risk that could damage their community. Previous studies have shown that when the sender does not disclose the reward, there is uncertainty and unclearness about the real motives (Tuk, 2008). In addition, the senders are rated as more credible when they reveal that they are giving an opinion about a brand or product because a company has approached them (Carl, 2008). Thus, although bloggers may not consider the product as an incentive, they may want to make sure that their readers are aware of the reward obtained, in this case the received product. In contrast, when they have only received information, their intention to disclose may be lower since no risk is perceived. If they hide that a company has given them a product, it could be thought that bloggers have ulterior motives to not disclose it. In order to do not damage their reputation, bloggers will prefer to disclose that the company has given them a product, regardless of the need of returning it. Thus, we propose:

**H8: Bloggers will show a higher intention to disclose when receiving a product than when receiving only information about the product.**

**H9: Bloggers will show a similar intention to disclose when they can keep the product than when they have to return it.**

### **3. Methodology**

A 2 monetary incentive (yes vs. no) x 3 non-monetary incentive (only product information vs. keep the product vs. return the product) between-subjects experimental study was developed using bloggers. A control condition in which the blogger is aware of the product without the company intervention was also introduced. Seven scenarios were created for the study.

First, we had to select the topic of the blog. According to Technorati (2011), the topic most blogged is technology. Thus, the study is just focused on technological blogs. As it is important that the product fits with the type of blog because the reaction of bloggers to the campaign can vary, we chose a technological blog for the study. Thus, we selected a tablet as a target product. We did not provide any information about the brand and characteristics of the tablet in order not to bias the results.

We created a data base for developing the study including Hispanic technological blogs. We used the two most important Hispanic blog directories, "Bitácoras" and "La Blogoteca" for this purpose. The following information was registered for each blog: URL of the blog, name/s of the blogger/s, nationality and contact information. Contact information consists of an email, the URL of the contact form located in the blog or the Facebook/Google+ profile of either the blog or blogger. Duplicity between both data base were controlled. In addition, not updated blogs were not considered by excluding blogs without any post in 2013. The final data base includes 1,153 Hispanic blogs about technology.

Data were collected through an online survey. Contact information provided by bloggers was used to invite them to participate in the study. The link of the survey was accompanied by a message explaining the aim of the study. All respondents were offered a summary of the results. As we had seven experimental conditions (six experimental conditions and the control condition), we created different scenarios accessed through links. The questionnaire was the same for all participants in the six

conditions except for the manipulation checks. The questionnaire for the control condition had to be adapted to the absence of company approach. Bloggers were randomly assigned to the seven conditions.

We sent 1,120 messages to bloggers. 33 messages could not reach their corresponding bloggers because their contact information was wrong or communications failed. Following this procedure, 262 valid questionnaires were collected. A second message was sent between one and two weeks later as a reminder obtaining 97 additional valid questionnaires. Altogether, 359 valid questionnaires were collected with a final response rate of 32.05%.

We measured the intention to eWOM in the blog using semantic differential scale asking participants how likely they would blog about the product. Regarding the reaction of readers, we asked bloggers about their perceived negative reactions of readers using the scale of Tan et al. (2009) composed of four items (Cronbach's  $\alpha=0.919$ ). We used a three items scale to assess intention to disclose (Cronbach's  $\alpha=0.864$ ). All these concepts were measured on 11-point likert scales. Some information about the blog was requested at the last part of the questionnaire. Number of readers was measured by asking how many unique readers per month their blogs have. Blog address was also requested in order to avoid the same blogger participated twice in this study.

#### 4. Main results

Analyses of variance were performed to test the proposed hypotheses. As bloggers' perception of negative reaction of readers, intention to eWOM and intention to disclose were highly correlated, a MANOVA approach was used to test the proposed hypotheses. We also ran independent ANOVAs on each of the dependent variables in order to better interpret the proposed hypotheses.

As the size of the community of each blog may affect the results, we developed a MANCOVA test introducing the number of readers as a covariable. Number of readers had a great range, and therefore it was previously transformed into a logarithmic variable as Weisberg (2005) recommends. The MANCOVA tests shows that the number of readers of the blog has no effect on the perceived negative reaction of readers ( $F=0.688$ ,  $p=0.407$ ), nor on the intention to eWOM ( $F=0.000$ ,  $p=0.998$ ). The effect of the covariate is also non-significant on the intention to disclose ( $F=1.018$ ,  $p=0.314$ ).

Bloggers perceive a higher negative reaction of readers when the company offers them a monetary incentive than when monetary incentive is not offered ( $M_{\text{Monetary Incentive}}=2.83$  vs.  $M_{\text{Non-Monetary Incentive}}=2.24$ ;  $F=4.745$ ,  $p<0.05$ ), supporting H1. However, there are not differences between the strategy in which a monetary incentive is given to bloggers and the one in which a monetary incentive is not given on bloggers' intention to eWOM ( $M_{\text{Monetary Incentive}}=6.84$  vs.  $M_{\text{Non-Monetary Incentive}}=6.76$ ;  $F=0.059$ ,  $p>0.10$ ). Intention to disclose campaign in the blog is neither affected by the use of a monetary incentive ( $M_{\text{Monetary Incentive}}=6.14$  vs.  $M_{\text{Non-Monetary Incentive}}=6.00$ ;  $F=0.132$ ,  $p>0.10$ ). Thus, H2 and H3 are not supported. In addition, bloggers perceive that their readers will have similar negative reactions regardless the type of non-monetary incentive used ( $M_{\text{Product}}=2.45$  vs.  $M_{\text{Only Information}}=2.67$ ;  $F=0.632$ ,  $p>0.10$ ). Among those who were offered a product, the need for returning it did not affect the expected reaction of readers ( $M_{\text{Keep the Product}}=2.66$  vs.  $M_{\text{Return the product}}=2.22$ ;  $F=1.625$ ,  $p>0.10$ ). Thus, H4 and H5 are both supported. In addition, bloggers show a higher intention to eWOM when the company offers them a product compared to when they give them only information ( $M_{\text{Product}}=7.42$  vs.  $M_{\text{Only Information}}=5.77$ ;  $F=23.066$ ,  $p<0.01$ ). When the company offers the product to bloggers they show a higher intention to eWOM when being allowed to keep it than when not being allowed ( $M_{\text{Keep the Product}}=7.87$  vs.  $M_{\text{Return the product}}=6.96$ ;  $F=4.714$ ,  $p<0.05$ ). These results support H6 and H7. Finally, bloggers have a higher intention to disclose the WOMM campaign when they receive a product than when they receive only information about it ( $M_{\text{Product}}=6.43$  vs.  $M_{\text{Only Information}}=5.47$ ;  $F=6.774$ ,  $p<0.01$ ). Thus, H8 is also supported. In contrast, when bloggers receive the product, their intention to disclose is similar when they have to return it than when they do not have to ( $M_{\text{Keep the Product}}=6.09$  vs.  $M_{\text{Return the product}}=6.78$ ;  $F=2.322$ ,  $p>0.10$ ). Therefore, H9 is supported.

We also compared the intention to eWOM derived from these strategies with the control condition in which the company does not take part and the blogger is aware of the product through other channels. The two strategies that obtained worst results (those in which only product information is provided) generate a similar intention to eWOM than the control condition ( $M_{\text{Only Product Information+Monetary Incentive}}=5.57$  vs.  $M_{\text{Control Condition}}=5.59$ ,  $p>0.10$ ;  $M_{\text{Only Product Information+Non-Monetary Incentive}}=5.97$  vs.  $M_{\text{Control Condition}}=5.59$ ,

$p > 0.10$ ). In contrast, the strategies in which the product is given generate a higher intention to eWOM than the control condition ( $M_{\text{Keep the Product+Non-Monetary Incentive}}=8.09$  vs.  $M_{\text{Control Condition}}=5.59$ ,  $p < 0.01$ ;  $M_{\text{Keep the Product+Monetary Incentive}}=7.62$  vs.  $M_{\text{Control Condition}}=5.59$ ,  $p < 0.05$ ;  $M_{\text{Return the Product+Non-Monetary Incentive}}=7.02$  vs.  $M_{\text{Control Condition}}=5.59$ ,  $p < 0.05$ ;  $M_{\text{Return the Product+Monetary Incentive}}=6.90$  vs.  $M_{\text{Control Condition}}=5.59$ ,  $p < 0.10$ ).

Further analysis are being developed in order to test the mediation effects of monetary and non-monetary incentives on the intention to eWOM and the intention to disclose through the negative perceive reactions of readers.

## 5. Conclusions

Blogs have become an important information source for consumers. Many blogs have more audience and are more credible than other mass media such as newspapers or TV (Johnson and Kaye, 2004; Kanlli, 2012). In addition, information provided by blogs is more influential than information provided by other social media platforms (Technorati, 2013). Thus, companies are interested in encouraging bloggers to post about their products and brands (Li and Du, 2011).

We have shown that most techniques to approach bloggers to spread the word are effective. However, not all of them are equally successful. Giving only information to bloggers has not very much enhanced the likelihood to spread the word about the product. Giving money to bloggers has no impact on the intention to write a post about the product. However, giving a product to bloggers enhances the likelihood of posting about it. The highest intention to post about the product is observed when bloggers can keep the product. Most of these results are explained by the trade-off between how ethical the monetary incentive is versus a gift. People are deterred from monetary incentives because the society signals that this behavior is unacceptable, however giving and receiving gifts are seen as good things to do (Ben-Ner and Putterman, 1999) and people generally strive to present themselves in a favorable light (Kunda, 1990; Sedikides, 1993).

## 6. Study 2. Readers' reaction

In the previous study we have shown that a monetary incentive does not affect the intention to eWOM of bloggers, while a non-monetary incentive, that is, when a company gives a product to bloggers, increases their intention to eWOM. Bloggers also think that readers will not react against the blog when they write a post due to a company gift. However, the real readers' reactions could be different. In fact, previous studies have shown that some readers have rejected their favourite bloggers when they have started to commercialize their blogs (Wijnia, 2004). In addition, 76% of consumers trust in bloggers who have received a free product, while only 45% of them trust in bloggers who were paid for writing a post (Social Media Link, 2013). Thus, it will be interesting to complement the results of this study with the readers' opinions about the participation of bloggers in this type of campaigns. Thus, we will develop a next study in which blogs' readers will be asked about their reactions in a situation in which their favourite blogger writes post because of company approach.

# THE APPLICATION OF THE SIGNALLING THEORY TO MOBILE SHOPPING. THE GENDER EFFECT

---

SONIA SAN MARTIN GUTIÉRREZ

JANA PRODANOVA

*Universidad de Burgos*

## ABSTRACT

*In mobile shopping contexts, where consumers cannot try or touch the products before purchasing and where quality cannot be inferred ex\_ante, consumers will perceive higher risk and opportunistic behavior on the part of the vendor. Following the signaling theory and applying it to a mobile commerce context, we propose hypotheses related to the power of some quality signals from the vendor and the site to reduce shopper perceived risk and fear of opportunism: vendor reputation, site design, personalized service and personalized information. Besides, as long as research suggests that male and female behavior is somewhat different, we propose to analyze differences and similarities between men and women in those perceptions. Information has been collected from 447 mobile shoppers and results will allow us to know what signals are more effective to reduce perceived risk and opportunism by men and women.*

## KEYWORDS:

Mobile shopping; signaling theory; opportunism; risk; gender.

## 1. Introduction

The penetration of mobile phones is clearly increasing and allows many daily operations such as shopping. There are almost 7 billions of mobile telephone subscriptions in the world and more than 90% of the population has access to mobile networks ITU (2013). The mobile phone is the most used device in the world. 82% of Spanish consumers have searched for a product or service with a smartphone and it is decisive in the shopping decision (24% of smartphone users have bought with it). IAB Spain research study (2012) finds that 59% of the Internet users own a smartphone and that 8 out of 10 mobile users surf the Internet using their devices. Mobile shopping (m-shopping) refers to the activities of consumers who use wireless Internet service when shopping using mobile phones.

Among the advantages of mobile phones, there are ubiquity, personalization, convenience, mobility, localization and interactivity (Lee, 2005), which are key to adoption of this technology. When the consumer has to choose the most appropriate mobile vendor to buy from, a problem of information asymmetry may appear (Mishra et al., 1998; Kirmani and Rao, 2000; Singh and Sirdeshmukh, 2000). Due to a lack of information, the consumer has difficulties to distinguish the true quality of different products/services and the true behavior of vendor firms (Mishra et al., 1998; Pavlou et al., 2007) and has, therefore, fear of vendor opportunism. This information asymmetry is greater when consumers do not have information about the vendor and mobile shoppers (m-shoppers) feel there are lack of interaction and advice, lack of experience with this kind of shopping, impossibility to touch or try products and services, distrust when paying and transferring personal data with the mobile phone, lack of knowledge, too small mobile phone screens.

There are different factors –signals- that vendors can use to facilitate shoppers the evaluation of products and services and reduce perception of risk and opportunism. For the purposes of this study, a signal is regarded as a firm's characteristic or cue that reveals information about product quality or firm behavior and that offers its costs or revenues as a hostage, bond, promise or commitment (Kirmani and Rao, 2000; Mishra et al., 1998). Signals can be a good solution to the perceived risk and opportunism problem in B2C relationships (Mishra et al., 1998; Singh and Sirdeshmukh, 2000). There are few studies that analyze them in a m-shopping context (Yeh and Li, 2009). Moreover, research has determined that demographic and contextual characteristics such as gender (Zhang et al., 2007; Kolsaker and Payne, 2002) influence the purchase experience. The objective of this study is to study gender differences and similarities regarding the influence of four signals- reputation, personalized information and service and design- on perception of risk and opportunism. Information has been collected from Spanish mobile shoppers.

## 2. Theoretical background and proposed hypotheses

### 2.1. Proposed relations among signals, risk and opportunism

Consumers usually perceive more risk in distance shopping in comparison with offline shopping (Kim et al., 2009). In distant shopping risk decreases in the evaluation of alternatives phase of the shopping process and increase in the shopping phase (Cunningham *et al.*, 2005), which is the one analyzed in this study. Some typical risks in m-shopping refer to the need to provide personal information to the vendor and the suspicion that after payment is processed, the goods purchased could not arrive (Singh and Sirdeshmukh, 2000). If a technology fails to provide the expected result, it will result in a loss for the consumer (Laukkanen and Kiviniemi, 2010). Several works studying perceived risk in the context of mobile marketing treat it essentially as a fear of providing personal or banking data to a firm and of loss of privacy (Gao et al. 2010). All those risks can lead to a need for controlling the vendor or the fear that the vendor does not fulfil its promises or hides relevant information.

