## RESUMEN

*La literatura advierte sobre la necesidad de investigar el concepto “valor de marca”, puesto que la creación de marcas fuertes y la mejora de su valor hoy en día representa una línea de actuación prioritaria para las empresas. A pesar del gran interés por este tópico entre los académicos y prácticos, la investigación empírica sobre su eco, impacto y medición en las empresas hoteleras está en su fase inicial de desarrollo. Por ello, este trabajo progresa en la dirección de una propuesta del proceso de creación del valor de marca basado en el consumidor en la industria hotelera. El estudio empírico fue realizado entre 475 huéspedes de hoteles de categoría superior ubicados en Croacia. Los resultados demuestran que la imagen y la lealtad ejercen un impacto positivo sobre el valor de marca, mientras que el impacto de la confianza y el compromiso es mediado por la lealtad.*

## PALABRAS CLAVE

*Valor de marca, hoteles de categoría superior, consumidores, PLS.*

---

<sup>1</sup> Este estudio ha sido realizado con el apoyo financiero prestado por el proyecto I+D del Plan Nacional del Ministerio de Educación y Ciencia - ECO2010-17475.

## **1. Introducción**

La literatura de marketing ha sugerido en múltiples ocasiones que los consumidores otorgan un valor adicional a los productos a través de su marca (Lassar et al., 1995; Yoo et al., 2000; Pappu et al., 2006). Así, el valor de marca se entiende como el valor añadido con el que la marca dota a un producto (Yoo et al., 2000), reflejando la idea de que la marca es uno de los activos más importantes de las empresas, debido a su capacidad de asegurar ventajas competitivas sostenibles y no imitables (Aaker, 1991).

Con la incorporación del concepto “valor de marca” o “capital de marca” quedó arraigada la idea de que las características intangibles asociadas a las marcas contribuyen al valor empresarial, puesto que proporcionan a la organización una plataforma para lograr una ventaja competitiva y la obtención de unas mayores ganancias futuras (Delgado y Munuera, 2001). Asimismo, según explican Bravo et al. (2011), una marca fuerte favorece la atracción de todos los agentes del mercado, dificulta los movimientos de los competidores y permite obtener un posicionamiento diferenciado. Todo ello ha conducido a un gran interés por el estudio de la marca y de su valor tanto en el ámbito académico, como empresarial (Del Río et al., 2002; Oliveira et al., 2008), mostrando, en particular, una creciente repercusión en el entorno hotelero (Bailey y Ball, 2006).

Sin embargo, la amplia variedad de planteamientos y metodologías ha originado desacuerdos relativos a la concepción y evaluación del valor de marca (Villarejo, 2001). En este sentido, Srivastava y Shocker (1991) han iniciado un debate relativo a la redundancia de la noción, indicando que su definición no es necesaria, tratándose de un constructo equivalente a la idea de lealtad, apego a la marca, posicionamiento o ventaja competitiva. A partir de ahí, se ha creado una cierta confusión sobre cuál es la mejor forma de estimar el concepto (Keller, 1998), en qué consiste realmente su valor, cómo se genera y de qué factores depende (Del Río et al., 2002). Desde entonces, las cuestiones relativas a una correcta evaluación del concepto siguen estando presentes tanto en la teoría como en la práctica (Lee et al., 2011).

Con el fin de ofrecer una panorámica completa en torno al valor de marca, en este trabajo presentamos una revisión de las perspectivas del análisis del constructo y distintas propuestas de concepción y evaluación. Esto nos permitirá ofrecer una nueva evaluación del concepto y contrastarla en un entorno específico – la industria hotelera, donde la investigación empírica acerca del valor de marca todavía está en su fase inicial (Bailey y Ball, 2006).

Este trabajo está compuesto por seis partes. Después de esta primera parte introductoria, en la segunda parte se presenta el marco conceptual que recoge distintas perspectivas del análisis del valor de marca, centrándose en el valor de marca basado en el consumidor y su repercusión en la industria hotelera. En la tercera parte se enuncian las hipótesis, seguidas por el diseño de la metodología de la investigación, abordado en la cuarta parte. En la quinta parte se describe el análisis y el tratamiento estadístico de los resultados obtenidos en la investigación empírica. El trabajo acaba con las conclusiones, las implicaciones y las futuras líneas de investigación derivadas.

## **2. Marco conceptual**

### ***2.1. Perspectivas del análisis del valor de marca***

Desde la literatura se han evidenciado varios criterios de estimación del valor de marca. En concreto, destacan tres perspectivas de análisis del constructo: a) la perspectiva financiera; b) la perspectiva del consumidor; y c) la perspectiva global (Del Río et al., 2002; Kim et al., 2003; Kim y Kim, 2005; Bailey y Ball, 2006; Buil et al., 2010; Xu y Chan, 2010).

De un lado, la perspectiva financiera se basa en los beneficios o resultados monetarios que la marca puede aportar a las empresas (Buil et al., 2010). Por tanto, este enfoque adopta una orientación económica, enfatizando el papel de la marca como activo de las empresas con capacidad para afectar a los flujos de caja de la compañía, el valor de las acciones y/o el precio de venta en caso de adquisición, absorción o fusión (Del Río et al., 2002). Es decir, representa la diferencia entre los flujos de caja

obtenidos por un producto con marca y los flujos de caja resultantes en el caso de que ese mismo producto se vendiera sin marca (Simon y Sullivan, 1993).

De otro lado, la perspectiva centrada en el consumidor parte de la premisa de que el valor de las marcas reside en la mente de los consumidores (Leone et al., 2006). En este sentido, la marca generará el valor para la empresa siempre y cuando aporte valor al consumidor (Aaker, 1991; Keller, 1993; Cobb et al., 1995; Prasad y Dev, 2000; Yoo y Donthu, 2001; Round y Roper, 2012). Por tanto, los trabajos que adoptan este enfoque sugieren aproximarse al valor de marca a través de las percepciones (atributos, beneficios y actitudes), las preferencias o los comportamientos de los consumidores hacia la marca (Del Río et al., 2002). Las conceptualizaciones del valor de marca propuestas por Aaker (1991), Keller (1993) y Yoo y Donthu (2001) han abordado el concepto desde esta perspectiva. Como veremos más adelante, estas son las contribuciones más relevantes y referenciadas en la literatura de marketing.

Por último, la perspectiva global combina las dos perspectivas anteriores, abarcando tanto el valor financiero de la marca como el poder de mercado (Motameni y Shahrokhi, 1998). Esta aproximación tiene en cuenta las actitudes y las conductas de todos los agentes que pueden interactuar con la marca: principalmente, la empresa, los consumidores, los distribuidores y los mercados financieros (Del Río et al., 2002). Según, Farquhar (1989), para la empresa, el valor de marca representa un incremento en los flujos de caja o en cualquier otro indicador financiero. Desde la perspectiva de los distribuidores, el valor de una marca se aprecia en el menor poder negociador que éstos tienen con relación a la empresa propietaria de la misma. Y desde el punto de vista del consumidor, equivale a la utilidad no explicada por los atributos tangibles.

Entre estas tres perspectivas del análisis del valor de marca, domina aquella basada en el consumidor. Según matiza Keller (1993), la conceptualización de valor de marca desde la perspectiva del cliente es fundamental, ya que proporciona unas pautas específicas para las estrategias de marketing y la toma de decisiones en la administración de empresas. Por tanto, si bien un enfoque financiero podría proporcionar una visión más precisa a la hora de evaluar la marca, es posible que a los gerentes de marca esta aproximación no les resulte útil en el desarrollo de su estrategias de marketing, puesto que la perspectiva financiera sólo se limita a estimar el valor de una marca. En cambio, la perspectiva del consumidor es más práctica porque ofrece una visión estratégica del comportamiento del consumidor y ayuda a los directivos a establecer las estrategias de marca adecuadas (Kim et al., 2008).

A partir de la revisión de 60 estudios empíricos en torno al valor de marca, 30 de ellos llevados a cabo en el sector turístico y hotelero y 30 en otros ámbitos, podemos observar que la literatura de marketing pone un fuerte énfasis en el valor de marca basado en el consumidor. En concreto, encontramos un gran número de estudios (p.e. Cobb et al., 1995; Kayaman y Arasli, 2007; Kim et al., 2008; Lee y Kim, 2009; Nel et al., 2009; Kimpakorn y Tocquer, 2010; So y King, 2010; Malik y Naeem, 2011; Dioko y So, 2012; Hsu et al., 2012; Šerić y Gil, 2012) que han examinado el valor de marca desde la perspectiva del consumidor en las empresas hoteleras, tal y como abordamos a continuación.

## **2.2. Valor de marca basado en el consumidor en la industria hotelera**

En la industria hotelera, el valor de marca ha sido definido como *“las actitudes y percepciones formadas, favorables y desfavorables, que influyen al consumidor a la hora de reservar el hotel”* (Prasad y Dev, 2000, p. 24). Bailey y Ball (2006) definen el valor de marca del hotel como *“el valor que los consumidores y los propietarios del hotel asocian con la marca del hotel y el impacto de estas asociaciones en su comportamiento”* (p. 34).

Desde la revisión empírica observamos que distintos estudios (p.e. Kim et al., 2003; Kim y Kim, 2005; Kayaman y Arasli, 2007; Lee y Kim, 2009; Nel et al., 2009; Malik y Naeem, 2011) han concluido que en las empresas hoteleras el valor de marca es entendido mejor según la propuesta de conceptualización de Aaker (1991). Este autor ha abordado el valor de marca desde la perspectiva del consumidor, considerando el constructo como un conjunto de asociaciones y comportamientos (Delgado y Munuera, 2001) e identificado en el valor de marca cuatro dimensiones principales: a) la lealtad hacia la marca; b) la notoriedad de marca; c) la calidad percibida y d) las asociaciones de la marca (en el sector hotelero frecuentemente consideradas como la imagen de marca).

A partir de la concepción de Aaker (1991), en la literatura de marketing hotelero han sido desarrolladas otras propuestas empíricas y conceptuales que frecuentemente han sido referenciadas en la literatura. Así, Prasad y Dev (2000) han establecido un marco hipotético del valor de marca de hotel que contiene dos dimensiones: a) el rendimiento de la marca, compuesto por la satisfacción, la intención de recompra, la relación entre precio-valor percibido y la preferencia hacia la marca y b) la notoriedad de marca, evaluada a través de la *top of mind* y el recuerdo. Por su parte, a partir de una extensa revisión de la literatura, basándose en las aportaciones de Aaker (1991) y Keller (1993), Xu y Chan (2010) han propuesto un marco conceptual en torno al valor de marca en las empresas hoteleras, clasificando el constructo en los aspectos relativos a la actitud (el conocimiento de la marca) y el comportamiento (la lealtad hacia la marca). De acuerdo con esta concepción, tres dimensiones del conocimiento de marca (la notoriedad, las asociaciones y la calidad de experiencia) son fundamentales para determinar el valor de marca del hotel y la lealtad hacia la marca. Sin embargo, como los mismos autores han señalado, es cuestionable si las asociaciones de la marca y la calidad de experiencia pueden ser consideradas como conceptos distintos y separables, por lo que futuras investigaciones son necesarias para corroborar esta propuesta.

En su estudio sobre el valor de marca de hoteles de lujo abordado desde la perspectiva del consumidor, Kimpakorn y Tocquer (2010) han identificado seis dimensiones del valor de marca de servicios: a) la notoriedad de marca; b) la calidad percibida; c) la diferenciación de la marca; d) las asociaciones primarias y secundarias; e) la confianza en la marca y f) las relaciones con la marca. Sus resultados revelaron que la diferenciación y la confianza son las dimensiones que tienen el máximo impacto sobre las relaciones que se establecen con la marca. Además, estos autores han estudiado el compromiso de los empleados del hotel, mostrando que en los hoteles con un elevado valor de marca, los empleados mostraron un elevado nivel de compromiso hacia la marca, mientras que en los hoteles con un bajo valor de marca, el compromiso de los empleados ha sido más bajo. Al haber incorporado el papel de las variables confianza y compromiso en la creación del valor de marca, este estudio ha sido el primero en profundizar en el enfoque relacional en la investigación empírica en torno al valor de marca en las empresas hoteleras.

Del mismo modo, Dioko y So (2012) han considerado la confianza y el compromiso como dimensiones del valor de marca de hotel de un lado y el valor de marca de destino de otro. Además, el estudio de Hsu et al. (2012) ha demostrado que la confianza influye de forma positiva sobre la lealtad hacia la marca en hoteles de categoría superior en China y que, como tal, representa una dimensión esencial del valor de marca del hotel. Esta creciente tendencia actual de considerar la confianza y el compromiso como variables que influyen sobre la creación del valor de marca en hoteles implica la necesidad de abordarlas más detenidamente en función de los generadores de valor en la relación.

Por último, observamos que algunos estudios llevados a cabo en el sector turístico en general (p.e. Gómez y Molina, 2012) y en restaurantes (p.e. Rajh y Ozretić, 2009) y hoteles (p.e. So y King, 2010) en particular, han considerado el valor de marca de forma global. La evaluación del constructo desde una perspectiva global ha sido desarrollada por Yoo y Donthu (2001). Estos autores han medido el constructo a través de cuatro indicadores reflectivos que resumen su esencia. De este modo, el valor de marca global viene evaluado a través del diferencial de preferencia del individuo debido a la presencia de la marca en comparación con otra que tiene las mismas características, atributos y estímulos comerciales (Delgado y Munuera, 2001).

Con todo, concluimos que las siguientes variables pueden influir sobre la creación del valor de marca en las empresas hoteleras: a) la notoriedad; b) la imagen; c) la calidad percibida; d) la lealtad; e) la confianza y f) el compromiso.

### **3. Hipótesis de investigación**

A partir de la revisión de la literatura, de un lado, hemos concluido que existe la tendencia a considerar el valor de marca como un constructo multidimensional compuesto por cuatro dimensiones sugeridas por Aaker (1991), es decir: a) la notoriedad de marca; b) la imagen de marca; c) la calidad percibida y d) la lealtad hacia la marca. Cobb et al. (1995) han agrupado estas dimensiones en función de su perspectiva de estudio. Así, la notoriedad, la imagen y la calidad percibida se pueden entender como

variables perceptuales, mientras que la lealtad hacia la marca es considerada como una variable de naturaleza más relacional.

De otro lado, si bien en la literatura se encuentran aportaciones (p.e. Yoo et al., 2000; Delgado y Munuera, 2001; Arnett et al., 2003; Washburn y Plank, 2002; Atilgan et al., 2005; Wang et al., 2006; Rajh y Ozretić, 2009; Chahal y Bala, 2010; Gómez y Molina, 2012) que han examinado empíricamente el impacto de distintas dimensiones del valor de marca sobre el valor de marca global propuesto por Yoo y Donthu (2001), observamos que la tendencia de estudiar el valor de marca global en las empresas hoteleras es muy limitada (p.e. So y King, 2010), siendo necesario corroborar la forma en la que distintas dimensiones identificadas contribuyen a su formación.

Así, en primer lugar, varios estudios (p.e. Arnett et al., 2003; Rajh y Ozretić, 2009; Wang et al., 2011; Gómez y Molina, 2012) han mostrado que la notoriedad influye de forma positiva al valor de marca global. En este sentido, Aaker (1991) considera que la notoriedad contribuye al valor de marca en cuatro formas: a) el reconocimiento como “ancla” (Villarejo, 2001, p. 30) a la que se pueden vincular otras asociaciones; b) la familiaridad y el agrado que se siente hacia las marcas conocidas; c) el compromiso que se establece entre empresa y cliente; y d) el hecho de considerar las marcas entre las alternativas en la elección de un producto (Villarejo, 2001). Por todo ello, proponemos la primera hipótesis de investigación:

*H1: La notoriedad influye de forma positiva y significativa sobre el valor de marca.*

En segundo lugar, desde la literatura se advierte que la imagen de marca tiene un impacto positivo y significativo sobre el valor de marca global (Rajh y Ozretić, 2009; Wang et al., 2011; Gómez y Molina, 2012), puesto que facilita el conocimiento de una marca, sus asociaciones con los diferentes atributos tangibles e intangibles y su posicionamiento en la mente del consumidor. Adicionalmente, contribuye al proceso de obtención de información, ayuda en el proceso de decisión del consumidor a través de la diferenciación y la extensión de la marca, creando los sentimientos y actitudes positivas hacia la misma y proporcionando a la vez una razón para comprar (Aaker, 1991). A partir de ahí, proponemos la segunda hipótesis de investigación:

*H2: La imagen influye de forma positiva y significativa sobre el valor de marca.*

En tercer lugar, la calidad percibida genera valor de marca de diversas formas: a) suministra la razón sobre la que se basa la compra; b) otorga la posibilidad de diferenciación y el consecuente posicionamiento de la marca en la mente del consumidor; c) da la opción de cargar un precio superior; d) puede ser significativa para los intermediarios del canal de distribución; y e) constituye la base para las estrategias de extensión de marca, a través del uso de su nombre para introducir nuevas categorías de producto (Aaker, 1991). Este impacto positivo de la calidad percibida sobre el valor de marca ha sido contrastado empíricamente tanto en las investigaciones centradas en el producto (p.e. Yoo et al., 2000; Yoo y Donthu, 2001; Washburn y Plank, 2002) como aquellas centradas en los servicios (p.e. Arnett et al., 2003; Wang et al., 2006; 2011). Esperamos corroborar esta relación en la industria hotelera y planteamos la tercera hipótesis de investigación:

*H3: La calidad percibida influye de forma positiva y significativa sobre el valor de marca.*

En cuarto lugar, una serie de contribuciones ha evidenciado que la lealtad ejerce un efecto positivo sobre el valor de marca global en distintos sectores (p.e. Yoo et al., 2000; Yoo y Donthu, 2001; Washburn y Plank, 2002; Arnett et al., 2003; Atilgan et al., 2005; Bravo et al., 2006; Wang et al., 2006; 2011; Buil et al., 2010; Chahal y Bala, 2010), incluido el sector turístico (p.e. Gómez y Molina, 2012). La lealtad hacia la marca se conforma como la medida del vínculo entre el consumidor y la marca que a menudo constituye el núcleo del valor de marca, siendo la satisfacción uno de sus indicadores (Aaker, 1991). La lealtad genera valor a una marca principalmente reduciendo los costes de marketing, ya que mantener los clientes satisfechos resulta menos costoso que conseguir nuevos clientes y porque los clientes leales son posibles prescriptores del producto al convencer a los demás de su uso (Aaker, 1991; Villarejo, 2001). Además, una marca con alta lealtad favorece la introducción en nuevos mercados y reduce los gastos de promoción (Villarejo, 2001). Teniendo en cuenta estas consideraciones, proponemos la cuarta hipótesis a investigar:

*H4: La lealtad influye de forma positiva y significativa sobre el valor de marca.*

Por último, si bien algunos estudios han identificado la confianza (p.e. Kimpakorn y Tocquer, 2010; Dioko y So, 2012; Hsu et al., 2012) y el compromiso (p.e. Dioko y So, 2012) como las dimensiones del valor de marca del hotel, solo Hsu et al. (2012) han testado empíricamente el impacto que la confianza ejerce sobre el valor de marca, analizando la lealtad como el constructo mediador en la relación. Además, varios autores (p.e. Mattila, 2006; Tanford et al., 2011) han concluido que el compromiso afectivo, entendido como una dimensión del compromiso que implica la relación con una empresa, disfrutar de la colaboración y tener un sentido de pertenencia a la empresa (Jaros et al., 1993; Geyskens et al., 1996) es la forma del compromiso que más incide sobre la lealtad del consumidor en empresas hoteleras. Por ello, en este estudio nos centramos en este componente afectivo del constructo.

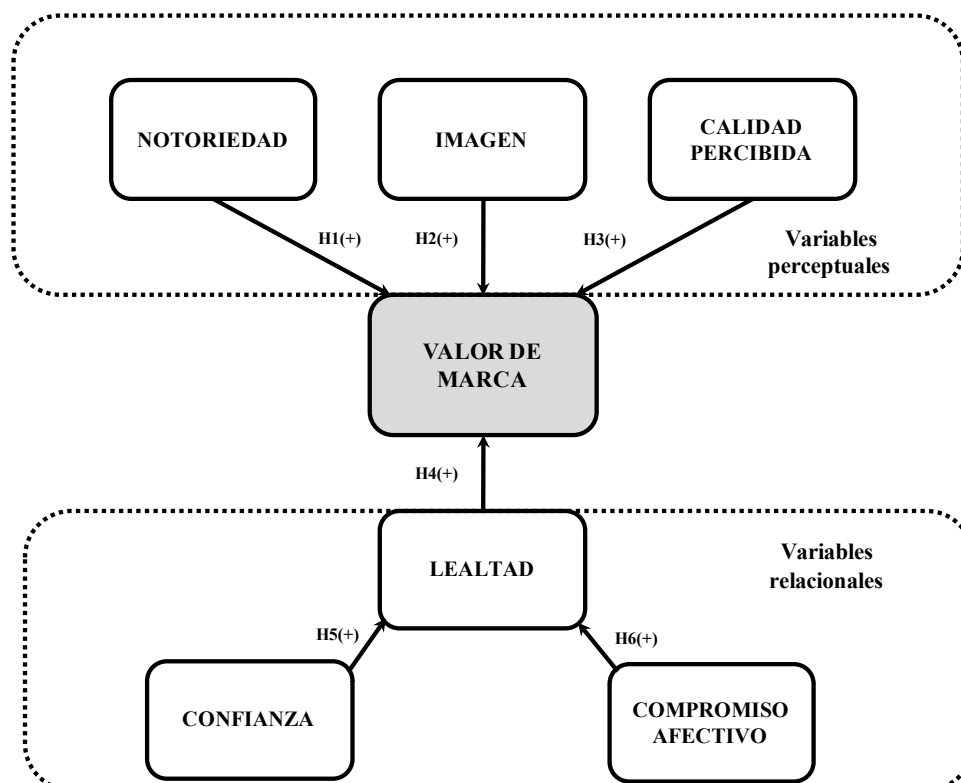

Con todo, se puede concluir que en el contexto de los intercambios relacionales, la literatura de marketing reconoce la confianza y el compromiso como variables centrales para la continuidad de las relaciones a largo plazo. En este sentido, la teoría de “compromiso-confianza”, propuesta por Morgan y Hunt (1994) ha sugerido que el compromiso y la confianza presentan los elementos clave del marketing de relaciones. De forma específica, encontramos diversas investigaciones (p.e. Mattila, 2006; Kimpakorn y Tocquer, 2010; Wilkins et al., 2010; Choi et al., 2011; Tanford et al., 2011; Hsu et al., 2012; Leeman y Reynolds, 2012) que confirman que estas variables actúan como antecedentes de la lealtad hacia la marca en el entorno hotelero. Por ello, consideramos que el impacto de la confianza y de la dimensión afectiva del compromiso sobre el valor de marca es mediado por la lealtad y planteamos las dos últimas hipótesis a investigar:

*H5: La confianza de los huéspedes influye de forma positiva y significativa sobre su lealtad.*

*H6: El compromiso afectivo de los huéspedes influye de forma positiva y significativa sobre su lealtad.*

Todas las hipótesis de investigación se recogen en el modelo causal propuesto, ilustrado en la Figura 1. Como se puede observar, consideramos que sobre el valor de marca global inciden tanto las variables perceptuales (la notoriedad, la imagen y la calidad percibida), como las variables relacionales (la lealtad, la confianza y el compromiso afectivo).

**FIGURA 1**  
**Modelo causal**

#### 4. Metodología

Con el fin de lograr los objetivos propuestos, hemos elaborado un cuestionario para los huéspedes de hoteles, que pretendía medir el valor de marca global y sus antecedentes. Así, evaluamos la imagen, la calidad percibida y la lealtad mediante las escalas de Kim et al. (2003) y Kim y Kim (2005), elaboradas para medir las dimensiones del valor de marca en los hoteles de lujo, reteniendo ocho indicadores para evaluar la imagen, 10 para medir la calidad percibida y seis para valorar la lealtad. Por lo que respecta a la evaluación de la notoriedad, proponemos tres indicadores a partir de la adaptación de la escala desarrollada por Kim et al. (2008) y un indicador que pretendía evaluar la conciencia de la marca del hotel. En relación a la evaluación de la confianza utilizamos una versión adaptada de la escala de Hsu et al. (2012), midiendo el constructo a través de dos indicadores, mientras que para la medición del compromiso afectivo utilizamos tres indicadores a partir de la escala de Mattila (2006). Por último, con el fin de evaluar el valor de marca global, adaptamos a la industria hotelera la escala de Yoo y Donthu (2001). Con todo, el cuestionario incluía preguntas cerradas medidas a través de una escala Likert de 5 puntos y fue redactado en castellano y posteriormente traducido en inglés, italiano y croata por nativos y expertos en materia.

El trabajo de campo se ha llevado a cabo en Croacia en el año 2012, abarcando los hoteles de cuatro y cinco estrellas ubicados en todo el país. Croacia es considerada como uno de los principales destinos turísticos emergentes en el área del Mediterráneo que actualmente viene experimentando un auge turístico notable (Marrero y Santana, 2008). Según los datos publicados por el Consejo Mundial de Viajes y Turismo, el turismo actualmente representa el 26,5% del PIB del país, lo que supone más del triple del peso medio del turismo sobre el PIB en la Unión Europea. Además, se espera un crecimiento del 4,6% hasta el año 2022 (WTTC, 2012). Así, a pesar de la actual crisis económica, el país ha logrado aprovechar al máximo la costa y las 1200 islas, atrayendo la financiación tanto de los sectores públicos como privados (Norton, 2010).

Decidimos incluir en el estudio empírico todos los hoteles de cinco estrellas de Croacia, que según los datos publicados en la página web del Ministerio de Turismo de Croacia en junio de 2012 eran 27 (MINT, 2012). De otro lado, con la ayuda de los expertos en la industria hotelera del país identificamos 50 hoteles de cuatro estrellas, que por las características de sus prácticas de gestión sostenemos que son los más adecuados para este estudio. En 24 de ellos obtuvimos permiso para entrevistar a 20 huéspedes en cada hotel. Obtuvimos un total de 475 encuestas válidas suministradas a través de entrevista personal o auto-administradas. Indicar que 252 huéspedes se alojaron en 14 hoteles de cuatro estrellas, mientras 223 se alojaron en 10 hoteles de cinco estrellas.

#### 5. Análisis de datos y resultados

El instrumento de medida del modelo estructural ha sido validado a través de la técnica de regresión por mínimos cuadrados parciales (PLS) con ayuda del software Smart PLS (versión 2.0). Este método es una técnica establecida que ha despertado creciente interés en la literatura y elevado uso en un gran número de investigaciones (p.e. Barclay et al., 1995; Chin, 1998; Chin y Newsted, 1999; Arnett et al., 2003; Cepeda y Roldán, 2004; Wang et al., 2006; 2011; Sanz et al., 2008; So y King, 2010; Gómez y Molina, 2012).

Si bien la técnica PLS puede ser utilizada para la confirmación de la teoría, en la literatura se señala que es aconsejable usarla también en los casos donde las relaciones podrían o no existir y cuando el constructo estudiado es relativamente nuevo (Chin y Newsted, 1999). Consideramos que este estudio parte de este supuesto, dado que el valor de marca del hotel está en su fase principal de desarrollo (Bailey y Ball, 2006). Además, las relaciones entre los antecedentes del valor de marca global, si bien observadas en teoría, han sido raramente contrastadas empíricamente. Por ello, consideramos completamente válido aplicar esta técnica en el análisis de los datos.

A continuación pasamos a analizar la validez (convergente y discriminante) y la fiabilidad del instrumento de medida empleado.

### 5.1. La validez y la fiabilidad del instrumento de medida

Para la valoración de la validez convergente analizamos las cargas de cada indicador sobre su variable latente, la varianza extraída promedio (AVE) y las cargas cruzadas (cross-loadings) (Barclay et al., 1995; Sanz et al., 2008) (véase Tabla 1). Al revisar las cargas de los constructos, eliminamos algunos indicadores de la imagen, al tener, según el criterio de Bagozzi y Yi (1988), cargas inferiores a 0,6. En la siguiente fase analizamos las cargas cruzadas, eliminando otro indicador de la imagen, dado que tenía carga superior sobre un constructo distinto de aquel al que estaba asociado. Una vez analizada la varianza extraída promedio de los constructos, concluimos que todos los valores obtenidos son mayores de 0,5, con lo que se sostiene que más del 50% de la varianza del constructo es debida a sus indicadores (Fornell y Larcker, 1981; Cepeda y Roldán, 2004). Con todo, corroboramos la validez convergente del instrumento de medida del modelo propuesto (Barclay et al., 1995; Sanz et al., 2008).

Para comprobar la fiabilidad de las escalas propuestas, analizamos la consistencia interna a partir de los criterios  $\alpha$  de Cronbach (fiabilidad simple) e índice de fiabilidad compuesta (IFC). Los  $\alpha$  de Cronbach tienen valores superiores a 0,7 (Nunnally y Bernstein, 1994) y el valor de IFC es superior a 0,6 (Bagozzi y Yi, 1988), lo que da un resultado aceptable.

\*p<0,01.

Posteriormente, el análisis se ha centrado en la validez discriminante (véase Tabla 2). Ésta indica en qué medida un constructo dado es diferente de otros constructos (Cepeda y Roldán, 2004). Para valorarla Fornell y Larcker (1981) recomiendan el uso de la varianza extraída promedio (AVE). En ambos estudios, la raíz cuadrada del valor AVE de todos los constructos resulta mayor que la varianza compartida entre el constructo con los otros constructos del modelo (la correlación al cuadrado entre dos constructos). Esto corrobora la validez discriminante de las escalas de medida empleadas (Barclay et al., 1995; Sanz et al., 2008).

Una vez verificado que el modelo de medida es satisfactorio en relación a los criterios precedentes, es decir, las medidas de los constructos son fiables y válidas, damos paso a la evaluación del modelo causal (Barclay et al., 1995; Cepeda y Roldán, 2004).

### 5.2. La evaluación del modelo causal

La medida del poder predictivo de un modelo es dada por el valor R<sup>2</sup> para las variables latentes dependientes. Esta medida indica la cantidad de varianza del constructo que es explicada por el modelo (Falk y Miller, 1992; Cepeda y Roldán, 2004). Los resultados demuestran que todos los valores son mayores de 0,1, lo que supera el límite necesario establecido por Falk y Miller (1992), - indicar que el valor R<sup>2</sup> de notoriedad, imagen, calidad percibida, confianza y compromiso afectivo

equivale a zero, siendo estas variables independientes-. A la vez que se ha analizado el tamaño del valor  $R^2$  como criterio de relevancia predictiva, también se ha aplicado la técnica de reutilización de muestra – *blindfolding*, proporcionando una distancia de omisión de siete (Aldás, 2008). El estadístico  $Q^2$  de todas las variables resulta positivo. Este estadístico representa una medida de lo bien que los valores observados son reconstruidos a partir de los parámetros estimados (Sanz et al., 2008). Por tanto, las hipótesis formuladas respecto a las variables latentes tendrán un nivel predictivo adecuado y permitirán evaluar la significatividad de las relaciones causales establecidas.

Para la estimación del modelo, igual que para la validación del modelo de medida, utilizamos la técnica PLS y el procedimiento de remuestreo por *bootstrapping* de 500 submuestras de tamaño igual a la muestra original, para la determinación de la significatividad de los parámetros obtenidos (Chin 1998; Sanz et al., 2008).

Según se puede observar en la Tabla 3, encontramos que existen relaciones positivas y significativas entre: a) la imagen y el valor de marca ( $\beta=0,2645$ ,  $p<0,001$ ; H2); b) la lealtad y el valor de marca ( $\beta=0,4699$ ,  $p<0,001$ ; H4); c) la confianza y la lealtad ( $\beta=0,5077$ ,  $p<0,001$ ; H5) y d) el compromiso afectivo y la lealtad ( $\beta=0,3982$ ,  $p<0,001$ ; H6). Sin embargo, no podemos confirmar las hipótesis que proponían la existencia de relación positiva y significativa entre la notoriedad y el valor de marca de un lado ( $\beta=0,0713$ ; H1) y la calidad percibida y el valor de marca de otro ( $\beta=0,0719$ ; H3). Si bien estas relaciones son positivas, el valor  $t$  resultante del procedimiento de remuestreo indica que el parámetro obtenido no es significativo.

TABLA 3  
Contraste de hipótesis de investigación

RELACIÓN	HIPÓTESIS	$\beta$	$t$
H1: Notoriedad → Valor de marca.	RECHAZADA	0,0713ns	1,6802

## 5. Conclusiones

A través de este estudio se ha pretendido contribuir a la investigación en torno al valor de marca, contrastando empíricamente su creación en el ámbito de la industria hotelera. Los resultados confirman la influencia directa sobre el valor de marca de dos variables que en la literatura hemos identificado como dos posibles antecedentes del valor de marca global: la imagen y la lealtad hacia la marca. El impacto de estas dos variables sobre el valor de marca global es significativo al 1%, al igual que el efecto de la confianza y del compromiso afectivo sobre la lealtad. Sin embargo, el impacto de la confianza y compromiso afectivo sobre el valor de marca es indirecto, pues resulta mediado por la lealtad hacia la marca. Las relaciones que se muestran entre las variables relaciones, es decir entra la confianza y la lealtad de un lado y el compromiso afectivo y la lealtad de otro, al igual que la relación que se establece entre la lealtad y el valor de marca global son las relaciones más fuertes dentro del modelo propuesto. Esto quiere decir que las variables relacionales tienen más importancia en la creación del valor de marca global, comparado con las variables perceptuales, es decir la imagen (significativa al 1%) y la notoriedad y la calidad percibida (no significativas). Otros estudios (p.e. Yoo et al., 2000) han mostrado también mayores efectos de la lealtad sobre el valor de marca, argumentando un mayor vínculo existente entre esta dimensión y el valor de marca que entre el resto de dimensiones.