*H1: Perceived risk increases perceived opportunism.*

The signals that we are going to propose in this study are especially relevant in a m-shopping context and refer both to the m-vendor and the m-site. Moreover, we confirmed they are important signals for m-shoppers by performing a pre-test with 15 consumers.

*Reputation* indicates quality of the products and services, given the absence of vendors who advise the m-shopper and given the impossibility of seeing, testing and touching the products before the m-shopping. Reputation is an important signal to reduce risk as in many cases it is transferred from

offline contexts to electronic contexts and it is supposed that a reputable vendor will find it easy to sell electronically than a not-known vendor. Xiong and Liu (2005) and Jarvenpaa et al. (1999) consider that customers will favour sites that represent a merchant with good reputation in the market. Siau and Shen (2003) suggest that m-vendor reputation contributes to the reduction of risk and initial trust formation.

*Design aesthetics* is relevant in a m-shopping context as there are not vendors and it is impossible to touch and try products electronically. Given the fact that users actually interact through their mobile device interface, the design and development of effective mobile interfaces can be a major determinant for the penetration and growth of m-shopping (Manganari et al., 2007). Li and Yeh (2010) suggest that aesthetics might be an important part of designing an overall enjoyable user experience with mobile devices. A m-shopping environment may also be effective in encouraging transactions (Yeh and Li, 2009) and reducing risk and fear of inappropriate or opportunistic behavior on the part of the m-vendor.

*Personalization* is an important signal in m-shopping contexts, as it is related to the especial characteristic of mobile phones in comparison with other means of buying and selling and scarcely investigated in m-shopping literature (Lee, 2005; Zarpou et al., 2012). Personalization is not so possible in offline selling than in mobile selling as the mobile phone is a personal tool and goes with the consumer anywhere and anytime. We propose that both personalized information and personalized service are relevant signals of quality and vendor behavior. In a similar vein and for online shopping, Thirumalai & Sinha (2011) distinguish decision (information) and transaction (products/services bought) personalization. Mobile phones are a personal tool and allow customization. The mobile environment allows marketers to build profiles of its customers and develop an interactive relationship so that marketing actions can be personalized to meet the needs and wants of a small or even individual segment of homogeneous audience (Lee, 2005). Zarpou et al. (2012) consider that personalization is a relevant relationship driver in m-shopping contexts. Lee (2005) and Li and Yeh (2010) suggest that personalization help to reduce risk and be confident when buying in m-shopping contexts. Therefore, it is expected that the m-shopper will perceive less risk and will have less fear of opportunism if he/she perceives that he/she is treated as a unique customer and receives personalized products, services and information.

*H2: Vendor reputation reduces perceived risk (H2a) and perceived opportunism (H2).*

*H3: Mobile site design reduces perceived risk (H3a) and perceived opportunism (H3b).*

*H4: The offer of personalized information reduces perceived risk (H4a) and perception of opportunism (H4b).*

*H5: The offer of a personalized service reduces perceived risk (H5a) and perception of opportunism (H5b).*

## **2.1. The gender effect**

Research about gender and risk is not conclusive (Coley and Burgess, 2003). Some studies have failed to identify gender differences in certain phases of purchase (Okazaki, 2004) and other studies in different purchasing contexts do show gender differences. In general, women are more risk averse than men and have a lower preference for competitive environments, especially when they face a risky situation (Croson and Gneezy, 2009), as it happens in a m-shopping context. Jayawardhena et al. (2010) state that men and women respond in different ways in a mobile context, men are more decisive and especially value perceived control as mobile marketing is a functional activity destined more for men.

The study carried out by Luo et al. (2006) suggests that women seek elements that help them to reduce risk in on-line purchasing. Women attach greater relevance to the elements that mitigate risk and allow privacy and security in the use of new information technologies (Garbarino and Strahilevitz, 2004). On the contrary, men seek to develop their own identity, they are more independent in their purchase process and have more utilitarian motives when buying (Citrin et al. 2003), thus it is expected that they are less influenced by vendor signals.

As for the role of gender as a moderating variable of the previous hypotheses, it is possible that the relations proposed in H1-H5 differ in accordance with the gender of the m-shopper. However, the rest of signals can be more important in the case of women as they are more receptive to signals as they are more concerned to reductions of risk when making decisions, especially to personalization because it

allows the shopper to feel there is a close relationship. It appears that females are more involved in buying activities, value salespeople more than males do and are more concerned about privacy, attach greater value to relationships with salespeople and value relational aspects of the purchase more than men (Jacobucci and Ostrom, 1993). In consequence, we believe that, at the time their trust is generated, women will value the personalization of products and services, and the information that is made available. As long as background is not controversial and no study has analyzed the reduction of risk and opportunism through signals, we propose a general hypothesis to obtain innovative results in this field.

*H6: Gender moderates relations between quality signals, perceived risk and opportunism.*

### 3. Empirical study

A sample of 447 m-shoppers was collected using C.A.T.I. systems in June. They were randomly selected from a national panel of m-users, but they had to have bought at least once with the mobile phone to be included in the sample. We think that collecting information from m-shoppers is interesting and innovative in Spain because it is essential to have first-hand information from early adopters to know their perceptions to improve m-vendor strategies. The type of Spanish m-shopper is mainly young (less than 25 years old), with secondary studies, and with a low social and economic level. Products or services acquired with the mobile phone are principally music and participation in contests as ONTSI (2012) also shows.

In the questionnaire, the members of the survey were asked to indicate the product/service and the company from which they had lastly bought by mobile phone and, regarding these answers, they were asked about the signals, perception of risk and opportunism and profile variables. To measure the proposed variables, 5-position Likert Scales were employed. These scales were adapted to the context of the study basing on the indicators proposed in the literature and with the help of a pre-test performed with 15 consumers who have already bought with the mobile phones. The measurement scales proposed here are based on Ganesan (1994) and Jarvenpaa et al. (1999) in the case of reputation; on Cyr et al. (2006) for design aesthetics; on Luarn and Lin (2005) and Schierz et al. (2010) in the case of perceived risk; Srinivasan et al. (2002), in the case of personalization (although we have separated all the indicators into the ones referred to personalization of information and the ones referred to personalization of customer service); Ping (1993) and Wathne and Heide (2000) in the case of opportunism. Analyses will be made with SPSS and structural equation modeling programs and we hope to have some preliminary results to present in the Conference.

### 4. Contributions

The aim of this study is to empirically analyze if men and women are different regarding perceptions of signals, risk and opportunism in the asymmetric relationships that can exist in m-shopping. The contributions are: (1) The application of variables from signaling theory to the study of m-shopping, which involves an advance in the study of m-shopping and the ways and the role of signals in reducing risk and perceived opportunism and we do not know any similar study in m-commerce. (2) The analysis of gender differences, which has relevant academic, but also managerial implications. Results confirm that gender is an important criterion to take into account, and in each case, the effect of the signals on perceived risk and opportunism is different. (3) We have used a sample of m-users who have already bought with the mobile and this is the first of this kind in Spain as others are only based on information gathered from users and none of them about the variables in our model. M-vendors can address an information asymmetry problem using signalling, but it would be advisable to know which are the most appropriate signals to reduce perceived risk and opportunism if the m-vendor target is mainly women or men.

# WHY DO MARKETERS REALLY NEED TO WORK WITH DIGITAL ENGINEERS ?

---

ANTONIO HYDER  
antonio.hyder@uch.ceu.es  
Universidad Cardenal Herrera CEU

## RESUMEN

*Due to the prolific rise of consumer digital technologies and of Web sites in particular, we contribute a framework that evidences the need for engineers and marketers to collaborate in the development of combined online consumer behaviour (OCB) models. Previous marketing researchers affirmed that there is a scarcity of combined consumer-technology research, and that robust online consumer behaviour models should take into account both marketing and technological viewpoints. After comparing previous frameworks of human computer interaction (HCI) and OCB, we evidence that there are still many research gaps that exist due to the fragmented nature of OCB. This in turn highlights the substantial opportunities for combined research.*

## Palabras clave:

*online consumer behaviour, human computer interaction, interdisciplinary digital framework, Web site*

## **1. Introduction**

There is no doubt that technology in general and digital technologies in particular, such as Web sites, are shaping the destiny of consumers. In order to better understand exchange (Bagozzi, 1975) within the Internet medium, recent research has acknowledged the need for combined consumer-technology approaches (Dennis et al., 2010; Taylor and Strutton, 2009). Many digital communication devices such as Web sites or mobile phones stand at the intersection of technology with marketing. Whilst technology clearly contributes to the systems infrastructures of digital devices, from a marketing perspective aspects such as experience, information overload, interaction, content design, cognition and balance of attributes -just to name a few- also play crucial important role in device development. Online consumer behaviour (OCB) literature is too fragmented, the scarcity of OCB research frameworks and the inexistence of a combined consumer-technology framework overall represents a limitation for the progress of research within this field (Dennis et al., 2010; Taylor and Strutton, 2009, Pomirleanu et al., 2013). The marketing discipline would be better positioned to 'lead the study of the next area in online purchasing' should information systems and marketing researchers collaborate (Taylor and Strutton, 2009). Still, researchers from both areas are not working together and this could be the reason why there is a scarcity of multidisciplinary models crucial for making progress in the field of OCB. Based on this limitation, the objective of this work in progress is to exemplify why combined consumer-technology research models are needed, how they are relevant to digital marketing research in general and to the study of online consumer behaviour in particular. Our contribution specifies interdisciplinary topics to be taken into account when conducting future combined technology-consumer research.

## **2. Background research**

Dennis et al. (2010) differentiated between consumer oriented research and technology oriented research affirming that there is a scarcity of literature that combines these two perspectives into a combined consumer-technology research approach required for appropriately studying how consumers behave on Web sites. Online consumer behaviour examines customers' online behaviour from a marketing perspective (e.g. Bigné, Ruiz, Aldás and Sanz, 2008). Kwong et al. (2003) and Cheung et al. (2005) suggested two frameworks for the analysis of online consumer behaviour literature arguing that the literature on online consumer behaviour is very fragmented. In contrast, human-computer interaction (HCI) is a research field that belongs to the discipline of information systems and is concerned with the study of interaction between people and computers. (Hewett, Baecker, Card, Carey, Gasen, Mantei, Perlman, Strong and Verplank, 1996). From an industry perspective, consumer navigation Web sites is solely assessed with technological metrics such as clickstreams (Bucklin and Sismeiro, 2009) and neglect the use of consumer surveys in order to assess psychological behavioural aspects such as attitudes. Models should take into account these two perspectives together. Whilst there is yet no framework that combines previous OCB and HCI research frameworks together, in what follows we analyse the overlaps that arise between HCI and OCB.

## **3. A combined OCB-HCI framework**

We propose the framework illustrated in table 1 that illustrates how fields from both research areas of OCB and HCI overlap or are very similar. This framework has been built by analysing the content of a HCI framework suggested by Zhang and Galleta (2006). Then, based their HCI topic classification, similar OCB content from Cheung, 2005 and Kwong et al., 2003 was organised so that it matched the HCI category. In table 1, the column marked 'category in HCI' comprises the HCI research topics in the column on its right. A similar approach for the OCB frameworks has been utilised. The 'OCB research topic' column has been specifically organised so that it matches the 'HCI research topic' column on its left. The HCI topic classification of Zhang and Galleta (2006) shows how research areas are similar and overlap across OCB and HCI. However, there are other HCI areas that overlap with marketing topics that are not represented in the two OCB frameworks, for instance information presentation evaluation (Hong et al., 2005) and retention (e.g. Li et al., 2006). This lack of inclusion of these other topics in previous OCB and HCI frameworks could evidence that there is still much

progress to be done due to the fragmented nature of OCB. This in turn represents substantial opportunities for research within this discipline.

**Table 1. Overlap of consumer and technology research issues**

Technology-oriented research		Consumer-oriented research	
Human-computer interaction classification (Zhang and Galleta, 2006)		Online consumer behaviour frameworks (Cheung, 2005; Kwong et al., 2003)	
Category in HCI	HCI research topic	OCB research topic	Category in OCB
Attitude	Attitude	Attitude	Consumer characteristics
	Satisfaction	Satisfaction	After purchase evaluation
Cognitive belief and behaviour	Incentives	Incentives	Merchant and intermediary characteristics
	Intention	Intention	Consumer characteristics
	Behaviour	Past experiences / behaviour	Need recognition
	Adoption	Adoption	Online consumer purchase
Acceptance, use	Adoption		
Development methods and tools	Social-cognitive	Social	Need recognition
Emotion	Affect, emotion, enjoyment, flow, hedonic quality, humour	Experience	Consumer characteristics
	Intrinsic motivation	Motivation	
Performance	Effectiveness, efficiency, performance, productivity	Navigation, usefulness	Medium characteristics
Trust	Loyalty, trust, risk, security	Continuance, trust, risk, security	Consumer characteristics
			Online consumer purchase
User interface design and development	Interface metaphors	Interface	Medium characteristics
	Information presentation	Web site design and content	Information search
		Information presentations	Medium characteristics
		Layout	Product / services characteristics
Instrumental usability (Ease of use)	Ease of use	Medium characteristics	
User interface evaluation	Usability	Navigation	Medium characteristics
User Support	Issues related to user support, general support and information centre	After sales services	After purchase evaluation
			Merchant and intermediary characteristics

#### OVERLAP OF RESEARCH TOPICS

#### 4. Conclusion

With this work in progress we are evidencing that as both engineers and marketers are researching on equivalent topics that will have an impact on the consumer, in order to develop robust models they should take into account research from the contrary field. For instance, a digital interface on a mobile phone or a Web site should be well-developed from both a technological performance viewpoint and from consumers' performance perspective. These two research orientations might have not yet been brought together, as perhaps researchers from both areas might not have been aware of the research existing in other fields or simply persist in their research disciplines. Table 1 could be utilised in the future for the development of new consumer-technology behavioural models. Whilst it is understandable that researchers from both OCB and HCI have focused on their own individual research fields, table 1 could serve as a means to bring researchers from the fields of online consumer behaviour and HCI into a common space. Our suggested framework has implications for both academics and practitioners in the sense that it reflects the need for creating multidisciplinary teams

for the achievement of improved outputs in both research and practice. Future research can make progress by continuing to develop interdisciplinary models like the one suggested by Dennis et al. (2010).

## RESUMEN

*En este trabajo se analiza si los valores según la escala de Schwartz varían entre los directivos responsables de exportación de pymes entre las empresas con mayor éxito exportador, frente a las que tienen un éxito exportador limitado. El estudio se aplica a una muestra de 196 Pymes exportadoras españolas. En primer lugar se aplica un clúster de clases latentes para clasificar las empresas en función del performance exportador, para después aplicar test de comparaciones de medias y buscar diferencias significativas en los valores de Schwartz entre directivos de empresas de ambos grupos. Los valores en los que aparecen diferencias significativas son: honestidad, influencia, ambición, lealtad, justicia social, autoridad, vida excitante y orden social.*

## Palabras clave:

Performance exportador, escala de valores de Schwartz, internacionalización, pymes, clúster de clases latentes.

## 1. Introducción

En cualquier situación empresarial saber distinguir los factores que llevan al éxito de una empresa es una cuestión capital. No menos importante, en una etapa de globalización de los mercados en la que nos encontramos, es analizar los factores que llevan al éxito de una empresa exportadora. Esto es así, ya que el número de empresas exportadoras en España aumenta de forma progresiva. Si a esto unimos el hecho de investigar factores clave para el éxito exportador de PYMES, teniendo en cuenta que las PYMES suponen el 99% de las empresas de la OCDE, la justificación de cualquier estudio que permita mejorar su conocimiento y gestión es fundamental (Aragón-Sánchez & Rubio-Bañón, 2005). Su importancia en la creación de puestos de trabajo, innovación tecnológica y rejuvenecimiento económico está reconocido por todos los actores económicos, por ello, es importante que los factores que ayuden a explicar los resultados exportadores de las pymes sean una prioridad en la investigación (Freeman, Styles, & Lawley, 2012)

Un aspecto clave de las pymes es la influencia de las características personales de sus directivos en la toma de decisiones. En las grandes empresas las decisiones tomadas en los equipos directivos son más consensuadas y corporativas. Sin embargo, en las pymes la influencia individual y el carácter de los directivos y/o propietarios tiene un mayor efecto en la toma de decisiones (Della Torre & Solari, 2013), es decir, son organizaciones con menos trabas burocráticas, lo que da a los directivos más libertad de acción a la hora de tomar e implementar decisiones estratégicas (Hakonsson, Burton, Obel, & Lauridsen, 2012). Por ejemplo, se ha demostrado el efecto del nivel educativo, edad o experiencia de los directivos en la toma de decisiones de pymes (Wagner & Paton, 2014). Respecto a la influencia de los directivos de pymes en la internacionalización, aspectos como la orientación global, experiencia de trabajo, conocimiento de lenguas extranjeras, o relaciones formales e informales de sus directivos son aspectos clave para una rápida internacionalización de sus empresas (Przybylska, 2013). Tampoco se pueden olvidar otras características de estos directivos tales como percepción del riesgo, tolerancia de la ambigüedad, resistencia al cambio y auto-confianza (Acedo & Jones, 2007).

Sin embargo, junto a las características personales de los directivos, aunque la literatura también reconoce la importancia e influencia de los valores personales en la toma de decisiones y resultados empresariales (Hambrick, 2007), escaso es el conocimiento que se posee sobre esta cuestión, existiendo un gap investigador sobre el que es necesario ir avanzando. Con todo esto, el objetivo que nos planteamos en este trabajo es analizar si los valores, según la escala de Schwartz, varían entre los directivos responsables de exportación de pymes con mayor éxito exportador, frente a las que tienen un éxito exportador limitado. Por tanto, nuestra pregunta o cuestión de investigación es comprobar si las empresas con mayor éxito exportador tienen unos directivos con valores personales diferentes de aquellos que gestionan las exportaciones de empresas con un éxito exportador limitado.

Sobre la cuestión de investigación planteada, este trabajo tiene como principal contribución demostrar que efectivamente los directivos de pymes exportadoras con mejores resultados poseen un sistema de valores más proactivo frente a directivos de pymes exportadoras cuyo sistema de valores es más conservador.

Para lograr el objetivo planteado, el presente trabajo tiene la siguiente estructura. En primer lugar, se definen los antecedentes teóricos centrados en la internacionalización de las pymes, el resultado exportador y los sistemas de valores en los directivos. A continuación, se presenta la metodología empleada, definiéndose la muestra, las escalas de medidas y la herramienta de análisis de datos. Finalmente, se presentan los resultados y conclusiones del estudio, así como las limitaciones y futuras líneas de investigación.

## 2. Antecedentes teóricos

### 2.1. *La internacionalización de las Pymes*

La internacionalización de las pymes es un factor muy estudiado en la literatura reciente de negocios internacionales y marketing internacional. Los estudios se han centrado principalmente en las

características distintivas de los procesos de internacionalización de este tipo de empresas, como son: rápidas expansiones internacionales, gran uso de redes y alianzas, expansión nacional e internacional al mismo tiempo, falta de recursos y experiencia y centrarse en nichos de mercados globales (Schweizer, 2012). Según datos de la Unión Europea, un 25% de las Pymes de la UE27 han hecho exportaciones en los tres años anteriores al estudio (el valor en empresas españolas está prácticamente en ese promedio), que es el año 2009 ([http://ec.europa.eu/enterprise/policies/sme/market-access/files/internationalisation\\_of\\_european\\_smes\\_final\\_en.pdf](http://ec.europa.eu/enterprise/policies/sme/market-access/files/internationalisation_of_european_smes_final_en.pdf)). Según este estudio las principales barreras que se encuentran las pymes para exportar son:

- Barreras internas: precio de su producto o servicio y alto coste de la internacionalización.
- Barreras externas: falta de capital, falta de información adecuada, falta de apoyo institucional y los costes y dificultades burocráticas del transporte internacional.

Este mismo estudio concluye que:

- las Pymes internacionalizadas tienen mayores rendimientos económicos que las no internacionalizadas,
- mientras mayores son las pymes mayor es su probabilidad de exportar
- mientras más pequeño es el mercado doméstico también aumenta la probabilidad de exportar,
- pymes fabricantes y mayoristas son especialmente activas en el comercio internacional,
- las pymes más involucradas con la innovación de productos y procesos son más proclives al comercio internacional.

A partir de un estudio más reciente, también de la UE ([http://ec.europa.eu/enterprise/policies/international/files/2013-sme-internationalisation-final-report\\_en.pdf](http://ec.europa.eu/enterprise/policies/international/files/2013-sme-internationalisation-final-report_en.pdf)), la mayoría de las agencias de promoción exterior europeas están fomentando la internacionalización hacia países del BRIC (Brasil, Rusia, India y China), así como USA y países limítrofes de la frontera europea como Turquía y Ucrania.

## **2.2. Medición de resultados exportadores**

El resultado exportador es el output fundamental con el que se suele medir la actuación de la empresa exportadora en los mercados extranjeros y es un aspecto esencial para la toma de decisiones en el ámbito internacional (Madsen, 1998). Cavusgil y Zou (Cavusgil & Zou, 1994) definen el resultado exportador como la extensión por la cual la firma alcanza sus objetivos a través de la exportación de sus productos-marcas a los mercados extranjeros, incluyendo tanto aspectos económicos (beneficio, ventas, etc.) como estratégicos (posicionamiento internacional, incremento de la cuota de mercado derivado de la exportación, logro de objetivos internacionales, etc.), a través de la planificación y ejecución de la estrategia de marketing de la empresa exportadora.

Se han usado principalmente 3 paradigmas alternativos para explicar teóricamente el performance exportador: paradigma performance-conducta-estructura, paradigma relacional y el enfoque basado en los recursos (Freeman et al., 2012). El primero, basado en la teoría de la organización industrial, indica que los resultados dependen principalmente de las características del sector en el que opera la empresa (Ruppenthal & Bausch, 2009; Zou & Cavusgil, 2002). El segundo, basado en la teoría de intercambio relacional, destaca la relevancia de la naturaleza e impacto de las relaciones exportador-cliente (Ural, 2009). El enfoque basado en los recursos (RBV con sus siglas en inglés) indica que las empresas pueden conseguir ventajas competitivas sostenibles distribuyendo recursos y capacidades valiosas que son inelásticas en el mercado (Akhter & Robles, 2006). Algunos trabajos han integrado los tres enfoques con la idea de ofrecer un modelo integrador que reúna los diferentes determinantes del resultado exportador (Navarro, Acedo, Losada, & Ruzo, 2011; Navarro-García, Rondán-Cataluña, & Acedo-González, 2013). En todo caso, de la revisión de la literatura (Rose & Shoham, 2002; Sousa, Martínez-López, & Coelho, 2008) se desprende dos aspectos básicos del resultado exportador: (1) es un concepto multidimensional, el cual debe ser valorado a través de medidas cuantitativas (ventas, rentabilidad, crecimiento, etc.) y cualitativas (éxito percibido, satisfacción, logro de objetivos, etc.) (Freeman et al., 2012); (2) las medidas empleadas para su evaluación deben reflejar las percepciones directivas sobre los resultados alcanzados (ej. satisfacción directiva con el resultado exportador) (Lages, Jap, & Griffith, 2007).

En el presente trabajo se tienen en cuenta los dos aspectos señalados (1) se conciben dos dimensiones del resultado exportador, una cuantitativa -crecimiento de las ventas de exportación y rentabilidad de las exportaciones- y otra cualitativa –satisfacción directiva-; (2) se tienen en cuenta las percepciones directivas (satisfacción directiva global) asociada a la actividad exportadora.

### 2.3. Los valores de Schwartz en los directivos

Los valores personales son los principios que de una forma estable se emplean para evaluar el comportamiento propio y el de los demás. Generan una forma subjetiva de interpretar la realidad asociada al entorno en el que se actúa (Finkelstein, Hambrick, & Cannella Jr, 2008). La teoría de valores básicos humanos de Schwartz (Schwartz, 1992) se ha utilizado con gran profusión durante más de 20 años en estudios de diversas áreas de conocimiento, países y con objetivos muy diversos (Schwartz et al., 2012). Hay varios factores que diferencian la escala de valores de Schwartz de otras anteriores, destacando la universalidad de la estructura y del contenido de esos valores. Así los 10 tipos de valores propuestos por su teoría son valores reconocidos en todas las culturas. En la tabla 1 se presentan la definición de cada uno de los valores y los valores representativos de los mismos.

TABLA 1  
Ítems y definición de la escala de valores de Schwartz

<b>Tipo</b>	<b>Definición</b>	<b>Valores representativos</b>
<b>Auto-dirección</b>	Pensamiento y acción independiente (eligiendo, creando, explorando)	Creatividad, libertad, independencia, curiosidad, elección de las propias metas.
<b>Estimulación</b>	Excitación, novedad y desafío en la vida	Osadía, una vida variada, una vida excitante
<b>Hedonismo</b>	Placer y gratificación sensorial para uno mismo	Placer, vida placentera
<b>Logro</b>	Éxito personal al demostrar competencia de acuerdo a los estándares sociales	Triunfador, competente, ambicioso, influyente
<b>Poder</b>	Estatus social y prestigio, control o dominios de las personas o recursos	Poder social, autoridad, riqueza
<b>Seguridad</b>	Seguridad, armonía, y estabilidad de la sociedad, de las relaciones sociales y de uno mismo.	Seguridad familia, seguridad nacional, orden social, decencia, reciprocidad en los favores.
<b>Conformidad</b>	Moderación de las acciones, inclinaciones e impulsos probables de disgustar o dañar a otros y de transgredir las expectativas o normas sociales	Auto-disciplina, obediencia, amabilidad, respeto a los padres y personas mayores.
<b>Tradición</b>	Respeto, compromiso y aceptación de las costumbres e ideas que la cultura tradicional o religión brindan	Aceptar ser parte de la vida, humildad, devoción respecto por la tradición, moderación.
<b>Benevolencia</b>	Preservación y bienestar de la gente con quien uno está en frecuente contacto personal	Amabilidad, honestidad, perdón, lealtad, responsabilidad
<b>Universalismo</b>	Entendimiento, apreciación, tolerancia, y protección del bienestar de todas personas y de la naturaleza	Tolerancia, sabiduría, justicia social, equidad, un mundo en paz, un mundo de belleza, unidad con la naturaleza, protección del ambiente

Un aspecto interesante respecto a estos valores culturales es el alto nivel de consenso con respecto a la importancia relativa de los 10 valores citados entre diferentes sociedades. En la gran mayoría de las naciones estudiadas benevolencia, universalismo y auto-dirección son los aspectos más relevantes y

tradición, poder y estimulación son los menos. Esto indica que aspectos de la naturaleza humana y del funcionamiento social que conforman las prioridades individuales de valores son ampliamente compartidas entre culturas diversas (Schwartz et al., 2012).

Con respecto a los directivos, estos siguen modelos psicológicos que influyen en la forma de percibir el entorno y afectan a su toma de decisiones (Johnson & Hoopes, 2003; Nadkarni & Barr, 2008). Las creencias y valores individuales ejercen una influencia importante en la creación de las opiniones y modelos mentales de los directivos (Hambrick, 2007; Soriano & Castrogiovanni, 2012). En este contexto, es importante comprender el papel que pueden jugar los valores personales en la toma de decisiones empresariales, pues influye en la forma en que los directivos interpretan las situaciones de mercado, las decisiones estratégicas adoptadas, los recursos comprometidos, etc., y, por tanto, pueden ser determinantes de los resultados empresariales (White, Varadarajan, & Dacin, 2003).

Desde el punto del continuo que supone el inventario de valores humanos (Schwartz, 1992), dos posturas cabe destacar desde la óptica directiva: (a) *enfoque conservador*, caracterizado por un predominio de la visión individualista, de mantenimiento del status quo y que se muestra reacia a realizar cambios, en la cual predominan los valores de seguridad, conformidad, tradición, poder y logro. Esta postura implica aplicar una lógica tradicional, fruto de una cultura reactiva, en la resolución de problemas, toma de decisiones, actitudes y comportamientos empresariales (Schwartz & Bardí, 2001). Sus repercusiones suelen ser negativas en la rapidez de respuesta y adaptación a los deseos de los consumidores, motivaciones para innovar, o diversificar mercados (Krasnikov & Jayachandran, 2008); (b) *enfoque proactivo*, caracterizado por un predominio de la visión colectiva, de apertura al cambio y predisposición para realizar adaptaciones y orientarse al mercado, donde predominan los valores de estimulación, independencia de pensamiento o auto-dirección, hedonismo, benevolencia y universalismo (Sousa, Ruzo, & Losada, 2010).

Algunos estudios ha evidenciado los planteamientos expuestos (Carpenter, Geletkanyez, & Sanders, 2004; Hambrick, 2007). Sin embargo, en el ámbito exportador, como señalan Sousa et al. (Sousa et al., 2010)) existe un importante desconocimiento del papel que desempeñan los valores de los responsables de exportación en las decisiones adoptadas y éxito alcanzado por la empresa exportadora en los mercados exteriores, a pesar de que algunos trabajos han mostrado la gran relevancia de su estudio (Leonidou, Katsikeas, & Piercy, 1998). En este gap investigador encuentra su fundamento el presente trabajo, describiendo a continuación la metodología desarrollada para alcanzar los objetivos propuestos.