Por otra parte, observamos que el impacto de la notoriedad y de la calidad percibida sobre el valor de marca es positivo, pero no significativo. Esto coincide con algunas contribuciones previas. Así, en primer lugar, distintos estudios que examinaron el valor de marca en la industria hotelera han demostrado que la notoriedad no representa una dimensión significativa en formación del constructo (p.e. Kim et al., 2003; Kim y Kim, 2005; Bailey y Ball, 2006; Kayaman y Arasli, 2007), ni que influye sobre el valor de marca global del hotel (p.e. So y King, 2010). En este sentido, los estudios que han sido realizados en hoteles de lujo en Corea del Sur (p.e. Kim et al., 2003; Kim y Kim, 2005), han demostrado que la notoriedad afecta significativamente al rendimiento de las empresas estudiadas, pero no al valor de marca. Asimismo, en el trabajo de Kayaman y Arasli (2007) centrado en los hoteles de lujo en el Norte de Chipre, la notoriedad ha sido eliminada después del análisis factorial confirmatorio, puesto que no ha cargado de manera significativa sobre el valor de marca. Además, el efecto de la notoriedad de marca sobre el valor de la marca no ha sido significativo en el estudio de So y King (2010), realizado entre 288 turistas alojados en un hotel en Australia. Por ello, podemos concluir que la notoriedad, a pesar de ser un factor importante, no siempre ha sido considerada como una dimensión clave del valor de marca en la industria hotelera. Como matizan Bailey y Ball (2006) en su estudio sobre los significados del valor de marca de hotel, esto puede ser explicado por la observación de Olsen et al. (1998), según la cual hay muchos hoteles conocidos que no son consistentes en su oferta y por tanto, padecen pobres percepciones de sus servicios. Esto significa que solo la notoriedad de marca no garantiza el éxito en las empresas hoteleras. So y King (2010) lo explicaron sosteniendo que no es la notoriedad de marca la que afecta al comportamiento del consumidor, sino las percepciones basadas en la experiencia durante la estancia en el hotel.

En segundo lugar, concluimos que la calidad percibida no influye de forma significativa sobre el valor de marca global y por tanto, no podemos aceptar la hipótesis que establecía la relación positiva y significativa entre estas dos variables, el resultado que también coincide con algunos estudios previos (p.e. Atılğan et al., 2005; Bravo et al., 2006; Buil et al., 2010). En esta línea, la razón de esta falta de influencia significativa de la calidad percibida sobre el valor de marca puede deberse a que la calidad percibida tiene un carácter cognitivo y actitudinal y que por ello, no ejerce un efecto tan significativo como, por ejemplo la lealtad, la variable que implica, además, un componente conductual. Así, la compra del servicio y la visita del hotel parece ser la consecuencia de la mayor valoración del huésped de la marca frente a otras alternativas, y en muchos casos esta elección es realizada entre marcas percibidas como similares. En cualquier caso, otros estudios (p.e. Yoo et al., 2000) han mostrado también mayores efectos de la lealtad sobre el valor de marca, argumentando un mayor vínculo existente entre esta dimensión y el valor de marca que entre el resto de dimensiones. Además, otra posible causa de esta influencia no significativa de la calidad percibida puede encontrarse en el hecho de que según los resultados obtenidos los hoteles estudiados gozan de una elevada calidad percibida, lo que puede haber originado que esta variable no tenga un papel predominante en la creación del valor de marca.

### ***5.1. Implicaciones y futuras líneas de investigación***

A la luz de los resultados obtenidos pueden derivarse diversas implicaciones para los profesionales de marketing en general y los directivos de empresas hoteleras en particular. Los hallazgos de este estudio apuntan a la necesidad de formación y gestión de una imagen positiva de marca y al logro y mantenimiento de un cliente leal, si el hotel quiere generar un valor de marca basado en el consumidor. En este sentido, los directivos deben procurar la creación de una imagen de marca favorable, asegurando comodidad y un alto nivel de servicio. Asimismo, deben ser capaces de generar una imagen diferenciada haciendo lo posible para que sus huéspedes se sientan especiales durante la estancia en el hotel. Al hacerlo, se obtendrán clientes satisfechos, que estarán dispuestos a repetir la visita y hacer recomendaciones positivas sobre el hotel. Además, otro aspecto que hay que tener en cuenta es que la confianza y el compromiso afectivo inciden sobre el valor de marca a través de la lealtad. Por ello, los directivos deben conseguir la confianza del huésped e incentivar el apego emocional y la carga personal en la relación con tal de obtener un cliente leal y aumentar el valor de marca del hotel.

De otro lado, la calidad percibida no ha mostrado tener el efecto significativo esperado sobre el valor de marca. Sin embargo, los gestores de los hoteles no deben pensar que su papel deja de ser

importante, dado que desde la literatura se advierte que la calidad percibida ejerce un papel relevante en la creación tanto de la imagen (p.e. Kayaman y Arasli, 2007; Malik y Naeem, 2011) como de la lealtad (p.e. Kayaman y Arasli, 2007; Hyun y Kim, 2011; Malik y Naeem, 2011; Hsu et al., 2012), que según los resultados de este estudio inciden de forma positiva y significativa sobre el valor de marca global.

Si bien este estudio es un intento de una nueva propuesta de medida del valor de marca, el constructo invita a profundizar en su investigación, sobre todo en el hecho de determinar cuáles son las dimensiones que contribuyen a su formación. A pesar de la contrastada influencia de algunos antecedentes generadores de valor de marca contemplados en este trabajo, la notoriedad y la calidad percibida no se manifiestan como componentes significativos en la creación del valor de marca global. Si bien estos hallazgos coinciden con resultados obtenidos en otros estudios, nos llevan a proponer futuras investigaciones que validen el impacto de estos constructos en el proceso de generación del valor de marca. En esta línea, se podría volver a examinar la influencia de las seis dimensiones propuestas sobre el constructo entendido de forma global. Esto implica evaluar la influencia directa de la confianza y del compromiso sobre el valor de marca, sin considerar el impacto mediador de la lealtad en dichas relaciones. Además, sería interesante incorporar en futuros estudios nuevas dimensiones posibles del valor de marca, que han sido validadas en otros estudios, tales como la satisfacción o el valor percibido.

Para concluir, nuevas aportaciones podrían considerar otras perspectivas metodológicas diferentes. Sería una alternativa interesante, dentro de la perspectiva del análisis estructural, una estrategia de modelización competitiva, que permitiría comparar distintas estructuras de relaciones entre los antecedentes del valor de marca, en particular, para explorar de manera más robusta las relaciones establecidas entre estas variables. Adicionalmente, nuevas contribuciones podrían considerar la lealtad como una consecuencia del valor de marca, dado que la lealtad del consumidor es entendida como el output final de las estrategias de marketing empleadas por una empresa. Por ello, en lugar de ser analizada como un antecedente, en futuros trabajos esta variable podría ser examinada como un resultado del valor de marca.

## RESUMEN

*Las investigaciones que estudian la influencia de la actitud de los residentes hacia la actividad turística en momentos de incertidumbre económica son escasas. A partir de un modelo de medición de la percepción de los impactos del turismo basado en la teoría del intercambio social se ha efectuado una exploración de cómo la crisis económica influye en las actitudes de los residentes hacia el turismo. Utilizando los datos de una muestra de ciudadanos de Tenerife y Mallorca tomada en dos momentos diferentes: en 2005 en auge económico y en 2014 en situación de crisis prolongada, se analiza la variación de las percepciones. En general se confirma que los residentes en momentos de crisis muestran un mayor apoyo a la actividad turística, tienden a sobrestimar los beneficios y a subestimar los costes. El estudio avanza en la comprensión teórica del apoyo de los residentes hacia el turismo durante un período de incertidumbre económica y se discuten las implicaciones prácticas para la planificación y el desarrollo del turismo.*

## Palabras clave:

Crisis económica, percepción impactos turismo, apoyo de los residentes

1.

## 1. Introducción

La importancia de la actividad turística en muchas economías ha llevado a numerosos autores a analizar y a constatar la importancia que tiene la actitud de los residentes a la hora de favorecer su desarrollo (Pearce 1998; Nunkoo y Gursoy, 2012). Dicha actitud condiciona aspectos fundamentales del éxito del desarrollo turístico de un destino, como son la predisposición a trabajar en el sector, las iniciativas de emprendimiento e innovación, las inversiones de empresarios locales y de forma muy especial afecta a la satisfacción en la interacción entre el residente y el turista (Allen, Long, Perdue y Kielselbach, 1988; Ritchie, 1988).

En consecuencia, el tema ha suscitado un gran atractivo académico y son numerosos los trabajos sobre modelos explicativos del apoyo a la actividad turística por parte de los residentes (Sharples, 2014), una parte importante de los mismos fundamentados en la teoría del intercambio social (TIS) (Sutton, 1967; Perdue, Long y Allen, 1990; Ap, 1992) que sostiene que las actitudes de un individuo como integrante de la comunidad hacia la industria del turismo, y el posterior apoyo que muestre para su desarrollo, estarán influenciadas por la evaluación que realice de las repercusiones que tiene la actividad, es decir será el resultado de la comparación de la percepción de los impactos positivos frente a la percepción de los impactos negativos (Ap 1992; Gursoy, Jurowsky y Uysal, 2002; Jurowski, Uysal y Williams, 1997; Lindberg y Johnson 1997; McGehee y Andereck 2004; Nunkoo y Ramkissoon, 2012; Garau, Díaz y Gutiérrez 2013).

Sin embargo, la actual situación de crisis económica, ha empezado a generar un debate sobre la influencia que tiene la percepción de la situación económica en la percepción de los impactos del turismo y en la actitud de soporte a desarrollo turístico y algunos trabajos han sugerido que las percepciones se ven afectadas por la percepción que se tiene del estado de la economía local y de los beneficios personales que cada individuo obtiene del turismo (Stylidis y Terzidou 2014; Smeral, 2009)

Lamentablemente, la mayor parte de estos estudios no suelen disponer de datos longitudinales o comparaciones entre destinos con lo cual es difícil generalizar los resultados sobre los efectos de una crisis en la percepción de los impactos del turismo (Stylidis y Terzidou 2014). En este contexto y con el fundamento conceptual de la teoría del intercambio social, este trabajo tiene como objetivo comprobar la influencia de una situación de crisis en la percepción de los impactos del turismo, utilizando para ello dos mediciones efectuadas en 2005 y 2014 en dos destinos turísticos de primer orden como son Tenerife y Mallorca.

Así pues, este estudio pretende generar un avance en la comprensión teórica de cómo se forma el apoyo de los residentes hacia el desarrollo del turismo y los cambios que se producen en una situación de económica, para con estas informaciones ser capaces de proporcionar recomendaciones a los gestores del destino turístico para mejorar la actitud de los residentes en relación al turismo.

## 2. El apoyo de los residentes a la actividad turística

### 2.1. Los impactos de la actividad turística

El concepto de apoyo o actitud hacia el turismo está relacionado con la predisposición de los residentes a apoyarlo que viene determinada por la percepción que tienen los residentes por los impactos de dicha actividad (Allen et al., 1993; Johnson, Snepenger y Akis, 1994; Lankford, 1994; Lindberg y Johnson, 1997; Perdue, Long y Allen, 1987; Snaith y Haley, 1999; Concua y Atzenib, 2012).

La mayoría de los estudios relacionados con la actitud hacia el desarrollo turístico por parte de los residentes suelen tener como base la Teoría del Intercambio Social (Sutton, 1967; Perdue, Long y Allen, 1990; Ap, 1992) que sostiene que las actitudes de un individuo como integrante

de la comunidad hacia la industria del turismo, y el posterior apoyo que muestre para su desarrollo, estarán influenciadas por la evaluación que realice de las repercusiones que tiene la actividad y de la comparación de la percepción de los impactos positivos frente a los negativos (Ap 1992; Gursoy et al. 2002; Jurowski et al. 1997; Lindberg y Johnson 1997; McGehee y Andereck 2004; Nunkoo y Ramkissoon, 2012). En general, se suele aceptar que la percepción de los residentes suele estar relacionado con tres (Murphy, 1985; Gursoy et al, 2002) o cuatro (Gutiérrez, 2010) grandes grupos de impactos que incluyen impactos, económicos, culturales, sociales y medioambientales, siendo numerosas las aportaciones relacionadas con impactos situados en cada una de las dimensiones.

En la dimensión económica, normalmente los residentes suelen reconocer el impacto económico positivo que genera el turismo en relación con las oportunidades de empleo de la población, los ingresos para los negocios locales y el aumento del nivel de vida, mientras que como costes económicos se han identificado la generación de empleos de bajos salarios estacionales y poco estables, a un aumento del coste de vida ante la mayor demanda de bienes y servicios, que siempre la actividad turística incorpora mano de obra local y que los negocios pueden estar en manos de empresas foráneas que no reinvierten sus beneficios en el territorio (Ritchie, 1988; Tosun, 2002; Weaver y Lawton, 2001; Um y Crompon, 1987; Liu et al., 1987; Pizam, 1978; Keogh, 1989; Gutiérrez, 2010).

En relación a los impactos sociales, la literatura ha identificado un conjunto de aspectos en los que la actividad turística puede influir positivamente tales como la mejora de la calidad de vida, mayor limpieza de los espacios, conservación de los recursos y mejora de los servicios públicos, o negativamente. Impactos sociales negativos que pueden incluir la pérdida de valores tradicionales, problemas de congestión de tráfico o incremento de problemas sociales en general (Lankford y Howard, 1994; Liu y Var, 1986; Tyrrell y Spaulding, 1984; Long, Perdue y Allen, 1990; Keogh, 1990; Prentice, 1993; Sethna y Richmond, 1978; Perdue, Long y Gustke, 1991; King, Pizam y Milman, 1993; Gutiérrez, 2010, Tovar y Lockwood, 2008)

En la dimensión cultural los investigadores (Schadler, 1979; Belisle y Hoy, 1980; Meleghy, Preglan y Tafershofer, 1985; Liu et al., 1987; Pizam, 1978; Tosun, 2002; Mathieson y Wall, 1982; Gutiérrez, 2010, Nunkoo y Gursoy, 2011) consideran que la actividad turística provoca impactos culturales positivos como son la recuperación de la artesanía, la preservación de la cultura local y los beneficios derivados de la relación cultural entre los residentes y los turistas. Los impactos culturales negativos percibidos por la población residente están relacionados con la pérdida de las tradiciones, la aculturación y la desvirtualización y banalización del acervo cultural.

Finalmente, se ha identificado que el turismo es un factor que causa efectos en el medioambiente, generalmente asociado a impactos negativos, la polución medioambiental, la destrucción de recursos naturales, la degradación de la vegetación y el agotamiento de la vida salvaje (Ahmed y Krohn, 1992; Andereck, 1995; Koenen, Chon y Christianson, 1995; Var y Kim, 1990; Gutiérrez, 2010), la congestión en el uso de las instalaciones de recreo al aire libre (Johnson et al., 1994), exceso de transeúntes (Brunt y Courtney, 1999; Reid y Boyd, 1991). No obstante, se han encontrado percepciones positivas hacia los impactos medioambientales del turismo, tales como la mejora en la apariencia de la comunidad (Perdue et al., 1990) y el aumento de las oportunidades de ocio (McCool y Martin, 1994; Perdue et al., 1990) o que el turismo ayuda a crear una mayor concienciación y apreciación por la necesidad de preservar el medioambiente (Var y Kim, 1990).

La percepción de los impactos suele verse afectada por diferentes factores. Algunos autores han demostrado que los residentes involucrados en la industria turística perciben un mayor nivel de ganancia o beneficio personal y que tienden a tener percepciones de impacto más positivas que otros que no lo están (Brunt y Courtney, 1999; Haralambopoulos y Pizam, 1996; Jurowski et al, 1997; Lanford y Howard, 1994; McGehee y Andereck, 2004; Sirakaya, Teye y Sönmez, 2002).

## **2.2. Crisis económica y apoyo de los residentes hacia el turismo**

Los modelos que examinan la relación actitud-conducta tienen que tener en cuenta elementos del contexto en el que se producen las decisiones de comportamiento (Bagozzi, 1992), tales como el entorno económico. El estado de la economía local, y en particular la crisis económica, se considera un factor importante en la vida de las personas, por el efecto que provocan elevadas tasas de desempleo, la pérdida de ingresos y los recortes en las inversiones públicas y privadas (Stylidis y Terzidou 2014). Los estudios realizados en diversas disciplinas, sugieren que la crisis económica afecta negativamente a la salud pública (Levy y Sidel, 2009, Zavras, Tsiantou, Pavi y Mylona, 2013), al nivel de consumo (Hurd y Rohwedder, 2010, Voon y Voon, 2012), al estado de ánimo de las personas (Graham, Chattopadhyay y Picon, 2010) y a la ocupación hotelera (Song, Lin, Witt, y Zhang, 2011), entre otros.

El complejo fenómeno de la crisis económica no puede ser completamente comprendido sólo con indicadores objetivos de la situación económica, tales como el PIB y los datos de desempleo disponibles (Hayo, 2005). En un estudio realizado en USA por Campbell y Converse (1972) identificaron que aunque el ingreso nacional había aumentado, las personas no percibían una mejoría en su situación socioeconómica. Una comprensión más amplia de la crisis sólo puede tenerse cuando se considera también la percepción de la vida económica de los individuos (Stokes, 2001). Gabel y Whitten (1997) sugieren que son más bien las percepciones de los habitantes (economía subjetiva) y no tanto los indicadores de la economía “objetiva”, las que influyen en las actitudes de los residentes.

En las comunidades que experimentan recesión económica severa se producen importantes cambios como el cierre de empresas, reducción del ingreso disponible, reducción del empleo, etc. (Stylidis y Terzidou 2014). Fenómenos similares han sido descritos en estudios de turismo que examinaron la etapa de transición de los destinos urbanos rurales y pequeños, como antiguas comunidades mineras (Vargas-Sánchez et al., 2009), comunidades agrícolas (Byrd et al., 2009, Lee, 2013) y comunidades de pescadores (Trakolis, 2001). Teniendo en cuenta que estas comunidades se enfrentan al declive de los sectores tradicionales (la agricultura, la minería, etc.), las autoridades locales exploran estrategias alternativas de desarrollo para evitar la recesión, incluido el turismo (Andereck y Vogt, 2000), que a menudo sirve como un medio para el rejuvenecimiento de su economía (Latkova y Vogt, 2012, Vargas-Sánchez et al., 2009).

Por otra parte, la literatura sobre la actitud de los residentes hacia la actividad turística sostiene que el estado percibido de la economía local influye significativamente en los impactos percibidos de desarrollo turístico (Gursoy y Rutherford, 2004, Gursoy, Chi, y Dyer, 2010, Nunkoo y Ramkissoon, 2010). Los residentes, en particular, tienden a sobreestimar los beneficios (económicos) y subestiman los costos (el medio ambiente) en los que se incurre por el desarrollo turístico (Gursoy et al., 2002, Nunkoo y Ramkissoon, 2010).

Por tanto, es de esperar que el estado percibido de la economía local afecte a la percepción de los impactos del turismo de los residentes. En concreto, en época de crisis económica, los residentes a priori son más favorables a la actividad turística, sobrevaloran los beneficios y subestiman los costes de los impactos del turismo (Stylidis y Terzidou 2014).

En el presente estudio se plantea como objetivo determinar si es posible contrastar en un enfoque longitudinal si efectivamente una situación de crisis provoca los cambios en la percepción de los residentes de los impactos del turismo y en su actitud hacia su desarrollo sugeridos en la literatura. Específicamente las hipótesis que se pretende contrastar son:

H1: En una situación de crisis económica la actitud de los residentes hacia la actividad turística mejora.

H2: En una situación de crisis económica la percepción de los beneficios económicos del impacto de la actividad turística es mayor.

H3: En una situación de crisis económica la percepción de los beneficios sociales del impacto de la actividad turística es mayor.

H4: En una situación de crisis económica la percepción de los beneficios culturales del impacto de la actividad turística es mayor.

H5: En una situación de crisis económica la percepción de los beneficios medioambientales del impacto de la actividad turística es mayor.

H6: En una situación de crisis económica la percepción de los costes económicos del impacto de la actividad turística disminuye.

H7: En una situación de crisis económica la percepción de los costes sociales del impacto de la actividad turística disminuye.

H8: En una situación de crisis económica la percepción de los costes culturales del impacto de la actividad turística disminuye.

H9: En una situación de crisis económica la percepción de los costes medioambientales del impacto de la actividad turística disminuye.

### 3. Metodología

#### 3.1. Instrumento de medida

Para la medición de la actitud y de la percepción de los impactos del turismo se utilizó una adaptación de la escala propuesta y testada por Díaz y Gutiérrez (2010), Gutiérrez (2010), que cubren la mayor parte de las percepciones de beneficios y costes en las cuatro dimensiones analizadas: económica, social, cultural y medioambiental.

La siguiente tabla recoge los 24 ítems utilizados en la escala de medida. Las respuestas se midieron en una escala Likert de cinco puntos que van desde Muy en desacuerdo (1) a Muy de acuerdo (5).

TABLA 1  
Dimensiones e impactos del turismo

	<b>Costes económicos percibidos</b>
P6x1	La actividad turística produce mayor precariedad en el empleo y empleos poco deseados
P6x2	El turismo ha hecho que suban los precios en las islas y que se incremente el coste de la vida
P6x3	La actividad turística de la isla ha provocado un incremento del coste de la vivienda y del suelo.
	<b>Beneficios económicos percibidos</b>
P6x4	El sector turístico genera grandes oportunidades de empleo y desarrollo profesional para los residentes
P6x5	El turismo contribuye de manera relevante a elevar los niveles de renta y el salario de los residentes.
P6x6	El turismo genera importantes ingresos por impuestos para las administraciones y atrae inversiones
	<b>Costes sociales percibidos del turismo</b>
P6x7	La actividad turística favorece que se creen problemas de inseguridad ciudadana en la isla (más delitos, más robos, vandalismo, ...)
P6x8	En la isla el turismo es causa importante de la congestión del tráfico.
P6x9	El desarrollo del turismo ha hecho que se pierda la tranquilidad y la calidad de vida que antes existía
	<b>Beneficios sociales percibidos del turismo</b>
P6x10	Gracias al turismo hay más parques, áreas para nadar, caminar, practicar deportes, más oferta de ocio y entretenimiento

P6x11	El turismo favorece la mejora en los servicios básicos útiles en la vida cotidiana (agua, luz, centros civiles...)
P6x12	Gracias al turismo se producen mejoras en sanidad, educación, ... en general en aspectos sociales
	<b>Costes culturales percibidos del turismo</b>
P6x13	El turista cuando están en la isla, afecta negativamente a tu vida cotidiana
P6x14	El turismo está provocando la pérdida de la identidad y cultura canaria
P6x15	En la isla se siente uno extraño por causa del turismo
	<b>Beneficios culturales percibidos del turismo</b>
P6x16	El turismo ayuda a crear y mantener exhibiciones culturales e históricas, favoreciendo nuestras tradiciones
P6x17	El turismo favorece en el tinerfeño el conocimiento y comprensión de culturas diferentes
P6x18	El turismo favorece en el tinerfeño la valoración de la identidad cultural canaria
	<b>Costes medioambientales percibidos del turismo</b>
P6x19	En la isla el turismo causa problemas importantes de contaminación y polución (basura, ruido, ...).
P6x20	El turismo provoca erosión y destrucción en los ecosistemas locales, de interior, medianías y monte, y litoral.
P6x21	El turismo consume en exceso recursos naturales como el agua y hace peligrar la disponibilidad de estos recursos
	<b>Beneficios medioambientales percibidos del turismo</b>
P6x22	En las zonas en desarrollo turístico se mantiene una estructura urbana armónica y regular.
P6x23	Gracias al turismo se han mantenido y protegido espacios naturales
P6x24	Frente a otras actividades económicas, el turismo es menos contaminante y más respetuoso con el medio

Por otra parte, la medición del apoyo de los residentes hacia la actividad turística se construyó a partir de tres ítems extraídos de la revisión de la literatura y se recogen en la siguiente tabla. Igualmente, las respuestas a estas declaraciones fueron medidos en una escala Likert de cinco puntos que van desde Muy en desacuerdo (1) a Muy de acuerdo (5).

TABLA 2  
**Ítems de la escala de apoyo de la comunidad a la actividad turística**

	<b>Apoyo de la comunidad al desarrollo turístico</b>
P7x1	El desarrollo turístico ha permitido el desarrollo global de Tenerife y sus habitantes
P7x2	Se debe potenciar al turismo como uno de los motores básicos de la economía de Tenerife.
P7x3	Para mi vida cotidiana, la actividad turística es beneficiosa
P7x4	El comportamiento del turista durante la visita es correcto, normal

### **3.2. *Ámbito de aplicación***

Con objeto de poder generalizar los resultados dentro de una tipología de destinos similares, se ha realizado el estudio simultáneamente en dos destinos turísticos. Para ello, el estudio se basa

en los datos de dos encuestas administradas, una en 2004 antes de la crisis y otra en 2014 en una fase avanzada de la misma. Los datos se han obtenido en dos destinos turísticos maduros tradicionales de primer orden, Tenerife y Mallorca.

### *Tenerife*

Tenerife es una de las 7 islas Canarias, que con una superficie de 2.034 km<sup>2</sup>, es la mayor de todo el archipiélago. Es un territorio insular que concentra la mayor parte de su actividad turística en dos zonas: los municipios de Puerto de la Cruz-La Orotava, en el norte de la isla, y los municipios de Arona-Adeje, en el sur. Aunque el residente percibe la actividad turística en todo el territorio insular en su vida cotidiana.

La economía Canaria se encuentra en un mal estado, similar al resto del territorio nacional. Una lectura de los datos del PIB y empleo así lo indican. El PIB, a precios constantes, a partir de 2007 muestra descensos hasta del 2012, aunque el 2011 mostraba un leve dato positivo de recuperación. En cuanto al empleo en 2012 en Canarias aún continuaba con la tendencia negativa observada en años anteriores, desde 2007, alcanzando elevados niveles de paro superiores al 30% (Consejo Económico y Social de Canarias, 2013).

En cuanto a la actividad turística, del total de turistas recibidos en Canarias, Tenerife ostenta aproximadamente el 38% de cuota (Turismo de Tenerife, 2013). Y su actividad turística representa casi el 30% del PIB en 2012, participación que ha aumentado en los últimos años desde el 27% en 2009. En cuanto al empleo turístico, en este momento representa el 34,7% del total en Canarias, cuota que también ha ido creciendo cada año con la evolución del mercado (Exceltur, 2012).

La evolución del número de turistas alojados en Tenerife, a diferencia que los datos macroeconómicos, ha mejorado desde 2007, hasta llegar al total de 4.973.047 turistas alojados en 2013 (Turismo de Tenerife, 2013). En 2009 el mercado extranjero alcanzó la cifra de turistas alojados más baja de los últimos 13 años (3.257.638), mientras que el nacional ha ido cayendo consecutivamente desde 2008 hasta 2013, donde se ha llegado a niveles de 2003 (1.161.922), mostrando una cierta estabilidad en el decrecimiento.

Por tanto la actividad turística se ha visto afectada en parte por la crisis, pero la pronta recuperación, al menos en el mercado extranjero, ha permitido incluso aumentar la demanda turística en los últimos años y las posibilidades económicas que el turismo representa para una sociedad que supera ya el 30% de tasa de desempleo. De hecho según Exceltur (2012), a pesar del mal escenario nacional, el PIB turístico ha experimentado un avance interanual del 0,5%, llegando a ese 30% en su contribución al PIB total directa, donde no se han considerado las contribuciones indirectas de otros sectores de actividad.

### *Mallorca*

Mallorca es la mayor de las cuatro islas habitadas que conforman el archipiélago Balear y la que atrae el mayor número de visitantes. Desde 2006 la llegada de turistas se ha mantenido estable, desde los 9,6 millones de turistas de 2006 a los aproximadamente 9,5 millones en 2013. Mallorca posee al menos cinco zonas de actividad turística a lo largo de toda la costa perimetral y otra situada en el interior. La isla tiene 3.625 km<sup>2</sup> y ha aumentado su población desde los 790.763 habitantes en 2006 a los 864.763 de 2013 (INE, 2013, IBSTAT, 2013).

En Baleares, desde el inicio de la crisis en 2008 se han observado crecimientos negativos del Valor Añadido Bruto hasta 2010, con tasas interanuales de -2,7% en 2009 y -0,9% en 2010 y a partir de esa fecha se ha producido un estancamiento técnico con crecimientos inferiores al 0,6% (IBSTAT, 2013), consecuencia de decrecimientos significativos en todos los sectores económicos, excepto a partir de 2011 del sector servicios, debido a la importancia en el de la actividad turística.

Esta situación de crisis económica se ve especialmente reflejada en los índices de paro de la comunidad que ha pasado de aproximadamente de un 7% en 2007 a más de un 26% en 2013 (EPA, 2013). En este entorno tan desolador, el sector turístico, que genera más del 25% del total

del empleo turístico ha sido el que menos puestos de trabajo ha perdido, incluso en determinados momentos ha generado ocupación (IET, 2013).

### 3.3. Muestra

Para la obtención de los datos necesarios para el contraste de diferencias en los impactos y actitud de los residentes en ambos destinos se ha utilizado como instrumento de recogida un cuestionario estructurado, diseñado específicamente para el trabajo. La recogida de información se realizó a través de entrevistadores en las zonas de residencia de la población y con cuestionarios autoadministrados seleccionando a cada unidad muestral estratificando por zona geográfica, sexo y edad, de cada destino, para cumplir las cuotas de la población. Tras la recogida de información se determinó una muestra válida de 115 personas en 2014 y 225 en 2005 para el análisis en el caso de Tenerife y de 419 en 2014 y 221 en 2005 para Mallorca (tabla 3).

TABLA 3

## 4. Resultados

### *Fiabilidad y validez de la escala*

En primer lugar, se evalúa el modelo de medida asegurando la fiabilidad de cada ítem, la fiabilidad del constructo, la varianza media extraída (AVE) y la validez discriminante de los indicadores que son medida de las variables latentes.

Se comienza el análisis valorando la fiabilidad individual de los constructos, examinando su carga factorial, fiabilidad compuesta (FC) y varianza media extraída (AVE) (Chin, 1998; Fornell y Larcker, 1981). En la Tabla 4 se presentan estas medidas así como cada uno de los ítems utilizados. Las cargas factoriales son todas superiores o muy próximas a 0,7 indicando que, al menos el 50% de la varianza del constructo se ve reflejada en el indicador (Chin, 1998). La FC es siempre mayor que 0,7, que es lo que exigido en la investigación básica (Nunnally, 1978).

En cuanto a la varianza media extraída (AVE) por cada constructo de sus indicadores, esta es mayor o muy próxima a 0,5, indicando que se explica el 50% o más de la varianza del indicador (Fornell y Larcker, 1981).

TABLA 4  
Fiabilidad individual, fiabilidad compuesta y varianza extraída de los factores

	P6x22	0,68177			0,55518		
Actitud hacia turismo	P7x1	0,78036	0,53028	0,77847	0,77158	0,5984	0,8561
	P7x2	0,68011			0,80126		
	P7x3	0,58192			0,80422		
	P7x4	0,68630			0,71380		

Para garantizar la validez discriminante, hemos comparado la raíz cuadrada de las AVE con las correlaciones entre constructos (Tabla 5). Todos los constructos se relacionan en mayor medida con sus propias medidas que con otros constructos. Adicionalmente, se han analizado las cargas factoriales cruzadas y se ha comprobado que no son significativas en relación con las cargas factoriales (Chin, 1998).

### Análisis ANOVA

Para conocer el efecto de la crisis en la actitud de los residentes hacia la actividad turística y en los impactos percibidos en los dos destinos analizados, Tenerife y Mallorca, se ha realizado un análisis de la varianza (ANOVA) utilizando como variable independiente el año de recogida de la información (2005 y 2014) y como variables dependientes, por un lado, el constructo de “Apoyo de la comunidad al desarrollo turístico”, y por otro lado, los constructos de la escala de beneficios y costes separados en sus cuatro componentes económicos, sociales, culturales y medioambientales.

En la tabla 6 se recogen los resultados agregados del análisis de la varianza para los constructos de análisis.

**TABLA 6**  
**Influencia de la crisis en la actitud del residente hacia la actividad turística**

		TENERIFE			MALLORCA		
		2014	2005	Sig.	2014	2005	Sig.

Significación: \*\*\* nivel  $p < 0,001$ ; \*\* nivel  $p < 0,01$ ; \* nivel  $p < 0,05$ .

En primer lugar se destaca que la actitud de los locales hacia el turismo ha mejorado de forma significativa en 2014 frente a 2005 tanto en Tenerife como en Mallorca, por lo que se confirma la hipótesis H1.

Con respecto a los impactos de la actividad, en general, se puede observar que los residente perciben que los beneficios son mayores en la época de crisis, mientras que los costes percibidos son menores, tal y como cabía esperar según el análisis de la literatura existente.

Este comportamiento general presenta diferencias significativas en los costes económicos, sociales, culturales y medioambientales. Sin embargo, no presenta diferencias significativas en la percepción de los impactos de los beneficios económicos. Por otra parte, tampoco es significativa la diferencia en Mallorca de los beneficios sociales y culturales y en Tenerife no es significativa la diferencia de los beneficios medioambientales.

Por tanto se pueden contrastar las hipótesis H6, H7 y H8 y no se puede contrastar la hipótesis H2, aunque sí parcialmente las hipótesis H3, H4, H5.

## 5. Conclusiones e implicaciones

Teniendo en cuenta los factores que determinan la percepción de los impactos del turismo de los residentes, se ha comprobado a través de este estudio longitudinal y contemplando dos destinos diferentes, que la crisis económica parece influir en la forma en que los residentes perciben los cambios (impactos) que se producen como consecuencia del turismo. Esto corrobora los resultados del estudio de Lau y Heldman de (2009), que sugieren que la recesión económica puede maximizar sustancialmente los efectos en las actitudes de la gente hacia la formulación de políticas. También confirma los resultados de Styliadis y Terzidou (2014) del estudio llevado a cabo en Kavala, una ciudad en el norte de Grecia gravemente afectada por la crisis económica,

en el que observaron el efecto de la situación económica en la percepción de los impactos y de la actitud hacia el desarrollo turístico.

Los residentes en esta nueva situación en la que se enfrentan al desempleo y a la austeridad financiera, parecen subestimar los costes económicos de los impactos de la actividad turística (Hipótesis H2). Esto está en consonancia con estudios llevados a cabo en regiones económicamente deprimidas (Aref, Redzuan y Gill, 2009 y Lepp, 2007), donde se observó que los residentes tienden a sobreestimar los logros económicos y subestiman los costos del desarrollo del turismo (Gursoy y Rutherford, 2004 y Nunkoo y Ramkissoon, 2010).

Igualmente, los residentes en esta situación valoran en mayor medida los beneficios socio-culturales (Hipótesis H5 y H7) y subestiman sus costes (Hipótesis H4 y H6). Esto está plenamente alineado con la teoría del intercambio social y muchos estudios (Chhabra y Gürsoy, 2011 y Jurowski et al., 1997), que observaron que los residentes locales que perciben los beneficios económicos del turismo son más propensos a reconocer los aspectos positivos del desarrollo del turismo que los que perciben menos o ningún beneficio.

Parece que la crisis económica crea un cambio en las prioridades de las personas. Mientras que la sociedad moderna es propensa a valores conservacionistas y de respeto al medioambiente (Huber, 2000), que busca patrones ambientalmente adecuados para la producción y el consumo, al mismo tiempo, el entorno económico complejo, inestable y de riesgo obliga a las personas a luchar por un medio alternativo de supervivencia en un mundo económicamente impredecible. Por lo tanto, en este entorno se tiende a subestimar los costes de los impactos medioambientales (Hipótesis H8) y a sobreestimar los beneficios colaterales sobre el medioambiente que genera la actividad turística (Hipótesis H9). Algunos estudios han revelado cómo los residentes llegan a adaptarse a los cambios generados por el turismo, incluso en los impactos negativos percibidos (contaminación, congestión) Kayat (2002). Otros estudios no turísticos también han verificado que las personas suelen sacrificar el medioambiente en favor de su propio beneficio económico (Harris, 2006).

Como consecuencia, cabía esperar, y en efecto se confirma, que la actitud de los residentes hacia la actividad turística en épocas de crisis e incertidumbre económica es aún más positiva (Hipótesis H1). El apoyo comunitario al turismo puede entenderse en la creencia general de que el turismo puede crear oportunidades para que las personas que ayuden a escapar de las dificultades (Kayat, 2002). Tales preocupaciones de los residentes se pueden explicar teniendo en cuenta el concepto de la “dependencia local” desarrollado por Cox y Mair (1988).

Según Cox y Mair (1988), muchos de los residentes tienden a favorecer el desarrollo económico local (es decir, el turismo), debido a su dependencia directa o indirecta de la actividad. En la misma línea Wyllie (1998) identificó que incluso algunos residentes que no se benefician directamente del turismo, apoyan su desarrollo por temor a que una crisis económica tendría un efecto negativo en la comunidad en su conjunto.

En general, esta investigación contribuye a la comprensión del papel crucial que desempeña el contexto económico para influir en la percepción del desarrollo del turismo de los residentes. En concreto, la actual crisis económica está llevando a los residentes de Tenerife y Mallorca a adoptar una actitud en general más positiva hacia el turismo.

Los resultados, sin embargo, no sugieren que los residentes apoyen cualquier política que pueda tener efectos e impactos negativos, sino que están en necesidad de mejorar sus condiciones de vida (Prentice, 1997). Esto se ha puesto de manifiesto en la intensa oposición mostrada por grupos locales a determinadas políticas como el caso de la ecotasa (Holden, 2009), por ser percibida como una reducción de la competitividad, o también en el caso del rechazo a las prospecciones petrolíferas por el impacto negativo que puede tener para la actividad turística.

Dado que el turismo depende en gran medida del apoyo de la comunidad local, los planificadores de la comunidad se enfrentan al reto de ajustar sus estrategias a las necesidades de los residentes locales, sin comprometer la sostenibilidad (Stylidis y Terzidou 2014). De lo contrario, los efectos negativos sobre el entorno sociocultural y natural pueden socavar la

viabilidad económica del turismo en el largo plazo (Jamal y Getz, 1995). Por tanto, los planificadores locales deben hacer hincapié en la contribución del turismo al empleo y al bienestar económico, debiendo transmitir que no se puede hacer a cualquier costo que pueda comprometer el futuro.

A pesar de sus efectos devastadores, la crisis económica también puede ser considerado como una oportunidad para reestructurar el sector turístico y aumentar su competitividad (O'Brien, 2012). Los resultados del estudio sugieren que se deben implementar metodologías de planificación colaborativa y estrategias cuidadosamente diseñados que satisfagan las necesidades de sus residentes, del sector y de los turistas, dado que los resultados de este estudio es inequívoco en cuanto a la intensidad del apoyo de los residentes hacia el turismo y la voluntad de superar la crisis.

## 6. Limitaciones

Este estudio, al igual que cualquier otra investigación, presenta algunas limitaciones. Las principales aportaciones se derivan de que el modelo utiliza datos longitudinales (2005 vs. 2014) y una comparación cruzada de casos (Tenerife vs. Mallorca). Por lo tanto, los resultados se pueden generalizar para destinos de tipología similar y además el modelo se puso a prueba en dos momentos diferentes (en momento de auge económico y durante la crisis económica). No obstante, alguna de las muestras obtenidas puede resultar algo escasa. Por otra parte, en 2005 no se incluyeron algunos factores exógenos que también podrían explicar parte de la variación en la percepción y el apoyo del turismo de los residentes y que en el modelo podrían haber sido relevantes como puede ser la percepción del estado de la economía local. Finalmente sería interesante investigar las percepciones y el apoyo de los residentes en otros destinos de tipología de desarrollo turístico diferentes.

Universidad de Valladolid

## RESUMEN

*El presente trabajo trata de analizar la influencia de la motivación en el comportamiento del consumidor turístico. Partiendo de la relación entre imagen-satisfacción-lealtad se establecen dos tipologías de visitantes en base a factores motivacionales y se estudia la forma en qué varía en ellos la relación entre los tres constructos. El análisis efectuado para una muestra de 350 turistas de una ciudad histórica con un claro posicionamiento de destino cultural, permite concluir que la imagen del destino influye de forma significativa en la satisfacción de la visita con independencia de la motivación y que el peso de la satisfacción en las intenciones futuras de los visitantes es mayor cuando éstos viajan por motivos externos vinculados a los atributos y atractivos del destino.*

## Palabras clave:

Perfiles motivacionales, imagen percibida, satisfacción, lealtad al destino

## 1. Introducción

La trascendencia que en términos económicos tiene comprender por qué los visitantes vuelven a un destino ya conocido ha hecho que la lealtad se convierta en el objetivo de numerosos estudios e investigaciones. En este sentido, gran parte de los trabajos realizados se han centrado en identificar sus antecedentes –como la satisfacción, el valor percibido, la imagen- así como sus factores condicionantes, produciéndose en las últimas décadas avances muy destacados en la comprensión de este fenómeno. No obstante, como evidencia la revisión de la literatura aún hay ciertas cuestiones abiertas al debate que exigen avanzar y profundizar en la comprensión de la repetición de la visita y por, extensión, en el comportamiento futuro de los visitantes.

En el ámbito turístico, la particularidad y naturaleza única del producto turístico hace que la lealtad sea un objetivo que no resulta fácil de conseguir (Olivier, 1999). En este sentido, algunos autores han apuntado que los visitantes son básicamente desleales (Bowen y Shoemaker, 1998). Esto se debe, en gran medida, a la importancia que tiene la búsqueda de nuevas experiencias y el deseo de conocer nuevos lugares en el comportamiento de gran parte de los turistas. Este junto a otros factores motivacionales -como el deseo de relajarse, salir de la monotonía, aumentar su cultura, etc- juegan un rol fundamental en las elecciones y decisiones de los individuos (Alegre y Juaneda, 2006; Jang y Feng, 2007)

La influencia de la motivación en la imagen percibida y en la satisfacción ha sido ampliamente aludida en la literatura turística. La motivación como factor que impulsa a los individuos a actuar y antecedente de la conducta viajera se configura como un filtro a través del cual los individuos construyen su imagen del destino (Castaño, Moreno y Crego, 2006). Además, la motivación puede ejercer una influencia determinante en la satisfacción en la medida en que los turistas obtendrán un mayor o menor grado de satisfacción global en función de la evaluación que realicen de aquellos aspectos de su visita más relacionados con los motivos de su viaje.

Por otro lado, numerosos estudios han incidido en la influencia de la imagen en la satisfacción y la relación entre satisfacción-lealtad (Bigné, Mattila y Andreu, 2008; Hosany y Witha, 2010; Jang y Feng, 2007). En estos y otros estudios se concluye que una imagen favorable, derivada de su experiencia en el destino, determina una evaluación positiva que conducirá a la satisfacción de los visitantes; además, hay un cierto acuerdo en que cuánto más satisfechos estén los individuos más probable es que éstos generen una comunicación positiva y se incremente la probabilidad de que repitan su estancia en él mismo. La integración de ambas consideraciones ha abierto un nuevo campo de investigación que explora la relación imagen-satisfacción-intenciones futuras.

Dentro de este marco, el presente trabajo pretende avanzar en el conocimiento de la influencia que ejerce la motivación en la imagen percibida del visitante sobre el destino, su satisfacción y su comportamiento futuro.

Partiendo de la idea de que el mercado turístico es heterogéneo y que son múltiples y dinámicas las motivaciones que mueven a los individuos a viajar, hemos identificado dos grandes perfiles motivacionales de visitantes de un destino cultural. Con estas premisas nos planteamos el objetivo de explorar si la motivación establece o no cambios en la relación entre éstos tres constructos.

### **1.1. La relación satisfacción-lealtad**

La satisfacción puede considerarse como un juicio evaluativo postcompra, que incorpora elementos cognitivos y afectivos, y que realiza el consumidor sobre su experiencia (Olivier, 1999).

Desde la perspectiva de las empresas y destinos turísticos, el objetivo de conseguir que los individuos alcancen elevados niveles de satisfacción está ampliamente justificado en la medida en que esto se traduce en la generación de una comunicación positiva (*lealtad actitudinal*) y aumentan las posibilidades de que éstos repitan la visita al destino (*lealtad comportamental*).

En las últimas décadas se ha realizado un gran esfuerzo investigador orientado hacia la obtención de modelos generales que permitan explicar la satisfacción y la lealtad del consumidor. Muchos de estos

estudios han analizado los antecedentes de la satisfacción – como la experiencia, las emociones, la calidad y el valor percibido (De Rojas y Camarero, 2008; Hosany y Witham, 2010; Bigné et al. 2008; Gallarza y Saura, 2006)- y sus consecuencias.

Los resultados de gran parte de ellos establecen que la satisfacción es un antecedente de las intenciones futuras de los visitantes. Trabajo como los de Chi y Qu (2008), Chen y Tsai (2007), Yoon y Uysal, (2005), Bigné et al. (2008), Lee, Yoon y Lee (2007) Han, Kim y Kim, (2011); establecen el efecto directo y positivo de la satisfacción confirmando la idea de tener clientes satisfechos incrementan las posibilidades de que éstos aumenten el consumo del producto y generen una comunicación positiva del mismo. No obstante, algunos autores han matizado y cuestionado el efecto de la satisfacción (Agustin y Singh, 2005; Lee, Lee y Lee, 2005). Bigné, Sánchez y Sánchez (2001) se muestran cautos a la hora de establecer una relación directa entre ambas variables. Sus investigaciones para dos destinos españoles, sólo consiguen probar para uno sólo de ellos esta hipótesis. Basándonos en las consideraciones anteriores y al objeto de confirmar la validez de esta relación en destinos culturales establecemos la siguiente hipótesis:

*(H1): La satisfacción es un antecedente de las intenciones futuras del visitante*

### **1.2. La relación imagen-satisfacción-lealtad**

En el contexto actual, la idea de que la imagen percibida influye tanto en la elección del destino como en la evaluación que este realiza de su experiencia en él mismo y por extensión en su comportamiento futuro de los individuos es ampliamente asumida.

La imagen ha sido considerada como una representación mental de las creencias, sentimientos e impresión global que tienen los individuos hacia un objeto o destino (Baloglu y McCleary, 1999). Este constructo está integrado por una dimensión cognitiva o perceptual y una emocional; existiendo una estrecha relación entre ambos componentes que dan como resultado la imagen global que los individuos tienen de un producto (Stern y Krakover, 1993).

La imagen cognitiva ha sido medida tradicionalmente a través de un conjunto más o menos amplio y diverso de atributos caracterizadores de los destinos (Gartner, 1989, Beerli y Martín, 2004) con capacidad para atraer y persuadir a los individuos para visitar un lugar determinado. Por su parte, el aspecto emocional de la imagen está vinculado a los sentimientos que los visitantes pueden sentir y experimentar hacia el destino.

Distintas investigaciones han analizado el proceso de formación de la imagen probando empíricamente que la percepción cognitiva y la evaluación afectiva ejercen una influencia directa en la imagen percibida (Baloglu y McCleary, 1999; Rodríguez, Frías y Castañeda, 2013; Stern y Krakover, 1993). y será resultado tanto de la percepción subjetiva de los atributos y elementos del destino como de los sentimientos que despierte en el visitante. En consonancia con estas premisas establecemos la siguiente hipótesis:

*(H2): La imagen del destino es resultado de la evaluación de un componente cognitivo y afectivo que la determinan*

Numerosos estudios previos han propuesto un amplio abanico de atributos con capacidad para recoger la imagen percibida, basándose en la idea de que la imagen es una percepción subjetiva del destino que se deriva de la valoración que el individuo realiza de sus atributos y características (Hunt, 1975; Phelps, 1986; Stabler, 1995; Chen y Tsai, 2007). Una imagen positiva, originada por dicha valoración y la favorable experiencia vivida por los individuos en el destino, puede contribuir a la satisfacción de los visitantes.

El efecto directo y positivo de la imagen sobre la satisfacción ha sido probado en la literatura confirmándose la existencia de una relación causal entre ambos constructos (Bigné et al., 2001; Lee et al. 2005) y demostrando que existe una relación entre la imagen cognitiva y afectiva y la satisfacción experimentada por el visitante (Rodríguez et al, Frías y Castañeda, 2013). Prayag y Ryan (2012) confirman que cuanto más positiva es la imagen percibida más altos son los niveles de satisfacción. En este mismo sentido, los resultados de Chi y Qu, (2008) establecen que la imagen percibida influye

directamente en los atributos que utiliza el individuo para construir su satisfacción y que ambos son antecedentes directos de la satisfacción global.

*(H3): La imagen global es un antecedente de la satisfacción del visitante*

La revisión de la literatura evidencia un menor número de trabajos que analicen la influencia de la dimensión cognitiva y emocional de forma diferenciada en la satisfacción de los turistas y por extensión en la relación imagen global-satisfacción-lealtad. Algunos como los de Rodríguez et al, Frías y Castañeda (2013) revelan la influencia significativa de la imagen cognitiva en la imagen afectiva, la satisfacción y la imagen global. Otros como del Bosque y San Martín (2008) apuntan que cuanto más positiva es la imagen preconcebida del destino más alta es la lealtad al destino pero no sucede así en el caso de su impacto en la satisfacción experimentada después de la visita.

Por otro lado, aunque se ha demostrado la influencia de algunos factores motivacionales en el componente afectivo aún está prácticamente sin explorar la incidencia de éstos en la relación que guarda la imagen con la satisfacción y la lealtad. En la medida en que la evaluación que el individuo realiza del destino puede estar determinada por los criterios de evaluación derivados de la motivación que actúan como filtro a través de los cuáles los individuos elaboran su imagen del destino, resulta de interés analizar el papel que ambos componentes de la imagen pueden tener sobre la imagen global y en su relación con la satisfacción y la fidelidad del visitante. Estas consideraciones nos llevan a establecer la siguiente hipótesis:

*(H4): La motivación determina las relaciones que se establecen entre la imagen percibida, la-satisfacción y las intenciones futuras de los visitantes*

### **1.3. La motivación y su influencia en las decisiones de los turistas**

En el ámbito del turismo, la motivación se configura como un meta-concepto que actúa como detonante de la conducta viajera siendo un factor explicativo clave de las decisiones y comportamiento de los turistas. La motivación permite dar respuesta a tres cuestiones esenciales del ciclo turístico: (i) las razones por la que los individuos viajan, (ii) la elección concreta del lugar al que viajan; y (iii) los resultados obtenidos de su experiencia (Castaño, Moreno, García y Grego 2003).

Viajar cubre necesidades psicosociales muy amplias (Schmidhauser, 1989), lo que hace que la mayoría de las personas viajen por la confluencia de un conjunto más o menos variado de motivos aunque, en ocasiones, pueda identificarse un motivo principal sin el cual el viaje no se hubiera realizado. Estos motivos que mueven y dirigen la conducta de los individuos pueden tener causas muy diferentes y ser activados tanto por sensaciones internas como por estímulos externos (Gnoth, 1997; Goossens, 2000).

Numerosas investigaciones se han centrado en el análisis de la motivación turística lo que ha permitido avanzar en su comprensión como fenómeno psicosocial. Dentro de la multiplicidad de enfoques y teorías que han abordado su estudio uno de los más utilizados y aplicados en la literatura es el modelo de los factores de empuje y arrastre (Dann, 1977;1981; Goonssens, 2000; Jan y Wu, 2006; Iso-Ahola, 1982) . Los primeros (*push factors*) están relacionados con los deseos del turista y por tanto con aspectos más internos y emocionales. Dentro de esta tipología se incluye, entre otros, la necesidad del individuo de relajarse, escapar del estrés y de los patrones de vida cotidianos, buscar la interacción social y viajar con la familia. En cambio, los factores de arrastre (*pull factors*) o motivos externos están más conectados con aspectos cognitivos y se vinculan a los atractivos y atributos del destino (Crompton, 1979; Yoon y Uysal, 2005); aunque éstos también pueden reforzar a los motivos internos (Yoon y Uysal, 2005).

Otra de las teorías motivacionales de referencia es la formulada por Crompton (1979). En ella establece una doble clasificación diferenciando una primera tipología de “*motivos psicológicos*” en la que incluye siete factores de empuje (escape, exploración, relax, prestigio, regresión, mejora de relaciones familiares e interacción social) y una segunda clase denominada “*motivos culturales*” más orientados al destino (*pull factors*) e integrados por la novedad y las necesidades culturales.

En una línea complementaria e interrelacionada, otros autores han establecido la “necesidad de escape” – que puede concretarse en el deseo del individuo de dejar atrás su entorno cotidiano (push factor)- y la “necesidad de búsqueda” (pull factor) -asociada al deseo de conseguir una recompensa psicológica intrínseca-; como dos de las dimensiones fundamentales de la motivación turística (Iso-Ahola, 1982; Ross e Iso-Ahola,1991). Por su parte, Ryan y Glendon (1998) identifican cuatro grandes factores motivacionales: una *dimensión social* –relacionada con el aspecto relacional de los viajes y las vacaciones- una *dimensión de relax* –que combina las necesidades de búsqueda y escape-, una *dimensión intelectual* –referida al conocimiento y el descubrimiento- y una *dimensión de maestría o competencia* relacionada con el desarrollo de habilidades.

Estas aportaciones evidencian el carácter multidimensional y complejo de la motivación. Pero además, ponen de manifiesto que las motivaciones de los individuos son heterógenas y dinámicas (Pearce1988; 1993; Lee, Lee y Wicks, 2004). Distintos grupos de individuos pueden viajar al mismo destino por motivos diferentes. De hecho, estas razones pueden variar de una persona o segmento de mercado a otro y de un proceso de decisión al siguiente (Devesa, Laguna y Palacios, 2010, Kozac, 2002) lo que exige un análisis continuado de la evolución del mercado y la aplicación de estrategias de segmentación como pre-requisito para el diseño de estrategias de marketing efectivas.

La identificación de segmentos utilizando variables motivacionales permite la identificación de tipologías de visitantes que pueden presentar distintos niveles de atractivo para el destino en función de su tamaño, gasto o correspondencia con el posicionamiento del destino. Un destacado número de investigaciones han utilizado la motivación como criterio para identificar perfiles diferenciados de visitantes, estableciendo la pertinencia y utilidad de ésta como variable de segmentación (Barroso Castro et al., 2007; Beh y Bruyere, 2007; Devesa, Laguna y Palacios; 2010; Formica y Uysal, 1996; Lee et al., 2004; Molera y Albadarejo, 2007). Sin embargo, aún son escasos los trabajos centrados en estudiar si la heterogeneidad del mercado afecta a la relación entre el destino turístico y los visitantes (Barroso Castro et al, 2007).

Yoon y Uysal (2005) apuntan que una comprensión completa de la lealtad necesita considerar de forma simultánea la satisfacción y la motivación y señalan que la variación de las motivaciones puede hacer cambiar los estándares y niveles de satisfacción de los individuos. Sus resultados -además de confirmar que la satisfacción es un antecedente de la lealtad-, indican que los factores externos afectan a la satisfacción y que existe una relación significativa entre los factores internos y lealtad. Otros estudios como Schofield y Thomson (2007) también establecen la influencia de algunos factores push y pull en la satisfacción y en las intenciones de los visitantes. Por su parte, Jang y Feng (2007) se centran únicamente en el efecto de la búsqueda de novedad señalando que este motivo tiene un efecto directo en la satisfacción a corto plazo y en la intención de volver a visitar el destino a medio plazo.

Aunque estos estudios apuntan la existencia de una relación entre los constructos sus resultados apuntan desiguales resultados sobre el impacto de los factores motivacionales en la satisfacción y la lealtad. Ello unido a las cuestiones aún abiertas en torno a la relación satisfacción-lealtad parece indicar la necesidad de seguir investigando en esta línea al objeto de comprender mejor el papel que juega la motivación en la misma.

Teniendo en cuenta estas consideraciones, planteamos la existencia de distintos perfiles de visitantes usando como criterio de asignación variables motivacionales con el objetivo de analizar si el mayor o menor peso de determinados factores influyen en el comportamiento de los visitantes en términos de imagen percibida, satisfacción e intenciones futuras.

## **2. Metodología**

### **2.1. Muestra y procedimiento**

Los datos utilizados para el estudio fueron obtenidos a través de cuestionarios realizados a una muestra representativa de visitantes de un destino cultural. Se realizaron un total de 350 entrevistas, en diferentes lugares de la ciudad y en diferentes horarios del día. La muestra estaba equilibrada en

cuanto al sexo de los entrevistados, con un ligero predominio de las mujeres (53%), con una edad media de 49 años y con mayor presencia de estudios universitarios (62% de la muestra) y de trabajadores por cuenta ajena (31%). La inexistencia de diferencias estadísticamente significativas en todas las variables pertinentes para nuestra investigación, permiten considerar la muestra como una muestra única de turistas.

## 2.2. Escalas de medidas

Las motivaciones de los visitantes fueron medidas a partir de una escala en la que se incluyeron un total de 17 ítems iniciales de tipo Likert de 10 puntos que comprendían tanto factores de empuje (*pull factors*) como de arrastre (*push factors*). Con ellos se trató de recoger las razones de viaje más frecuentes y relevantes, y su elección se realizó de acuerdo con la revisión bibliográfica efectuada (Crompton, 1979; Crompton y McKay, 1997; Goossens, 2000; Lee et al., 2004; Ragheb y Beard, 1982).

Como paso previo a los cálculos posteriores, se realizó un análisis factorial de la escala de motivación del que se extrajeron cuatro factores. Aunque nuestro interés reside en las puntuaciones factoriales que se derivan de dichos componentes como instrumento para establecer la fuerza de las motivaciones en cada sujeto, resulta interesante caracterizar cada uno de los cuatro factores de la solución final, pues, sin duda, nos ayudará a comprender los resultados que de ellos se derivan (Tabla 1).

TABLA 1

**Matriz de componentes rotados del cuestionario de motivación de la visita**

	Componente			
	1	2	3	4
VISITAR MONUMENTOS Y PATRIMONIO	,857			
AUMENTAR CULTURA Y FORMACIÓN	,846			
VISITAR A FAMILIARES Y AMIGOS	-,557			
NUEVAS EXPERIENCIAS Y SITIOS NUEVOS	,444	-,619		
CERCANÍA AL LUGAR DE RESIDENCIA	-,410			
DISFRUTAR DE LA GASTRONOMÍA		,724		
CONOCER SITIO		-,508		
DISFRUTAR DE LAS VACACIONES Y TIEMPO LIBRE		,452		,402
DISFRUTAR DEL ENTORNO NATURAL		,440		
DESCANSAR, NO HACER NADA			,794	
ESCAPAR DE LAS TENSIONES			,629	
COMENTAR EXPERIENCIA VIAJE				,386
FAVORECER RELACIONES				,796

El primero de los factores tiene pesos importantes en motivos que tienen en común la visita monumental e histórica, el aumento de la cultura y la propia formación así como por la búsqueda de sitios nuevos y de nuevas experiencias. Un segundo factor tendría un fuerte contenido gastronómico, de un visitante de cercanía, así como del disfrute del entorno natural.

Un tercer factor, que podríamos denominar *Búsqueda del descanso y la tranquilidad*, estaría formado por un visitante que busca la tranquilidad y el descanso, como alternativa a la vida de la ciudad. El último de los factores tendría que ver con visitantes que encuentran en las relaciones interpersonales unos de los motivos principales de la visita siendo el viaje una buena manera de favorecer dichas relaciones interpersonales (con la familia, la pareja, los amigos, etc.).

El coeficiente Alpha de Cronbach de la escala alcanzó un valor de 0,85. Para el análisis de la validez se procedió a realizar un AFC con los 17 ítems del cuestionario, en un modelo de cuatro factores, obtenidos a partir del análisis factorial anterior. Dicho modelo presenta un ajuste razonable (Tabla 2).

TABLA 2

**Evaluación de modelos de 4 factores de las escalas de motivación (AFC)**

Modelo	S-B <sub>(Chi-cuadrado)</sub> (gl) (p)	GFI	RMSEA	NFI	NNFI	CFI	AGFI	AIC
<b>Factores Escala de motivaciones (4 factores)</b>	166.400 (76) (P = 0.000)	0.962	0.0686	1.000	1.074	1.000	0.940	254.400

En la construcción de la escala de satisfacción, se partió de una concepción multidimensional de la misma en la idea de que la evaluación que hace un individuo sobre su experiencia es resultado de un proceso complejo. De las diferentes metodologías utilizadas en el estudio y medición de la satisfacción (expectation-performance, importance-performance, disconfirmation approach) se optó por aquella en la que ésta es medida a través del resultado experimentado por los individuos (Devesa y Palacios, 2006; Truong y Foster 2006; Yu y Goulden, 2006). La escala final presentó un Alfa de Cronbach aceptable (Tabla 3).

TABLA 3

**Análisis de la fiabilidad de las diferentes subescalas**

Subescala	Alfa de Cronbach	Número de elementos
<b>Imagen cognitiva</b>	0'71	7
<b>Imagen afectiva</b>	0'72	3
<b>Satisfacción</b>	0'71	4
<b>Lealtad</b>	0'81	3

Por su parte, la escala para medir las intenciones futuras ha recogido tanto la dimensión actitudinal como comportamental de la lealtad. En consonancia con trabajos anteriores, ésta se ha operativizado mediante tres ítems que recogen tanto las intenciones de volver a visitar el destino como la intención de generar una comunicación positiva del mismo (Barroso Castro et al. (2007); Chen y Chen, 2010; Yoon y Uysal, 2005; Lee et al. 2007). La escala final presentó un Alfa de Cronbach elevado de 0'81 (Tabla 3).

En cuanto a la imagen, se partió de la consideración de ésta como la suma de creencias, ideas e impresiones que las personas tienen de un destino o lugar (Hunt, 1975; Crompton, 1979). La medición del componente cognoscitivo se realizó mediante una escala multi-ítems integrada por 24 atributos característicos del destino (Beerli and Martín, 2004, Chen and Tsai, 2007; Chi and Qu, 2008). Para medir el componente afectivo se utilizó una escala de diferencial semántico integrada por tres ítems que recogen la dimensión emocional de la imagen percibida del destino, basándonos en los trabajos de Balogly y McCleary, (1999); Beerli y Martín (2004), Bosque y San Martín (2008) y Russel y Snodgrass (1987). Por último, la imagen global, se operativizó a través de un único ítem pidiéndose a los entrevistados que la valorarán en una escala de diez posiciones. Tanto la escala de imagen cognitiva como la escala de imagen afectiva alcanzaron valores aceptables (Tabla 3).

**3. Resultados**

El análisis factorial de la escala de motivación de la visita analizada en el apartado anterior, además de establecer una distinción entre los diferentes motivos de los turistas y visitantes, nos permitió disponer de un conjunto de puntuaciones factoriales con las características que necesitamos para realizar un análisis de cluster. Pretendemos con ello, establecer el menor número posible de grupos motivacionales con significatividad lógica y estadística a partir de esas puntuaciones normalizadas con valores medios y desviaciones típicas iguales; la ausencia de correlaciones entre los factores está asegurada por haber sido obtenidos con rotación Oblimin. El método seleccionado para el análisis de cluster será el de clasificación no jerárquica bajo la premisa de maximizar la varianza entre tipologías y minimizar la varianza dentro de cada grupo.

De todas las soluciones posibles, la que mejor cumple estos requisitos es la que establece dos conglomerados que pasamos a identificar a partir de sus valores medios en las puntuaciones factoriales mencionadas (Tabla 4).

TABLA 4

<b>Tipologías motivacionales</b>			
<b>Conglomerado (Tamaño)</b>	<b>Valor medio en cada factor</b>	<b>Factores con los que se correlaciona</b>	<b>Nombre del conglomerado</b>
1 230 miembros (66%)	F1 = 0'46	F1 y F2	Visitante Cultural y gastronómico
	F2 = 0'24		
	F3 = -0'01		
	F4 = -0'32		
2 120 miembros (34%)	F1 = -0'88	F2 y F3	Visitante relacional y de relax
	F2 = -0'45		
	F3 = 0'17		
	F4 = 0'62		

El primero de los conglomerados tendría puntuaciones elevadas en los motivos relacionados con la visita cultural y monumental (factor F1) y que tiene en la gastronomía un motivo más de la visita (factor F2); este primer conglomerado estaría formado por el 66 % de la muestra.

El segundo conglomerado tiene valores medios elevados en el tercer factor, relacionado con los visitantes que buscan la tranquilidad y el descanso, así como con el factor cuatro, que hemos denominado visitante relacional. Este grupo lo compone el 34% de la muestra y, por razones evidentes, le hemos denominado visitante relacional y de relax.

Tras la determinación de las tipologías motivacionales, vamos a establecer los modelos en los que hacemos explícitas las relaciones de causalidad entre imagen, satisfacción y lealtad para cada uno de esos conglomerados así como para el total de la muestra. Estos modelos nos permitirán a aceptar o refutar cada una de las hipótesis planteadas. Para su cálculo se han utilizado la matriz de covarianza y el algoritmo de cálculo de los mínimos cuadrados no ponderados pues con dicha estrategia de cálculo, se realizan estimaciones consistentes sin necesidad de asumir multinormalidad de las variables (Ruiz 2000).

El path análisis de la relaciones entre la imagen, la satisfacción y la lealtad a partir de los datos del total de la muestra presenta un buen ajuste (Tabla 5). Además, la matriz landa X del modelo presenta todos los valores significativos con  $p > 0'05$ .

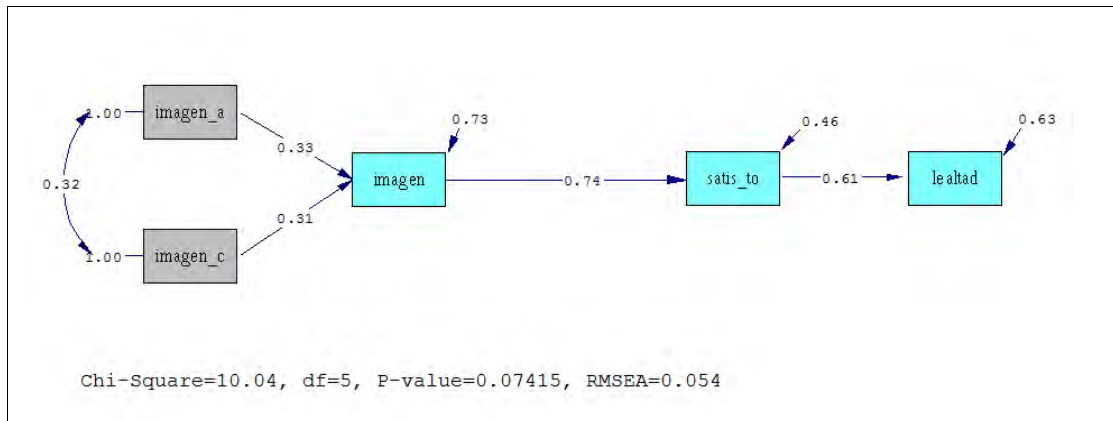

TABLA 5

<b>Ajustes del modelo general</b>								
<b>Modelo</b>	<b>S-B (Chi-cuadrado) (gl) (p)</b>	<b>GFI</b>	<b>RMSEA</b>	<b>NFI</b>	<b>NNFI</b>	<b>CFI</b>	<b>AGFI</b>	<b>AIC</b>
<b>Modelo general</b>	10.474 (5) (P = 0.074)	0.98	0.053	0'98	0'98	0'99	0.96	30.039

El modelo presenta relaciones directas y significativas entre la imagen afectiva y la imagen cognitiva con la imagen final. Concretamente, la imagen afectiva determinaría la imagen final con un peso de 0'33 y de 0'31 la imagen cognitiva. Existiría, además, una correlación significativa entre ambos componentes de la imagen del destino. (Figura 1).