### **3. Metodología**

#### **3.1. Muestra**

La muestra de empresas obtenidas se obtuvo a partir de la base de datos de empresas exportadoras del Instituto de Comercio Exterior (ICEX). Se mantuvo la proporcionalidad sectorial, los cuestionarios se enviaron por e-mail a 1200 directivos responsables de las exportaciones de sus empresas. Se obtuvieron 196 encuestas de empresas con menos de 250 empleados (Pymes). Se obtuvo una tasa de respuesta del 16,3%, que está dentro de los límites normales de respuesta a encuestas mandadas por e-mail. Sólo se usó un encuestado en cada empresa que tenía que ser el responsable de las exportaciones de la empresa, que por ser pymes en muchos casos coincidía con el gerente de la misma. A los encuestados se les pidió que pusieran el puesto que desempeñaban en la empresa y que valoraran su competencia, habilidades y responsabilidades en términos de exportaciones. Altos valores en estas competencias de los encuestados nos aseguran minimizar el riesgo potencial atribuible del sesgo del encuestado.

#### **3.2. Escalas de medida**

Para medir la escala de valores de Schwartz, se ha seguido el “Draft Users Manual” que el mismo Prof. Shalom Schwartz publicó (Schwartz, 2009), con el fin de ayudar a los investigadores que usen su escala para usarla correctamente. La escala se tradujo al castellano para pasarla en el cuestionario. Los 45 ítems de la escala SVS han demostrado tener una fuerte fiabilidad entre distintas culturas (Schwartz, 1992). La escala original se presenta en el anexo 1. Respecto al resultado exportador,

incluye tanto aspectos cuantitativos (crecimiento de las ventas de exportación en el último año y rentabilidad de las exportaciones) como cualitativos (satisfacción global directiva con el resultado de las exportaciones).

### 3.3. Análisis estadísticos

Teniendo en cuenta que el objetivo de este trabajo es analizar si los valores, según la escala de Schwartz, varían entre los directivos responsables de exportación de pymes entre las empresas con mayor éxito exportador, frente a las que tienen un éxito exportador limitado, el primer paso es clasificar a las empresas de la muestra en función de sus resultados exportadores. Para ello hemos utilizado un clúster de clases latentes usando las variables sobre performance exportador que estaban recogidas en el cuestionario que son: satisfacción global con las exportaciones, crecimiento de las ventas de exportación el último año y rentabilidad de las exportaciones en el último año. Otros trabajos han demostrado las ventajas del clúster de clases latentes, frente a las técnicas tradicionales de conglomerados (Javier Rondan-Cataluna, Jesus Sanchez-Franco, & Francisco Villarejo-Ramos, 2010) entre las que destacan: creación de segmentos a posteriori, se pueden usar variables cualitativas, y los casos se asignan a cada grupo en función de sus probabilidades de pertenencia que se estiman directamente del modelo.

Una vez clasificadas las empresas en grupos usamos test t de comparación de medias, y como los datos no cumplen el requisito de normalidad usamos también los test no paramétricos siguientes: prueba de la mediana para muestras independientes, U de Mann-Whitney y la prueba de Kolmogorov-Smirnov para muestras independientes. En este caso, analizamos cada uno de los ítems de la escala de valores de Schwartz de los directivos de las Pymes de la muestra para cada uno de los grupos de empresas obtenidos del clúster de clases latentes, viendo de esta manera si hay diferencias significativas entre ellos.

## 4. Resultados

Como se indica en la sección anterior, primero hicimos un clúster de clases latentes usando las variables de performance exportador, atendiendo al criterio de menor BIC (Bayesian Information Criterion), nos quedamos con el modelo de dos grupos o clases latentes (ver tabla 2).

TABLA 2  
Selección del número de clústeres

		LL	BIC(LL)	Npar	L <sup>2</sup>	df	p-value	Class.Err.
Model1	1-Cluster	-737,5576	1538,4526	12	129,9805	92	0,0056	0
<b>Model2</b>	<b>2-Cluster</b>	<b>-711,2792</b>	<b>1507,0083</b>	<b>16</b>	<b>77,4238</b>	<b>88</b>	<b>0,78</b>	<b>0,1033</b>
Model3	3-Cluster	-703,817	1513,1963	20	62,4993	84	0,96	0,1068
Model4	4-Cluster	-702,2803	1531,2353	24	59,4259	80	0,96	0,2288
Model5	5-Cluster	-702,3152	1552,4177	28	59,4958	76	0,92	0,3313
Model6	6-Cluster	-700,8099	1570,5195	32	56,4852	72	0,91	0,3789

Respecto a las medidas de bondad de ajuste, el modelo con 2 grupos tiene un error de clasificación de 0.103, R<sup>2</sup> de entropía de 0.617, R<sup>2</sup> standard de 0.657, valores todos ellos aceptables.

Los dos clústeres que salen son los siguientes:

TABLA 3  
Descripción de los clústeres

	Cluster1	Cluster2
Tamaño Clúster	0,7071	0,2929
Indicadores		
SAT. GLOBAL EXPORT.		
Media	3,791	2,658

CREC. VENTAS EXPORT. ULT. AÑO		
Media	5,0252	2,5175
RENTAB. EXPORT ULT. AÑO		
Media	2,8918	2,3902

Se observa en la tabla 3 que el clúster 1 engloba a casi el 71% de las empresas de la muestra, y el segundo algo más del 29%. El clúster 1 representa a las empresas con mayor éxito exportador ya que la satisfacción global con las exportaciones, el crecimiento de las ventas de exportación y la rentabilidad de las exportaciones del último año están valoradas mucho más positivamente que en el clúster 2, que está formado por aquellas empresas cuyos directivos perciben un desempeño exportador limitado.

El siguiente paso fue depurar la muestra, eliminando los casos en los que no se habían rellenado por parte del responsable de exportación la parte de la encuesta relacionada con los valores de Schwartz. No se eliminaron en la fase anterior porque de estas empresas si teníamos datos de resultados. Se pasó de 196 a 183 pymes exportadoras.

Las empresas son asignadas al clúster al que tienen mayor probabilidad de inclusión. Así aparecen 127 en el clúster 1 y 56 en el clúster 2. Aplicamos un test t de comparación de medias, y como los datos no cumplen el requisito de normalidad usamos también los test no paramétricos siguientes: prueba de la mediana para muestras independientes, U de Mann-Whitney y la prueba de Kolmogorov-Smirnov para muestras independientes. La tabla 4 refleja sólo las variables que en el test t y en alguno de los no paramétricos mostraron diferencias significativas entre los dos grupos son los que hemos señalado, buscando al máximo la robustez de los resultados obtenidos.

TABLA 4

Los ítems 8, 9, 27, 30, 33, 34, 39 y 45 de la escala de Schwartz muestran diferencias significativas entre los directivos de las empresas del clúster 1 y el clúster 2, con un nivel de confianza de al menos el 90%. Analizamos para estos ítems los test no paramétricos de diferencias de medias para muestras independientes (tabla 5).

TABLA 5

**Pruebas no paramétricas para muestras independientes**

Ítems de la escala de Schwartz	Significación asintótica de la Prueba de la mediana para muestras independientes	Significación asintótica de la U de Mann-Whitney	Significación asintótica de Kolmogorov- Smirnov para muestras independientes
V08	0.063	0.044	0.068
V09	0.007	0.012	0.033

	2	56	2,82	1,927	,257
v45	1	127	5,64	1,283	,114
	2	56	5,20	1,531	,205

Así los ítems de la escala SVS que muestran diferencias significativas entre los directivos encargados de las exportaciones en PYMES entre los clústeres 1 (éxito exportador) y 2 (poco éxito exportador) son: 8 orden social, 9 una vida excitante, 27 autoridad, 30 justicia social, 33 lealtad, 34 ambición, 39 influencias, 45 honestidad. Por tanto, encontramos diferencias significativas en 6 de las 10 dimensiones de la escala: seguridad, estimulación, poder, universalismo, benevolencia y logro.

## 5. Conclusiones

La mayoría de estudios centrados en el análisis de la influencia de los aspectos personales de los directivos en la toma de decisiones y resultados empresariales en el contexto internacional se ha centrado en las propias características personales (Przybylska, 2013); (Wagner & Paton, 2014) y pocos trabajos han ofrecido conclusiones sobre la repercusión de los valores. En este trabajo se demuestra algo que intuitivamente se podría pensar, pero que es difícil de demostrar, y es que los directivos dedicados a la exportación de las pymes con mayor éxito exportador poseen valores y rasgos de personalidad que difieren significativamente de los directivos de pymes cuyos resultados exportadores no son tan buenos.

En particular los aspectos que difieren son los siguientes. Para los directivos de pymes con éxito exportador es más importante el orden social y la estabilidad de la sociedad que para sus colegas de pymes con menor resultado exportador. Es decir, este aspecto de la seguridad es una dimensión que predomina en los directivos de empresas exportadoras con mejores resultados en los mercados extranjeros. También, los primeros le dan mayor importancia a tener una vida excitante y llena de experiencias estimulantes, aflorando la dimensión de estimulación; a tener más autoridad y dirigir o capitanear equipos de personas, reflejando una capacidad de poder; a ser más leales a las personas y a los grupos a ser más sincero y honesto, aspectos estos relacionados con la benevolencia; a ser ambicioso y trabajar duro para aspirar a más logros y a ser más influyente teniendo más impacto en las personas y acontecimientos estos son aspectos asociados al logro. Todo ello muestra el predominio de un sistema de valores proactivo, caracterizado por una visión colectiva de los negocios, de tolerancia y apertura al cambio, y predisposición para realizar adaptaciones y orientarse al mercado, repercutiendo positivamente en el resultado exportador ((Sousa et al., 2008; Sousa et al., 2010).

Sin embargo, para los directivos de pymes con éxito exportador es menos importante corregir las injusticias o cuidar del débil que para los directivos del grupo de pymes con menos éxito exportador, este aspecto está relacionado con el universalismo, mostrándose éstos últimos más proteccionistas o conservadores. Ello puede ser un reflejo de un enfoque conservador, caracterizado por un predominio de la visión individualista, de mantenimiento del status quo, mostrándose reacio a realizar cambios. Esta postura implica aplicar una lógica dominante tradicional, fruto de una cultura reactiva, en la resolución de problemas, toma de decisiones, actitudes y comportamientos empresariales (Schwartz & Bardí, 2001). Sus repercusiones suelen ser negativas en la rapidez de respuesta y adaptación a los deseos de los consumidores, motivaciones para innovar, o diversificar mercados (Krasnikov & Jayachandran, 2008). Todo ello puede repercutir negativamente en los resultados empresariales, como se refleja en la presente investigación.

Es interesante resaltar el hecho de que corregir las injusticias o cuidar del débil, sea el único valor en los que hemos encontrado diferencias significativas al que los directivos de pymes con menos éxito exportador han dado más importancia que a los directivos del otro grupo. Parece que estos aspectos más sociales, más asertivos tienen menos presencia en los directivos de pymes con éxito exportador. El perfil de estos directivos es más agresivo en los que una vida excitante, la autoridad, la lealtad, el orden social, ambición, ser influyente y sincero son valores a los que les dan más importancia que sus colegas de pymes con menor éxito exportador.

En definitiva, este trabajo demuestra que las empresas con mayor éxito exportador tienen unos directivos con valores personales diferenciados de aquellos que gestionan las exportaciones de empresas con un éxito exportador limitado.

Para finalizar, señalar la principal limitación de este trabajo como es considerar exclusivamente la influencia de los valores en los resultados empresariales, obviando otros aspectos sobre los que la literatura apunta una repercusión más directa como son las orientaciones directivas y decisiones estratégicas, actuando estos factores, en ocasiones, como mediadores o moderadores de la relación valores-resultados empresariales. Esta limitación constituye una guía para orientar futuros trabajos de investigación.

#### ANEXO 1. ESCALA DE VALORES DE SCHWARTZ

1 EQUALITY	equal opportunity for all
2 INNER HARMONY	at peace with myself
3 SOCIAL POWER	control over others, dominance
4 PLEASURE	gratification of desires
5 FREEDOM	freedom of action and thought
6 A SPIRITUAL LIFE	emphasis on spiritual not material matters
7 SENSE OF BELONGING	feeling that others care about me
8 SOCIAL ORDER	stability of society
9 AN EXCITING LIFE	stimulating experiences
10 MEANING IN LIFE	a purpose in life
11 POLITENESS	courtesy, good manners
12 WEALTH	material possessions, money
13 NATIONAL SECURITY	protection of my nation from enemies
14 SELF RESPECT	belief in one's own worth
15 RECIPROCATION OF FAVOURS	avoidance of indebtedness
16 CREATIVITY	uniqueness, imagination
17 A WORLD AT PEACE	free of war and conflict
18 RESPECT FOR TRADITION	preservation of time-honoured customs
19 MATURE LOVE	deep emotional & spiritual intimacy
20 SELF-DISCIPLINE	self-restraint, resistance to

	temptation
21 PRIVACY	the right to have a private sphere
22 FAMILY SECURITY	safety for loved ones
23 SOCIAL RECOGNITION	respect, approval by others
24 UNITY WITH NATURE	fitting into nature
25 A VARIED LIFE	filled with challenge, novelty and change
26 WISDOM	a mature understanding of life
27 AUTHORITY	the right to lead or command
28 TRUE FRIENDSHIP	close, supportive friends
29 A WORLD OF BEAUTY	beauty of nature and the arts
30 SOCIAL JUSTICE	correcting injustice, care for the weak
31 INDEPENDENT	self-reliant, self-sufficient
32 MODERATE	avoiding extremes of feeling & action
33 LOYAL	faithful to my friends, group
34 AMBITIOUS	hard-working, aspiring
35 BROADMINDED	tolerant of different ideas and beliefs
36 HUMBLE	modest, self-effacing
37 DARING	seeking adventure, risk
38 PROTECTING THE ENVIRONMENT	preserving nature
39 INFLUENTIAL	having an impact on people and events
40 HONOURING OF PARENTS AND ELDERS	showing respect
41 CHOOSING OWN GOALS	selecting own purposes
42 HEALTHY	not being sick physically or mentally
43 CAPABLE	competent, effective, efficient
44 ACCEPTING MY PORTION IN LIFE	submitting to life's circumstances
45 HONEST	genuine, sincere
46 PRESERVING MY PUBLIC IMAGE	protecting my "face"
47 OBEDIENT	dutiful, meeting obligations
48 INTELLIGENT	logical, thinking
49 HELPFUL	working for the welfare of others
50 ENJOYING LIFE	enjoying food, sex, leisure, etc.
51 DEVOUT	holding to religious faith & belief
52 RESPONSIBLE	dependable, reliable
53 CURIOUS	interested in everything, exploring
54 FORGIVING	willing to pardon others
55 SUCCESSFUL	achieving goals
56 CLEAN	neat, tidy
57 SELF-INDULGENT	doing pleasant things