FIGURA 1

**Modelo final del total de la muestra**

A su vez, la imagen del destino explicaría la varianza de la satisfacción final en un porcentaje del 54% (correlación de 0'74). (H3): La imagen global es un antecedente de la satisfacción del visitante. Por último, la satisfacción de la visita determinaría la lealtad al destino con un peso de 0'61; la satisfacción explicaría algo más del 37% de la lealtad al destino.

Para la comprobación de la H4, hemos elaborado los modelos correspondientes a cada uno de los dos conglomerados manteniendo de partida las mismas relaciones que en el modelo general que acabamos de analizar. Estos dos modelos presentan ajustes adecuados (Tabla 6).

TABLA 6

**Ajustes de los modelos por conglomerados**

Modelo	S-B <sup>(Chi-cuadrado)</sup> (g) (p)	GFI	RMSE A	NFI	NNFI	CFI	AGFI	AIC
Visitante cultural-gastronómico	8.765 (5) (P = 0.019)	0.99	0.0576	0.98	0.98	0.95	0.96	30.000
Visitante relacional y de relax	11.694 (5) (P = 0.039)	0.96	0.1070	0.94	0.92	0.99	0.88	30.000

El ajuste del modelo correspondiente a los visitantes culturales y gastronómicos es adecuado y parecido en su cuantía al obtenido en el modelo general. No así el obtenido con los visitantes relacionales y de relax, aunque el valor de Chi-Cuadrado nos permite considerar un ajuste correcto (Figuras 2 y 3).

FIGURA 2

**Estimación de modelos para los visitantes culturales-gastronómicos**

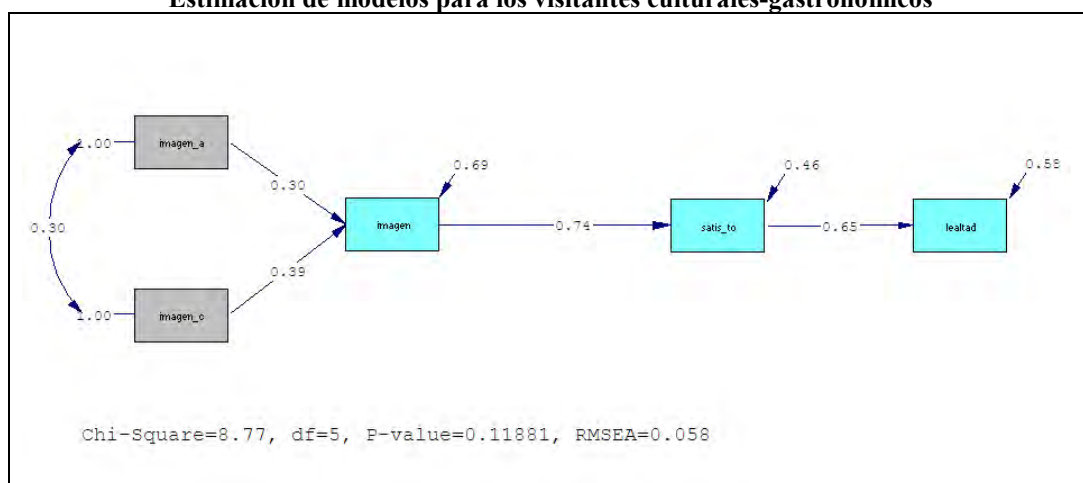

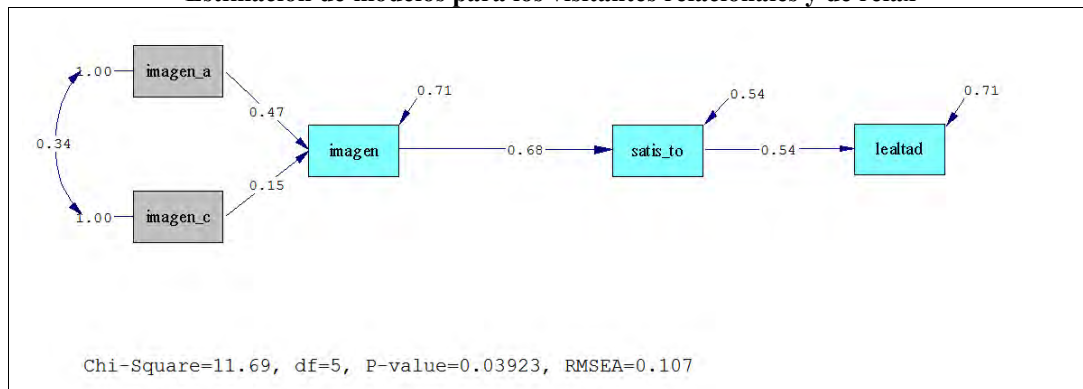

FIGURA 3  
Estimación de modelos para los visitantes relacionales y de relax

La imagen del destino en ambos segmentos motivacionales determina la satisfacción de la visita. Igualmente la satisfacción es un antecedente claro de la lealtad en ambos grupos; cabe considerar nos obstante, que el peso de la satisfacción como determinante de la lealtad es ostensible mayor en los visitantes culturales y gastronómicos. No obstante, la diferencia mayor se encuentra en el peso que la imagen afectiva y la imagen cognitiva tienen sobre la imagen general e, indirectamente, sobre la satisfacción y la lealtad. Concretamente, en el cluster de los visitantes culturales gastronómicos, el modelo ajusta de manera significativa con un peso mayor de la imagen cognitiva (correlación de 0'39) frente a la imagen afectiva (0'30). Por el contrario, en el grupo de los visitantes relacionales y de relax, la imagen cognitiva disminuye hasta un valor de 0'15 y aumenta, por el contrario, la afectiva (correlación de 0'47).

Con respecto al peso de la imagen general como determinante de la satisfacción, se obtienen pesos muy parecidos en ambos segmentos, lo que indicaría una clara dependencia de la satisfacción percibida de la imagen del destino.

En otro orden de cosas, la satisfacción general percibida como determinante de la lealtad presenta en ambos grupos motivacionales pesos elevados. No obstante, ahora el peso sobre la satisfacción es mayor en los visitantes culturales gastronómicos. Como en el caso anterior, los pesos obtenidos en los dos grupos son muy parecidos al alcanzado en el modelo general.

#### 4. Conclusiones

El mercado turístico posee particularidades que le convierten en un producto de naturaleza única en el que no siempre resulta fácil de conseguir los objetivos de venta propuestos. Se trata, además, de un mercado heterogéneo en el que las motivaciones que mueven a los individuos a viajar son múltiples y dinámicas. En la idea de que en el turismo querer contentar a todos es sinónimo de convencer a nadie, pronto surgieron propuestas en las que el establecimiento de perfiles o tipologías motivacionales mostraron su eficacia en dicho mercado turístico (Dann, 1977; Crompton, 1979; 1981; Goossens, 2000; Jan y Wu, 2006; Iso-Ahola, 1982).

En el presente trabajo indagamos en el efecto que estos perfiles motivacionales pudieran tener en las relaciones entre constructos sobradamente comprobados en la literatura al respecto. Concretamente, exploramos la posibilidad de que la motivación determine cambios en la relación entre la imagen del destino, la satisfacción y la lealtad.

En relación con la satisfacción, nuestros resultados confirman que la satisfacción experimentada por el visitante, independientemente de su perfil motivacional, tiene un efecto directo y positivo sobre sus intenciones futuras o sobre su lealtad. Podemos decir que la satisfacción es un buen predictor del comportamiento del consumidor, lo que explicaría que los visitantes más satisfechos tiendan a manifestar una mayor intención de volver al destino y de recomendarlo a personas de su entorno como

han confirmados estudios anteriores Chi y Qu, (2008); Chen y Tsai, (2007); Yoon y Uysal, (2005); Bigné et al., (2008); Lee, Yoon y Lee, (2007); Han, Kim y Kim, (2011).

Esta relación entre satisfacción y lealtad está presente también en los modelos correspondientes a las dos tipologías motivacionales que hemos establecido con nuestros datos (visitantes culturales-gastronómicos y visitantes relacionales y de relax) y apuntaría la validez de la relación satisfacción-lealtad con independencia de las causas que originan el viaje.

No obstante, la comparación de ambos modelos apunta la existencia de un peso mayor de la satisfacción como antecedente de la lealtad para los visitantes culturales-gastronómicos; aquellos con una motivación externa más clara. Dado que en el contexto actual, uno de los objetivos prioritarios para el desarrollo y potenciación de cualquier enclave turístico es conseguir altas tasas de repetición de la visita, desde una perspectiva estratégica y operativa, este resultado apuntaría la necesidad prioritaria de los destinos de estudiar y segmentar su mercado en base a criterios motivacionales, -sin perder de vista el carácter dinámico de la misma- con el fin de establecer targets prioritarios en los que la consecución de altos niveles de satisfacción conlleve en mayor medida la fidelidad de sus visitantes, diseñando una oferta adaptada a sus expectativas y necesidades.

Por otra parte, la imagen, además de tener una gran importancia en el contexto de pre-compra condicionando la elección del destino, también ejerce una influencia significativa en la valoración postconsumo que realiza el visitante. Los individuos tienden a realizar esta evaluación basándose en la experiencia vivida y la percepción subjetiva de los atributos que conforman el destino. Nuestros resultados demuestran esta directa relación entre la imagen del destino y la satisfacción sin considerar la motivación como variable interviniente. Resultados parecidos han sido presentados por Rodríguez et al, (2013) y Bosque y San Martín (2008). Pero además, los datos de los dos modelos correspondientes a los visitantes culturales-gastronómicos y a los visitantes relacionales y de relax también está presente esta relación causal de la imagen sobre la satisfacción.

En otro orden de cosas, en línea con lo expuesto en la literatura, hemos comprobado que la imagen que los turistas se construyen de nuestro destino tiene un doble componente cognitivo y emocional (Baloglu y McCleary, 1999). Tanto en el modelo general, sin considerar las diferentes tipologías motivacionales, como en los correspondientes a esos perfiles motivacionales, se han establecidos relaciones causales significativas estadísticamente entre un componente de la imagen relacionado con lo racional o cognitivo y otro componente más cercano a mundo de las emociones y los sentimientos.

Sin embargo, el peso de ambos elementos configuradores de la imagen general presenta algunas diferencias en los modelos estimados para las dos tipologías de visitantes establecidas. Así, observamos que el peso del componente cognitivo en la imagen global es mayor en el grupo de visitantes culturales y gastronómicos de lo que lo es en el grupo de turistas relaciones y de relax. Podemos decir pues que, en función de los motivos que empujan o arrastran a los individuos a realizar la visita, los atributos del destino jugarán un papel diferencial en la formación de su satisfacción y, consiguientemente, con su lealtad. Si, como es nuestro caso, el viaje se originó para buscar mejorar las relaciones con la gente que nos rodea y la tranquilidad, es muy probable que aspectos emocionales de la imagen del destino tenga un peso ostensiblemente mayor que otros; seguramente se valorará más como determinante de la imagen la paz, la tranquilidad o la calma que te ofrece el destino. Si, por el contrario, la visita se centra en la cultura, la visita a museos o espectáculos culturales, es más probable que sean otros indicadores como los horarios, la calidad de las exposiciones y el estado de los monumentos, los que adquieran importancia (más cercanos a un planteamiento racional y menos emocional). En resumen, nuestros datos sugieren que el impacto de la imagen sobre la satisfacción y de esta sobre la lealtad pudiera estar mediada por la motivación.

En base a ello, determinar cuáles son los atributos y elementos a partir de los cuales los turistas crean su impresión global del destino y tratar de potenciarlos para mejorar su imagen se configura como un factor clave para su desarrollo y crecimiento en la medida en que ello puede contribuir a la repetición de la visita y favorecer una comunicación positiva del destino. No obstante, antes de utilizar la imagen para tratar de influir en el comportamiento de los individuos es importante seguir avanzando en la comprensión la influencia que ejercen en ella algunos factores como la motivación.

En relación a las limitaciones del trabajo, señalar que el ámbito concreto en el que se ha realizado pueden limitar la extrapolación de los resultados obtenidos haciendo aconsejable su aplicación a otra tipologías de destino como los de sol y playa. También pensamos que la utilización de una muestra más amplia hubiera permitido establecer otros grupos motivacionales de turistas en los que testar la relación imagen-satisfacción-lealtad. En este sentido, el establecimiento dos tipologías motivacionales, no permitiría recoger del todo la heterogeneidad y complejidad del mercado turístico. Así mismo, convendría incluir en el modelo de relaciones causales de otras variables que pueden determinar el resultado final como pudiera ser la experiencia previa del turista en este tipo de visitas o la familiaridad con el destino. Estos aspectos constituyen las líneas de investigación futura que nos proponemos abordar en investigaciones posteriores.

## RESUMEN

*The present paper focuses on the customer-based brand equity of a tourist destination, and analyzes empirically the causal relationships existing between its dimensions in the case of a regional destination in Spain. Furthermore, we analyze the effect of the country's destination image (country as umbrella brand) on the region's destination image (region as sub-brand), as well as the moderating effect of country familiarity on the relationship between both constructs of image. The results obtained of a sample of 253 international tourists show that the country's destination image influences the region's destination image, as well as the existence of a chain of effects between brand awareness, image, perceived quality, and loyalty toward the regional destination.*

## Palabras clave:

Place branding, equity brand, country image, regional image, brand awareness

## 1. Introduction

Tourism is one of the main industries contributing to the development of the countries. In this sense, a tourist destination can be considered as a product (Yoon and Uysal, 2005; Boo et al. 2009), and territories, through Destination Marketing Organisations (DMOs), must struggle for attracting visitors and building loyalty. To that end, in a global and competitive environment, such as the current one, having a strong brand may be a good strategy for achieving positive returns, providing the differentiation needed from competitor territories and gaining competitive advantage (Hanna and Rowley, 2007; Pike, 2009). Despite its interest, “place branding” is one of the newest research areas (Cai, 2002), and it is still considered to be in its infancy (Konecnik, 2006; Pike, Bianchi and Kerr 2010). Up to now, the literature available is highly fragmented (Gertner, 2011), and concepts like “brand loyalty”, “brand equity” or “brand architecture”, with an extensive background in the marketing literature (Keller, 1993; Aaker, 1996; Aaker and Joachimsthaler, 2000), have been very little explored in the field of tourist destinations (Dooley and Bowie, 2005; Konecnik, 2006; Pike, 2007; Harish, 2010).

Taking into account its potential, the present paper tries to contribute to the literature with a study, focuses on international tourists, that take as a starting point the dimensions of the customer-based brand equity of a regional tourist destination, and analyses empirically the causal relationships or chain effects existing between them, considering the loyalty toward the regional destination as the main outcome variable to explain. Furthermore, taking into account the hierarchy of destination brands, the paper analyses the influence of country’s destination image on a region’s destination image in the case of Spain, a country with a “house of brands” strategy in touristic terms (Dooley and Bowie, 2005; Harish, 2010).

## 2. Literature review and research hypothesis

### 2.1. Customer-based brand equity of a place

“Place branding” is becoming a focal area for marketers, with a growing number of academic works, particularly in the field of destination and tourism marketing (Kaplan, Yurt, Guneri and Kurtulus, 2010). So far, the topic has been partly covered with studies about destination image (Baloglu and McCleary, 1999; Pike and Ryan, 2004; San Martín and Rodríguez del Bosque, 2008), but place branding is a complex and extensive field of research, and it cannot be limited to destination image studies only (Kaplan, Yurt, Guneri and Kurtulus, 2010). Specifically, the effectiveness of place brands can be measured by customer-based brand equity (CBBE) (Konecnik, 2006; Konecnik and Gartner, 2007; Pike, Bianchi and Kerr, 2010; Im, Kim, Ellio and Han, 2012), a multidimensional construct initially proposed by Keller (1993) and Aaker (1996) in the field of goods and services, and now extended to the territories.

Despite its potential for tourist destinations, the study of brand equity has only recently attracted the attention of academic researchers (Boo, Busser and Baloglu, 2009). Following the previous works, we accept that the customer-based brand equity features four dimensions: brand awareness, brand image, brand quality and loyalty. According to these authors, *brand awareness* is the presence of a destination in the mind of the people when a given travel context is considered; *brand image* represents the set of associations or impressions attached to the destination, composed of a variety of individual perceptions relating to various product/service attributes (Konecnik, 2004); *brand quality* is concerned with perceptions about the way in which the destination attempts to meet tourists’ functional needs (Keller, 2003), a holistic judgment made on the basis of the excellence or overall superiority of the service (Bigné, Sánchez and Sanz, 2005); and *brand loyalty*, that represents the core dimension of the CBBE concept (Aaker, 1996) and the main source of customer-based brand equity (Keller, 2003), is measured by intention to return to the destination and the willingness to recommend it (Pike, 2007; Chen and Myagmarsuren, 2010; Prayag, 2012).

Therefore, destination image is central to brand evaluation and brand equity, but other dimensions are also necessary to truly measure customer-based brand equity (Konecnik and Gartner, 2007; Boo, Busser and Baloglu, 2009).

## ***2.2. Loyalty toward a regional tourist destination: causal relationships between the dimensions of customer-based brand equity***

Different models of consumer behavior establish that awareness is a first and necessary step to loyalty (Konecnik 2006), the foundation of the hierarchy of brands (Pike et al. 2010) and “the ticket to enter the market” (Pike 2007). In general, it is accepted that the higher the level of awareness the more dominant is the brand, which will increase the probability of the brand being considered (Yasin, Noor and Mohamad 2007). According to the associative network model, memory consists of nodes, defined as stored information connected by links that vary in strength (Anderson, 1993; Keller, 1993). A destination brand represents a potential node, to which a variety of associations are linked (Pike, Bianchi and Kerr, 2010). Brand awareness reflects the strength of the brand node in the minds of consumers, so it is to be expected that a greater awareness of a destination will enhance the associations linked to it, both those that compose the brand image (Bigné, Andreu and Zanfardini, 2013) and perceptions relating to quality (Pike, Bianchi and Kerr). Few empirical studies have been conducted in this field, but we support in the theory and previous works to propose the following hypotheses in the context of a regional tourist destination:

H1. The awareness of the regional destination will have a direct and positive influence on the region’s destination image.

H2. The awareness of the regional destination will have a direct and positive influence on the perceived quality of the regional destination.

In research on consumer behavior, it has been widely recognized that the quality perceptions are influenced by the image of the product or service as perceived by consumers (Bloemer, de Ruyter and Peeters, 1998). In tourism, image plays an important role in evaluations and behavioral intentions of tourists (Lee, Lee and Lee, 2005). In particular, the relationship between image and perceived quality has been confirmed in several works focused on tourist destinations (Bigné, Sánchez and Sánchez, 2001; Bigné, Sánchez and Sanz, 2005; Hankinson, 2005; Chen and Tsai, 2007; Kim, Holland and Han, 2013). The image that tourists form of the destination influences on how they perceive the destination quality. In particular, given that the destination image is formed on the bases of tourist’s perceptions about the destination resources and attractions, a better destination image will reinforce the quality perceived in the destination as a whole. With this in mind, we establish the third hypothesis:

H3. The region’s destination image will have a direct and positive influence on the perceived quality of the regional destination.

In tourism, quality is very important to destination success because it influences on tourist behavior (Kim, Holland and Han, 2013). In this sense, Baker and Crompton (2000) establish that the primary motivation among tourism providers for investing effort in evaluating and improving their quality of performance is that such improvements will result in increased visitation. Since perceived quality is a destination’s offerings evaluation made by tourists (Zabkar, Brencic and Dmitrovic, 2010), it is reasonable to propose a positive relationship between perceived quality and loyalty toward the destination. This causal relationship, which is supported by previous studies in tourism (Pike, Bianchi and Kerr, 2010; Zabkar, Brencic and Dmitrovic, 2010; Jin, Lee and Lee, 2013; Kim, Holland and Han, 2013; Moon et al., 2013), represents the fourth hypothesis of this research:

H4. The perceived quality of the regional destination will have a direct and positive influence on loyalty toward the regional destination.

### ***2.3. Influence of the country's destination image***

“Place” construct is multidimensional, because it may refer to various geographical entities: countries, regions, cities and towns (Hanna and Rowley, 2007). Many studies on place branding concentrate on initiatives in one of these units adopting a monolithic understanding of space (Syssner, 2009), but we must not forget that cities, regions and nations are interrelated. In this sense, it is interesting to take into account the hierarchies of territories and brand architecture strategy adopted. This theory belongs to conventional branding, and describes a process of managing and designing a portfolio of brands (Kapferer, 2000). Extending the strategies proposed by Aaker and Joachimsthaler (2000) to the context of place branding, Dooley and Bowie (2005) propose the following: branded house (e.g. Egypt), sub-brands (Scandinavia), endorsed brands (Western Australia) and house of brands (Spain).

Taking into account the context of the present research, we would be studying the case of “house of brands” strategy, defined as the one that includes a portfolio of sub-brands that act independently of each other and the master brand (Kapferer, 2000). In the case of Spain, the country is divided into seventeen autonomous regions, each of which promotes its own destination brand, independently of the umbrella brand (Gilmore, 2002; Dooley and Bowie, 2005). However, and despite this strategy, it is accepted that people will have more concrete and relevant perceptions about countries, while their beliefs about regions or cities are usually less clear (Ashworth and Kavaratzis, 2007). Consequently, the image of a country will condition the image of the cities (or regions) located in that country (Cubillo, Sánchez and Cerviño, 2006).

Most papers related to the influence of country image are focused on the evaluations of products or services (Javalgi, Cutler and Winans, 2001; Ahmed, et al. 2002; Yasin, Noor and Mohamad, 2007). They show that country image has a great impact on consumer evaluations, since it includes stereotypes, perceptions about the country that, above all when the consumers are unfamiliar with the product, serve as a "halo effect", by which consumers infer product attributes (Ahmed et al. 2002). In the same line we postulate that, in the tourism field, the country's destination image (the umbrella brand) will influence on a region's destination image (a sub-brand), a theoretical relationship established by Cubillo, Sánchez and Cerviño (2006) in the field of academic programs but not proven empirically. Therefore, the fifth hypothesis is:

H5. The country's destination image will have a direct and positive influence on the region's destination image.

### ***2.4. The moderating effect of country familiarity***

In order to better understand the formation of the region's destination image, the concept of country familiarity is considered in this paper since it has been found to affect attitudes and preferences of individuals. In the literature on consumer behavior, familiarity has been defined as the consumer experience with a product and it reflects the direct and indirect knowledge available to the individual (Alba and Hutchinson, 1987). Therefore, familiarity goes beyond the mere experience of the individual (Cordell, 1997) and it is based on advertising exposure, information search and, of course, product use. In our context, country familiarity can be defined as the direct and indirect knowledge about a country based on the previous experience and information available to the individual.

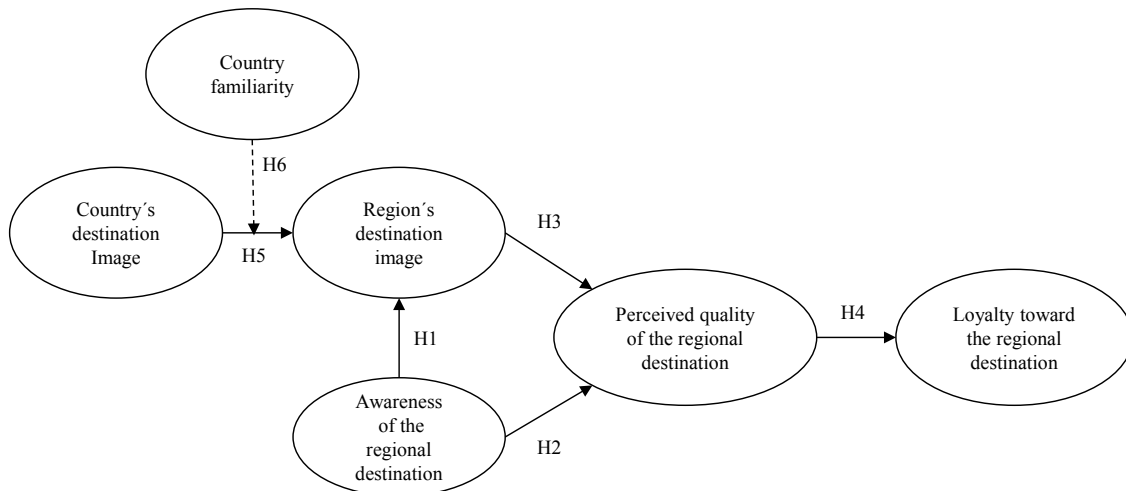

In relation to the moderating effect of country familiarity, it is necessary to emphasize that the level of contact with a country influences consumer perceptions (Balabanis et al., 2002). More concretely, the higher the familiarity with a country, more elaborated the information and the images about that country (Han, 1989). Especially in the case of international tourists, a deeper knowledge of the country as a whole would imply that they have more information about the country as a tourist destination. Therefore, in a context of high familiarity with the country, individuals will rely more on their images of the country destination (Fakeye and Crompton, 1991) to construct their perceptions about a regional tourist destination located in that country. Consequently, the hypothesis 6 is established:

H6. The higher the familiarity with a country, the higher the influence of the country's destination image on the region's destination image.

Figure 1 summarizes the hypotheses of this research.

FIGURE 1

**Theoretical model**

**3. Methodology**

A quantitative research was carried out to test the hypotheses. In particular, data was collected using a questionnaire that included questions about: 1) international tourists' beliefs about the brand of Cantabria as destination, a region in the north of Spain; 2) Spain's destination image as (i.e. the country as an "umbrella brand"); and 3) the characteristics of respondents. All the variables of the model were measured using multi-attributes instruments (ten-point Likert scales) adapted from previous works, in order to assure the content validity. Destination awareness was measured with three items, taking as a basis the work of Boo et al. (2009) and Pike et al. (2010); the scale used to measure destination image was adapted from San Martín and Rodríguez del Bosque (2008); perceived quality was measured by a scale adapted from Boo et al. (2009); and the scale of loyalty is derived from Konecnik and Gartner (2007), Boo et al. (2009) and Pike et al. (2010). Finally, country familiarity was measured in line with the bidimensional approach (i.e. informational and experiential dimensions) proposed by Baloglu (2001) –see appendix–.

The target population of quantitative research was international tourists above 18 years old. In relation to the sampling, the quota method (i.e. a non-probabilistic procedure) was used in this research. In particular, the characteristics of the population with regard to gender and age (information provided by the Spanish Institute of Tourism Studies) were used as a reference to select the individuals in the sample (table 1). Data collection was conducted through a personal survey to international tourists visiting a Spanish region (Cantabria) during the summer of 2013. More concretely, international tourists were approached in the international airport and several tourist attractions such as Cabárceno Park or Sardinero beach. Finally, a total of 253 valid responses were obtained (several socio-demographic characteristics of the sample are indicated in table 2).

## 4. Results

### 4.1. Estimation of the model

Before estimating the Structural Equation Model (SEM) and testing the research hypotheses, the reliability and validity of the measurement scales were checked by means of a confirmatory factor analysis, using EQS 6.1 software. The results confirm the reliability and convergent validity of the scales jointly studied (see table 3). The fit criteria indicate to what extent the factorial model fits the empirical data. In particular, three main classes of fit criteria are indicated: measures of absolute fit (BBNNFI is near to the 0.90 threshold and RMSA is below 0.08); measures of incremental fit (IFI and CFI are equal to 0.90); and measures of parsimonious fit (normed  $\chi^2$  is below 5). Additionally, none of the confidence intervals for pairs of latent constructs include 1.0 (Anderson and Gerbin, 1998), thus supporting discriminant validity of the model (table 4).

<sup>a</sup> Correlation among variables; <sup>b</sup> Confidence interval for high correlations

Subsequently, the research model was estimated following a SEM approach, to test the research hypotheses (Figure 2). The analyses were run using a robust maximum-likelihood estimation procedure in order to avoid problems of non-normality with the data. The goodness-of-fit indexes obtained were within the recommended intervals, thus confirming that the research model adequately fits to the data. All the causal relationships between variables were found statistically significant and in the direction postulated in this study.

In particular, tourists' loyalty towards the regional destination was positively influenced by the perceived quality of the destination, which in turn was directly influenced by image and awareness. Accordingly, the better the image and awareness attributed by tourists to the regional destination, the better its perceived quality will be and, therefore, tourists will be more loyal to the destination in terms of intention to return and recommend. Additionally, the region's destination image was significantly influenced by the country's destination image. In consequence, country destination acts as an "umbrella brand" that contributes to form the image of the regional destinations in the tourist's mind.

FIGURE 2

#### 4.2. Analysis of the moderating effect of familiarity

The analysis is based on a regression model with interactive effects, which include the direct effect of the country's destination image on the region's destination image, as well as the interactive effect (i.e. the moderating influence) of country familiarity on the relationship between country's destination image and region's destination image (Equation (1)):

$$\text{Region's destination image} = \alpha + \beta_1 \text{ country's destination image} + \beta_2 \text{ country's destination image} * \text{country familiarity}$$

It is necessary to indicate that each variable is based on the average of its items. In addition, before the estimation of the model, multicollinearity was eliminated by the residual-centring procedure (Lance, 1988). The interaction effect is replaced by a new variable resulting from the comparison between the interaction and the expression extracted from the regression of the two variables on the interactive effect. The results of the estimates are summarized in Table 5. The model explains a significant percentage of the observed variance, but H6 is rejected because the interaction between the “country’s destination image” and “country familiarity” does not significantly influence the region’s destination image.

## 5. Conclusions

The present paper examines the causal relationships or chain effects existing between the dimensions of the customer-based brand equity of a regional tourist destination, considering the loyalty of tourists as the main outcome variable to explain in the theoretical model. In addition, the paper takes into account the hierarchy of destination brands and analyses the influence of country’s destination image on a region’s destination image in the case of Spain, a country with a “house of brands” strategy in tourism (Dooley and Bowie, 2005; Harish, 2010). Finally, the moderating effect of country familiarity on the relationship between the two image constructs is also examined in this research.

The empirical evidence obtained from a sample of 253 international tourists visiting a regional destination supports that its loyalty towards the destination is positively influenced by the perceived quality of the destination which in turn is directly influenced by the destination's image and awareness. Accordingly, the influence of destination’s awareness and image on international tourists' intentions to return and recommend the destination (in this case, Cantabria) is mediated by its global perceived quality. In this sense, destination’s image (in terms of customers’ perceptions about its tourism resources) is the main determinant of perceived quality of the tourist destination, exerting through this variable an indirect effect on tourist’s loyalty. Moreover, the results obtained show that more recognizable or renowned destinations will be perceived as being of more quality, which intuitively show that tourists use the destination's “fame” as a signal of its quality. This way, destination's awareness indirectly influences tourists’ loyalty towards the destination.

Additionally, this research considers the hierarchy of destination brands and examines the influence that the country’s destination image exerts on the region’s destination image. In this sense, empirical evidence obtained supports that tourists’ perceptions of the regional destination are positively influenced by their perceptions of the country destination where the region is located. Therefore, the country’s brand acts as an “umbrella brand” of the region’s brand. However, this research doesn’t support the moderating effect of country familiarity on the relationship between both constructs of image. It is may be due to that, in a context where there

are a lot of destination brands (i.e. regional destinations) in the country, being familiar with the country does not necessarily imply a more elaborate and precise knowledge of the different regions located in that country. In addition, this result could also have an explanation in the distinctive characteristics of Cantabria as a tourist destination, which are mostly related to nature and “green” tourism and no so much to the sun and beach tourism, predominant in Spain. Therefore, tourists with a higher familiarity with the country will not necessarily make a stronger association between country and region in their minds.

These results have relevant implications for the management of regional destinations, and especially for the attraction and fidelization of international tourists. First, regional DMO (Destination Marketing Organizations) should focus marketing efforts on fostering the destination brand awareness for international tourist, with a strong stress in communication and promotion campaigns. Thus, a higher renown of the destination will be associated to higher perceptions of quality, which will lead to stronger intentions of return and recommendation. Additionally, these promotion and communication campaigns should also be designed to build a destination image (brand associations) based on the main resources of the destination demanded by tourists and in which the destination has competitive advantages. Moreover, given the tight relationship between national and regional destination brands, regional DMO should try to take advantage of the national destination image to reinforce the regional brand. In particular, this is especially recommendable in the case of regions that are not very renowned as tourist destinations, but that are located in countries with a well-known tourism brand, as is the case of Cantabria and Spain. Moreover, if it is possible to undertake a coordinated or even joint promotion of the country and region brands, would be have a relevant impact for the building of the region's destination brand, which in turn would strengthen the national touristic demand.

La información obtenida a través de canales de comunicación tradicionales y Web, junto con la generada por los usuarios y residentes, contribuye a la percepción de la imagen del destino turístico. La imagen ejerce una influencia sobre la intención de visita y de repetición. No obstante, las fuentes utilizadas así como su valoración suelen ser diferentes en función de las características del propio individuo. Partiendo de estas ideas, este trabajo pretende conocer el modo en que el lugar de residencia del turista, su nivel de conocimiento del destino, y la existencia de una experiencia ligada a visitas previas al destino, influyen en el tipo de fuente y valoración realizada sobre la misma. Los resultados obtenidos permiten señalar cómo determinados canales de comunicación resultan ser más efectivos para conseguir un primer impacto y fomentar el interés de nuevos visitantes, así como para lograr la implicación de los residentes y los viajeros en la difusión del destino.

## PALABRAS CLAVE:

*Fuentes de información, Web 2.0, UGC (User Generated Content), imagen del destino, visitantes, residentes, segmentos*

## Introducción

Turistas, viajeros y residentes utilizan diferentes fuentes de consulta para informarse sobre los destinos turísticos y la oferta de servicios disponibles. Sobre este particular, conviene resaltar cómo Internet se ha convertido en una fuente más de información, junto con las tradicionales fuentes habitualmente consideradas en la literatura relevante (e.g., Gunn y Gartner, 1993): (i) fuentes orgánicas, entre las que se encuentran amigos y conocidos; (ii) fuentes inducidas, en las que cabe mencionar los agentes comerciales, los proveedores, las Organizaciones de Marketing del Destino (en adelante, OMD) y la publicidad; y (iii) fuentes autónomas o independientes, entre las que es posible destacar los medios de comunicación, las guías de viajes, los libros y los documentales.