58 OBSERVING SOCIAL NORMS	to maintain face

# FACTORES QUE AFECTAN LA DINAMICA DE LAS EMPRESAS INTERNACIONALES: UN ANALISIS EMPIRICO EN COLOMBIA

DIANA MARCELA ESCANDÓN  
MIGUEL HERNANDEZ-ESPALLARDO  
AUGUSTO RODRIGUEZ OREJUELA

## RESUMEN

*El objetivo de este artículo es identificar los determinantes de los resultados internacionales de las empresas exportadoras tanto de tipo Tradicional como Born Global. Por tanto, se utiliza una muestra que incluye 319 empresas exportadoras pertenecientes a los dos grupos. Los autores utilizan un sistema de ecuaciones estructurales multigrupo para identificar si las empresas Born Global ven afectados sus Resultados internacionales de forma diferente a las empresas exportadoras tradicionales o si las diferencias sólo se enfocan en el modo de entrada al mercado internacional sin afectar significativamente los factores que inciden en los Resultados internacionales entre ambos grupos de empresas. Por tanto, se plantea como contribución la elaboración de un modelo general con factores relevantes de los Resultados internacionales como: la Orientación al Mercado Internacional, la Orientación al aprendizaje colaborativo, la Orientación Innovadora, la Experiencia internacional y el Dinamismo del Mercado, para contrastar empíricamente si existen diferencias significativas entre las empresas Born Global y las empresas exportadoras tradicionales.*

**PALABRAS CLAVES:** *Internacionalización, Orientación al mercado, Orientación al aprendizaje colaborativo, Resultados internacionales*

## 1. INTRODUCCION

El presente artículo pretende incluir los factores relevantes de los Resultados internacionales de las empresas exportadoras en Colombia a partir de tres orientaciones estrategicas como la Orientación al mercado, a la Orientación al aprendizaje y la Orientación innovadora. Estos autores tienen en cuenta que la Orientación al mercado tiene un efecto determinante en los Resultados organizacionales. Pero también existe una relación coetánea entre Orientación al mercado y Orientación al aprendizaje colaborativo. La Orientación innovadora es considerada como uno de los más importantes factores que influyen sobre los resultados empresariales (Hurley y Hult, 1998) pero los antecedentes claves de esta orientación son la Orientación al mercado (Narver y Slater, 1990; Jaworski y Kohli, 1993) y la Orientación al aprendizaje colaborativo (Baker y Sinkula, 2002).

## 2. RELACIONES CONCEPTUALES

### **La Experiencia internacional: antecedente de la Orientación al mercado internacional y de la Orientación al aprendizaje colaborativo**

Se sugiere una relación positiva entre Experiencia internacional y Orientación al mercado internacional teniendo en cuenta que la Orientación al mercado internacional es considerada como una nueva dinámica del marketing internacional que permite a las empresas identificar mejor las oportunidades que ofrece el mercado internacional y minimizar las amenazas para lograr ser competitivo (Cadogan et al., 1999). De tal forma que poseer experiencia sobre la forma como se realizan las actividades internacionales permite tener un mayor acceso a la información, generando y difundiendo la información de los mercados y estableciendo una respuesta ágil y precisa para el cliente. Por lo tanto, la primera hipótesis propone:

Hipótesis 1: La Experiencia internacional influye positivamente sobre la Orientación al mercado internacional.

Por otra parte, tener una Orientación al aprendizaje colaborativo puede aumentar la capacidad de absorber conocimientos específicos de aquellos aliados que cuentan con cierta experiencia dentro de la industria (Lane y Lubatkin, 1998). Por lo tanto, la tendencia de las empresas por desarrollar procesos de aprendizaje a partir de la conformación de redes de colaboración es impulsada por la experiencia adquirida previamente. En consecuencia se propone:

Hipótesis 2: La Experiencia internacional influye positivamente sobre la Orientación al aprendizaje colaborativo.

### **El Dinamismo del mercado: efectos sobre la Orientación al mercado internacional y la Orientación al aprendizaje colaborativo**

Cuanto mayor Dinamismo del mercado se genere debido a cambios en las preferencias de los clientes y movimientos estratégicos de los competidores, mayor será la tendencia de la organización por obtener información y posteriormente dar respuesta acorde a las necesidades de sus clientes (Blesa et al., 2008) en los diferentes mercados en los que opera como mecanismo para agregar valor y resultados empresariales. Por lo tanto la tercera hipótesis afirma:

Hipótesis 3: El Dinamismo del mercado influye positivamente sobre la Orientación al mercado internacional

En especial, la Orientación al aprendizaje colaborativo, que se basa en el intercambio de información dado en las redes empresariales, acelera el flujo de información y aumenta la frecuencia de retroalimentación teniendo en cuenta que la actuación en mercados altamente dinámicos hace que las empresas utilicen más

mecanismos de aprendizaje de tipo formal e informal (Ellis y Shpielberg, 2003). A partir de esta información se llega a la siguiente propuesta:

Hipótesis 4: El Dinamismo del mercado tiene una influencia positiva sobre la Orientación al aprendizaje colaborativo.

#### **La Orientación Innovadora como resultado de la Orientación al mercado internacional**

La razón detrás de esta relación radica en que las empresas que responden al mercado muestran un mayor compromiso hacia las necesidades de los clientes y evolucionan rápida y constantemente, buscando asegurar la satisfacción de sus clientes y ofreciendo innovaciones más radicales. Esta respuesta lleva a generar productos con mayor valor a los clientes, reforzando así la posición competitiva de la empresa, traduciéndose en mayores beneficios (Hurley et al., 2004; Erdil, 2004). Se plantea entonces la siguiente hipótesis:

Hipótesis 5: La Orientación al mercado internacional influye positivamente sobre la Orientación innovadora.

#### **La Orientación innovadora como resultado de la Orientación al aprendizaje colaborativo**

Esta relación se debe a que una organización comprometida con el aprendizaje es probable que tenga mayor capacidad para innovar con respecto a sus competidores dado que dentro de sus actividades de aprendizaje se encuentran las acciones para monitorear a sus competidores, entendiendo las fortalezas y debilidades de sus rivales y aprendiendo tanto de sus éxitos como de sus fracasos (Gatignon y Xuereb, 1997). Por lo tanto:

Hipótesis 6: La Orientación al aprendizaje colaborativo influye positivamente sobre la Orientación innovadora.

#### **Efectos de la Orientación al mercado internacional sobre los Resultados internacionales**

La Orientación al Mercado Internacional brinda la capacidad de crear valor superior para los clientes extranjeros. Si una empresa identifica las necesidades y preferencias de los clientes y es capaz de anticiparse a las necesidades futuras, tendrá una mejor posición para satisfacer a los clientes y desempeñarse bien frente a los competidores (Cadogan et al., 2002). De lo anterior se plantea la siguiente hipótesis:

Hipótesis 7: La Orientación al mercado internacional influye positivamente sobre los Resultados internacionales.

#### **Efectos de la Orientación al aprendizaje colaborativo sobre los Resultados internacionales**

Las empresas orientadas al aprendizaje colaborativo logran intercambiar experiencias con otros miembros de la red de colaboración beneficiándose en términos de mayor cooperación, mayor información por compartir, y mejores acuerdos para el desarrollo de sus actividades en el mercado (Poh-Lin, 2004) mejorando así el rendimiento de los miembros de las empresas que forman parte de la red de colaboración. Por lo tanto, las ventajas obtenidas a partir del aprendizaje colaborativo conducen a resultados superiores a nivel organizacional. Por lo tanto se plantea la siguiente hipótesis:

Hipótesis 8: La Orientación al aprendizaje colaborativo influye positivamente sobre los Resultados internacionales de las empresas.

#### **Efectos de la Orientación innovadora sobre los Resultados internacionales**

Kirbach y Schmiedeberg (2006) han señalado que la Orientación innovadora puede afectar a los Resultados internacionales de las empresas, teniendo en cuenta que las empresas en los mercados extranjeros se han aprovechado de dicha capacidad para aprender cómo crecer en entornos altamente competitivos logrando el crecimiento en las exportaciones. De acuerdo a lo anterior se plantea:

### Hipótesis 9: La Orientación innovadora influye positivamente sobre los Resultados internacionales

Las hipótesis planteadas son contrastadas para la muestra total de empresas exportadoras. Sin embargo en la revisión de la literatura se ha observado que las empresas Born Global, caracterizadas por su diferente modo de entrada al mercado internacional, desarrollan ciertas capacidades que las hacen diferenciarse de las empresas exportadoras tradicionales e incluso obtener mayores Resultados internacionales que las empresas exportadoras tradicionales. De esta forma empiezan a aparecer diferentes estudios argumentando una mayor influencia de ciertas variables sobre los Resultados internacionales de las Born Global y por esta razón los estudios relacionados con el desempeño de las empresas Born Global.

## 3. METODOLOGIA

La presente investigación tiene como unidad de análisis las empresas exportadoras en Colombia, utilizándose los datos de las empresas exportadoras registradas en Proexport (Promoción de Turismo, Inversión y Exportaciones de Colombia) con fecha de corte octubre de 2012. A la hora de distinguir las empresas Born Global de las exportadoras tradicionales se utilizan tres criterios. El primero se relaciona con su primer año de exportación, que no superará los 5 años de constituida. En segundo lugar, debe tener más del 30% de ventas anuales en el exterior. El tercer criterio, tener presencia de sus productos en más de dos países destino.

## 4. Resultados

En la Tabla 1 se muestran los resultados de la estimación de un modelo de ecuaciones estructurales multigrupo donde se permiten obtener datos para todas las empresas exportadoras (muestra total) y para las dos clases de empresas exportadoras por separado: Born Global y Exportadoras tradicionales. Se observa que los parámetros obtenidos para cada relación son significativos y tienen el mismo signo postulado en las hipótesis. El ajuste de los modelos total y multigrupo son satisfactorios (Anderson y Gerbing, 1988). El RMSEA es menor de 0,05 y las medidas de ajuste incremental (CFI, NNFI) son superiores a 0,9. El GFI no supera el umbral de 0,90, sin embargo el NNFI y el IFI por ser índices de ajuste incremental son considerados mejores índices de ajuste con respecto al GFI que es un índice de orden absoluto. Por tanto, el modelo total se convierte en la base para la explicación de las hipótesis planteadas y se rechaza la existencia de diferencias globalmente significativas en los comportamientos mostrados por las empresas exportadoras tradicionales y las Born Global. En términos del modelo total se confirma la hipótesis 1, donde se plantea que la Experiencia previa tiene una influencia positiva en la Orientación al mercado internacional ( $\gamma_{11} = 0,75$ ;  $p < 0,01$ ). Con respecto a la Hipótesis 2, la significatividad del coeficiente obtenido permite señalar una relación directa entre la Experiencia previa y el Aprendizaje colaborativo ( $\gamma_{51} = 0,49$ ;  $p < 0,01$ ). Por otra parte, la hipótesis 3 asociada a la relación positiva entre el Dinamismo del mercado y la Orientación al Mercado Internacional queda corroborada ( $\gamma_{12} = 0,27$ ,  $p < 0,01$ ). Los resultados confirman la Hipótesis 4 de la influencia positiva entre el Dinamismo del mercado sobre el Aprendizaje colaborativo ( $\gamma_{52} = 0,15$ ;  $p < 0,01$ ). En este sentido se confirma el papel de la Experiencia previa internacional y el Dinamismo del mercado como antecedentes de la Orientación al mercado internacional y de la Aprendizaje colaborativo. Con respecto a las consecuencias de la Orientación al mercado internacional y del Aprendizaje colaborativo se comprueba la influencia positiva de estas dos variables sobre la Orientación innovadora. Se confirma la hipótesis 5 acerca de la existencia de una influencia positiva de la Orientación al mercado internacional sobre la Orientación innovadora ( $\beta_{61} = 0,37$ ;  $p < 0,01$ ). También es comprobada la hipótesis 6. Existe una influencia positiva del Aprendizaje colaborativo sobre la Orientación innovadora ( $\beta_{65} = 0,26$ ;  $p < 0,01$ ). Por otra parte, también se comprueba que los Resultados internacionales dependen de la Orientación al mercado internacional y del Aprendizaje colaborativo. Se acepta la hipótesis 7 donde un comportamiento orientado al mercado internacional afecta positivamente a los Resultados internacionales ( $\beta_{71} = 0,26$ ;  $p < 0,01$ ). También se logra comprobar la hipótesis 8 acerca de la influencia positiva del Aprendizaje colaborativo sobre los Resultados internacionales ( $\beta_{75} = 0,24$ ;  $p < 0,01$ ). La hipótesis 9 hace referencia a la influencia positiva de la Orientación innovadora sobre los Resultados internacionales no

## FACTORES QUE AFECTAN LA DINAMICA DE LAS EMPRESAS INTERNACIONALES.....

comprobándose esta relación teniendo en cuenta que el coeficiente da no significativo ( $\beta_{76} = 0,09$ ;  $p > 0,1$ ).

## RESUMEN

*Research on tourism has been enormously benefited from the marketing of services literature in the understanding of satisfaction, its antecedents and its consequent factors. However, recent emphasis on customers' experiences has shifted the focus to a redefinition of the antecedents of satisfaction. From a survey to a sample of 136 British city travelers, using Partial Least Squares, we compare the Quality and Value of Services frameworks and the Experience Economy framework in a series of three regression models in order to determine which one shows higher explanatory power. Both alternative frameworks allow for a high but almost equal levels.*

## Palabras clave:

Experience Economy framework, Quality of services, Value of services, City travelling, Satisfaction

## 1. Introduction

During the end of the 80s and the 90s, with the focus on reaching higher quality levels in products and services, advances were made both in disentangling the concepts of perceived quality, value satisfaction and its interrelations (Parasuraman *et al.* 1985, Zeithaml 1988, Cronin & Taylor 1992) and in developing measurement scales, such as SERVQUAL (Parasuraman, *et al.* 1988, Zeithaml *et al.* 1990) and SERVPERF (Cronin & Taylor 1992, 1994, Cronin *et al.* 2000) in services, or GLOVAL (Sánchez *et al.* 2006), PERVAL (Sweeney & Soutar 2001, Williams & Soutar 2009) and SERVPERVAL (Petrick & Backman 2002) in the context of touristic travelling.

More recently, the focus on customers' own experiences, particularly in the case of hospitality and touristic services, have added new insights in this long-standing trend to include 'relevant higher level abstractions' (Zeithaml 1988). As Pine and Gilmore (1999) state, "when a customer buys a service, he purchases a set of intangible activities carried out on his behalf. But when he buys an experience, he pays to spend time enjoying a series of memorable events that a company stages to engage him in a personal way" (p. 2).

With these ideas in mind, the principal aim of our study is to determine empirically up to which extent this shift of focus brings an improvement to the understanding of tourist satisfaction and behavioral intentions. To this end, we focus on city break travelling, a type of touristic activity that, compared to vacation travelling, is characterized by lower risk, lower involvement (Dunne *et al.* 2001) and, in many cases, a greater amount of autonomy from the side of travelers. Secondly, we aim to add more insight to the knowledge of city break travelling, a niche type of tourism that despite the fact of being increasingly acknowledged by city managers and administrators (Dunne *et al.* 2011), is yet to receive the attention it deserves from the academy.

## 2. Research hypotheses

Traditionally, the study of quality in services has been based on the Expectancy disconfirmation theory (Oliver, 1981, Zeithaml 1988, Parasuraman, Zeithaml & Berry 1985, 1988). In particular, perceived quality is (1) different from objective quality, (2) entails a higher level of abstraction than focus on specific attributes, (3) it is a global assessment resembling attitude, and (4) it is rather "a judgment usually made within a consumer's evoked set" (Zeithaml 1988).

In the tourism context, this insight on the consumer's own judgments and attitudes has gone a step further with the differentiation between service quality and experience quality. The former has been referred to as the quality of the attributes of a service which are under the control of the supplier, while the latter adds to these attributes the tourists' own affective responses (Chen & Chen 2010).

A particular feature of short touristic travels to cities, compared to other types of vacation, may lie in the absence of a service provider. Consuming experiences can occur with or without an interaction with a service provider or 'experience enabler' in a market relation (Baron *et al.* 2010). In fact, touristic consuming experiences outline a continuum. At one extreme, there are complete products, services and experiences provided by private companies. At the other extreme, a traveler may opt for a travelling experience provided after contracting only a number of services from independent providers, sometimes at the point of destination, and seeking his or her travelling experience by himself or herself. This means that the quest of consumption experiences in city break travelling can fit in any point of this continuum. As a consequence, this idea brings important changes in the way to define quality of travel experience, when there can be no other service provider than the city itself.

For this reason, by quality of travel experience, in this study we refer to an overall judgment by a city traveler about the excellence of the ambience, amenities, services and options for leisure and entertainment that are offered in a city.

For its part, despite the fact of being a critical concept in customer consumption behavior, customer value has received less attention than service quality or satisfaction (Woodruff 1997, Williams & Soutar 2009). A customer forms an idea of the value of a product or service after considering the relative weight of its benefits against its costs or sacrifices (Zeithaml, 1988, Sweeney et al. 1999, Williams & Soutar 2009). In other words, the value of a product is the consumer's overall assessment of its utility based on perceptions on what is received and what is given (Zeithaml 1988, p.14).

Thus, our first three hypotheses form the core of our first proposed model are:

H<sub>1</sub>: The higher the level of quality of travel experience, the higher the tourist's value of travel experience.

H<sub>2</sub>: The higher the quality of travel experience the higher the tourist's satisfaction.

H<sub>3</sub>: The higher the value of travel experience, the higher the tourist's satisfaction

The second model we aim to test puts the antecedents of satisfaction in the experiences that a customer or, in this case, a traveler seeks. A critic to the expectancy disconfirmation theory, and its tangible form in the SERVQUAL model, has been argued on the fact that it does not adequately address the affective and holistic factors contributing to the overall quality of 'service experience' (Otto & Ritchie 1996). From the practice of marketing management, Pine and Gilmore (1999) argue that there has been a 'commodity mind-set' due to which many businesses missed the point on the fact that instead of services, customers want and are willing to pay for experiences, not merely tasks.

This difference in the point of view has been increasingly studied, and measurement scales have been proposed especially in the hospitality and touristic services literature (Stamboulis & Skayannis 2003, Quan & Wang, 2004, Oh et al. 2007, Andersson, 2007; Yuan & Wu, 2008, Hosany & Witham 2009, Mehmetoglu & Engen 2011). According to Pine and Gilmore's framework, the four factors that comprise the 'experience realms' are: entertainment, educational, escapist and esthetic.

An entertainment type of experience happens when customers passively absorb the consuming experience through their senses, "as generally occurs when viewing a performance, listening to the music or reading for pleasure" (Pine & Gilmore, 1999, p. 31). Secondly, the educational realm involves an active participation of the individual, contrary to the case of entertainment. Through it, the customer "absorbs the events unfolding before him" (p. 32). Thirdly, the escapist experience is one involving "a greater immersion than entertainment and education", and making the customer become an actor, detached or distracted from his or her own self at least for a time (p.33). Finally, the esthetic realm refers to experiences in which individuals are immersed and affected by the environment, contemplating and discovering through the senses about the fact of being there in that moment.

Pine and Gilmore (1999) also distinguish these four experience realms according to two coordinates forming a plane (p.30): passive *versus* active participation, and absorption *versus* immersion. In this sense, educational and escapist experiences demand active participation, whereas entertainment and esthetic are of a passive type. Correspondingly, entertainment and educational are more absorptive compared to esthetic and escapist experiences, which entail more immersion.

According to this, and following the ideas set in the same way in previous works (Oh et al. 2007, Hosany & Witham 2009, Mehmetoglu & Engen 2011) our hypotheses are:

H<sub>4</sub>: The higher the level of education experienced, the higher the tourists' satisfaction.

H<sub>5</sub>: The higher the level of entertainment in the travelling experience, the higher the tourist's satisfaction.

H<sub>6</sub>: The higher the level of escapism in the travelling experience, the higher the tourist's satisfaction.

H<sub>7</sub>: The higher the level of esthetics in the travelling experience, the higher the tourist's satisfaction.

From a practical point of view, it is obvious that the public and private agents in a city not only need to obtain an assessment of the perceived quality and the value from its touristic visitors. They also seek to set aims in favor of repetition of visiting experiences and good reputation. It is for this reason that quality and value have been related to word-of-mouth and repetition of destination in the study of touristic travelling (Cronin et al. 2000, Baker & Cropton 2000, Petrick & Backman 2002, Petrick 2004, Williams & Soutar 2009, Chen & Chen 2010, to mention a few).

Although there have been differing results in terms of the direct links between quality, value, satisfaction and behavioral intentions (Cronin et al. 2000, Chen & Chen 2010), in our study the main focus is to analyze the explanatory power of the first two on satisfaction, and the antecedent effect that this factor supposes on repetition and word-of-mouth. Thus, our general hypotheses are:

H<sub>8</sub>: The higher the general satisfaction from travelling, the higher the tourist's intention to revisit.

H<sub>9</sub>: The higher the general satisfaction from travelling, the higher the tourist's positive word-of-mouth.

H<sub>10</sub>: The higher the intention to revisit, the higher the tourist's positive word-of-mouth.

### 3. Empirical research

The empirical study is based on an internet survey to a group of 136 valid interviews to British Internet users during April 2013. Selection criteria was followed by means of two consecutive filter questions, the first of which differentiated whether the respondent travelled for touristic or working reasons to any national or international European destination within the last twelve months. The second filtering question was used to discard those respondents whose travelling consisted on visiting rural or non-urban destinations for more than 50% of the time spent. Finally, a one-by-one selection process was applied in order to discard those travellers whose destination was clearly non-urban, consisted on longer trips of a month or more or did not refer to any real or specific European city. Table 1 describes the main features of the sample gathered.

TABLE 1  
Descriptive values obtained from the respondents

Variable		Result
Gender	Female	63.2%
	Male	36.8%
Age	18 to 34 years	36.1%
	35 to 54 years	31.6%
	55 to 64 years	18.4%
	65 years or more	15.4%
Marital status	Single/ Alone	27.1%
	Married/living with partner	72.8%
Education level	Secondary school	25.7%
	Vocational Education and Training (VET)	17.6%

	General Academic Studies Degree	16.2%			
	Graduate	32.4%			
	Master's / Doctoral degree	8.1%			
<b>Destination</b>	Own country (UK)	36%			
	Abroad	64%			
<b>Travelling with...</b>	Alone	16.2%			
	With company	83.8%			
<b>No. times of visit to this city</b>	Never before	39%			
	1 to 4 times	22.3%			
	5 times or more	28.7%			
<b>Type of visit and main reason</b>	A trip within a longer vacation trip	15.4%			
	Within a longer trip for other purposes	13.2%			
	An expressly planned trip to this city	71.3%

### 3.1. Preparation and testing of the questionnaire

Although the constructs for the Education, Entertainment, Escapism and Esthetic experience realms were defined by Pine and Gilmore as central components of their Experience Economy framework (1999, pp.29-31), they did not propose measurement scales for them. However, other authors from the academic field have developed scales, such as Oh et al. (2007), Hosany and Witham (2009), and Mehmetoglu and Engen (2011). The first work presents a thorough set of scales for the aforementioned factors. However, we choose Mehmetoglu and Engen's (2011) set for brevity reasons in the need to handle an affordable extension in the questionnaire<sup>1</sup>. For the case of Value of travel experience we drew on Sweeney and Soutar (2001), Petrick (2004), Gallarza and Saura (2006), Williams and Soutar (2009), Cronin *et al.* (2000), and Forgas-Coll *et al.* (2012). In the particular case of Quality of travel experience, we also based generically on these works, although in this case, due to the specificity of city break travelling, consisting on giving an opinion about the own perceived quality as a result to a visit to a city, we had to set an own list of items for it. Lastly, the consequent (resulting) factors of General Satisfaction, Intention to revisit, and Word-of-Mouth were based on Petrick (2004).

<sup>1</sup> We also defined and included scales for measuring the antecedents of quality and value of travel experience, that were currently set in the literature. However, they are not relevant for the specific purposes of our study here.

### 3.2. Results of the contrast tests

To analyse the measuring model, we extracted the Cronbach's alpha, average variance extracted (AVE) and construct reliability measures. All these reliability measures give values above the recommended levels of 0.707 for the case of loading factors, 0.7 (Churchill & Iacobucci, 2005) for Cronbach's alphas, of 0.5 for the case of the average variances extracted (AVE), and of 0.65 for the case of composite reliability measures (Fornell & Larcker 1981). For their part, general goodness-of-fit tests provide good results. Table 2 shows the final set of items that complied with the reliability, validity and measurement invariance tests.

TABLE 2  
Standardized loadings and reliability measures for items and factors

	Standzd. loadings	Cronbach's alpha	AVE	Composite reliability
F1 EDU1: The visit to this city made me more knowledgeable	0.933			
EDU2: I learnt something new during my visit	0.911	0.824	0.850	0.919
F2 ENT2: I enjoyed sightseeing this city	0.891			
ENT1: The visit to this city was entertaining to me	0.889	0.738	0.792	0.884
F3 ESC1: I forgot all about time	0.944			
ESC2: During my visit to this city, I got carried away by the different events	0.810	0.727	0.774	0.872
F4 EST1: I experienced the surroundings of this city as attractive	0.909			
EST2: The surroundings strengthened my overall experience	0.890	0.765	0.809	0.895
F5 RQual3: Definitely, this is a good city for visitors	0.935			
RQual1: Overall, I believe this is a city of good quality for visitors	0.911			
RQual2: In general, I believe this city offers amenities, services and infrastructures of good quality to visitors	0.897	0.879	0.805	0.925
F6 REV2: The travelling experience from visiting this city is worth the time and effort spent on it	0.906			
REV1: The value I received from visiting this city is worth the money it cost	0.887			
REV3: The travelling experience compares favorably to other cities that we've seen	0.831	0.902	0.836	0.939
F7 RSat1: I am happy with the experience of having gone to this city	0.932			
RSat2: My choice to travel to that place was a wise one	0.900			
RSat3: We were delighted by what we lived and we saw there	0.867	0.847	0.766	0.907
F8 RRev1: I will choose to visit this city again	0.947			
RRev2: If I find a good price, in the future I will choose to visit this city again	0.929			
RRev3: It is possible that I will come back within the next five years	0.918	0.883	0.810	0.928
F9 RWOM2: If I completed a travel review on this city, it would be in general a positive one	0.960			
RWOM3: Overall, I would recommend this place to visit	0.949			
RWOM1: Overall, I have done a good comment about the travel to the city to my friends and relatives	0.928	0.924	0.868	0.952

Also, the square roots from any AVE value obtained bring resulting values that are higher than any squared correlation from their corresponding row or column. Therefore, convergent and discriminant validity among the obtained factors is ascertained (Anderson & Gerbing 1988). Table 3 shows the linear correlations of the obtained factors.

TABLE 3  
Bivariate correlations among factors

	F1	F2	F3	F4	F5	F6	F7	F8
<b>Education</b>								
<b>Entertainment</b>	0.612							
<b>Escapism</b>	0.513	0.463						
<b>Esthetics</b>	0.712	0.865	0.439					
<b>QualTravExp</b>	0.480	0.727	0.363	0.676				
<b>Value TravExp</b>	0.638	0.728	0.547	0.662	0.704			
<b>GenSat</b>	0.625	0.771	0.492	0.588	0.719	0.807		
<b>IntRevisit</b>	0.453	0.688	0.455	0.588	0.664	0.734	0.798	
<b>W-O-M</b>	0.573	0.770	0.467	0.712	0.771	0.818	0.837	0.791

The regression analysis was performed by means of Partial Least Square analysis. Three alternative models are tested, all including the resulting constructs of Satisfaction, Intention to revisit and Word-of-Mouth related in the same way (Table 4). Model 1 comprises the four defined measures of Experience economy as sole antecedents, whereas Model 2 considers the alternative of quality of travel experience, value of travel experience and the moderating effect of value on the relation between quality and satisfaction. Finally, Model 3 is an aggregation of the two previous models.

Table 4 shows the results from the coefficients and regression functions of satisfaction on the previously defined factors from the two compared frameworks, as well as the intention to revisit and word-of-mouth on the former.

In the case of Model 1, results show that the attributes of Entertainment followed by Aesthetics significantly affect on general satisfaction. The third factor in size of effect is Escapism. Thus, respectively, hypotheses H<sub>5</sub>, H<sub>7</sub> and H<sub>6</sub> are supported. For its part, Education does not seem to explain general satisfaction of travel experience among city breakers, meaning that hypothesis H<sub>4</sub> is not supported. Judging these results from Pine and Gilmore's (1999) classification of experience realms, at an aggregated level, it seems that city break travelling could be characterized as an experience of passive participation, and of immersion up to an extent, meaning that it entails a high degree of entertainment and aesthetics, and some degree of escapism.