Con la proliferación de los medios sociales en Internet y, más concretamente, de las redes sociales, cualquier persona puede publicar contenidos sobre el destino, los cuales pueden ser fácilmente consultados por otros individuos. Además de las personas, también pueden publicar contenidos turísticos los propios proveedores y las OMDs, llegando directamente a los turistas sin tener que utilizar intermediarios (WTT, 2011).

En la última década, diferentes estudios (e.g. Litvin, Goldsmith y Pan, 2006; Xiang y Gretzel, 2010, Munar, 2011; Lookinside Travel, 2012), han analizado cómo los turistas, junto con los proveedores de servicios turísticos, utilizan cada tipo de canal de comunicación en Internet (buscadores, Web de reservas de hoteles con referencias de los propios usuarios, redes sociales, blogs). En especial, se ha prestado especial atención al grupo de variables que conforman el denominado Contenido Generado por el Usuario (en adelante, UGC, procedente de la terminología más habitualmente utilizada en este contexto, User Generated Content) (Berthon, Pitt y Campbell, 2008).

Las diferentes plataformas Web consultadas a través de Internet (cuya información ha podido ser publicada por la propia OMD, los proveedores, los intermediarios, los medios de comunicación o los propios turistas o residentes), es susceptible de influir en la formación de la imagen del destino. De este modo, conviene considerar Internet en la gestión del destino por poder contribuir a conformar la imagen del destino al igual que las fuentes tradicionales.

Junto con los factores personales, las fuentes de información son las variables que explican la formación de las imágenes cognitiva, afectiva (e.g., Echtner y Ritchie, 2003; Beerli y Martin, 2004) y única del destino (e.g., Qu, Kim e Im, 2011), así como el punto de partida para analizar el comportamiento del usuario respecto a su fidelidad hacia el destino o intención de primera visita. A modo de ejemplo, resulta de interés mencionar el trabajo de Beerli y Martin (2004), que analizaron las relaciones entre diferentes componentes de la imagen percibida y los factores que influyen en su formación. En particular, incluyeron en su trabajo las siguientes variables: fuentes de información primarias y secundarias, la evaluación de la información en la pre-visita y la post-visita, la motivación, las experiencias turísticas acumuladas y las características sociodemográficas. En esta línea, también conviene señalar el trabajo de Baloglu y McCleary (1999), que habían propuesto una metodología similar.

Partiendo de estas ideas, este trabajo pretende analizar la utilidad de las diferentes fuentes de información (tanto las tradicionales como las procedentes de Internet), en la formación de la imagen de un destino turístico. Con objeto de ahondar en esta línea de investigación, se llevará a cabo este análisis para diferentes segmentos. En concreto, los segmentos de turistas que se tienen en cuenta han sido definidos en función de diversas variables: a) su lugar de residencia; b) si han visitado o no el destino; y c) si conocen o no a residentes. Este último criterio de segmentación ha sido escogido teniendo en cuenta la importancia que Schroeder (1996) confiere a los residentes, al sugerir que la imagen de los residentes puede tener un impacto en las imágenes orgánicas e inducidas de los no residentes.

Para lograr este propósito, se ha llevado a cabo un estudio empírico empleando una muestra de 541 individuos, entre turistas reales y potenciales y residentes, recogida en el segundo trimestre del año 2013. Los resultados obtenidos permiten poner de manifiesto la relevancia de Internet

como fuente de información y comunicación, ya que influye –junto a las fuentes tradicionales de comunicación– en la generación de la imagen cognitiva y afectiva, así como en las motivaciones para visitar un destino.

A continuación, la siguiente sección abordará el marco conceptual de la presente investigación, donde se muestra cómo el perfil del individuo influye en el tipo de fuente y valor que le ofrece a la misma en el proceso de formación de la imagen de marca. Una vez establecidas las hipótesis de trabajo, se procede a describir la investigación realizada partiendo de una muestra de 541 turistas nacionales e internacionales. Los resultados alcanzados señalan que existen algunas diferencias significativas entre el tipo de segmento del turista, en función de aspectos tales como por ejemplo, si ha visitado Mallorca con anterioridad, si conoce a residentes o el lugar de residencia, y la valoración de las fuentes de información consultadas.

## **Marco conceptual y planteamiento de hipótesis**

### ***La formación de la imagen de marca del destino turístico***

La formación de la imagen se describe por el proceso por el cual una representación mental del destino surge a través de informaciones enviadas por los agentes y seleccionadas por los receptores (Gartner, 1993). La cantidad y el tipo de fuentes de información sobre los destinos y las características sociodemográficas de los turistas influyen sobre las percepciones y cogniciones de los atributos del destino (Baloglu y McCleary, 1999). Gartner (1993) se refería a imágenes orgánicas e inducidas para distinguir entre fuentes no comerciales de aquella información controlada por los mercados de los destinos. Beerli y Martin (2004) y Seabra, Abrantes y Lages (2007) incorporan las fuentes de información como variable en la formación de la imagen del destino.

La variedad de fuentes de información consideradas es extensa. Sin embargo, son escasos los estudios precedentes que han tenido en cuenta la variedad de plataformas Web a la hora de tratarla como una fuente de información de la cual se pueden extraer dimensiones.

### ***El proceso de búsqueda de información***

Antes de decidir realizar un viaje o planificarlo, se efectúa una búsqueda de información, lo que conforma el proceso por el cual se va formando la imagen del destino turístico. La búsqueda de información es dinámica (Seabra et al., 2007). El proceso comienza mediante la consulta de fuentes internas procedentes de la memoria. Posteriormente, se busca información en fuentes externas, que pueden ser fuentes personales (amigos y familiares), fuentes comerciales (folletos y publicidad), fuentes no comerciales (comunidades de viajeros virtuales) y fuentes experienciales (inspecciones y visitas precompra). Antes de decidir el destino, resulta más importante la información procedente de conocidos y familiares; esta relevancia es incluso mayor que cuando se ha decidido.

Generalmente, los promotores del destino no tienen el control sobre la información aportada por las fuentes orgánicas y autónomas en la . La información recibida por amigos y conocidos a través del proceso de comunicación boca oreja ejerce una gran influencia sobre la formación de la imagen del destino, que es de alta credibilidad si ha sido solicitada de forma expresa, y de credibilidad media si no lo ha sido (Gartner, 1993).

La imagen proyectada a través de las diferentes fuentes de información puede que no coincida con la imagen deseada por el destino turístico o con su imagen real, ni con la imagen percibida por los consumidores. La imagen proyectada y la imagen percibida normalmente no coinciden debido a la falta de coordinación entre el punto de vista de la oferta del proveedor y de la demanda. Por ejemplo, los operadores turísticos han resultado fundamentales en la distribución de información, y han contribuido a la proyección de las imágenes que la gente percibe de ciertos destinos, emitiendo imágenes que ellos han seleccionado con intereses comerciales. Esto puede dar lugar a interpretaciones poco realistas de un lugar, que no coinciden con las imágenes del destino que desea su sociedad anfitriona (Van't Klooster, Go y Van Baalen, 2004).

### ***Fuentes de información***

Gunn (1988) distingue dos tipos de imágenes: (i) la imagen orgánica se basa en fuentes no comerciales de información, tales como noticias sobre el destino en los medios de comunicación de masas, la información recibida y las opiniones de amigos y parientes; (ii) la imagen inducida se basa en fuentes de información comercial, tales como las diferentes formas de la publicidad y la información de las agencias de viajes y los operadores turísticos. Los mayores índices de credibilidad y, de mayor influencia sobre la formación de la imagen, corresponden a las fuentes autónomas y orgánicas que, por otra parte, son las que representan menores costes para el destino turístico. Por tanto, no siempre la acción de mayor coste es la más efectiva en la generación o modificación de una determinada imagen (Serra et al., 2002).

Los turistas conforman las imágenes del destino a partir de la información adquirida desde las diferentes fuentes (Gartner, 1993). El resultado de las imágenes influyen las expectativas percibidas. Las expectativas están asociadas con lo que los consumidores sienten o desean de un servicio (Parasuraman, Zeithaml y Berry, 1988). Los turistas intentan completar sus expectativas cuando visitan el destino. Una vez allí, comparan la información recibida en la fase de planificación con sus propias experiencias. Los turistas que recolectan información completa y variada estarán bien informados sobre el destino específico que visitan, tendrán pocas sorpresas y completarán sus expectativas fácilmente (Echtner y Ritchie, 2003).

La imagen formada por las fuentes orgánicas, inducidas y autónomas se percibe antes de visitar el destino, Phelps (1986) la llama imagen secundaria. En contraste, la imagen primaria es la que se conforma al visitar el sitio. Mansfeld (1992) demuestra que existe un acuerdo general, aunque no esté basado en evidencias empíricas, de que las fuentes de información secundarias tienen tres funciones básicas en la elección del destino: minimizar el riesgo de la decisión, crear una imagen del destino y servir de mecanismo para justificar más tarde esa elección.

Zins (2009) analiza la influencia de las diferentes fuentes de información en la elección de un destino turístico. La principal fuente de información para decidirse por un destino turístico es la propia experiencia (40%), seguido por amigos y conocidos (31%). En cuanto a las fuentes de información de Internet los operadores turísticos tienen mucho más influencia para decidir el destino (20%) que las páginas oficiales del destino (11%) y las comunidades virtuales (5%).

### ***Internet y medios sociales como fuentes de información en la formación de la imagen de destino***

Internet se ha convertido en una de las principales fuentes de información turística (Buhalis y Licata, 2002; Pan y Fesenmaier, 2006; Wu, Wey y Chen, 2008). De forma global se estima que más del 50% de viajes de ocio y el 40% de viajes de negocios se reserva a través de Internet (WTT, 2011). Los datos publicados por Eurostat (2012) señalan que un 36% de la población de la Unión Europea (UE) utilizó durante el año 2012 la Red para informarse sobre viajes y servicios de alojamiento.

Gracias a Internet, en la última década se ha producido una explosión de plataformas Web y de medios sociales a disposición de cualquier persona y organización para publicar contenidos de cualquier índole, también turísticos. El auge en el uso de medios sociales, ha implicado un cambio en la experiencia virtual, tanto en la búsqueda y el consumo de información, como en la creación, conexión e intercambio de información. Los anteriormente consumidores pasivos, actualmente están generando contenidos, colaborando y emitiendo comentarios gracias a la Red. Las referencias de viajes, las fotografías y los planes de viajes se comparten y se bloggean, lo que contribuye a influir sobre turistas de todas las edades, conectándolos e interactuando con los proveedores de productos y servicios. Las descripciones oficiales del destino, el hotel o el producto ya no son la única fuente de información sobre el destino. No cabe duda de que la repercusión de todos estos hechos llegará a ser significativa (WTT, 2011). Munar (2011) analiza la relación entre los contenidos creados por los turistas (TCC – Tourist Created Content) y la marca de destino. El análisis del uso de marcas del destino en el TCC muestra que los turistas no incorporan los elementos formales de las marcas, como lemas o logotipo, en su narración al explicar sus experiencias. Para ilustrar este particular, es posible mencionar cómo un 26% de

la población de la UE (Unión Europea) señala haber publicado contenidos de propia creación en Web para ser compartidos. Asimismo, el 40% de esta población publicó en 2012 algún mensaje en medios sociales o en plataformas de mensajes instantáneos (Eurostat 2012).

Internet influye sobre el proceso de desarrollo de la imagen de marca del destino, por lo que la imagen afectiva y cognitiva se ve afectada por las búsquedas *online* (Biswas 2004). Choi, Lehto y Morrison (2006) señalan que, aunque la formación de la imagen ha sido muy examinada en la literatura, la investigación sobre la formación de la imagen en Internet está aún en un estadio temprano. Por eso es necesario plantear complementar la variable de fuentes de información con las diferentes plataformas Web, ya que éstas, según la bibliografía revisada, también pueden influir en la formación de la imagen del destino turístico.

La formación de la imagen ya no es un proceso de “empuje” de la comunicación de masas, sino una dinámica de selección, de reflexión, de compartir y de experimentar (Govers, Go y Kuman, 2007; Mackay y Vogt, 2012). La búsqueda de información es una parte significativa del proceso de decisión de compra, y ésta ha evolucionado gracias a Internet. No sólo se ha reducido la incertidumbre y los riesgos percibidos al acceder a más información, sino que también ha mejorado la calidad de los viajes (Gretzel y Yoo, 2008; Mackay y Vogt, 2012). Los servicios intangibles como el turismo no pueden ser evaluados antes de ser consumidos, por lo que comprarlos lleva asociado un alto riesgo; esto hace que los consumidores sean más dependientes a la influencia interpersonal a través del WOM (Word-Of-Mouth) electrónico (Lewis y Chambers, 2000). Además, Internet permite a los consumidores conectar directamente con los proveedores, transformando de este modo el rol de los intermediarios (Buhalis y Law, 2008).

### ***Formulación de hipótesis***

En la bibliografía consultada sobre el proceso de formación de la imagen de un destino normalmente se analiza atendiendo a la opinión de los que han visitado el destino, no se analiza la imagen de los turistas potenciales. Govers et al. (2007) cuestionan el hecho de que en los estudios realizados no se distinguen los diferentes grupos de consumidores. En relación a este fenómeno, en este trabajo se pretende analizar si existen diferencias significativas entre segmentos en la utilidad de las fuentes de información consultadas.

Atendiendo al trabajo de Gunn (1988), los turistas se forman una imagen de un destino turístico después de someterse a un proceso que consta de las siguientes etapas: (1) acumulación mental de imágenes del destino, formando así una imagen orgánica; (2) la modificación de la imagen inicial después de incorporar más información, formándose así una imagen inducida; (3) la decisión de visitar el destino; (4) la visita del destino; (5) el compartir información en el destino; (6) el regreso a casa, y (7) la alteración de la imagen en función a su experiencia en el destino.

A través de diversas acciones, la OMD proyecta una imagen del destino. Esta imagen proyectada, influye en la imagen que los consumidores forman en su mente. Pero además, en el proceso de formación de la imagen del destino, también participan otros elementos internos del individuo, entre los que cabe destacar, sus necesidades, motivaciones, conocimientos anteriores, preferencias y otros aspectos de carácter personal. De esta manera, los individuos construyen su propia imagen mental del destino turístico que da lugar a sus propias imágenes personales percibidas (Gartner, 1993; Bramwell y Rawding, 1996).

Algunas investigaciones han indicado que la imagen de los turistas tiende a ser más realista, compleja y diferenciada después de haber visitado un destino (e. g., Chon, 1991). De acuerdo con Selby y Morgan (1996), la comprensión de las diferentes imágenes que los visitantes y no visitantes tienen es muy valiosa, lo que permite tener en cuenta los atributos más destacados y volver a evaluar las imágenes para ser incorporadas en la planificación de marketing del turismo. La experiencia pasada puede ser más importante que la información obtenida de fuentes externas, porque cuando hay experiencia pasada, la necesidad de recibir la información de fuentes externas se torna más débil. En este sentido, Hsu, Wolfe y Kang (2004) concluyen que la imagen de un mismo destino es diferente en función de si el individuo lo ha visitado. Atendiendo a estas premisas se formulan las siguientes hipótesis:

*H1. La utilidad de las fuentes de información varía en función de si los visitantes han visitado el destino turístico previamente.*

*H2. La utilidad de las plataformas Web varía en función de si los visitantes han visitado el destino turístico previamente.*

Asimismo, se ha examinado la relación entre la ubicación geográfica de los turistas y su imagen del destino de vacaciones (e.g., Ahmed, 1996). Aunque otros estudios han revelado que la relación entre la ubicación geográfica y la imagen de destino no fue tan consistente como la relación de las visitas anteriores y la imagen del destino (Hsu et al., 2004). En relación a estas ideas se formulan las siguientes hipótesis:

*H3. La utilidad de las fuentes de información varía en función de la ubicación geográfica de los visitantes.*

*H4. La utilidad de las plataformas Web varía en función de la ubicación geográfica de los visitantes.*

Schroeder (1996) argumentó que la imagen de los residentes podría tener un impacto en las imágenes orgánicas e inducidas de los no residentes de los destinos. La imagen orgánica se define como la imagen formada a través de la experiencia directa o a través de la información que no es turística. La imagen orgánica en poder de no residentes podría verse afectada en general por las comunicaciones con los residentes. En relación a esta argumentación, se proponen las siguientes hipótesis:

*H5 La utilidad de las fuentes de información varía en función de si los visitantes conocen a residentes.*

*H6 La utilidad de las plataformas Web varía en función de si los visitantes conocen a residentes.*

## **Investigación**

### ***Diseño y metodología***

Con objeto de contrastar las hipótesis propuestas, se ha diseñado un cuestionario para analizar las variables fuentes de información y plataformas Web. La encuesta se ha lanzado a través de Internet utilizando la plataforma GoogleForms. Se ha definido un rango de variables con sus correspondientes indicadores para evaluar la formación de la imagen de Mallorca como destino turístico. En esta investigación se considera de forma detallada y pormenorizada la variable fuentes de información y plataformas Web. Esto ha permitido constatar la existencia de diferencias significativas entre segmentos de población a la hora de puntuar la utilidad de las fuentes, tanto tradicionales como a través de Internet.

### ***Variables y escalas de medida***

Todas las escalas utilizadas son de tipo Likert de 5 puntos, tal y como se proponen en los trabajos de Gartner (1989) y Baloglu y McCleary (1999), entre otros. Los ítems utilizados para medir las variables se han elaborado a partir de la bibliografía expuesta en la introducción y el marco teórico de esta investigación. Las fuentes de información tradicionales se han analizado a través de 14 ítems: fuentes oficiales de información turística de organismos de promoción del destino, proveedores (transportes, alojamiento, oferta complementaria), intermediarios (agencias de viajes o operadores turísticos), medios de comunicación especializados en turismo, medios de comunicación especializados en áreas de interés temático (deportes, vinos, espeleología, cine,...), libros, guías de viajes, documentales, películas y series TV, publicidad, ferias, amigos y conocidos, líderes de opinión e Internet.

Para profundizar en las diferentes plataformas Web se ha analizado la utilidad de la siguiente tipología de Web que son susceptibles de presentar contenido turístico (19 en total): buscadores (por ejemplo Google), Web de información turística oficiales (por ejemplo Illesbalears, Infomallorca, Spain), Web de información turística no oficiales (por ejemplo Teleweb-mallorca,

Seemallorca), Web de intermediarios (por ejemplo Lastminute, Thomson, Tui, Auf-nach-mallorca), Web de proveedores (por ejemplo de alojamiento Melià, Protur-hotels, oferta complementaria, Bcmplanetdance), Web con valoraciones de usuarios (por ejemplo Tripadvisor), blogs especializados en turismo (por ejemplo Blog.minube., Diariodelviajero), redes sociales generales (por ejemplo Facebook, Twitter), redes sociales especializadas en turismo (por ejemplo Travellerspoint, Viajeros), portales de intercambio de casas (por ejemplo Homeforexchange), portales de alquiler de alojamientos turísticos (por ejemplo Ownersdirect), portales de reservas hoteleras (por ejemplo Booking), portales de actividades y recursos turísticos (por ejemplo Wikitravel, Travelandleisure, Travel.yahoo/), aplicaciones donde compartir imágenes (por ejemplo Flickr, Picassa, Pinterest, Instagram), aplicaciones donde compartir vídeos (por ejemplo Youtube, Vimeo), foros (por ejemplo Lonelyplanet thortree), portales de viajeros hospitalitarios (por ejemplo Couchsurfing), portales de alquiler de casas propias o habitaciones (por ejemplo Airbnb), mapas (por ejemplo Maps.google)

### **Composición de la muestra**

La muestra final resultante asciende a 541 encuestas válidas, que se recogieron a través de un formulario *online* en 2013. El universo es de turistas internacionales, nacionales y residentes en Mallorca y la unidad muestral de una población mayor de 18 años internautas. El nivel de confianza es del 95% para un error muestral de 4,21% (véase Tabla 1).

Tabla 1: Ficha técnica de la investigación

<b>Universo</b>	Turistas internacionales, nacionales y residentes en Mallorca
<b>Unidad muestral</b>	Personas mayores de 18 años que utilicen Internet
<b>Método de recogida de información</b>	Cuestionario <i>online</i>
<b>Error muestral</b>	4,21%
<b>Nivel de confianza</b>	p=q=0.5 al 95%
<b>Procedimiento de muestreo</b>	Método probabilístico
<b>Diseño muestral</b>	La información fue recogida a través de una Web a través de un cuestionario <i>online</i> . El enlace se enviaba por correo electrónico y se publicaba en medios sociales.
<b>Número de encuestas</b>	541 encuestas válidas, sobre un total de 543 cuestionarios recogidos
<b>Periodo de recogida de información</b>	19 marzo a 2 de mayo 2013

Aunque llegaron respuestas de todas partes del mundo, se consideran los segmentos de personas que residen en Mallorca (23,8%), en España pero fuera de Mallorca (34,4%), y fuera de España (41,8%). De la muestra considerada, el 28,7% no conoce a residentes en Mallorca, mientras que el 71,3% conoce al menos algún residente. El 46% vive fuera de Mallorca y conoce a residentes. Un 68,25% ha visitado Mallorca y un 31,75% no la ha visitado nunca. Si se agrupa la muestra por edades el 13,3% tiene de 18 a 24 años, el 61,9% entre 24 y 44 años, el 20,9% entre 45 y 64 años y el 3,9% tiene más de 65 años. El 46% de los encuestados son hombres y el 54%, mujeres. En cuanto a los ingresos brutos familiares, la muestra está bastante repartida. De este modo, un 20,9% de menos de 15.000 €, un 27,7% de 15.001 a 30.000 €, un 21,3% de 30.001 a 45.000, un 13,9% de 45.001 a 60.000 €, y el resto (16,3%) más de 60.000 €.

## **Resultados**

### **Fuentes de información y Web más útiles en general**

La Tabla 2 ofrece las puntuaciones dadas a las fuentes de información inducidas, definidas por Gartner (1993) como aquéllas que pueden ser controladas por las autoridades del destino y los

intermediarios, los encuestados consideran que la publicidad y las ferias son las menos útiles. En una escala de 5 puntos, las puntuaciones medias obtenidas son respectivamente de 2,77 y 2,3. Para el resto de fuentes de información, las puntuaciones obtenidas en ningún caso supera el valor medio de 3. Ello hace considerar que las fuentes de información inducidas no son muy útiles a la hora de buscar información sobre Mallorca.

Tabla 2: Puntuaciones medias fuentes de información inducidas

	OMD	Proveedores	Intermediarios	Publicidad	Ferías
Media Total	3,03	3,11	2,76	2,77	2,3
Mediana Total	3	3	3	3	2
Moda Total	3	3	3	3	1

Por lo que respecta a las fuentes de información autónomas (Tabla 3 y 4), es decir, aquéllas que según Gartner (1993) no son controladas por las autoridades del destino, las medias toman una posición ligeramente superior al valor 3. Tan sólo los líderes de opinión y los films y la TV, con unas medias de 2,57 y 2,44 son valoradas como fuentes de baja utilidad. En el extremo contrario se encuentran las guías de viajes, que con una puntuación media de 3,47, puede ser considerada como la fuente de información más útil. De hecho, en relación a esta última fuente se observa cómo el 50% de los encuestados le confieren una puntuación media de 4.

Tabla 3: Puntuaciones medias fuentes de información autónomas

	Medios de turismo	Medios temáticos	Libros	Guías viaje
Media Total	3,17	3,07	3,01	3,47
Mediana Total	3	3	3	4
Moda Total	4	3	4	4

Finalmente, y en relación a las fuentes orgánicas, los encuestados señalan que los amigos y conocidos son las fuentes más útiles. Con una puntuación media de 4,19, esta fuente presenta un valor muy superior a todas las fuentes de información utilizadas en la formación de la imagen del destino, incluidas las fuentes inducidas y las autónomas, como ya pusieron de manifiesto Gartner (1993), Beerli y Martín (2004) y Zins (2009), entre otros.

Por lo que respecta a Internet, es la fuente de información que obtiene una puntuación media más elevada de todas, con un valor medio de 4,39, es considerada como la fuente más útil para obtener información sobre Mallorca, seguida de los amigos y conocidos. En ninguna investigación previa consultada se consideraba Internet el medio de información más útil. En esta investigación Internet ha sido clasificada como una fuente inducida y orgánica (Tabla 4).

Tabla 4: Puntuaciones medias fuentes de información autónomas y orgánicas

	Autónomas			Orgánicas	
	Documentales	Film y TV	Líderes de opinión	Amigos y conocidos	Internet
Media Total	3,06	2,44	2,57	4,19	4,34
Mediana Total	3	2	3	5	5
Moda Total	4	1	1	5	5

Uno de los objetivos de esta investigación, a diferencia de otras que tratan Internet como un canal general, es conocer cuál de las plataformas Web existentes en Internet es más útil para personas que buscan información sobre Mallorca. Los buscadores (puntuación media de 4,47) son considerados como los más importantes y útiles por los encuestados. Las páginas Web procedentes de fuentes inducidas, autoridades de destino y Web de intermediarios y

proveedores, tienen una puntuación media relativamente baja, no llegando a superar el valor de 3, excepto las Web de las OMD, cuya puntuación media es de 3,46 (ver Tabla 5).

Tabla 5: Puntuaciones medias plataformas Web: buscadores, Web OMD, Web Turísticas no oficiales, Web intermediarios, Web proveedores

	Buscadores	Web OMD	Web turísticas no oficiales	Web intermediarios	Web proveedores
Media Total	4,47	3,46	2,9	2,8	2,8
Mediana Total	5	4	3	3	3
Moda Total	5	5	4	1	3

Las páginas Web cuya información es generada por los propios usuarios que obtienen mayor puntuación en cuanto a utilidad percibida son las que contienen valoraciones de los usuarios, como por ejemplo Tripadvisor. La puntuación media obtenida, en una escala de 5 puntos, es de 3,55, mientras que la moda y la mediana obtenida son de 4. Por su parte los blogs de turismo y las redes sociales especializadas en turismo tienen una puntuación más bien baja, 2,91 y 2,53 respectivamente. Sin embargo las redes sociales generales tienen una puntuación un poco más alta, llegando a una utilidad media de 3,18 (Tabla 6).

Tabla 6: Puntuaciones medias plataformas Web: Web de valoraciones de usuarios, blogs y redes sociales

	Web Valoraciones usuarios	Blogs turismo	Redes sociales generales	Redes sociales turismo
Media Total	3,55	2,91	3,18	2,53
Mediana Total	4	3	3	2
Moda Total	4	1	4	1

Las plataformas Web para compartir imágenes, vídeos y opiniones -a través de foros-, y cuyo contenido lo generan los propios usuarios, no reciben una buena puntuación en cuanto a utilidad percibida como herramienta para obtener información de Mallorca como destino turístico. En cambio, los mapas en Internet, tipo Google Maps, es una de las herramientas más útiles para buscar información con una puntuación media de 3,82 (véase Tabla 7).

Tabla 7: Puntuaciones medias plataformas Web: compartir imágenes, compartir vídeos, foros, actividades y recursos turísticos, mapas

	Compartir imágenes	Compartir vídeos	Foros	Actividades y recursos turísticos	Mapas
Media Total	2,65	2,72	2,51	2,73	3,82
Mediana Total	3	3	2	3	4
Moda Total	1	1	1	1	5

Las páginas Web sobre alojamiento, no son señaladas como una fuente de información excesivamente útil. La excepción la encontramos con las Web de reservas hoteleras, como Booking, que llega a una puntuación media de utilidad de un 3,26, con una moda de 4 (Tabla 8).

Tabla 8: Puntuaciones medias utilidad plataformas Web: intercambio de casas, alquiler de alojamientos turísticos, reservas hoteleras, alquiler de casas y habitaciones, viajeros hospitalarios

	Intercambio casas	Alquiler alojamientos turísticos	Reservas hoteleras	Alquiler casas y habitaciones propias	Viajeros hospitalarios
No conoce residentes	2,42	2,57	3,29	2,63	2,5
Media Total	2,29	2,37	3,26	2,44	2,28
Mediana Total	2	2	3	2	2
Moda Total	1	1	4	1	1

***Puntuaciones significativamente distintas de fuentes de información y Web según segmentos***

Antes de comparar las medias mediante el test ANOVA, se han calculado los test de Levene y de Kolmogorov y Smirnov. En particular, para evaluar la homogeneidad de varianzas se realiza el test de Levene. Para la muestra de si se ha visitado Mallorca con anterioridad, el nivel de significación estadística cumple que  $p > 0,05$  en todos los casos, excepto en las fuentes OMD. Para la muestra de lugar de residencia, el nivel de significación estadística es  $p > 0,05$  en todos los casos, excepto en las fuentes Film, TV e Internet, buscadores y redes sociales de turismo, Web de intercambio de casas, foros, Web de viajeros hospitalarios, Web de alquiler de casas y habitaciones propias, y mapas. Para la muestra de si conoce a residentes, el nivel de significación estadística también cumple que  $p > 0,05$  en todos los casos, excepto en OMD, amigos y conocidos, buscadores y mapas. De este modo, se ha puesto de manifiesto cómo en la mayoría de los casos se puede asumir la homogeneidad de varianzas. Las pruebas de normalidad de Kolmogorov y Smirnov muestran que en los grupos “conoce a residentes”, “lugar de residencia” y “ha visitado Mallorca” ninguna de las variables se distribuye normalmente, ya que el nivel de significación  $p$  asociado a los contrastes de K-S (0,000) resulta en todos los casos inferior al nivel de significación alfa prefijado ( $p < 0,05$ ).

Tras comprobar los requisitos previos del ANOVA, se puede concluir que los resultados obtenidos no son totalmente fiables, puesto que los datos no siguen una distribución normal, por lo que resulta conveniente aplicar otro tipo de test. Para ello, se recurre al contraste de hipótesis utilizando un método no paramétrico, basado en el análisis de Kruskal-Wallis.

En cuanto a si se ha visitado Mallorca anteriormente, las diferencias significativas tras la prueba de Kruskal-Wallis (Tabla 9) se encuentran en medios de turismo, documentales y rodajes de cine y televisión y ferias. En los cuatro casos, los que no han visitado Mallorca le confieren más utilidad como canal de información. La H1 sólo se puede contrastar en tres de los catorce ítems medidos, uno es inducido y los otros dos son autónomos.

Tabla 9: Diferencias significativas según si ha visitado Mallorca. Fuentes inducidas y autónomas

	Ferias	Medios turismo	Documentales	Film y TV
Medias visitantes	2,2	3,06	2,92	2,31
Medias no visitantes	2,49	3,4	3,36	2,72
Prueba de Kruskal-Wallis (Sig.)	0,005	0,005	0,00	0,001

El hecho de haber visitado Mallorca con anterioridad hace que se presenten diferencias significativas, según la prueba de Kruskal-Wallis (Tabla 10), en las Web de las OMD, las Web de alquileres de alojamiento turístico, las Web de viajeros hospitalarios, y en los foros. En los cuatro casos existe una mejor valoración por parte de aquellos que no han visitado Mallorca. De este modo, es posible contrastar 4 ítems de los 19 que contiene la hipótesis H2; se trataría de

una fuente inducida y tres de orgánicas, según la clasificación de Gartner (1993), adaptada a quien crea el contenido en las plataformas Web.

Tabla 10: Diferencias significativas sobre la utilidad de las Web en función de si ha visitado el destino

	Web OMD	Alquiler alojamientos turísticos	Viajeros hospitalarios	Foros
Medias visitantes	3,38	2,28	2,15	2,41
Medias no visitantes	3,63	2,55	2,58	2,72
Prueba de Kruskal-Wallis (Sig.)	0,016	0,018	0,000	0,009

Así como argumentaban Chon (1991), Selby y Morgan (1996) y Hsu et al. (2004) que la imagen de un destino tiende a ser más compleja, realista y completa al haber visitado un destino, se deduce que la utilidad de las fuentes de información difieren en algunos casos. La información controlada por las autoridades tiende a ser mejor considerada por los no visitantes en las ferias y en las Web de las OMD, así como las fuentes autónomas tradicionales y algunas fuentes orgánicas a través de la Web 2.0.

Atendiendo a los diferentes segmentos de individuos por lugar de residencia que conforman la muestra, se observa cómo los valores medios presentados sólo por las fuentes de información autónomas, difieren ligeramente de los presentados para la muestra total. Los resultados presentados por el la prueba de Kruskal-Wallis permiten observar cómo según el lugar de residencia del individuo algunos de los valores medios son significativamente distintos ( $p < 0,05$ ). En función de si el encuestado reside en Mallorca, en el resto de España, o fuera del territorio nacional, percibe diferente nivel de utilidad en las siguientes fuentes de información: medios de turismo, medios temáticos, libros, guías de viajes, documentales, film y TV e Internet (Ver Tabla 11). El resto de fuentes de información no presentan diferencias entre segmentos

Tabla 11: Diferencias significativas según el lugar de residencia. Fuentes autónomas

	Medios turismo	Medios temáticos	Libros	Guías viaje	Documentales	Film y TV	Internet
Medias Mallorca	3,2	3,37	3,38	3,63	3,28	2,53	4,53
Medias España	2,9	2,75	2,6	3,25	2,76	2,2	4,18
Medias extranjeros	3,37	3,17	3,14	3,57	3,18	2,58	4,36
Prueba de Kruskal-Wallis (Sig.)	0,001	0,00	0,00	0,007	0,001	0,016	0,020

Por tanto, se puede contrastar en parte la H3. Sólo las fuentes de información autónomas muestran diferencias significativas por lugar de residencia. Las fuentes de información inducida y orgánica no son significativamente distintas. Los medios especializados en turismo y los rodajes de televisión y cine son mejor puntuados por los extranjeros; los medios temáticos, los libros, las guías de viajes, los documentales y los líderes de opinión son mejor puntuados por los mallorquines, seguido de los extranjeros.

Atendiendo a los resultados de la prueba de Kruskal-Wallis, las variables que quedan con puntuaciones medias significativamente diferentes según el lugar de residencia (Tabla 12) son redes sociales generales, sitios Web de actividades y recursos turísticos, sitios Web para compartir imágenes, Websites de viajeros hospitalarios y mapas Websites de alquiler de alojamientos turísticos y Websites de intercambio de casas. La mayoría están enmarcadas en el grupo UGC. Los individuos residentes en España son los que ofrecen unas puntuaciones medias más bajas para estas fuentes de información. Las Web que reciben unas puntuaciones más elevadas son las redes sociales y los mapas. En el caso de las redes sociales, la puntuación media recibida por los residentes en Mallorca es de 3,4 y la recibida por los extranjeros de 3,33.

Mientras, en el caso de los mapas, la puntuación media ofrecida por los mallorquines asciende hasta 4,16. Estos resultados demuestran que la H4 sólo se puede contrastar en parte, y principalmente por la tipología de Web cuyos contenidos son generados por los usuarios.

Tabla 12: Diferencias significativas sobre la utilidad de las Web en función de la residencia

	Redes sociales generales	Actividades y recursos turísticos	Alquiler alojamientos turísticos	Intercambio casas
Medias Mallorca	3,4	2,65	2,22	2,22
Medias España	2,83	2,44	2,23	2,13
Medias Extranjeros	3,33	3,03	2,56	2,45
Prueba de Kruskal-Wallis (Sig.)	0,000	0,000	0,007	0,036
	Compartir imágenes	Foros	Viajeros hospitalarios	Mapas
Medias Mallorca	2,81	2,56	2,24	4,16
Medias España	2,31	2,31	1,95	3,64
Medias Extranjeros	2,84	2,65	2,59	3,78
Prueba de Kruskal-Wallis (Sig.)	0,000	0,040	0,000	0,002

Analizando los segmentos por lugar de residencia como proponían Ahmed (1996) y Hsu et al. (2004) las fuentes de información clásica inducidas y las UGC son, en general, mejor valoradas por los residentes fuera de España.

Tabla 13: Diferencias significativas según si conoce a residentes. Fuentes autónomas y orgánicas

	Film y TV	Amigos y conocidos	Internet
Medias conoce residentes	2,35	4,33	4,4
Medias fuera Mallorca conoce residentes	2,27	4,35	4,32
Medias no conoce residentes	2,65	3,86	4,2
Prueba de Kruskal-Wallis (Sig.)	0,025	0,000	0,018

La H5 se puede contrastar en parte. Las fuentes de información orgánica (amigos y conocidos e Internet) presentan diferencias significativas. Conocer a residentes hace que sea mucho más útil la fuente de información de amigos y conocidos a la hora de obtener información sobre Mallorca. Según se muestra en la Tabla 13, la fuente orgánica de amigos y conocidos resulta más útil por la gente de fuera de Mallorca que conoce a residentes llegando a una media de 4,35. Las fuentes inducidas y autónomas no presentan diferencias significativas a excepción de los rodajes. No conocer a residentes hace que se puntúe mejor la utilidad de los films y TV para informarse sobre Mallorca.

En cuanto a si el encuestado conoce o no a residentes, las diferencias encontradas según en la prueba de Kruskal-Wallis (Tabla 14) se presentan en los buscadores, Web de las OMD, Web de alquiler de alojamientos turísticos y Web de viajeros hospitalarios. Sólo 4 de los 19 ítems se pueden contrastar en la H6. Los buscadores son más útiles para los que conocen a residentes, las Web de las OMD. Una explicación sobre este hecho podría ser que se necesita un conocimiento previo para saber lo que buscar. Las Web de alquiler de alojamientos y de viajeros hospitalarios son más útiles para los que no conocen a residentes.

Así se pone de manifiesto otra vez lo que predijo Schroeder (1996), conocer a residentes impacta en la formación de la imagen, del destino, ya que como se ha comprobado el hecho de conocer a residentes hace que se valore mejor la fuente de información de amigos y conocidos.

Por otra parte, en esta investigación se añade que el hecho de no conocer a residentes hace que se valore mejor las plataformas Web de viajeros hospitalarios, que permiten entrar en contacto con residentes.

Tabla 14: Diferencias significativas sobre la utilidad de las Web en función de si conoce a residentes

	Buscadores	Web OMD	Alquiler alojamientos turísticos	Viajeros hospitalarios
Medias conoce residentes	4,55	3,39	2,28	2,2
Medias fuera Mallorca conoce residentes	4,48	3,39	2,32	2,19
Medias no conoce residentes	4,25	3,65	2,57	2,5
Prueba de Kruskal-Wallis (Sig.)	0,041	0,021	0,016	0,010

El hecho de que el turista conozca, o no, personas que residen en el destino puede influir en la utilidad percibida en las fuentes de información. Los resultados ofrecidos tras el desarrollo de un la prueba de Kruskal-Wallis evidencian algunas diferencias significativas sólo en las fuentes film y TV, amigos y conocidos e Internet.

## Conclusiones

En general, la mayoría de fuentes de información y plataformas Web no presentan diferencias significativas en cuanto a la utilidad que representan para los segmentos analizados. De forma global, las fuentes orgánicas y autónomas adquieren una mejor valoración que las inducidas. Aunque si se desea llegar a potenciales visitantes que nunca han estado en Mallorca y que tampoco conocen a residentes y viven en el extranjero, se deben seleccionar los mejores y más rentables canales de comunicación. Por este motivo, hay que tener en cuenta una serie de pequeñas diferencias a la hora de planificar las acciones de comunicación de un destino turístico. Se observan algunas fuentes de información y plataformas Web más idóneas según los segmentos de población en tipos de comunicación tradicionales y emergentes. El grueso de diferencias más relevantes se da en las fuentes de información autónoma, que son mejor valoradas por los residentes fuera de España.

Atendiendo a la ubicación geográfica, cuando se trata de impactar a residentes fuera de España para darles a conocer Mallorca, hay que tener en cuenta, además de las fuentes mejor puntuadas en general, los medios especializados en turismo y los rodajes de cine y televisión como soportes de gran impacto para dar visibilidad a la isla. El resto de fuentes de información autónoma también son mejor valoradas por parte de los residentes extranjeros. Por tanto, cuando se plantea el dar a conocer el destino en mercados emergentes, resulta de gran interés analizar las fuentes autónomas de más impacto entre la población de un país concreto para intentar difundir el destino en dicho país. Por otro lado, el hecho de conocer a residentes hace que se valore mejor la fuente orgánica de amigos y conocidos. En este sentido, resulta interesante implicar a los propios residentes en las campañas de comunicación del destino.

En cuanto a las plataformas Web, la mayor parte de las que recibe unas medias significativas diferentes se concentra en las que el contenido es generado por los propios usuarios. Es en este grupo donde existe más variabilidad en las puntuaciones. Cabe destacar que cuanto más se conoce el destino, mejor se valoran los mapas tipo Google; esto puede deberse a que se tiene acceso a un mejor conocimiento del territorio. Por otro lado, es importante señalar que está incrementando el auge de una nueva modalidad turística que sigue las pautas de los modelos de negocio de consumidor a consumidor (C2C). En el caso del turismo, se trata de ofrecer servicios turísticos de viajero a viajero, o de residente a viajero, como intercambio de casas para pasar las vacaciones, el alquiler de habitaciones o casas particulares para turismo o foros. El tipo de plataformas que permiten esta modalidad de turismo se valora más positivamente por parte de los residentes fuera de España.

Se ha constatado que conocer a residentes ofrece un conocimiento del destino también mayor, lo cual proporciona una utilidad superior a los buscadores, al conocerse de antemano lo que se está buscando. En cambio, no conocer a residentes proporciona más valor, tanto a la información oficial publicada en la Web de las OMD cómo a la información de tipo informal sobre turismo publicada por los UGC, en concreto por los propios residentes. Destacan las Web de alquiler propio y la de viajeros hospitalarios que acogen a turistas en sus casas.

No haber visitado Mallorca con anterioridad sólo presenta ligeras diferencias en las Web de viajeros hospitalarios, foros y Web de alojamientos turísticos, que son mejor valoradas por los no visitantes. En este sentido, se recomienda a las OMD seguir publicando información turística y útil en sus Web e implicar a residentes y viajeros en las campañas de comunicación para llegar de una forma más orgánica a futuros viajeros potenciales.

Este estudio tiene la limitación que sólo se consideran a usuarios de Internet para realizar la encuesta, sin embargo hay que tomar en consideración que según datos de la Encuesta de Gasto Turístico (EGATUR, 2013) del Instituto de Estudios Turísticos, el 63,3% de los turistas que visitaron las Islas Baleares en 2011 utilizan Internet en la preparación de sus viajes.

Como futuras investigaciones, se propone tomar en consideración el uso de los dispositivos móviles a la hora de consultar información turística y en concreto de las Apps y su tipología. Por ejemplo, en este estudio no se han tenido en cuenta aplicaciones tipo Forsquare o Pinterest que en el último año se han puesto tan de moda entre los usuarios de “smartphones”. Otra línea de investigación que se recomienda desarrollar es examinar si la proyección de la imagen deseada de un territorio explicada en el plan de marketing de la OMD se ajusta a la imagen proyectada en la Web de la OMD. Además, también se propone analizar si la imagen proyectada por la OMD se ajusta a la imagen compartida por los UGC.

## RESUMEN

*El turismo rural se muestra como un campo multidisciplinar de investigación de gran interés, donde todavía se echa en falta un salto hacia estudios causales relacionados con el marketing. El presente trabajo pretende testar la relación causal entre satisfacción y lealtad al destino de turismo rural, introduciendo como novedad un papel más destacado para las relaciones que surgen entre los turistas y los proveedores de servicios turísticos y los residentes. Para ello se ha recogido una muestra de 464 turistas rurales a través de encuesta on-line. La evaluación del modelo a través de la técnica PLS, muestra una alta capacidad explicativa de los constructos endógenos satisfacción global y lealtad. Destaca el papel de la satisfacción con los atributos del destino y de las relaciones con los residentes como antecedentes de la satisfacción global, no siendo significativo el impacto de la satisfacción con las relaciones con los proveedores de servicios turísticos.*

## PALABRAS CLAVE:

*Marketing turístico, satisfacción, lealtad, turismo rural, modelos de ecuaciones estructurales, técnica PLS*

## 1. Introducción

El turismo rural como fenómeno turístico ha sido muy estudiado tanto a nivel nacional como internacional, atendiendo a aspectos como su concepto, su evolución o su desarrollo en zonas del globo muy diversas. Se trata de un campo multidisciplinar de investigación de gran interés, que ha experimentado un aumento cuantitativo en la literatura tanto a nivel nacional como internacional. Lo que se echa en falta es un salto hacia los estudios causales relacionados con el marketing para la mejor planificación, gestión y comercialización de destinos y empresas de turismo rural, así como sucede en otros subsectores turísticos.

En este trabajo se cuestiona si la satisfacción tiene efectos sobre la lealtad a los destinos de turismo rural, pues parece que las diferentes particularidades que posee cada sector pueden llegar a definir la lealtad con matices diferentes, así como también los diferentes patrones de consumo. El sector turístico incluye servicios muy heterogéneos, pero fundamentales para la misma actividad que es viajar. Se podría definir al cliente fiel como aquel que elige la misma cadena hotelera cada vez que emprende un viaje vacacional, que siempre que visita la misma ciudad por cuestiones de trabajo y se aloja en el mismo hotel, el turista que continuamente elige volar con la misma compañía aérea, o que siempre requiere los servicios de la misma agencia de viajes, aunque la frecuencia sea muy irregular. El problema que subyace, a criterio de Oppermann (1999), es que la duración del período de compra en el sector turístico es muy variable. Según Oliver (1999), en el caso de los bienes de consumo la preferencia continuada del producto de una marca sobre otra podría ser un indicador de la lealtad de un cliente. Sin embargo, Bigné *et al.* (2005) afirman que medir la lealtad como la repetición de compras en el turismo es difícil, dado que el consumo es infrecuente y se prefiere visitar lugares nuevos. Por tanto, las características específicas del turismo rural hacen necesaria la investigación sobre la lealtad de estos clientes, pues la multiplicidad de destinos y tipos de alojamientos que ofrece esta modalidad turística es tan amplia y variada que la probabilidad de repetición de la visita puede ser baja. Resultaría relevante entonces poner de manifiesto la capacidad que tiene el turismo rural de fidelizar a sus clientes a través de la satisfacción, lo cual tiene repercusiones tanto teóricas como prácticas para una mejor planificación, gestión y comercialización de destinos y empresas de turismo rural.

Frecuentemente en la literatura, el estudio de la satisfacción se ha abordado desde los atributos del destino, mientras que otros aspectos como las relaciones con los proveedores de servicios y los propios residentes del destino no son tenidos en cuenta. En el caso del turismo rural, existe facilidad para desarrollar una relación próxima con el proveedor de servicios turísticos, mientras que también suele desarrollarse una relación particular con los residentes de estos destinos turísticos, convirtiéndose en parte fundamental del producto de turismo rural. Por ello, parece interesante estudiar la satisfacción no sólo haciendo referencia los elementos que posee el destino, sino también a las relaciones que el turista establece con las persona del lugar, tratando de entender cómo influyen en la satisfacción global y ésta en sus intenciones de volver y de recomendar el destino. Palmer y Mayer (1996) subrayan la facilidad que tienen los pequeños negocios locales y familiares a la hora de desarrollar relaciones con sus clientes, escenario que se reproduce en el turismo rural. Alegre y Cladera (2009) aseguran la importancia de la relación entre satisfacción con la hospitalidad y la satisfacción global.

Por tanto, el objetivo de esta investigación se define como conocer la relación que existe entre la satisfacción y la lealtad hacia los destinos de turismo rural, debido a sus particularidades, introduciendo como novedad un papel más destacado para las relaciones que surgen entre los proveedores de servicios turísticos y los residentes del lugar con los turistas.

El presente trabajo se estructura en cinco apartados. El primero de ellos aborda algunas cuestiones introductorias sobre el tema objeto de estudio, plantea su justificación y objetivos. El siguiente, recopila las cuestiones teóricas relacionadas con la satisfacción y la lealtad en turismo, con aplicación a las características particulares del turismo rural, planteando además las hipótesis de investigación y el modelo teórico que se pretende testar. Después se presentan las cuestiones metodológicas para pasar, a continuación, a la exposición de los resultados. Se finaliza con las conclusiones de este trabajo.

## 2. Las relaciones causales entre satisfacción y lealtad en el ámbito del turismo rural

### 2.1. La satisfacción en el turismo rural: la propuesta de tres dimensiones

Dentro del estudio del comportamiento del turista, la satisfacción es un concepto central (Kozak, 2001), siendo el conocimiento de la psicología del consumidor de vital importancia para el éxito de los destinos turísticos. Por ello, es necesario realizar un gran esfuerzo en la investigación del proceso de satisfacción (Rodríguez del Bosque y San Martín, 2008), pues fallos en la satisfacción de los turistas puede afectar a la probabilidad de su regreso al destino o en la recomendación del mismo (Rivera y Croes, 2010). Además, el concepto juega un importante papel en la planificación y comercialización de productos y servicios turísticos (Yoon y Uysal, 2005), por lo que su estudio tiene una trascendental doble implicación, tanto teórica como práctica en el ámbito de los destinos turísticos.

A pesar de la profusión de conceptualizaciones generalistas, la literatura sobre satisfacción manifiesta la necesidad de tratar el concepto bajo un enfoque dependiente del contexto en el que surge. Por tanto, hay que tener presente que las características del sector turístico ejercen un notable impacto en el concepto (Bowen y Clarke, 2002). La satisfacción en el ámbito turístico ha sido estudiada con gran profusión (Kim *et al.*, 2012), aplicándose a diversos contextos como agencias de viajes, alojamientos y destinos (Rodríguez del Bosque y San Martín, 2008), y habiéndose utilizado varias perspectivas y teorías (Yoon y Uysal, 2005), siendo el enfoque dominante el utilizado en esta literatura el de la disconfirmación de expectativas promovido por Oliver (1980), que dentro del turismo ha sido utilizado en un amplio abanico de contextos (productos turísticos en relación a la naturaleza, destinos, agencias de viajes, etc.) (Petrick *et al.*, 2001; Jang y Feng, 2007; Lee *et al.*, 2012).

En el caso concreto de la satisfacción con el destino turístico, Hernández *et al.* (2006) conceptualizan la satisfacción con el destino como la valoración del grado de cumplimiento de las necesidades y deseos de los turistas, en cuanto al gran abanico de servicios y actividades que ofrece el destino. De una forma muy sencilla y basándose en la perspectiva de Oliver (1980), Wang y Hsu (2010) definen la satisfacción aplicada al ámbito de los destinos como la evaluación postcompra del destino. Por su parte Phillips *et al.* (2013: 15), en términos generales, entienden la satisfacción con el destino turístico como “la sensación general de contento que un turista siente al visitar un destino que cumple sus expectativas y necesidades de viaje”. Sin embargo, las definiciones de satisfacción pueden diferir en cuanto a su nivel de especificidad (Yi, 1990), incluyendo el hecho de que la satisfacción pueda ser estudiada a nivel de transacciones específicas o de forma global (Johnson *et al.*, 1995). La satisfacción puede abordarse a nivel global (Oliver, 1980) o a nivel de atributos en cuanto a los antecedentes de la satisfacción (Oliver, 1993). Según Oliver (1993), existe una dualidad entre influencias afectivas positivas y negativas en la experiencia de consumo, que puede proceder de experiencias positivas o negativas del nivel de atributos. Por tanto, según el autor, la satisfacción con los atributos, puede concebirse como el juicio subjetivo del consumidor como resultado de las observaciones del desempeño de los atributos, mientras que la satisfacción global se configuraría como una función de las evaluaciones a nivel de atributos. De este modo, la satisfacción global y la satisfacción con los atributos se entienden como constructos distintos pero relacionados. La satisfacción con los atributos tiene un impacto positivo y directo en la satisfacción global y captura buena parte de la variación de la satisfacción global.

En la aplicación de estas cuestiones al sector turístico y, en concreto, a los destinos, Kozak y Rimmington (2000) aseveran que las diferencias entre los productos turísticos hacen difícil la medición de la satisfacción del cliente. Por ello, es importante identificar y medir la satisfacción con cada componente del destino porque cada uno dirige a la satisfacción global con el mismo. Ozdemir *et al.* (2012b) destacan que la revisión de la literatura revela que hay algunos atributos que podrían hacer que los turistas se sientan satisfechos o insatisfechos con un destino. Ozdemir *et al.* (2012a) afirman que en sus vacaciones en un destino los turistas experimentan una amplia gama de atributos como hoteles, restaurantes, tiendas, playas, recursos naturales, culturales e históricos, y que se evalúan cada uno por separado. Consecuentemente, es lógico pensar que la satisfacción global es una función de la satisfacción con atributos específicos del destino. Según Ozdemir *et al.* (2012b), estudios recientes han intentado identificar los atributos del destino que generan satisfacción o no durante las estancias de los turistas.

Por su parte, la satisfacción global en el caso específico de los destinos puede entenderse como la definen Chen y Tsai (2007: 1116), que sería como “el grado de placer o contento sentido por el visitante, resultado de la habilidad de la experiencia de viaje de cumplir los deseos del visitante, expectativas y necesidades en relación al viaje”. Por su parte Phillips *et al.* (2013: 95) la conciben como “la evaluación subjetiva de consumo basada en todos los elementos asociados a las experiencias”, de modo que el concepto se compondría de las experiencias de cada uno de los encuentros con el servicio durante el viaje. Prayag y Ryan (2012: 348) se refieren a ella simplemente como “un constructo acumulativo que suma la satisfacción con las varias facetas del destino”.

Kim y Brown (2012) están de acuerdo en la diferencia conceptual entre el desempeño de cada atributo y de la satisfacción global, indicando una relación causal entre ambos conceptos. La relación entre la satisfacción con los atributos del destino y satisfacción global ha sido probada en la literatura (Alegre y Cladera, 2006, 2009; Chi y Qu, 2008; Eusébio y Vieira, 2013; Maroofi y Dehghan, 2012; Ozdemir *et al.*, 2012b; Phillips *et al.*, 2013), pero es necesario testar tal relación en el ámbito de los destinos de turismo rural, de modo que la  $H_1$  se enunciaría de la siguiente forma.

*H<sub>1</sub>: La satisfacción con los atributos del destino tiene efectos sobre la satisfacción global con el destino de turismo rural.*

Estudios recientes sugieren que es necesaria más investigación para comprender mejor otros aspectos experienciales de la satisfacción del turista hacia un destino particular y sus relaciones con la satisfacción global (Kim y Brown, 2012). Por este motivo, se ha tratado de estudiar la satisfacción con un enfoque innovador en el contexto del turismo rural, tratando de involucrar, además de la satisfacción con los atributos del destino, la satisfacción que se produce en cuanto a las relaciones que se desarrollan con los proveedores de servicios turísticos y con los propios residentes del destino.

Según Choo y Petrick (2012), pocos estudios han examinado las relaciones interpersonales que los clientes perciben y experimentan en el encuentro con el servicio. Este hecho tiene importantes implicaciones en marketing, y por consiguiente en las relaciones que afectan a la experiencia turística, pues desde el punto de vista del visitante, hay una serie de relaciones que pueden influenciar experiencias agradables durante el encuentro con el servicio. Los resultados del trabajo de estos autores apuntan a la necesidad de extender el enfoque del marketing relacional enfocado en el cliente al resto de relaciones que se producen con otras partes involucradas en la prestación del servicio, como son los prestadores de servicios y los acompañantes. Desarrollaron su investigación en el ámbito del agroturismo, tipología turística encuadrada dentro del turismo rural, lo cual supone otro incentivo para introducir este constructo en el modelo de estudio de este trabajo. Por otra parte, según Bigné *et al.* (2005: 30) “un adecuado desarrollo del turismo implica que todos los agentes del destino, y no sólo aquellos que pertenecen al sector turístico, estén involucrados en la gestión y la planificación del turismo. Consecuentemente, la comunidad de acogida es otro elemento a considerar en la competitividad de un destino”. De modo que también es necesario incorporar al estudio la importancia de las relaciones que se establecen entre los turistas y los residentes. Choo y Petrick (2012) se propusieron testar las relaciones que ejerce la satisfacción con las relaciones con los proveedores en la satisfacción en general, consiguiendo comprobar esta relación. Alegre y Cladera (2009) aseguran la significación de la relación entre satisfacción con la hospitalidad y satisfacción global. A partir de estos antecedentes se formulan las  $H_2$  y  $H_3$ .

*H<sub>2</sub>: La satisfacción con las relaciones con los proveedores de servicios turísticos tiene efectos sobre la satisfacción global con el destino de turismo rural.*

*H<sub>3</sub>: La satisfacción con las relaciones con los residentes tiene efectos sobre la satisfacción global con el destino de turismo rural.*

## **2.2. La lealtad en el turismo rural y su relación con la satisfacción global**

A pesar de que la lealtad ha sido ampliamente estudiada en el sector turístico, sigue siendo un concepto esquivo tanto para la teoría como para la práctica (McKercher *et al.*, 2012). El concepto de lealtad al destino ha recibido poca atención en la literatura (Oppermann, 1999, 2000; Yoon y Uysal, 2005). A juicio de McKercher *et al.* (2012) esto podría deberse a que el turista parece ser

inherentemente desleal y que los modelos de lealtad existentes producen resultados pobres en su aplicación al turismo.

El hecho de que los destinos operen en un mercado globalizado y altamente competitivo, les fuerza a buscar estrategias innovadoras y ventajas competitivas, como es en la búsqueda de la lealtad, estimulando así los lucros que surgen a partir de la repetición de la visita sobre la base de clientes actuales y sus recomendaciones (Fyall *et al.*, 2003; Shirazi y Som, 2011), así como comprender por qué los turistas son fieles a los destinos y qué determina su lealtad (Chen y Gursoy, 2001). Una cuestión empírica clave a responder en este contexto es qué pauta de comportamiento en el consumo turístico puede ser interpretado como indicador de lealtad (Riley *et al.*, 2001).

Yoon y Uysal (2005) señalan que los destinos turísticos pueden ser considerados productos, y los turistas pueden volver a visitarlos o recomendarlos a otros turistas potenciales como familiares o amigos. Chen y Gursoy (2001) definen operacionalmente la lealtad al destino como el nivel de percepciones de los turistas de un destino como un lugar recomendable, destacando que los estudios que sólo consideran la repetición de visitas como un indicador de la lealtad al destino son deficientes. Esto se debe a que los que no regresan a un destino particular podrían simplemente buscar experiencias de viaje diferentes en nuevos lugares, aun manteniendo la lealtad al destino visitado anteriormente. Por ello, estos autores defienden la intención de recomendar el destino como un indicador de la lealtad. McKercher y Guillet (2011) también defienden este indicador de la lealtad, dado que ante la poca probabilidad de la intención de visitar el destino, el turista tendría un papel importante como su defensor, incluso más que su propia intención de repetir.

Sin embargo, el debate sobre la gradación que puede darse en cuanto a la lealtad hacia un destino, así como la probabilidad de que un turista nunca se convierta en fiel es un debate abierto. Los turistas podrían mostrar una alta propensión a ser leales, debido a las características inherentes a los servicios turísticos. Los servicios turísticos se pagan a distancia, sin tener la posibilidad de realizar una prueba antes de la compra. El turista soporta un alto nivel de incertidumbre y riesgo ante una posible mala experiencia en un nuevo destino, mientras que éste se reduce al volver a un destino conocido (McKercher y Guillet, 2011). En este sentido, Alegre y Juaneda (2006: 686) señalan que “algunas motivaciones turísticas podrían inhibir la lealtad al destino” como, por ejemplo, el deseo de romper con la monotonía de la vida cotidiana, conocer nuevos lugares, personas y culturas, o buscar nuevas experiencias. Sin embargo, las personas con aversión al riesgo podrían sentirse impulsadas a visitar un destino familiar.

Apoyándose en diversos autores, Pearce y Kang (2009) destacan que hay tres dificultades en la transferencia del concepto de lealtad al turismo: (a) un amplio consenso entre los teóricos sobre el hecho de que la búsqueda de la novedad es un componente básico del comportamiento del turista, (b) las características propias de los diferentes productos turísticos, de modo que los viajes de placer son de poca frecuencia, y (3) la duda sobre en qué base se asienta la lealtad del turista, pues la lealtad del cliente puede desarrollarse en cualquiera de los elementos que lo componen.

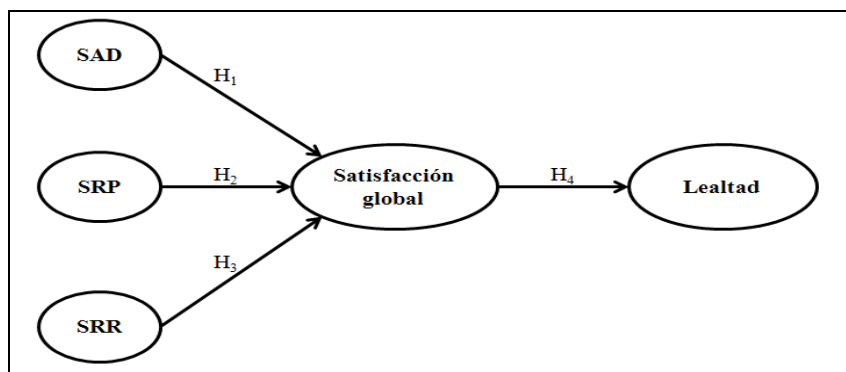

Loureiro (2010) destaca que el turismo rural debe enfrentarse a los retos de un mercado cada vez más competitivo, por lo que es interesante mantener visitantes leales con el fin de garantizar el éxito a largo plazo de los destinos y organizaciones turísticas que operan en ellos, así como su sostenibilidad. Phillips *et al.* (2013) destacan que la repetición de la visita es el mayor desafío al que se enfrentan los destinos de turismo rural, y que la recomendación es una de las herramientas de marketing más importante para atraer nuevos clientes, especialmente en estos destinos.

La relación entre satisfacción global y lealtad ha sido relación ampliamente verificada en la teoría (eg. Bigné *et al.*, 2005; Yoon y Uysal, 2005; Hernández *et al.*, 2006; Hui *et al.*, 2007; Matzler *et al.*, 2007; Chi y Qu, 2008; Rodríguez del Bosque y San Martín, 2008; Mechinda *et al.*, 2009; Williams y Soutar, 2009; Rivera y Croes, 2010; Wang y Hsu, 2010; Yüksel *et al.*, 2010; Žabkar *et al.*, 2010; Chen y Tsai, 2012; Forgas *et al.*, 2012; Kim y Brown, 2012; Kim *et al.*, 2012; Maroofi y Dehghan, 2012; Prayag y Ryan, 2012), aunque resulta interesante comprobar también su relevancia en el contexto del turismo rural, así se enuncia la H<sub>4</sub>.

*H<sub>4</sub>: La satisfacción global afecta a la lealtad hacia el destino de turismo rural.*

La FIGURA 1 representa el modelo teórico que se testa en la presente investigación.

FIGURA 1  
Modelo teórico

### 3. Metodología

#### 3.1. Escalas de medición

La satisfacción con los atributos del destino se ha venido utilizando en varios trabajos proponiendo varias escalas que miden múltiples elementos de un destino con especificaciones diferentes (eg. Alegre y Cladera, 2006, 2009; Matzler *et al.*, 2007; Chi y Qu, 2008; Chi, 2011, 2012; Maroofi y Dehghan, 2012; Ozdemir *et al.*, 2012a, b; Phillips *et al.*, 2013). En este trabajo, para medir este constructo se ha recurrido a la construcción de indicadores globalizados, tratando de simplificar la escala para poder ser aplicada a cualquier destino de turismo rural. A partir de una escala aplicada al turismo rural propuesta por Campón *et al.* (2010), se han planteado los ítems para esta escala. En cuanto a la satisfacción con las relaciones con los proveedores de servicios turísticos, se han utilizado como base la escala propuesta por De Wulf *et al.* (2001). Escasos son los resultados que aporta la revisión de la literatura realizada sobre la medición de la satisfacción con las relaciones con los residentes de los destinos, que conducen a los trabajos de Alegre y Cladera (2006, 2009), que en su constructo satisfacción con los atributos del destino, utilizan una dimensión relacionada con estas cuestiones. Campo y Garau (2010), tras un análisis factorial sobre atributos del destino encuentran un factor que denominan satisfacción con la hospitalidad. Sobre las bases de los indicadores propuestos por estos autores se ha construido la escala propuesta para este estudio. Se han incluido además dos indicadores que tendrían relación con la función que muchas veces cumplen los residentes de un destino, de ayuda en la resolución de problemas que pueden darse durante la estancia y ofrecer informaciones sobre el lugar.

A pesar de que el constructo satisfacción global frecuentemente se ha estudiado a través de un único indicador (eg. Bigné *et al.* 2005; Alegre y Cladera, 2006, 2009; Chen y Tsai, 2007; Jang y Feng, 2007; Chi y Qu, 2008; Rivera y Croes, 2010; Maroofi y Dehghan, 2012; Prayag y Ryan, 2012; Eusébio y Vieira, 2013; Phillips *et al.*, 2013), a partir de las recomendaciones de MacKenzie *et al.* (2005) sobre los riesgos de utilizar un único ítem, se ha apostado por una escala multi-ítem.

Para la identificación de los indicadores que formen parte de la escala para la medición de la satisfacción global se han tenido en cuenta las de Rodríguez del Bosque y San Martín (2008), Williams y Soutar (2009), Wang y Hsu (2010), Yüksel *et al.* (2010), Žabkar *et al.* (2010) y Forgas *et al.* (2012), que tienen como denominador común que han basado sus escalas en las propuestas por Oliver (1980, 1997, 1999). Se ha enriquecido la escala con un indicador propuesto por Tse y Wilton (1988) y Oliver (1997) que observan la distancia al punto ideal como una medida de la satisfacción que refleja cómo debería ser el desempeño del servicio.

Para el estudio de la lealtad se ha estimado interesante la escala utilizada por Mechinda *et al.* (2009), pues se ha tenido en cuenta que tanto la revisita como la recomendación aparecieran, puesto que son indicadores clave para el estudio de la lealtad.

Las escalas utilizadas en este trabajo han sido validadas por especialistas: profesores e investigadores de diversas universidades españolas y profesionales del sector del turismo rural, del turismo en general y del marketing.

### 3.2. Muestra, trabajo de campo y análisis de los datos

El presente estudio se ha desarrollado en España, país donde el turismo rural ha tenido una excepcional expansión en los últimos años, tanto desde el punto de vista de la oferta como de la demanda (Hernández *et al.*, 2011), recurriendo a la utilización de una metodología cuantitativa a través de encuesta on-line, haciendo difusión de la misma a través de *e-mailing*, redes sociales, página web y blog, tratando de conseguir además un efecto bola de nieve en la obtención de respuestas. El universo de esta investigación estaría compuesto por todas aquellas personas que practican turismo rural al menos una vez cada dos o tres años, cuestión que constituía la primera pregunta del cuestionario. Antes del lanzamiento final del mismo, se desarrolló un pilotaje, seleccionando una pequeña submuestra de la población objeto de estudio para comprobar de forma definitiva la corrección del mismo (Miquel *et al.*, 2000). El trabajo de campo se llevó a cabo entre abril y junio de 2013, obteniendo una muestra no probabilística de conveniencia de 464 turistas rurales.