From the results in Model 2, both the value of travel experience, followed by the perceived quality seem to exert a significant influence on general satisfaction. Also, the mediation effect of the value of travel experience in the relation between quality and satisfaction appears to be statistically significant. Therefore, hypotheses H<sub>3</sub> and H<sub>2</sub> are sustained. Also, judging from the values of the coefficients and the significance of this mediating effect, value of travel experience turns out to be clearly the most influential factor between these two.

Judging from the size of the coefficients of determination ( $R^2$ ) between Models 1 and 2, we find that the second is only slightly greater. The calculated confidence intervals for both models,  $R_1^2$  and  $R_2^2$  (Cohen et al., 2003, p.88) give overlapping values, meaning that Model 2 does not predict General Satisfaction significantly more than Model 1.

With respect to Model 3, comprising the combined effects, results indicate that only aesthetics and entertainment from the Experience Economy framework, along with value of travel experience, from the second framework, have significant regression coefficients, meaning that H<sub>3</sub>, H<sub>7</sub> and, also significantly but to a lesser extent H<sub>5</sub>, would still be supported. However, these significant effects have a reduced size in their slopes compared to their respective values in alternative Models 1 and 2. On the contrary, hypotheses H<sub>2</sub> (quality of travel) and H<sub>6</sub> (escapism) would not hold as in their respective (previously tested) models. Finally, the coefficient of determination ( $R^2$ ) for Model 3 shows a confidence interval that overlaps with those from Models 1 and 2. Therefore, it cannot be concluded that this model has a significantly greater explanatory power than the two previous models.

TABLE 4

One tail significance levels: \*  $p < 0.05$  ; \*\*  $p < 0.01$ ; \*\*\*  $p < 0.001$

With respect to the regression functions of the intention to revisit on satisfaction, and word-of-mouth, on the former two, all the obtained regression coefficients give statistically significant values<sup>2</sup>. Therefore, satisfaction leads to intention to revisit the city. Also, both satisfaction and the intention to revisit the city seem to lead to a good word-of-mouth with friends and acquaintances. In particular, there is also a significant mediating role from the factor of intention to revisit the city in the relation between satisfaction and word-of-mouth.

#### 4. Conclusions

Over the last 30 years the study of determinants of satisfaction in touristic services has experienced significant progress. The efforts made in the measurement of perceived quality and value, and their relations with satisfaction and behavioral intentions in services have given light to the understanding of customers' interpretations about their consumption process. It has been known and repeatedly evidenced that consumers organize information at increasing levels of abstraction, ranging from a product's physical attributes, through its functional and practical benefits, up to reaching its emotional payoffs (Young & Feigin 1975). In this line, progress in measurement scales during these years has gradually given way to the inclusion of "the salient intrinsic attributes, extrinsic attributes, perceived quality, and other relevant high level abstractions", as it was proposed by Zeithaml (1988, p. 14).

In the case of touristic travelling, this evolving process has given way to conceptually rich and new points of view stressing more on the *experiential aspect* of consumption. Despite the advantages of these alternatives, at least from the results of the regressions performed in our study, it does not seem this new factors or their combined use with the previous ones add more explanatory power.

Secondly, with regard to the characterization of city break travelling, interestingly, these trips seem to create basically an entertaining and esthetic experience, and a slight degree of escapism in travelers.

Finally, evidence sustains the idea that in city breaks, satisfaction leads very especially to an intention to revisit the city, but also to a positive word-of-mouth. It also seems clear that the intention to revisit mediates in the relation from satisfaction to word-of-mouth.

#### 5. Limitaciones and implications for future research

We must admit that there is still more work to do in future analyses delving into the primary antecedents of satisfaction and behavioral intentions, especially in the case of adding attributes defined from the prism of travelers' experiences, for which the literature is still scarce. Also, it is convenient to conduct additional tests to the combined relations among factors from these two frameworks, in order to understand more deeply what determines satisfaction, repetition and good-referencing in city travelling.

## RESUMEN

*El objetivo de esta investigación es analizar el impacto de la cultura en la percepción de valor de un servicio en función del medio que se haya utilizado para su adquisición, bien sea el canal tradicional (canal offline) o Internet. La muestra está formada por 300 consumidores españoles y 300 británicos. Dado que los dos países objeto de estudio difieren en sus dimensiones culturales, se realiza un análisis multigrupo que permite analizar el efecto moderador de la cultura sobre los determinantes de la calidad del servicio hotelero y del valor. Los resultados muestran que las diferencias culturales se ponen de manifiesto cuando el servicio se adquiere vía online, mientras que cuando el servicio se adquiere a través del canal offline, la cultura no determina la percepción de calidad del consumidor.*

## Palabras clave:

Satisfacción, Riesgo percibido, Calidad del servicio, Valor percibido, Cultura, Canal offline e Internet.

## 1. Introducción

El conocimiento por parte del proveedor de un servicio de la evaluación del mismo por el consumidor, es fundamental para comprender su comportamiento (Nilson 1992; Ostrom y Iacobucci 1995). Además, la evaluación del servicio se ha considerado un constructo subjetivo que puede variar en función del medio en el que se haya comprado, es decir, esa evaluación se ve afectada por el canal utilizado para la adquisición del servicio.

En los últimos años las agencias de viaje tradicionales han experimentado grandes dificultades para atraer y mantener a los consumidores, además de hacer frente a los desafíos presentados por la naturaleza cambiante de la industria turística. El aumento de las expectativas de los visitantes y el crecimiento del uso de las tecnologías de la información, en particular Internet, son algunos de los factores que han hecho que sea más difícil para las agencias de viaje mantener su ventaja competitiva. Las agencias de viajes tradicionales han sido el canal de distribución más usado por los turistas (Buhalis y Law, 2008; Suárez et al., 2007). Sin embargo, en los últimos años, Internet ha revolucionado la industria del viaje y del turismo (Xiang et al., 2014) y se ha convertido en la fuente de información más importante para los turistas (Wu et al., 2008; IET, 2010) así como el medio más usado para la adquisición de determinados servicios turísticos (Frontur, 2010).

Dado el crecimiento exponencial de los viajes internacionales, el interés por las influencias de las dimensiones culturales en el comportamiento de los turistas está empezando a fortalecer el conocimiento en este campo. Para alcanzar el éxito en el desarrollo del turismo internacional, los profesionales del sector deben entender las diferencias culturales entre los turistas, así como entre los turistas y los lugares visitados (Meng, 2010) y adaptar el diseño de sus plataformas de venta para atender las necesidades de estos turistas internacionales (Tigre et al., 2014).

Concretamente, la investigación cross-cultural es relevante dentro de la industria turística por varias razones (Pizam y Fleischer, 2005). En primer lugar, la industria ha experimentado un importante crecimiento internacional en los últimos años. En segundo lugar, las características culturales son de importancia vital para el atractivo real de un producto. Por último, el turismo es un servicio consumido por personas de diferentes nacionalidades.

A pesar de la importancia reconocida de la cultura en turismo (Pizam y Jeong, 1996; Kozak, 2002, entre otros), se han llevado a cabo pocos estudios para comprender cómo las dimensiones culturales influyen en la evaluación del servicio turístico. En este contexto, es importante considerar el papel determinante de la cultura nacional en la conformación de la interacción humana en todas sus formas, incluyendo tanto las agencias de viaje tradicionales como el mercado online, teniendo en cuenta que la cultura puede ayudar a explicar muchos de los patrones observados en las preferencias de los turistas y en sus comportamientos. En palabras de Reisinger y Turner (2003, p. 10) "la cultura del turista explica su comportamiento". Tomando estas consideraciones como punto de referencia, el propósito de este estudio es analizar el impacto de la cultura en el valor percibido de un servicio en función del medio que se haya utilizado para su adquisición, bien sea el canal tradicional o Internet. Concretamente, el objetivo de esta investigación es analizar cómo la evaluación que realiza el individuo sobre el canal de compra (satisfacción, riesgo percibido) influye sobre la evaluación del servicio turístico consumido (calidad y valor percibido del servicio hotelero), teniendo en cuenta dos canales principales de compra (agencia e Internet). Además, se analizan las posibles

diferencias que se puedan encontrar debidas a las dimensiones culturales “aversión al riesgo” e “individualismo-colectivismo”.

## **2. Revisión de la literatura e hipótesis**

### ***2.1. El canal de compra en la evaluación de un servicio turístico***

#### ***2.1.1. El canal de compra como determinante de la evaluación del servicio turístico***

La calidad del servicio y el valor percibido son dos de las variables clave de la evaluación de un servicio turístico. Con respecto a la calidad percibida del servicio, estudios previos establecen, tanto desde un punto de vista teórico (Chen and Dubinsky, 2003; Cronin et al., 2000), como desde un enfoque empírico (Liao and Wu, 2009; Kumar and Lim, 2008; Kim et al., 2008; Snoj et al., 2004) – que la calidad del servicio es un factor determinante del valor percibido. Concretamente, diversos investigadores proponen que la calidad del servicio tiene un efecto positivo sobre el valor percibido global (Fornell et al. 1996) y queda demostrado en estudios previos (Cronin et al. 2000; Dodds et al. 1991).

La evaluación de un servicio se ve afectada por la experiencia en la compra del turista. En el caso concreto de un turista, se puede asumir que, la evaluación que el turista realiza del proceso de compra en un canal –tradicional o electrónico- (fundamentalmente medido a partir de la satisfacción y el riesgo) debe influir sobre la evaluación del propio servicio. Basándonos en la Teoría de Redes (Collins and Loftus, 1975) que postula que la memoria está estructurada por nodos y que los nodos están relacionados entre ellos. Podemos asumir que, el canal usado para adquirir el servicio y el propio servicio son nodos que están vinculados.

#### ***2.1.2. Diferencias entre los canales de distribución: agencias de viaje tradicionales e Internet***

La revisión de la literatura pone de manifiesto que la evaluación de la oferta electrónica difiere de los servicios tradicionales interpersonales (Liljander et al., 2002; Santos, 2003; van Riel et al., 2001). Claramente el componente diferenciador es la tecnología (Parasuraman y Grewal, 2000). Internet presenta ventajas importantes respecto a las agencias tradicionales tales como la accesibilidad, la facilidad de actualización, la información en tiempo real, comunicaciones interactivas, etc. Sin embargo, desde el punto de vista del consumidor, la percepción de riesgo en la utilización de Internet para hacer compras es más alta que en las agencias de viaje tradicionales, ya que deben proporcionar los datos personales y la información relacionada con el pago antes de recibir el producto o servicio. En otras palabras, la compra a través de Internet trae consigo un mayor grado de ambigüedad que las compras en los establecimientos tradicionales, como las agencias de viajes (Suki y Suki, 2007). A diferencia de los sitios webs, las agencias de viajes obtienen mejores resultados en la interacción personal. Obtienen mejores resultados que los oferentes online en relación al contacto humano y los servicios personalizados (Law, et al., 2004) y por lo tanto se espera una mayor satisfacción en este canal.

Así se propone que,

*H1. El canal a través del cual compra el cliente un servicio turístico influye en la calidad percibida de dicho servicio.*

## **2.2. Efecto moderador de la cultura en la evaluación de un servicio turístico**

Estudios previos establecen que la cultura es persuasiva en todos los aspectos del consumo y el comportamiento del consumidor y debería de ser integrada en las teorías de comportamiento del consumidor (Mooij, 2004). A partir de los años 80, diversos investigadores han debatido sobre las dimensiones más apropiadas para conceptualizar la cultura (Hofstede, 1980, 1991; Keillor y Hule, 1999; Steenkamp, 2001, por ejemplo). Sin embargo, el marco desarrollado por Hofstede (1980, 2010) es el paradigma cultural más empleado (Sivakumar and Nakata, 2001; Steenkamp, 2001). Hofstede define la cultura nacional como “el programa colectivo de la mente que distingue a los miembros de un grupo de los miembros de otro grupo diferente” (Hofstede, 1991, p. 5). Su marco propone cinco dimensiones con el propósito de ilustrar que “las diferencias culturales entre las naciones modernas deberían ser significativamente medidas y ordenadas en un conjunto discreto de variables, representando diferentes respuestas a un problema universal de la sociedad humana” (Hofstede, 1991). Las cinco dimensiones son: distancia al poder, aversión al riesgo, individualismo-colectivismo, masculinidad-feminidad y orientación a largo plazo. Sin embargo, las dimensiones de individualismo-colectivismo y aversión al riesgo son las más empleadas en la investigación cross-cultural del comportamiento del consumidor (Yaveroglu y Donthu, 2002; Yenyurt y Townsend, 2003; Reimann et al., 2008).

Individualismo se refiere a una cultura en la cual la gente cuida solamente de sí mismo y de su familia más inmediata, mientras que en culturas colectivistas prevalecen los valores del grupo frente a los individuales. La aversión al riesgo hace referencia a la extensión por la cual la gente se siente asustada por la incertidumbre y la ambigüedad e intenta evitar tales situaciones (Hofstede, 1980, 1991, 2001).

Estudios previos ponen de manifiesto que los sentimientos y las emociones de los consumidores son aspectos importantes del comportamiento del consumidor (Derbaix y Pham 1991; Havlena y Holbrook 1986). De modo que, los aspectos emocionales y afectivos de las teorías del proceso de decisión evidencian que el valor de la experiencia puede influir en la calidad percibida del servicio (Schwarz y Clore 1988). Además, un sentimiento positivo que tiene un consumidor de una experiencia previa llevaría a una evaluación positiva de calidad, mientras que un sentimiento negativo nos conduciría a una percepción de calidad negativa (Schwarz y Clore 1988).

La literatura pone de manifiesto que turistas de diferentes culturas difieren en la evaluación global de la calidad percibida de un servicio (Donthu y Yoo, 1998, Furrer et al., 2000, Hsieh y Tsai 2009). Estas variaciones pueden deberse a la dimensión cultural de individualismo-colectivismo.

Culturas consideradas individualistas ponen más énfasis en los atributos específicos de un proceso o producto y presentan una mayor preferencia por los valores utilitarios del intercambio (Bhawuk y Brislín 1992). Mientras que culturas colectivistas dan más valor a las opiniones de otras personas (Samli 1995; Mooij 2004). En concreto, en las sociedades individualistas, los consumidores principalmente persiguen sus propios intereses (Dash et al. 2009) y son menos tolerantes con los proveedores que ofrecen una calidad del servicio deficitaria. Por el contrario, los consumidores colectivistas son más tolerantes frente a un servicio defectuoso (Donthu y Yoo 1998). La búsqueda de

información online y la satisfacción con el sitio web son en gran medida experiencias individuales. Por lo tanto, es de esperar que los consumidores de culturas individualistas pongan más énfasis en la relación entre la satisfacción con la atención recibida durante la contratación del servicio y la calidad percibida del servicio turístico consumido que los individuos de culturas colectivistas.