TABLA 1  
Ficha técnica del estudio

<i>Universo</i>	Personas que practican turismo rural con cierta frecuencia (al menos una vez cada dos o tres años)
<i>Ámbito</i>	España
<i>Método de recogida de información</i>	Encuesta <i>on line</i>
<i>Base de datos</i>	No existe
<i>Unidad muestral</i>	Personas que practican turismo rural con cierta frecuencia (al menos una vez cada dos o tres años)
<i>Tamaño de la población</i>	Indefinido
<i>Muestreo</i>	Muestra no probabilística de conveniencia
<i>Trabajo de campo</i>	Del 22 de abril al 18 de junio de 2013
<i>Número de encuestas realizadas</i>	567 (103 finalizaron en la primera pregunta)
<i>Respuestas válidas</i>	464 (cuestionarios completos)

Por lo que respecta a los procedimientos y técnicas de análisis, para el análisis descriptivo de los datos se ha utilizado el programa estadístico IBM SPSS Statistics Version 21. El grueso del análisis estadístico se localiza en la evaluación de modelos de ecuaciones estructurales (*Structural Equation Modelling*, SEM). Los SEM se configuran como los únicos métodos de estadística multivariante que permiten testar relaciones causales entre variables dependientes e independientes simultáneamente (Martínez-López *et al.*, 2009). Para testar el modelo teórico propuesto, se ha escogido la técnica *Partial Least Squares* (PLS), dado que es especialmente apropiada para estudios exploratorios con fines predictivos, objetivos de la presente investigación (Hair *et al.*, 2011). Aunque PLS estima los parámetros de media y estructurales a la vez, los modelos de medida y estructural han de ser analizados e interpretados en dos fases. Esta secuencia asegura que se han obtenido medidas válidas y fiables de los constructos, antes de adoptar conclusiones sobre las relaciones entre los mismos (Barclay *et al.*, 1995). A continuación se exponen los resultados obtenidos de la aplicación de estas técnicas de análisis.

## 4. Resultados

Por lo que respecta a la caracterización demográfica de la muestra, se puede afirmar que es bastante similar en cuanto al sexo, con una participación de un 41,2% de hombres, y un 58,8% de mujeres. El grupo con mayor representatividad es el “de 26 a 35 años” (53,9%). Destacar que entre los 26 y 55 años suman el 85,6% de la muestra, lo cual responde aproximadamente al perfil clásico por edad del turista rural (Mediano, 2004; García, 2005; López y López, 2005).

Por lo que respecta al perfil de estos encuestados como turistas rurales, en cuanto a la frecuencia con la que realizan turismo rural, el 49,8% de los encuestados lo practican “una o dos veces al año”, es decir, la mitad de la muestra realiza turismo rural con regularidad, por lo que esta muestra se podría calificar como adecuada por su nivel de interés y conocimiento del turismo rural.

A continuación se exponen los resultados de la evaluación del modelo teórico.

### 4.1. Evaluación del modelo de medida

Según Hair *et al.* (2011) los modelos que utilizan constructos cuyos indicadores son reflectivos, como sucede con los constructos en causa, deben ser evaluados en cuanto a su fiabilidad y validez. La evaluación del modelo de medida involucra cuatro pasos: la evaluación individual de los indicadores, la consistencia interna del constructo, la validez convergente y la validez discriminante.

La evaluación individual de los indicadores requiere la observación de los *loadings* o correlaciones simples de cada indicador con su respectivo constructo. Para que el indicador sea aceptado en su constructo ha de poseer una carga igual o superior a 0,707 (Hair *et al.*, 2011; Barclay *et al.*, 1995), aunque esta regla no debe ser tan rígida en etapas iniciales de desarrollos de escalas o cuando éstas se aplican a diferentes contextos, de modo que *loadings* de 0,50 o 0,60 pueden ser aceptados (Barclay *et al.*, 1995). Se comprueba que todos los indicadores poseen valores superiores 0,707, a excepción de SGL6 (0,6351), LEA1 (0,5004) y LEA2 (0,5227), si bien se encuentran en el umbral crítico de tolerancia. La consistencia interna del constructo se verifica a través de la fiabilidad compuesta. Su valor ha de estar comprendido entre 0,60 y 0,70 en estudios exploratorios, y entre 0,70 y 0,90 para estadios más avanzados de investigación (Nunnally y Bernstein, 1994). Sus valores oscilan entre 0,85 y 0,94, siendo por tanto, adecuados. La evaluación de la validez convergente se estudia a través del *Average Variance Extracted* (AVE). Un AVE por encima de 0,5 indica un grado suficiente de validez convergente, lo que significa que más de la mitad de la varianza de la variable latente es explicada por sus indicadores (Hair *et al.*, 2011). Todos los valores del AVE para cada uno de los constructos se encuentran por encima del nivel crítico propuesto. La exposición de estos resultados se recoge en la TABLA 2.

TABLA 2  
Evaluación del modelo de medida

	Media	Desviación típica	Cargas	Estadístico $t^*$	Fiabilidad compuesta	AVE
<b>Satisfacción con los atributos del destino</b>	-	-	-	-	<b>0,9336</b>	<b>0,7786</b>

*El valor crítico de <i>t-test</i> de dos colas es de 1,65 para un nivel de significación del 10%, 1,96 para un nivel de significación de 5% y 2,58 para un nivel de significación del 1% (Hair <i>et al.</i> , 2011).						

La evaluación de la validez discriminante se ha llevado a cabo a través de la demostración de que las correlaciones entre los constructos son más bajas que la raíz cuadrada del AVE (Barclay *et al.*, 1995).

En la TABLA 3 la raíz cuadrada del AVE se presenta en la diagonal y en negrita. A la luz de la citada tabla se comprueba que el modelo posee validez discriminante.

TABLA 3  
Análisis de la validez discriminante

	<i>Lealtad</i>	<i>Satisfacción con los atributos del destino</i>	<i>Satisfacción global</i>	<i>Satisfacción con las relaciones con los proveedores de servicios turísticos</i>	<i>Satisfacción con las relaciones con los residentes</i>
<i>Lealtad</i>	<b>0,7433</b>	0	0	0	0
<i>Satisfacción con los atributos del destino</i>	0,6373	<b>0,8824</b>	0	0	0
<i>Satisfacción global</i>	0,7143	0,7697	<b>0,8525</b>	0	0
<i>Satisfacción con las relaciones con los proveedores de servicios turísticos</i>	0,5667	0,6867	0,7402	<b>0,8856</b>	0
<i>Satisfacción con las relaciones con los residentes</i>	0,4498	0,6343	0,5677	0,5692	<b>0,8785</b>

Una vez desarrollados los análisis anteriores, puede asegurarse que el modelo de medida es fiable y válido, de modo que se puede continuar con la evaluación del modelo estructural.

#### 4.2. Evaluación del modelo estructural

Según Hair *et al.* (2011), los pasos para evaluar el modelo estructural serían los siguientes: análisis de  $R^2$  para cada constructo dependiente; análisis de la significación de los *paths*, a través del procedimiento *bootstrapping*; y análisis de la relevancia predictiva ( $Q^2$ ), a través del procedimiento *blindfolding*.

Dado que el objetivo del análisis de modelos de ecuaciones estructurales con PLS es la predicción, es necesario explicar la varianza de las variables latentes endógenas, es decir, el nivel de  $R^2$ . En los estudios de investigación de marketing un valor de  $R^2$  de 0,75, 0,5 o 0,25 para las variables latentes endógenas en el modelo estructural pueden ser descritos como sustancial, moderado o débil respectivamente (Hair *et al.*, 2011). El modelo posee una capacidad explicativa de sus variables latentes endógenas moderada-sustancial para la satisfacción global, puesto que viene a ser explicada en un 67,8% por sus predictores, mientras que la de la lealtad es moderada, dado que su varianza explicada asciende al 51,0% por el impacto directo de la satisfacción global. Es necesario explicar en qué medida las variables predictoras contribuyen a la varianza explicada de las variables endógenas, lo cual viene a ser representado por el coeficiente  $\beta$ , que recoge los coeficientes de los *paths* o pesos de regresión estandarizados de los mismos. La varianza explicada de un constructo endógeno por otra variable latente viene dado por el valor absoluto del resultado de multiplicar el coeficiente *path* ( $\beta$ ) por el correspondiente coeficiente de correlación entre ambas variables (Falk y Miller, 1992). El factor más influyente en la satisfacción global es la satisfacción con los atributos del destino, que consigue explicar el 36,4% de la misma, seguido de la satisfacción con las relaciones con los residentes con un 28,8%. Las relaciones con los proveedores de servicios turísticos apenas tienen influencia en la satisfacción global (2,6%). El test de Stone-Geisser ( $Q^2$ ) está destinado a estudiar la capacidad del modelo de predecir. El valor de  $Q^2$  se obtiene usando el procedimiento *blindfolding*, que es solamente aplicable a constructos latentes endógenos que posean modelo de medida reflectivo. Si  $Q^2$  para cierta variable latente endógena es mayor que cero, el constructo latente posee relevancia predictiva (Hair *et al.*, 2011). Los resultados de este test indican que el modelo posee capacidad de predecir en cuanto a la satisfacción global y la lealtad. La TABLA 4 detalla pormenorizadamente los resultados comentados.

TABLA 4

### Efectos en las variables endógenas

	$R^2$	$Q^2$	Efecto directo ( $\beta$ )	Correlación	Varianza explicada
<b>Satisfacción global</b>	<b>0,6784</b>	<b>0,4906</b>	-	-	-
H <sub>1</sub> : SAD → SATISGLO	-	-	0,4734	0,7697	36,4%
H <sub>2</sub> : SRP → SATISGLO	-	-	0,046	0,5677	2,6%
H <sub>3</sub> : SRR → SATISGLO	-	-	0,3889	0,7402	28,8%
<b>Lealtad</b>	<b>0,5102</b>	<b>0,2738</b>	-	-	-
H <sub>4</sub> : SATISGLO → LEA	-	-	0,7143	0,7143	51,0%

El análisis de la significación de los caminos o *paths*, a través del procedimiento *bootstrapping* revela que las hipótesis enumeradas son soportadas empíricamente a través de los resultados obtenidos para un nivel de confianza del 99%, a excepción de la H<sub>3</sub>, que no encuentra apoyo empírico.

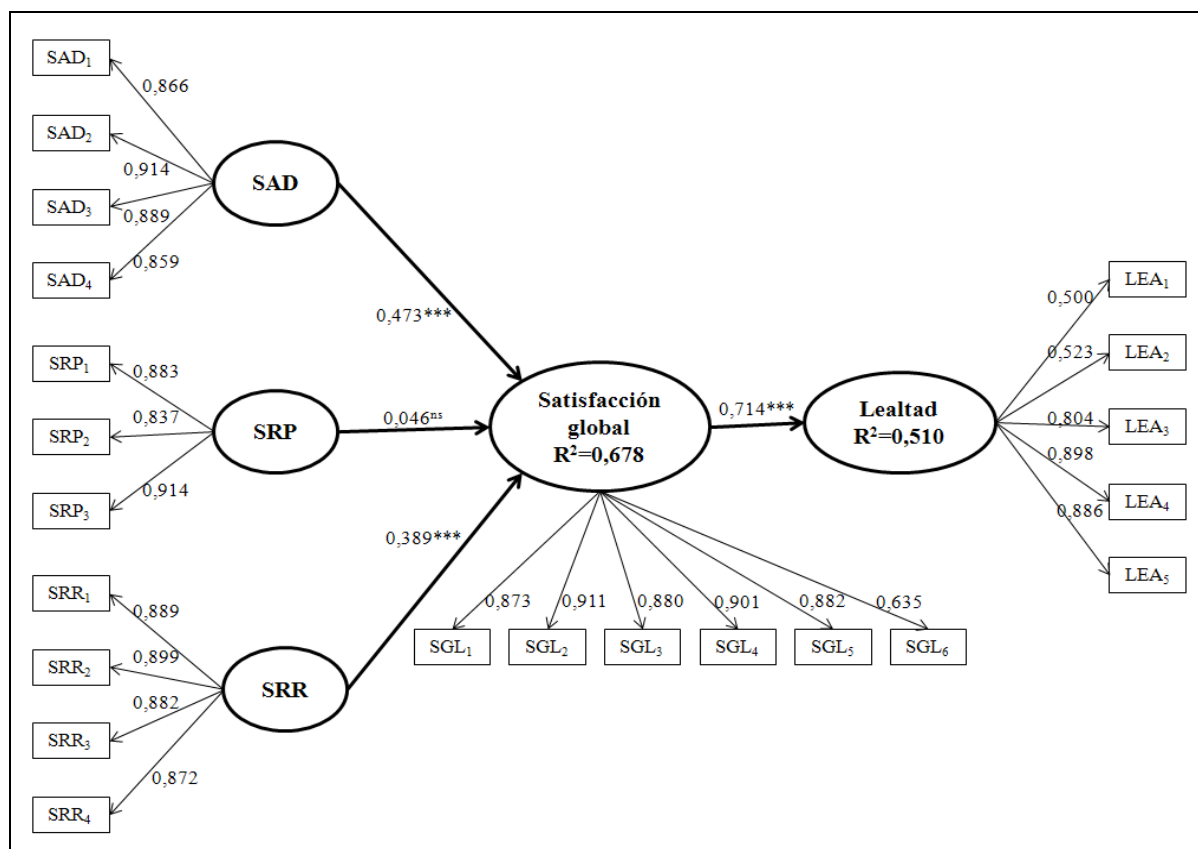

TABLA 5  
Resultados del modelo estructural

Hipótesis	Coefficientes path ( $\beta$ )	Estadístico <i>t</i> (bootstrap)
H <sub>1</sub> : SAD → SATISGLO	0,4734***	9,9005
H <sub>2</sub> : SRP → SATISGLO	0,046 <sup>ns</sup>	1,142
H <sub>3</sub> : SRR → SATISGLO	0,3889***	8,5855
H <sub>4</sub> : SATISGLO → LEA	0,7143***	24,8768

\*El valor crítico de *t-test* de dos colas es de 1,65 para un nivel de significación del 10%, 1,96 para un nivel de significación de 5% y 2,58 para un nivel de significación de 1%.

El resumen gráfico de la evaluación del modelo propuesto puede observarse en la FIGURA 2.

FIGURA 2  
Resultados gráficos de la evaluación del modelo

### 4.3. Discusión de los resultados

El modelo teórico propuesto para esta investigación ha encontrado un buen ajuste del modelo de medida y ha encontrado apoyo empírico para las hipótesis establecidas excepto para la hipótesis H<sub>2</sub>,

que vincula satisfacción con las relaciones de los proveedores de servicios turísticos y satisfacción global.

La satisfacción con los atributos del destino sería el factor que más contribuye a la satisfacción global (36,4%), seguida de la satisfacción con las relaciones con los residentes (28,8%). A pesar de que los estudios anteriores no introducen la satisfacción con las relaciones con los residentes como antecedente de la satisfacción global, o lo hacen de una forma muy parcializada, parece ser una acertada elección a la hora de explicar la satisfacción de los turistas con el destino de turismo rural, pues se constituye como un elemento interesante en la configuración de la satisfacción global. La satisfacción con las relaciones con los proveedores de servicios turísticos es el factor con menor relevancia en la construcción de esta variable (2,6%), mostrándose incluso como una relación no significativa. Entre las posibles razones que justificarían este resultado podría aludirse al hecho de que el turismo rural se instala en un entorno que desconoce el sector turístico como negocio, lo que deriva en problemas en su profesionalización (Millán, 1999), cuestión que pudiera ser percibida por los clientes. Sin embargo, en los últimos años se puede hablar de un sector especializado, más profesionalizado, que apuesta por altos parámetros de calidad y, que como apuntan Polo *et al.* (2012), las empresas de turismo rural tienden a enfocarse en la orientación al cliente, debido a su estrategia de especialización en un nicho de mercado. Sin embargo, lo que podría subyacer a la discusión de la hipótesis H<sub>2</sub> es una posible carencia en orientación a la relación. Por tanto, los aspectos relacionales en la satisfacción con el turismo rural tienen una repercusión parcial, en comparación con la especial influencia de la satisfacción con los atributos del destino. Su explicación probablemente se encuentre en el hecho de que la satisfacción con los atributos del destino es un constructo que frecuentemente ha avalado su importancia como antecedente de la satisfacción global, actuando como mediadora ante la lealtad hacia el destino o las intenciones de comportamiento hacia el mismo (Alegre y Cladera, 2006, 2009; Chi y Qu, 2008; Eusébio y Vieira, 2013; Maroofi y Dehghan, 2012).

Por lo que respecta a la relación entre satisfacción global y lealtad a los destinos de turismo rural, la hipótesis H<sub>4</sub> encuentra apoyo empírico en el contexto del turismo rural, siendo este resultado consistente con un amplio elenco de estudios (eg. Bigné *et al.*, 2005; Yoon y Uysal, 2005; Hernández *et al.*, 2006; Matzler *et al.*, 2007; Chi y Qu, 2008; Rodríguez del Bosque y San Martín, 2008; Mechinda *et al.*, 2009, Williams y Soutar, 2009; Rivera y Croes, 2010; Wang y Hsu, 2010; Yüksel *et al.*, 2010; Žabkar *et al.*, 2010; Chen y Tsai, 2012; Forgas *et al.*, 2012; Kim y Brown, 2012; Kim *et al.*, 2012; Maroofi y Dehghan, 2012; Prayag y Ryan, 2012). Los resultados obtenidos dan soporte a la estructura del modelo teórico que se ha presentado donde las tres dimensiones propuestas de la satisfacción en el ámbito de los destinos de turismo rural consiguen explicar el 67,8% de la variación de la satisfacción global, mientras que ésta consigue explicar el 51,0% de la varianza de la lealtad, arrojando resultados moderados-sustanciales de la capacidad explicativa de este modelo que relaciona la satisfacción y la lealtad en el contexto del turismo rural.

## 5. Conclusiones

El turismo rural como fenómeno turístico ha sido muy estudiado tanto a nivel nacional como internacional, fruto del fuerte desarrollo que ha tenido como es el caso de países como España, sin embargo, el sector se enfrenta a diversos desafíos que es necesario afrontar para su mejor planificación, gestión y comercialización de destinos y empresas de turismo rural. Resulta relevante estudiar cómo la satisfacción con los destinos de turismo rural ejerce influencia sobre la lealtad hacia éstos, debido a la intención de estos turistas de volver o recomendar el destino, lo que permite rentabilizar el valor que éstos ofrecen a lo largo del tiempo. Además, parece necesario estudiar la influencia que ejercen los elementos del destino en la satisfacción con el mismo, sino también las posibles relaciones que pueden establecerse durante la visita con los proveedores de servicios turísticos y con los propios residentes, lo que se hace aún más palpable en estos destinos, donde el trato directo del turista con estos agentes es muy frecuente y característico. Por tanto, se ha planteado un modelo teórico que introduce la satisfacción con los atributos del destino, la satisfacción con las relaciones con los proveedores de servicios turísticos y la satisfacción con las relaciones con los residentes del destino como predictores de la satisfacción global, y ésta como antecesora de la lealtad.

Tras la evaluación del modelo a través de la técnica PLS, puede afirmarse que el modelo posee una alta capacidad explicativa de los constructos endógenos satisfacción global y lealtad. Se destaca el importante papel de la satisfacción con los atributos del destino como principal predictor de la satisfacción global, mientras que la satisfacción con las relaciones con los residentes también posee un papel destacado, no siendo significativo el papel de la satisfacción con las relaciones con los proveedores. Es de destacar que las relaciones que se establecen con los residentes en los destinos de turismo rural tienen una importancia relevante en la satisfacción global del turista con el destino, importancia que frecuentemente queda diluida en los constructos de satisfacción con los atributos del destino. La relación entre la satisfacción global y la lealtad se hace patente en este estudio en el ámbito del turismo rural.

Por lo que respecta a las implicaciones prácticas de estos resultados, puede afirmarse que en lo referente a la satisfacción con los atributos del destino los gestores de destinos de turismo rural han de tener presente una fuerte orientación al mercado, para ofrecer a los clientes unos servicios que conformen una experiencia satisfactoria dando respuesta a las necesidades y motivaciones manifestadas por los clientes. Si bien la satisfacción con los atributos del destino se centra en la orientación al cliente, la satisfacción con las relaciones con los proveedores de servicios turísticos se centraría en una fuerte orientación a la relación por parte de los empresarios de turismo rural. Éstos deberían preocuparse por incorporar una fuerte orientación a la relación en sus actividades, promoviendo aspectos como el trato especial a clientes habituales. Según Yen *et al.* (2009), el trato preferencial, las comunicaciones personalizadas, el fomento de las habilidades de comunicación interpersonal y premiar a los clientes por un comportamiento relacional pueden incrementar la posibilidad de que los visitantes consigan una evaluación positiva del proveedor de servicios turísticos. Por lo que respecta a la satisfacción con las relaciones con los residentes, ésta se revela como un factor importante y valorado por los turistas rurales, de modo que los gestores han de involucrar a los residentes en los programas de desarrollo turístico. Contar con la colaboración de los residentes es fundamental para el éxito de los destinos, puesto que forman parte del propio producto turístico.

Por tanto, los programas de desarrollo turístico en el ámbito del turismo rural, su planificación y elaboración de productos han de contar no sólo con un ente que coordine las acciones a nivel de destino y estrategias de marketing, sino que involucre la preocupación por mantener la autenticidad del entorno y atributos físicos propios del medio rural, a los empresarios y a los residentes, conformado así una unión de esfuerzos que deberían desembocar en una alta satisfacción global para el turista rural en estos destinos, con las repercusiones que ello tiene en la lealtad y en el comportamiento de revisita y recomendación. Según Eusébio y Vieira (2013), la satisfacción y la lealtad son vitales para mantener la ventaja competitiva del destino, lo que redundará en estabilidad económica y empleo para la comunidad local.

Aunque se ha querido hacer un estudio centrado únicamente en la relación entre satisfacción y lealtad en el turismo rural, las limitaciones más importantes de este trabajo podrían proceder del hecho de no haber tenido en cuenta otras variables de interés y que se estiman como relevantes en el ámbito del turismo rural como las emociones (eg. Petrick, 2004; Yüksel y Yüksel, 2007; Rodríguez del Bosque y San Martín, 2008), la autenticidad (eg. Kolar y Žabkar, 2010; Ramkissoon y Uysal, 2011; Zhou *et al.*, 2013), la familiaridad (eg. Mechinda *et al.*, 2009), la búsqueda de la novedad (eg. Jang y Feng, 2007; Bigné *et al.*, 2009; Assaker *et al.*, 2011) o la autenticidad (Ramkissoon y Uysal, 2011; Cho, 2012; Kolar y Žabkar, 2010; Zhou *et al.*, 2013). En definitiva se trata de seguir profundizando en el conocimiento de los factores que generan satisfacción y lealtad hacia los destinos de turismo rural, por las importantes repercusiones socioeconómicas que el turismo genera en estas áreas.

*Universidad de Huelva*

## ABSTRACT

*This paper proposes a model of the formation of tourism product and service online purchase intention based on the antecedents of perceived privacy and security from the model proposed by Ray et al. (2011), extended to third-party assurance seals and related constructs. A total of 451 individuals participated in an experiment in which they were instructed to visit tourism product and service websites for shopping and compare them. The results indicate that perceived trust depends on perceived information quality and perceived security. The main predictors of consumers' perceived privacy and security are, respectively: Internet privacy concern, and vendor reputation.*

## Keywords:

E-commerce; trust; assurance, concerns privacy; security; online purchase intention

## 1. Introduction

The number of Internet users has experienced a substantial increase but many users do not make purchases online because they are reluctant to provide personal information and/or transactional information for electronic payment online because they do not trust e-commerce (Kim, Ferrin, and Rao, 2008a; Kim et al., 2011). A study of e-commerce showed that more than 87% of users were concerned about security and privacy protection in online shopping (Ray, Ow, and Kim, 2011). In addition, the lack of perceived privacy and security protection is a major reason why many consumers choose not to shop online; therefore, trust plays a relevant role in online transactions (Kim et al., 2011; Wu and Chang, 2006). Trust has been proved in the tourism context to be one of the most relevant variables that makes e-business successful in the accommodation industry, specifically hotels and resorts (Fam, Foscht, and Collins, 2004) and the air travel industry, namely low-cost carriers (LCCs) (Escobar-Rodríguez and Carvajal-Trujillo, 2014; Kim et al., 2009, 2011). In this study, we analyze the antecedents of perceived security and privacy, extending the model proposed by Ray et al. (2011) by adding a new factor, consumers' perception of third-party assurance seals, and two constructs related to it, the disposition to third-party certification and the understanding of third-party seals. In addition, we examine the influence of trust on perceived value and the influence of these two factors on purchase intention (Kim, Xu, and Gupta, 2012). We extend the antecedents of perceived privacy and security by including, according to signaling theory, third-party assurance seals and two personal predispositions related to them, the disposition to third-party certification and the understanding of third-party seals. We have extended the model, including third-party assurance seals and the related constructs, because there are very few studies examining the role of third-party mechanisms in helping to increase trust in e-commerce, unlike third-party certification mechanisms as they exist in offline settings (Özpolat et al., 2013). Among the few studies addressing that issue, Lee and Cranage (2011) concluded that the use of privacy seals, such as TRUSTe, increases reliability in privacy protection and information disclosure.. Although some studies have examined consumers' perceived value and purchase intentions (Llach et al., 2013) and trust and purchase intentions (Kim et al., 2011), no one has examined the effect of perceived trust on perceived value in the field of e-commerce and tourism. Furthermore, research regarding online consumers' perceived trust in tourism products and services (Kim et al., 2011) has been very scarce. With this in mind, this study aims 1) to examine the influence of perceived trust and perceived value on the intention to use e-commerce websites in shopping for tourism products and services; 2) to assess the effect of the factors information quality, perceived security, and perceived privacy on consumer trust in the website; and 3) to analyze the influence of privacy and security signals and personal predispositions of consumers on the perceived privacy and perceived security.

## 2. Review of the related literature and theoretical background

### 2.1. *Perceived trust, perceived privacy, perceived security, information quality, and their relationships*

Trust in websites plays an important role in e-commerce because consumers are unlikely to shop online if they do not trust the online seller website on which they are shopping (Gefen, 2002; Jarvenpaa et al., 1999; Kim et al., 2008a, 2011). Hence, it is relevant for online sellers to establish trusted transaction processes so that consumers place trust in them and consequently form an online purchase intention (Grabosky, 2001). In the field of e-commerce, Pavlou (2003) defined trust as the belief that renders consumers vulnerable to the good faith of online sellers after learning of their characteristics (Liao et al., 2006). Kim et al. (2008a) defined information quality as the consumers' general perception of how complete and accurate the information on the website is, concerning both the services offered and the procedure for carrying out the online purchase transaction. Perceived security can be defined as the perception by consumers that the online seller has included the antecedents of security, such as verification, authentication, encryption, protection, and non-repudiation (Kim et al., 2008a). Perceived privacy protection can be conceptualized as the probability that the online seller will assure that the confidential information on the consumer acquired during the online transaction is protected against

unauthorized disclosure or use (Kim et al., 2008a). Based on the previous evidence, we formulate the following hypotheses:

H01. The consumers' perception of the quality of website information has a positive effect on trust.

H02. The consumers' perception of website security protection has a positive effect on trust.

H03. The consumers' perception of website protection of privacy has a positive influence on trust.

## ***2.2. Antecedents of perceived privacy and perceived security***

Although Ray et al. (2011) examined the factors influencing perceived privacy and perceived security, these factors have not been analyzed in the field of tourism. We decided to explore the antecedents of perceived privacy and perceived security because of their great influence on trust in the online seller website (Kim et al., 2009). Accordingly, we extend the model proposed by Ray et al. (2011) by incorporating third-party assurance seals and a couple of related constructs. Ray et al. (2011) differentiated antecedents of privacy and security in response to the five sources that confer trust: 1) consumers' personality; 2) knowledge based on consumers' prior experiences; 3) institutional assurances from the online seller; 4) calculative assurances from the online seller; and 5) cognitive assurances from third parties (Gefen et al., 2003; Kim and Benbasat, 2003). These five sources are grouped into two broad components: first, the consumers' individual predispositions regarding privacy and security signals; and second, privacy and security signals according to signaling theory (Figure 1; Table 1).

The first component, consumers' personal predispositions, refers to the factors that might predispose users to perceive privacy and security measures on the website of the online seller. Within the first component, we added to the two variables considered by Ray et al. (2011), Internet privacy and security concerns and familiarity with the website, two others, disposition to third-party certification and understanding of third-party assurance seals. The factors Internet privacy concerns and disposition to third-party certification represent consumers' personality-based trust sources because they refer to consumers' predisposition to trust others and believe in their good intentions (Gefen et al., 2003; Ray et al., 2011). On the other hand, familiarity with the website and understanding of third-party assurance seals are consumers' knowledge-based trust sources (Table 1), the former because consumers' familiarity with the seller website reduces uncertainty (Gefen et al., 2003; Kim et al., 2008a) and the latter because consumers' understanding of seals displayed on the seller's website increases their trust. Internet privacy concerns refer to the propensity to be generally concerned about threats to personal information submitted over the Internet (Dinev and Hart, 2006; Malhotra et al., 2004; Ray et al., 2011; Sheehan and Hoy, 2000; Smith et al., 1996). Familiarity with the website includes the predisposition of consumers to trust online sellers based on their prior knowledge of them (Ray et al., 2011).

The second component proposed by Ray et al. (2011), security/privacy signals, is based on signaling theory. Within this component, they include the factors used by online sellers to increase trust by providing institutional, calculative, and cognitive assurances (Gefen et al., 2003; Ray et al., 2011) (Table 1). These signals cannot directly influence the perceptions of consumers because the quality of security and privacy is difficult for consumers to appreciate (Ray et al., 2011). Ray et al. (2011) included three signals from online sellers that could affect perceived privacy and security: privacy and security policies, perceived website investment, and the reputation of the online seller. In our model, we add a fourth signal, third-party assurance seals. Privacy and security policies are statements provided by online sellers that supply argumentation and claim that privacy and security are assured (Kim and Bembasat, 2003; Lowry et al., 2011; Ray et al., 2011). Schlosser et al. (2006) refer to the website investment made by the online seller in terms of the effort, time, and money spent on developing the website. This investment signals the importance of security and privacy protection for the online seller because the physical appearance of products has always been a signal of quality (Dawar and Parker, 1994; Ray et al., 2011). Privacy and security policies as website investments are

first-hand quality information sources about the online seller website, provided directly by the online seller (Özpolat et al., 2013). Regarding the reputation of the online seller, Ray et al. (2011) considered that second-party information on sellers is a signal of quality, indicating privacy and security protection to consumers (Duncan and Moriarty, 1998; Gefen et al., 2003). The reputation of the online seller provides quality information on the online seller’s website based on the experience of previous shoppers, that is, a second-party information source (Özpolat et al., 2013).

In accordance with the constructs and relationships of the model proposed by Ray et al. (2011), as well as the previous evidence, we suggest the following hypotheses regarding consumers’ perceived privacy and security:

H04: The Internet privacy concern negatively influences the consumers’ perception of website security protection.

H05: The Internet privacy concern negatively influences the consumers’ perception of website privacy protection.

H06: Familiarity with the online seller’s website positively influences the consumers’ perception of website security protection.

H07: Familiarity with the online seller’s website positively influences the consumers’ perception of website privacy protection.

H08: Privacy and security policies positively influence the consumers’ perception of website security protection.

H09: Privacy and security policies positively influence the consumers’ perception of website privacy protection.

H10: Perceived website investments positively influence the consumers’ perception of website security protection.

H11: Perceived website investments positively influence the consumers’ perception of website privacy protection.

H12: The online seller’s reputation positively influences the consumers’ perception of website security protection.

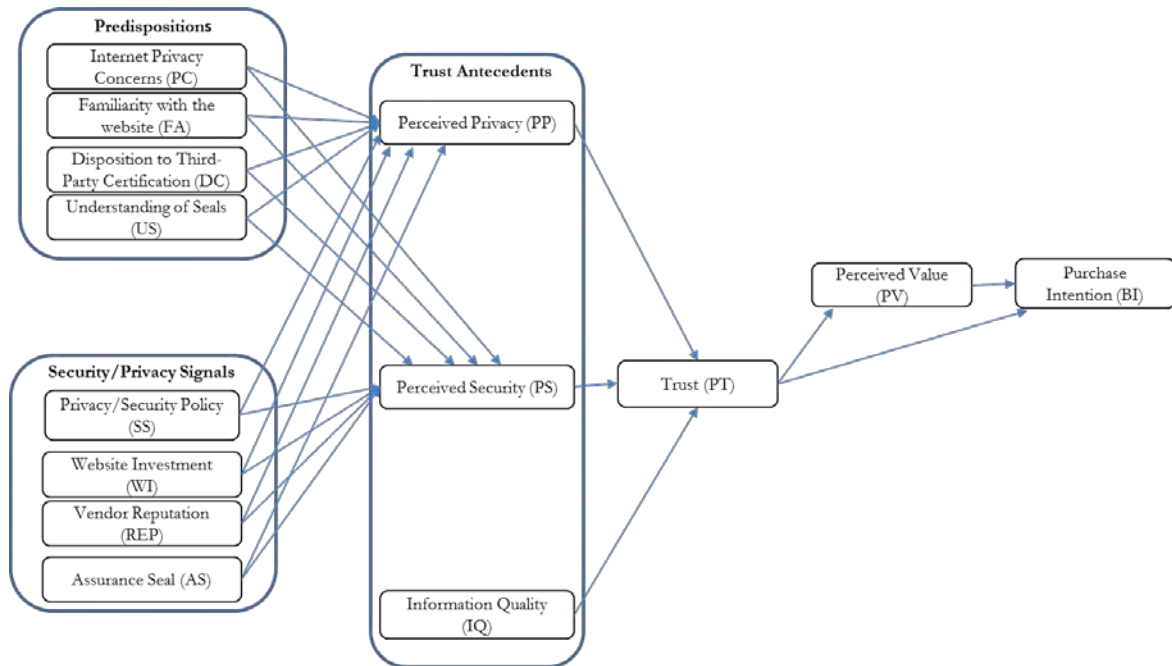

H13: The online seller’s reputation positively influences the consumers’ perception of website privacy protection.

FIGURE 1  
**Proposed model**

### 2.2.1. Third-party assurance seals

Third-party assurance seals (e.g., TRUSTe, VeriSign, BBBOnline) provide assurance to consumers that a website follows operating practices, the payments are secure, and/or the privacy policy indicates what it can and cannot do with personal data collected online (Kim et al., 2004, 2008a; Shapiro, 1987). The companies that provide assurance seals examine the website's security, privacy, and service quality and if it meets a number of quality standards it is allowed to display the assurance seal (Özpolat et al., 2013). Third-party seals are sources of trust based on institutional assurances (McKnight and Chervany, 2001) (Table 1) and they might increase consumers' perceived security and privacy (Jiang et al., 2008; Kimery and McCord, 2002).