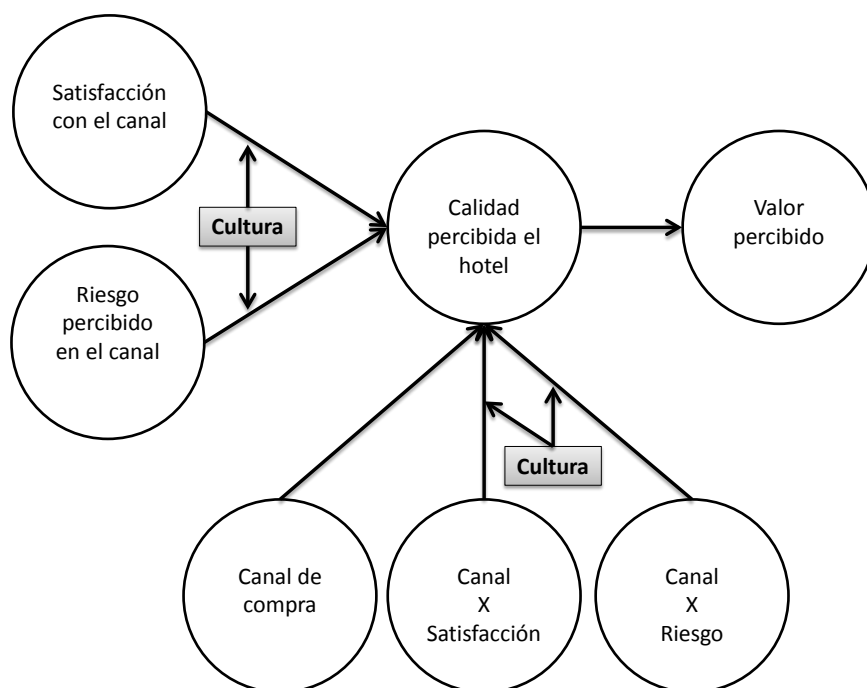

También el riesgo asumido en la decisión de compra tendrá un impacto en la calidad percibida del hotel. De modo que podría plantearse una relación negativa entre el riesgo y la percepción de la calidad para turistas de culturas con fuerte aversión al riesgo. Consumidores procedentes de culturas con una elevada aversión al riesgo están más preocupadas por las promesas hechas por el proveedor del servicio y con la seguridad (Lee and Joshi, 2007) – en otras palabras, con la calidad del servicio. Sin embargo, estas relaciones serán poco importantes para los turistas con una baja aversión al riesgo, dada su sensibilidad al riesgo relativamente baja (Suki y Suki 2007).

En resumen, se puede concluir que las diferencias encontradas en turistas de distintas culturas en términos de individualismo-colectivismo y aversión al riesgo van a tener un efecto moderador sobre la formación de la calidad percibida del servicio turístico, por lo tanto se propone que,

*H2. La cultura a la que pertenece un turista modera el efecto de la satisfacción y del riesgo como principales determinantes de la calidad percibida del servicio turístico adquirido.*

A partir de esta revisión de la literatura, el modelo conceptual que se propone testar en esta investigación es el recogido en la figura 1.

**Figura 1. Modelo teórico propuesto**

### 3. Metodología

#### 3.1. Diseño de la muestra y recolección de datos

Se ha seleccionado una muestra de turistas procedentes de dos nacionalidades, española y británica. La elección está basada en que España y Reino Unido muestran grandes diferencias en las dimensiones culturales individualismo/colectivismo y de aversión al riesgo (Hofstede 1980, 2001).

TABLA 1  
Puntuaciones de las dimensiones culturales de Hofstede para España y Reino Unido

	España	Reino Unido
Individualismo-Colectivismo	51	89
Aversión al riesgo	86	35

El estudio está basado en dos cuestionarios estructurados realizados telefónicamente. Un cuestionario fue administrado a turistas, tanto españoles (150) como británicos (150), que han contratado el servicio turístico a través de las agencias de viaje tradicionales y otro cuestionario administrado a turistas (españoles – 150 - y británicos-150-) que han contratado el servicio turístico a través de agencias de viaje online. Concretamente el servicio contratado era el de un hotel. Los cuestionarios cuentan con dos preguntas filtro para poder incluir a los turistas en la muestra. En primer lugar, que los turistas hayan contratado el hotel usando uno de los dos canales analizados y, en segundo lugar, que su nacionalidad, bien sea española o británica, coincida con su país de residencia

Respecto a la composición de la muestra, el 51,4 % de los encuestados fueron hombres y el resto mujeres. La mayoría de los turistas tenían más de 35 años. Alrededor del 90% de todos los encuestados provenían de hogares formados por dos o más personas, el 59% cuenta con estudios universitarios y el 74% contaba con un trabajo remunerado.

### 3.3. Escalas de medida

Todas las escalas de medida han sido adaptadas de instrumentos validados usados en la literatura.

**Satisfacción:** se midió usando dos ítems ampliamente aceptados en la literatura (grado de satisfacción y grado de placer) (Oliver 1981).

**Calidad percibida del hotel:** se midió usando una versión adaptada de la escala de Dodds et al. (1991), Grewal et al. (1998), Sweeney et al. (1999) y Teas y Agarwal (2000). (El hotel es de buena calidad; El hotel es fiable; El hotel está disponible).

**Riesgo percibido:** se midió a partir de una escala adaptada de estudios previos (Gupta and Kim 2010; Chen and Dubinsky 2003; Sweeney et al. 1999). (Es arriesgado comprar un producto de estas características; Es probable que en la reserva haya algún error).

**Valor percibido:** se usó una escala utilizada en el sector servicios (Gallarza and Gil 2006; Cronin et al. 2000; Zeithaml 1988). (El valor de esta compra ha sido bueno; La diferencia entre lo que he dado y recibido ha sido positiva; La compra ha satisfecho mis necesidades y mis carencias).

Para todas las escalas de medida se utiliza un rango 1-5 en formato Likert.

## 4. Resultados

Para estimar los dos modelos, y dado que, tanto en las agencias de viajes como en Internet los datos no siguen una distribución normal multivariante, se utilizó bootstrap con 1000 réplicas para los test de significación de los parámetros.

Con respecto a la evaluación del modelo de medida, se demuestra que el alpha de Cronbach ( $\alpha$ ) está dentro de los límites recomendados por la literatura. También se calcularon los índices de fiabilidad compuesta (FC) y varianza extraída (VE), con resultados favorables, por encima del 0,7 y 0,5 respectivamente (Tabla 2).

TABLA 2  
Fiabilidad compuesta y Varianza Extraída

	España			Reino Unido		
	FC	VE	$\alpha$	FC	VE	$\alpha$
<b>Satisfacción</b>	0.89	0.80	0.89	0.86	0.76	0.86
<b>Riesgo percibido</b>	0.70	0.55	0.68	0.67	0.48	0.64
<b>Calidad del hotel</b>	0.86	0.75	0.84	0.89	0.80	0.88
<b>Valor percibido</b>	0.89	0.75	0.89	0.91	0.78	0.91

Para analizar el modelo, se llevó a cabo un path análisis multi-grupo, diferenciando por culturas. La variable canal de compra se introduce en el modelo como variable de interacción, incluyendo su efecto principal y la interacción con la satisfacción y el

riesgo percibido en el canal. El canal es codificado como “0” Internet, “1” agencia de viajes.

La bondad de ajuste de los indicadores del modelo path multi-grupo se muestra en la Tabla 3.

TABLA 3  
Índices globales

<b>Chi cuadrado</b>	55.18
<b>Grados de libertad</b>	10
<b>p-valor</b>	0.00
<b>RMSEA</b>	0.08
<b>NFI</b>	0.95
<b>IFI</b>	0.96
<b>CFI</b>	0.96
<b>GFI</b>	0.97

Todos los indicadores se encuentran dentro de los límites recomendados por la literatura, con la excepción de la Chi-cuadrado.

Con respecto al modelo estructural, se muestran los coeficientes estandarizados distinguiendo entre grupos de consumidores españoles y británicos.

TABLA 4  
Coeficientes estandarizados (valores p)

	<b>España</b>	<b>Reino Unido</b>	<b>Diferencias por cultura (test-t)</b>
<b>Satisfacción → Calidad del hotel</b>	0.27 (0.003)	0.62 (0.002)	3,48(0.001)
<b>Riesgo percibido → Calidad del hotel</b>	-0.33 (0.002)	0.01 (0.894)	3,35 (0.001)
<b>Canal de compra → Calidad del hotel</b>	0.00 (0.972)	0.00 (0.977)	0.00 (1,00)
<b>Canal x Satisfacción → Calidad del hotel</b>	0.14 (0.099)	-0.08 (0.253)	-2,14 (0.033)
<b>Canal x Riesgo → Calidad del hotel</b>	0.26 (0.004)	0.04 (0.517)	-2,17 (0.030)
<b>Calidad del hotel → Valor percibido</b>	0.14 (0.03)	0.22 (0.002)	0,96(0.335)

En general, el modelo de determinantes de la calidad percibida del hotel para el caso del turista español muestra que las evaluaciones que éste realiza respecto al canal de compra en términos de satisfacción y de riesgo tienen un efecto significativo sobre su percepción de calidad del hotel, como es de esperar de acuerdo con las conclusiones a las que llegan trabajos previos (Schwarz y Clore 1988; Lee and Joshi, 2007). Sin embargo, para los turistas británicos es solamente significativo el coeficiente de la relación entre satisfacción y calidad percibida. Mediante la comparación entre ambas culturas, se puede concluir que para los británicos es más importante la satisfacción en la formación de su percepción de calidad del hotel (0.62 vs. 0.27 respectivamente para británicos y españoles, p-valor de la diferencia=0.001), y menos relevante el riesgo percibido en el canal (0.01 vs -0,33, respectivamente, p-valor de la diferencia=0.001). Este resultado apoya la existencia de un efecto moderador de la cultura en los

determinantes de la calidad percibida del servicio turístico, tal y como se propone en la hipótesis 2.

Respecto al efecto del canal de compra sobre la percepción de calidad, por sí solo, no tiene efecto principal significativo ni en el caso de los turistas españoles ni en el caso de los británicos. Sin embargo, su efecto interacción con la satisfacción y el riesgo sí son significativos en turistas españoles. Así, cuando el canal de compra es Internet (codificado como 0), el efecto total de la satisfacción y del riesgo sobre la calidad es el descrito en párrafos anteriores, mientras que cuando el canal es agencia de viajes (codificado como 1), el efecto total de la satisfacción sobre la calidad aumenta en 0.14 ( $0.27+0,14=0,41$ ), mientras que el efecto negativo del riesgo se reduce en 0,26 ( $-0,33+0,26=-0,07$ ). Este resultado apoya el efecto moderador del canal sobre la evaluación de la calidad percibida (hipótesis 1). Sin embargo, en el caso de los turistas británicos, este mismo efecto moderador resulta ser no significativo para ambas variables (satisfacción y riesgo), lo que sugiere la existencia de una interacción cultura x canal.

Para finalizar, la relación entre calidad percibida del hotel y el valor percibido por el turista es significativa, positiva y sin diferencias significativas entre culturas.

## 5. Conclusiones

En este estudio se ha analizado el efecto que sobre la evaluación de un servicio turístico disfrutado (calidad y valor percibido del servicio hotelero) tiene la evaluación que realiza un individuo sobre el canal de compra (satisfacción y riesgo percibido) teniendo en cuenta dos canales principales de compra (agencia e Internet). Además, se analizan las posibles diferencias que se puedan encontrar debidas a las dimensiones culturales “aversión al riesgo” e “individualismo-colectivismo”.

La principal aportación de este trabajo es la comprobación empírica de la influencia del canal y el efecto moderador de la cultura del turista sobre la evaluación del servicio consumido. En esta línea, los resultados ponen de manifiesto que la relación entre la satisfacción con el medio (tradicional u online) y la calidad percibida del hotel es significativa tanto para turistas individualistas (británicos) como colectivistas (españoles). Sin embargo, el coeficiente de dicha relación es mayor para turistas individualistas que han contratado el servicio turístico a través de Internet que para aquellos que lo han contratado a través de las agencias de viajes.

En lo que se refiere a la relación entre el riesgo percibido y la calidad percibida del hotel, los resultados derivan que hay una relación significativa y negativa para individuos de culturas aversas al riesgo (españoles) que han adquirido el servicio a través de Internet. Sin embargo, este efecto no es significativo para turistas de culturas con baja aversión al riesgo con independencia del medio a través del cual se haya adquirido el servicio.

De modo que, para aquellos turistas que provienen de culturas individualistas y con escasa aversión al riesgo su evaluación de la calidad del servicio hotelero estará condicionada principalmente por la satisfacción que percibe en el canal de compra, sin diferencias para el canal físico o electrónico, y sin que el riesgo percibido suponga un factor de menoscabo de dicha calidad. Sin embargo, para los turistas de culturas colectivistas y con alta aversión al riesgo, el canal será determinante para identificar los principales determinantes de la calidad, la satisfacción cuando se trata de una agencia de viajes y conjuntamente satisfacción y riesgo cuando se trata de Internet.

Desde un punto de vista gerencial, los resultados derivan importantes implicaciones. Durante mucho tiempo, los temas culturales han sido muy trabajados en aspectos relacionados con la vida en general y con la satisfacción en el trabajo (Hofstede, 2001). Sin embargo, no hay muchas investigaciones que traten la discusión de la influencia de los valores culturales en la evaluación de un servicio turístico. Mientras que estudios previos ponen de manifiesto que los proveedores del servicio no alcanzan las expectativas de los consumidores procedentes de diferentes culturas (Warden et al., 2003) y que la cultura debe jugar un papel primordial (Clark et al., 1996), el objetivo de estos estudios no ha sido controlar la evaluación del servicio de acuerdo a los valores culturales de los individuos. Basándonos en lo anterior, en este estudio se pone de manifiesto que las variaciones culturales tienen una influencia significativa en la evaluación del servicio turístico.

De modo que, si los proveedores del servicio quieren competir de manera eficaz en un entorno globalizado, deben conocer cómo los turistas evalúan los servicios que contratan. Este análisis es de especial interés en el mercado internacional ya que la evaluación de los turistas va a estar influenciada por su cultura de origen. Estos resultados están en línea con estudios previos que ponen de manifiesto la necesidad de adaptar las plataformas de venta, para atender mejor las necesidades de los mercados internacionales (Tigre et al., 2014).

Por último, cabe destacar que estos resultados podrían aplicarse no sólo a las empresas que trabajan a nivel internacional, sino también a los que operan en un solo país. De ahí que los autores de esta investigación sugieran que todos los proveedores de servicios deben tener en cuenta la aversión al riesgo y el individualismo/colectivismo a la hora de ofertar sus servicios.