A number of studies have analyzed the influence of third-party assurance seals on trust but there is a lack of consensus (Özpolat et al., 2013). If consumers perceive that the online seller provides security and privacy protection in online transactions by means of signals such as third-party assurance seals, their perceived uncertainty and online shopping risk should tend to be reduced (Kim and Benbasat, 2003; Wu et al., 2010). In fact, seals should contribute to increasing consumers' privacy protection (Hoffman et al., 1999) and/or security protection (Udo, 2001). Thus, if third-party assurance seals are cues for security and privacy protection on the website of online sellers, it can be hypothesized that displaying assurance seals will positively influence consumers' perception of website privacy and security protection. Thus, this study suggests the following research hypotheses:

H14: The presence of a third-party assurance seal positively influences the consumers' perception of website privacy protection.

H15: The presence of a third-party assurance seal positively influences the consumers' perception of website security protection.

### 2.2.2. Disposition toward third-party certificates

With this construct, we refer to the disposition to trust third-party certification, such as seals. The influence of the disposition to trust on trust has been studied in the literature in general (Kim et al., 2008a; Kimery and McCord, 2002; Mayer et al., 1995; Wu et al., 2010). Jiang et al. (2008) proposed the influence of the disposition to trust third-party certification on the perception of third-party certification identifying logos and the influence of this factor on online seller trust. The disposition to trust third-party certification is defined as the tendency to depend on third parties for trustworthy information during online transactions (Jiang et al., 2008). In

this study, it is hypothesized that security and privacy protection will be related to the disposition to third-party certification in tourism e-commerce products, as follows:

H16: Consumers' disposition to third-party certification positively affects their perception of website security protection.

H17: Consumers' disposition to third-party certification positively affects their perception of website privacy protection.

### ***2.2.3. Understanding of third-party assurance seals***

The understanding of third-party assurance seals indicates that the consumer knows that his/her data are protected (Lowry et al., 2011). Online sellers display third-party assurance seals on their websites to increase consumers' perception of website security and privacy protection; however, if the consumers do not understand them, they are useless. This factor was analyzed by Lowry et al. (2011), who also considered that the use of a third-party privacy assurance seal will not be effective if the consumers do not understand them. In accordance with that, we propose the following research hypotheses:

H18: Consumers' understanding of third-party assurance seals positively influences their perception of website security protection.

H19: Consumers' understanding of third-party assurance seals positively influences their perception of website privacy protection.

### ***2.3. Perceived value, perceived trust, purchase intention, and their relationships***

Based on prospect theory (Kahneman and Tversky, 1979; Wang and Wang, 2010), in this research, we assume that an overall judgment of value influences the online purchase intention. In the e-commerce context, perceived value can be defined as the consumer's assessment of benefits against costs when shopping with an online seller (Zeithaml, 1988). Consequently, the perceived value from a transaction with an online seller is a net benefit (Kim et al., 2012; Seddon, 1997). Obviously, consumers wish to shop for products with the vendors that offer maximal value (Kim et al., 2012; Wang and Wang, 2010; Zeithaml, 1988). In the e-commerce context, studies have confirmed the relationship between perceived value and purchase intention (Chang and Wang, 2011; Fuentes-Blasco et al., 2010; Kim et al., 2012; Wu et al., 2014). Thus, this study proposes the following hypothesis regarding tourism product and service shopping online:

H20: Perceived value on a website positively influences the online purchase intention.

According to Kim et al. (2012), if consumers perceive trust in an online seller, they expend less effort on searching for information about the online seller and on executing the online transaction. Then, perceived trust can decrease the transaction's non-monetary cost, which incorporates variables such as the time and effort required to choose an online seller (Chiles and McMackin, 1996) and the perceived risk of online shopping (Jarvenpaa et al., 2000; Kim et al., 2012). As perceived trust reduces the non-monetary cost, it raises the perceived value when shopping online on a seller website (Kim et al., 2012). Only Kim et al. (2012), in the e-commerce context, have examined the influence of perceived trust on perceived value and they confirmed this influence. In our research, we hypothesize the influence of perceived trust on perceived value as follows:

H21: Trust in an online seller positively affects the perceived value for customers.

In previous studies, the influence of trust on the intention to purchase online has been confirmed (Kim et al., 2008a, 2012; Wen, 2009). It has also been analyzed in the field of tourism and e-commerce (Kim et al., 2009, 2011). Thus, we hypothesize:

H22: Trust positively affects the online purchase intention.

## **3. Methodology**

### ***3.1. Measurements***

A set of measurement items was adapted to the specific context of this research and a total of 55 items was obtained. In Table 3, we present the complete list of items that were measured by means of multi-item scales ranging from 1 (“strongly disagree”) to 7 (“strongly agree”) for the constructs taken into account in this research. It can be seen that the third-party assurance seal construct is composed of four items (Cyr, 2013; Kim et al., 2008a). The purchase intention and perceived value constructs are measured by four items each (Kim et al., 2012). The disposition to third-party certification construct comprises three items (Jiang et al., 2008), and the familiarity with the website construct (Chiu et al., 2012) also comprises three items. The Internet privacy concerns, privacy and security policy, website investment, and vendor reputation constructs are composed of three items each (Ray et al., 2011). The information quality construct consists of six items (Kuan et al., 2008). The perceived security and perceived privacy constructs are composed of five and six items, respectively (Kim et al., 2008a) and the consumer trust construct is measured by three items (Kim et al., 2011). The understanding of seals construct is measured by five items (Lowry et al., 2011).

The items in the questionnaire were validated based on the opinions of a focus group of e-commerce and e-tourism academics and professionals, who were asked whether the items were appropriate for the purpose of evaluating e-commerce and trust. Some modifications were made to the items to make the meanings clearer, based on the focus group’s opinions. A pre-test was carried out on 40 individuals of different ages and genders selected by quota and convenience sampling, who had purchased tourism products and services on a website in the last year. This ensured that those individuals who had not previously purchased tourism products and services in the last year were dropped from the pre-test. Based on the feedback of this pre-test, only minor modifications were made to the wording of some items to increase the clarity further. A final questionnaire was realized and administered to 30 individuals of different genders and ages selected by quota and convenience sampling, who had purchased tourism products and services on a website in the last year. Thus, the clarity of the questionnaire was confirmed, and no changes were made to the questionnaire.

The questionnaire was originally drafted in English, but it was intended for use in Spanish for consumers from Spain who had experience of purchasing tourism products on websites. Therefore, the English questionnaire was translated into Spanish by a professional native English translator and researchers, who independently translated the English questionnaire into Spanish. After a careful analysis of the differences between these independently translated questionnaires in Spanish, a definitive version of the Spanish questionnaire was agreed. This final version was then translated back into English by another native English professional translator to ensure consistency between the English and the Spanish version of the questionnaire (Brislin, 1970).

### ***3.2. Sample and data collection***

This study used quota and convenience sampling. The convenience sampling method was utilized because the population size is unknown for this study (San Martín and Herrero, 2012). The quota sampling method was employed to match the target population structure in both age and gender (Kim et al., 2009, 2011; San Martín and Herrero, 2012). To calculate the number of participants that would be sufficient in each age and gender category, population data were obtained from the “15th Internet users survey” (AIMC, 2013), a study carried out by the “Asociación para la Investigación de Medios de Comunicación” (Table 2). Afterwards, to combine the diverse quotas, convenience sampling was carried out (San Martín and Herrero, 2012).

The participants were recruited by email among the community of our university. We e-mailed an invitation to participate in our research to current students, alumni, faculty, and staff and they were also asked to forward the invitation to their friends and colleagues. An appointment for the computer lab was given to the participants who answered our email. Additionally, we invited people randomly selected outside the university to participate. Those who agreed to participate were given a pen drive with the university seal. In the computer room, the participants were

instructed to visit at least two or three tourism product and service websites for shopping and compare them with a tourism product and service of their choice. We gave them this instruction because, according to Ahuja et al. (2003) and Kim et al. (2008a), individuals visit one to three websites prior to their online purchase. The tourism products and services included hotel bookings, airlines tickets, and transportation reservations. Cruise purchases were excluded (Kim et al., 2011). The participants were instructed to go through the online purchasing process up to the clicking of the purchase button (this step was excluded) (Kim et al., 2008a). After surfing the websites, they were randomly assigned to one of two questionnaires: one questionnaire asked items about the website from which the participant was less inclined to make a purchase; the other questionnaire asked the same items but about the website from which the user was more inclined to make a purchase (Kim et al., 2008a). Accordingly, we could ensure that the purchase intention construct had adequate variance, because we had data to predict both purchases and non-purchases (Kim et al., 2008a). We checked that all the participants followed the instructions given in the computer room with respect to viewing the websites and clicking each button up to the purchase button (Hu et al., 2010). We excluded questionnaires filled out in less than eight minutes because we felt it was not possible considering the length of the questionnaire (Ray et al., 2011).

The data collection was conducted from November 2013 to January 2014 within a computer room under the supervision of two members of the research team and one graduate student. A total of 451 usable questionnaires were obtained. The characteristics of the participants are very similar to those of the population (Table 2).

TABLE 2  
Quota sampling method in terms of gender and age

		Sampling (n= 451)	
		Population <sup>a</sup> (%)	Sample (%)
<b>Gender</b>	Male	74.1	67.8

	≥65	2	0.44
	Total	451	100

#### 4. Data analysis and results

A regression analysis of latent variables is used in this study, based on the partial least squares (PLS) optimization technique, to elaborate a model that represents the relationships between the

fourteen proposed constructs measured by many items. The PLS is a multivariate technique to test structural models (Wold, 1985), which estimates the model parameters that minimize the residual variance of the whole model's dependent variables (Hsu et al., 2006), does not require any parametric conditions (Chin, 1998), and is recommended for small samples (Hulland, 1999).

The data analysis took place through a two-stage methodology, in which the first stage was to develop and evaluate the measurement model and the stage second was to develop the full structural equation model (Gerbing and Anderson, 1988).

#### 4.1. Measurement model evaluation

The first step involved establishing the convergent and discriminate validity of the constructs and the individual reliability for each item.

The convergent validity of each construct is acceptable for a loading higher than 0.505 (Falk and Miller, 1992). The individual reliability for each item is given by loadings or correlations between the item and the construct. Table 4 indicates the loadings for each item and the t-values that are significant. They all comply with the established conditions.

To measure the internal coherence of all the indicators in relation to the constructs, the reliability was calculated, and to verify the reliability of the indicators, Dillon–Goldstein's rho, also referred to as the composite reliability coefficient (Werts et al., 1974), and the Cronbach coefficient alpha (Cronbach, 1970) were utilized, which range from 0 (no similarities) to 1 (maximum similarities). Both parameters are taken into account, as the first concerns the respective indicators while the second considers the contribution made by each indicator to be similar. Table 5 represents the values of each coefficient. The composite reliabilities are over the minimum acceptable limit of 0.70 (Gefen et al., 2000; Nunnally, 1978). The Cronbach coefficient alpha levels are also shown in Table 5. They are all above 0.70, which is recommended for confirmatory research (Churchill, 1979).

TABLE 4  
Items loading

Scale items	Loadings	t-values <sup>a</sup>
AS1. The third-party assurance seals on this website make me feel more comfortable.	0.892	124.72
AS2. The third-party assurance seals on this website make me feel more secure in terms of privacy.	0.928	146.47
AS3. Third-party assurance seals on this website make me feel safer in terms of the transaction.	0.934	175.74
AS4. The third party assurance seals on this website make me feel this website is secure.	0.931	200.02
BI1. The probability that I would consider to purchase a tourism product from this website is high.	0.904	122.57
BI2. If I were to purchase a tourism product, I would consider purchasing it from this website.	0.929	164.66
BI3. The likelihood of my purchasing a tourism product from this website is high.	0.944	233.45
BI4. My willingness to purchase a tourism product from this website is high.	0.941	240.89
DC1. I specifically look for third-party certification symbols.	0.627	9.19
DC2. I generally have faith in third-party certification.	0.944	135.21
DC3. I generally trust third parties.	0.944	46.49
FA1. I am familiar with this tourism product shopping website.	0.953	239.80
FA2. I am familiar with the processes of purchasing products from this tourism product shopping website.	0.959	266.69
FA3. I am familiar with searching for products at this tourism product shopping website.	0.952	261.99
IQ1. The tourism product website provides accurate information about the tourism product that I want to purchase.	0.848	81.94
IQ2. The tourism product website provides sufficient information when I try to make a transaction.	0.867	87.98
IQ3. The tourism product website provides enough depth of information about its products.	0.878	104.96
IQ4. The information provided by tourism product website is helpful to me in	0.868	106.68

purchasing tourism products.		
IQ5. The information in the tourism product website is clear for me to make a purchase.	0.876	122.30
IQ6. The tourism product website provides up-to-date information.	0.834	78.11
PC1. Compared with other subjects on my mind, online privacy/security is very important.	0.862	23.71
PC2. I am concerned about threats to online privacy/security today.	0.861	51.68
PC3. The greater my interest to obtain a certain service or product from the Internet, the more I tend to suppress my privacy/security concerns.	0.575	9.60
PP1. I am concerned that tourism product website collects too much personal information from me.	0.819	60.62
PP2. I am concerned that the tourism product website will use my personal information for other purposes without my authorization.	0.921	198.85
PP3. I am concerned the tourism product website will share my personal information with other entities without my authorization.	0.912	167.73
PP4. I am concerned that unauthorized persons (i.e. hackers) have access to my personal information.	0.820	54.00
PP5. I am concerned about the privacy of my personal information during a transaction.	0.815	47.39
PP6. I am concerned that the tourism product website will sell my personal information to others without my permission.	0.848	60.08
PS1. The tourism product website implements security measures to protect users.	0.813	82.23
PS2. The tourism product website usually ensures that transactional information is protected from accidentally being altered or destroyed during a transmission on the Internet.	0.787	59.16
PS3. I feel secure about the electronic payment system of the tourism product website.	0.883	129.22
PS4. I am willing to use my credit card on this website to make a purchase.	0.873	113.34
PS5. I feel safe in making transactions on this website.	0.880	114.31
PT1. This tourism product website has integrity.	0.914	154.70
PT2. This tourism product website is reliable.	0.958	330.96
PT3. This tourism product website is trustworthy.	0.937	170.82
PV1. Considering the money I pay to purchase tourism products on this website, online shopping here is a good deal.	0.859	96.99
PV2. Considering the effort I make in shopping on this website, online shopping here is worthwhile.	0.925	173.05
PV3. Considering the risk involved in shopping on this website, online shopping here is of value.	0.898	140.36
PV4. Overall, online shopping on this website delivers me good value.	0.920	209.63
REP1. This company is well known.	0.827	59.92
REP2. This company has a good reputation.	0.939	239.25
REP3. This company has a good reputation in its market.	0.921	142.04
SS1. The availability of a privacy or a security statement was easily seen on the tourism product website.	0.843	77.52
SS2. This tourism product website has a policy on privacy or security.	0.877	122.48
SS3. I am aware of the details of this tourism product website's privacy or security policy.	0.781	47.780
US1. Website assurance seals are designed to increase the privacy/security a customer has for a website.	0.717	31.15
US2. Websites must state how they collect and share data in order to be awarded a website assurance seal.	0.737	27.05
US3. Third-party organizations assess the business practices of a website before awarding a seal.	0.784	49.24
US4. You can click on the seal to verify that the website is entitled to display the seal.	0.740	27.84
US5. A website must display a data privacy and security statement in order to get a seal	0.701	29.08
WI1. A lot of time seems to have been invested in developing this website.	0.907	119.82
WI2. A lot of effort seems to have been invested in developing this website.	0.936	182.14
WI3. A lot of money seems to have been invested in developing this website.	0.898	126.55

<sup>a</sup>All tests were significant at p-value <0.001

Convergent validity indicates the common variance between the indicators and their construct. This validity is measured by the average variance extracted (AVE), and the acceptable threshold should be higher than 0.50 (Fornell and Larcker, 1981). Table 5 represents the AVE scores

achieved for each of the fourteen constructs employed, which in all cases surpasses the minimum desirable value.

TABLE 5.  
Composite reliability, AVE and Cronbach alpha coefficient

Construct	Composite reliability	AVE	Cronbach alpha
Assurance seal (AS)	0.957	0.849	0.941
Purchase intention (BI)	0.9621	0.864	0.947
Disposition to third-party certification (DC)	0.885	0.726	0.824
Familiarity with website (FA)	0.969	0.911	0.951
Information quality (IQ)	0.945	0.743	0.931
Internet privacy concerns (PC)	0.834	0.605	0.729
Perceived privacy (PP)	0.943	0.734	0.927
Perceived security (PS)	0.927	0.719	0.902
Trust (PT)	0.955	0.877	0.930
Perceived value (PV)	0.945	0.812	0.922
Vendor reputation (REP)	0.925	0.804	0.877
Privacy/security statement (SS)	0.873	0.697	0.784
Understanding of privacy seals (US)	0.855	0.542	0.796
Web site investment (WI)	0.938	0.835	0.901

In order to confirm the discriminant validity among the constructs, the AVE square root was superior to the correlation between the constructs (Fornell and Larcker, 1981).

Following the establishment of the individual reliability for each item and the convergent and discriminant validity of the constructs, the structural model was examined.

#### 4.2. Structural model

A PLS analysis was performed to test H1 through H22. The regression parameters are based on bootstrapping of 100 samples and not on a sample estimator. This facilitates the computation of the t-student test for each hypothesis and the generalization of the results (Lévy et al., 2009). The results represented in Table 6 indicate the relationship between the different constructs. All the r-squares are higher than 0.10, which indicates that the predictive capability of the model is satisfactory (Falk and Miller, 1992).

TABLE 6  
Summary of test results for the structural model

Hypothesis	Path	Standardized path coefficient	t-values	Supported?	Construct	R-squared
H14	AS→PP	0.028	0.736	No	Perceived privacy	0.139
H17	DC→PP	0.067	2.006	Yes (p<0.05)		
H07	FA→PP	-0.014	0.420	No		
H05	PC→PP	0.245	6.330	Yes (p<0.001)		
H13	REP→PP	-0.191	3.830	Yes (p<0.001)		
H19	US→PP	-0.064	1.696	No		
H11	WI→PP	-0.140	3.156	Yes (p<0.01)		
H09	SS→PP	-0.064	1.475	No		
H15	AS→PS	0.213	7.162	Yes (p<0.001)		
H16	DC→PS	-0.055	2.384	Yes (p<0.05%)		
H06	FA→PS	0.089	3.691	Yes (p<0.001)		
H04	PC→PS	-0.075	3.095	Yes (p<0.01)		
H12	REP→PS	0.325	10.120	Yes (p<0.001)		
H08	SS→PS	0.089	3.090	Yes (p<0.01)		
H18	US→PS	0.096	4.316	Yes (p<0.001)		
H10	WI→PS	0.303	8.696	Yes (p <0.001)		
H01	IQ→PT	0.598	23.305	Yes (p<0.001)	Trust	0.729
H03	PP→PT	0.012	0.800	No		
H02	PS→PT	0.319	12.087	Yes (p<0.001)		
H21	PT→PV	0.810	65.977	Yes (p<0.001)	Perceived value	0.656

H22	PT→BI	0.299	8.918	Yes (p<0.001)	Purchase intention	0.677
H20	PV→BI	0.561	17.847	Yes (p<0.001)		

## 5. Conclusions and implications for future research

Online transactions represent a new stage for the tourism industry, which is working to develop better commercial practices (Kim et al., 2011). Few studies have analyzed trust in online shopping (Kim et al., 2011) and its antecedents, and no study has analyzed the antecedents of perceived privacy and/or perceived security or the effect of perceived trust on perceived value. To fill this gap, we propose a model of the formation of online purchase intention based on the antecedents of perceived privacy and security from Ray et al. (2011) and extended to third-party assurance seals and related constructs, such as the disposition to third-party certification and the understanding of seals.

Our findings indicate that the main predictors of consumers' perceived privacy, in order of relevance, are: Internet privacy concern; vendor reputation; website investment; and disposition to third-party certification. The consumers' perceived privacy depends on the levels of general concerns about Internet privacy; the provider's reputation; the consumers' perceived shopping investment in the tourism product and service website; and the general disposition to trust the perception of third-party certification. On the other hand, there is no significant influence of third-party assurance seals, familiarity with the website, understanding of third-party seals, and privacy and security policies on the consumers' perceived privacy. Secondly, the empirical evidence of this study suggests that the main predictors of consumers' perceived security, in order of impact, are: vendor reputation; website investment; third-party assurance seals; understanding of third-party seals; privacy and security policy and familiarity with the website; Internet privacy concerns; and disposition to third-party certification. Thus, based on these findings, consumers' perceived security of websites for shopping for tourism products and services depends on eight variables: providers' reputation, consumers' perceived investment in the online shopping website, the display of third-party assurance seals on those websites, the understanding of the seals, the privacy and security policies available, consumers' familiarity with the providers or prior knowledge of these providers, the levels of general concerns about Internet privacy, and the general disposition to trust the perception of third-party certification. Thirdly, the findings indicate that the antecedents of consumers' perceived trust, in order of impact, are information quality and perceived security. Thus, consumers' perceived trust depends on the perception of the quality of the information on the website and the security measures that consumers perceive on the websites of tourism products and services. In contrast, the hypothesis of the influence of consumers' perceived privacy on consumers' perceived trust was not significant. Fourth, the empirical evidence of this research suggests that the main drivers of the online purchase intention of tourism products and services are, in order of relevance, perceived value and trust. Lastly, consumers' perceived trust influences the perceived value of online shopping.

The contribution of this study to the literature is the new knowledge about the factors that influence consumers' perceived security and privacy regarding tourism product and service websites. Additionally, this is one of the first studies to analyze, in the context of e-commerce and tourism, the influence of third-party assurance seals and two related constructs, the disposition to third-party certification and the understanding of privacy seals. Furthermore, this paper analyzes the factors that influence consumers' perceived trust in these websites once the perceived security and privacy are known. Finally, this is one of the first studies to analyze the effect of consumers' perceived trust on the perceived value of websites for online purchasing of tourism products and services.

Finally, we propose some ideas for future work in relation to the formation of perceived security and privacy, trust, perceived value, and online purchase intention. It would be interesting to replicate this research for different specific tourism products and services to reach more insightful conclusions. This study is cross-sectional, that is, it measures the variables at a single point in time; therefore, future studies should examine the validity of the proposed model by a longitudinal analysis. It would also be of interest to replicate this research in different countries and examine the possible cross-cultural differences. Another future research line is to include

other variables, such as user experience with the Internet, user experience of purchasing tourism products, consumer personality traits, the influence of price in the perceived value, and socio-demographic characteristics.

## RESUMEN

*El astroturismo es un recurso cada vez más explotado por los destinos turísticos, especialmente en entornos rurales y con escasa población ya que, la baja contaminación lumínica de dichos lugares, hace que la calidad del cielo sea mayor. No obstante, resulta difícil determinar si el éxito de este reclamo es un atractivo primario por sí mismo o puede ser secundario. Asimismo el astroturismo puede estar unido a una gran cantidad de aspectos diferentes como tradiciones de antiguas poblaciones (íberos, etc), astrología, astronomía y conocimiento del universo, naturaleza, entre otros. Así, el objetivo del presente trabajo en curso sería abordar este fenómeno estudiando cuáles podrían ser los principales factores que podrían determinar el diseño de un producto turístico basado en el astroturismo, de forma que pudiera convertirse en un atractivo primario con entidad propia. Así, este trabajo pretende contribuir a una corriente de investigación embrionaria basada en el interés que la astronomía despierta entre la población, de forma que pueda convertirse en una realidad para la potenciación de determinados destinos rurales*

### **Palabras clave:**

Astroturismo, destinos rurales, producto turístico

## 1. Introducción

Los turistas son cada vez más selectivos y en sus viajes no sólo quieren conocer nuevos destinos sino también vivir experiencias diferentes. El entorno rural permite ofrecer productos turísticos que compiten con el turismo más convencional. En los últimos años surgen diversos tipos de turismo como el turismo de niños o turismo de interés especial que surge como consecuencia lógica de la evolución de la sociedad en contrapunto al antiguo turismo de masas, Robinson y Novelli (2005).

No obstante, la oferta de la mayoría de estos destinos es muy similar y poco diferenciada entre sí. Con el objetivo de buscar nuevos atractivos, algunas zonas de la geografía han buscado en el cielo un recurso natural a explotar y son muchos los que han apostado por el astroturismo. Destaca como principal motor del astroturismo la Fundación Starlight, una entidad creada para la defensa del cielo como patrimonio de la humanidad. Avalada por la UNESCO, la Organización Mundial del Turismo (OMT), la Unión Astronómica Internacional (AUI) y diversas convenciones internacionales, la fundación trabaja para unificar naturaleza, ciencia, cultura, educación y turismo.

En la actualidad no hay literatura acerca del turismo astronómico pero empieza a surgir un gran interés por este fenómeno al que quieren sumarse distintos territorios para hacer del cielo uno de sus principales atractivos. Existen distintos artículos de opinión que por no estar sustentados en métodos de investigación sistemáticos pueden ser poco precisos.

La Comarca de Gúdar Javalambre, en Teruel, cuenta con una excelente calidad del cielo sin apenas contaminación lumínica, prueba de ello es la reciente instalación de un observatorio que, entre sus telescopios contará con uno pionero de nueva generación con un campo de visión de 3 grados, lo que lo convierte en único en el mundo. Gracias a su cámara panorámica podrá cubrir un área del espacio nunca antes conseguida por un equipo de observación astronómica.

Este observatorio está gestionado por la fundación CEFCA, Centro de Estudios de Física del Cosmos de Aragón y completará su infraestructura con la construcción en la localidad de Arcos de las Salinas de Galáctica, un centro de difusión y práctica de la astronomía como proyecto de ocio y turismo paralelo a las instalaciones científicas del observatorio

Asimismo se está trabajando para que el cielo de una zona de la comarca sea declarado como reserva starlight, es decir, un espacio en donde se establece un compromiso por la defensa de la calidad del cielo nocturno y el acceso a la luz de las estrellas. Tiene como función la preservación de la calidad del cielo nocturno y de los diferentes valores asociados, ya sean culturales, científicos, astronómicos, paisajísticos o naturales Iniciativa StarLight, 2007.

Tal y como cita la propia iniciativa, la Certificación Starlight permite por primera vez aunar la ciencia y el turismo, basando en la astronomía y la visión del firmamento una nueva forma de turismo inteligente que aporta criterios innovadores para el desarrollo responsable de la actividad. En la base del desarrollo del estándar se encuentra el reconocimiento de la ciencia como producto turístico y, al mismo tiempo, de la ciencia como metodología de trabajo en turismo.

Tanto en la Comarca de Gúdar Javalambre como en otras zonas, se han puesto en marcha distintas iniciativas para ofrecer productos turísticos diferenciados que han contado con gran participación e interés mediáticos pero siempre se ha tratado de un atractivo complementaria que, por tanto, impide conocer si el turista se ha desplazado con la intención primaria o secundaria de conocer el cielo o las actividades programadas en torno a la astronomía.

Asimismo, este tipo de turismo cuenta con gran apoyo institucional y social puesto que permiten un desarrollo local sostenible, tal y como indican Soria y Lludrés (2013), este tipo de turismo que van unidos a conceptos de “desarrollo local” o “endógeno” como modelo de crecimiento integral de un territorio, son actividades que pueden aprovechar al máximo de forma respetuosa con el entorno y la población residente los recursos presentes en el territorio.

El objetivo del presente trabajo en curso sería abordar este fenómeno estudiando cuáles podrían ser los principales factores que podrían determinar el diseño de un producto

turístico basado en el astroturismo, de forma que pudiera convertirse en un atractivo primario con entidad propia. Así, este trabajo pretende contribuir a una corriente de investigación embrionaria basada en el interés que la astronomía despierta entre la población, de forma que pueda convertirse en una realidad para la potenciación de determinados destinos rurales

## ***2. Revisión de la literatura y planteamiento de hipótesis***

El principal objetivo de este trabajo en curso será comprender mejor el fenómeno del turismo astronómico y valorar si puede ser un atractivo primario por sí mismo analizando el caso de la Comarca Gúdar Javalambre.

Para conseguir este objetivo se estudiarán las motivaciones de las personas interesadas por este tipo de turismo, realizar una segmentación del mercado de turistas interesados por la astronomía, analizar los distintos atractivos para conocer las posibilidades de productos turísticos realizables y valorar la importancia de los marchamos de calidad establecidos.

### ***2.1. Motivaciones en el turismo astronómico***

Las motivaciones turísticas suponen un concepto clave para el diseño y la creación de productos y servicios que aporten valor añadido a los turistas, Fandos y Puyuelo (2011), Las motivaciones suponen un componente fundamental en el proceso de toma de decisiones de los visitantes (Crompton y McKay, 1997). Así, diversos autores sostienen que en las motivaciones pueden influir necesidades físicas o fisiológicas (percepción sensorial y hedonismo), de seguridad, culturales, sociales, de pertenencia o interpersonales, de prestigio (delicias locales) y de status o autorrealización (McIntosh, Goeldner y Ritchie, 1995; Fields, 2002).

Según De la Poza (1993), la motivación turística es la razón que impulsa al turista para la realización del viaje. Son muchas las motivaciones que se han señalado como desencadenantes del deseo de viajar pero todas ellas se pueden ser agrupadas en cuatro categorías como clasifican Tocquer y Zins:

1. Motivaciones físicas: relacionadas con la salud física y mental del individuo, necesidad de distracción, relajación, actividades de esparcimiento, etc.
2. Motivaciones culturales; conciben el turismo como un factor de evolución personal a través del conocimiento de otras culturas y países o la ampliación del conocimiento artístico e histórico.
3. Motivaciones interpersonales: el turismo es concebido como un instrumento de desarrollo emocional, que se satisface visitando a familiares, amigos o estableciendo nuevas relaciones.
4. Motivaciones Sociales o de Prestigio: el turismo permite alcanzar ciertos logros sociales, como ser reconocido, apreciado y proyectar una buena imagen

Habrá que profundizar en aquellos estímulos que hacen que el turista se sienta atraído para desplazarse a un lugar concreto y, si las motivaciones relacionadas con la astronomía, resultan un atractivo primario por sí mismo para un destino de turismo rural.

Será objeto de estudio también el comportamiento del turista, desde el punto de vista del subconjunto del comportamiento del consumidor que tiene lugar en el proceso de adquisición del producto turístico, así como la participación en la experiencia de turismo y que se ve influenciado por factores de situación internos y externos(Valls, 1996):

H1 Los turistas ven en la astronomía un atractivo turístico por sí mismo en un destino rural

### ***2.2. Segmentos de consumidores diferenciados atraídos por turismo astronómico.***

La fuerte competencia de los destinos rurales y la existencia de una demanda muy heterogénea con relación a las motivaciones hace difícil que los destinos turísticos puedan satisfacer a todos los consumidores, pues cuando adquieren un producto no siempre buscan lo mismo ni reaccionan de igual manera (Ailwad, Gedenk y Neslin, 1999). Esta heterogeneidad se da en mayor medida en el mercado turístico, ya que existen diferentes tipos de visitantes (Sanchez, 2000) y los destinos, con los recursos y atractivos que poseen, no son capaces de ofrecer atractivo para todo tipo de públicos (Kotler, Bowen y Makens, 2003).

Por tanto, para conseguir lanzar un destino rural que tenga como principal recurso el astroturismo habrá que dirigirse hacia los clientes más idóneos, que son aquellos a los que se puede satisfacer mejor que los competidores (Lovelock, 1997) y que merecen una atención diferente y una respuesta organizada por parte de las empresas o del destino (Reichhel, 2004), con el objetivo de atraerlo.

Así, la segmentación se convierte en un elemento importante para la estrategia de marketing de los gestores turísticos (Nicolau, 2002), estrategia que contribuye al desarrollo y gestión de los destinos, por tanto, será objeto de estudio conocer los diferentes segmentos de consumidores que se sienten atraídos por este tipo de turismo; científicos, aficionados a la astronomía, amantes de la naturaleza, familias, profesionales.. así como la forma en que se demandan estos tipos de producto turístico.

El diseño del producto adecuado es, sin duda, la actividad más importante del marketing. Si disoñamos de un producto turístico que el mercado no desea, ni las mejores campañas promocionales, por muy brillantes que sean, ni los correctos ajustes de precios, ni la distribución perfecta, conseguirán que los consumidores lo adquieran, al menos, de forma repetitiva. Por el contrario, si el producto satisface al consumidor, lo único que necesitamos es que el resto de acciones de marketing sean correctas y coherentes para garantizar el éxito en el mercado (Serra, 2002).

H2 Existen distintos segmentos de la población interesados en realizar turismo astronómico.

### ***2.3. Atractivos astronómicos para el turismo***

El turismo sostenible aparece como la solución a los desastres del turismo convencional o turismo de masas. Implica nuevas relaciones entre la actividad turística y el entorno natural y socio cultural de las comunidades receptoras. Relaciones capaces de minimizar los impactos ya que precisa de un cambio de actitud en los turistas, no se trata de tropas hedonistas, ahora son ciudadanos preocupados por el medio ambiente, interesados por las culturas anfitrionas, y que demandan otras actividades (

Surge de esta forma el turismo alternativo, formas de turismo que son consecuentes con los valores naturales, sociales y comunitario, que permiten disfrutar positivamente tanto a anfitriones como a invitados y hacen que merezca la pena compartir experiencias (Smith y Eadington, 1994). Estas nuevas formas de turismo son el ecoturismo, el turismo rural, el turismo y podría ser también el astroturismo.

El cielo y la astronomía ofrecen distintos atractivos para la creación de productos turísticos. Para Swarbrooke (2002), las atracciones son el componente más importante del sistema turístico, siendo las que motivan el viaje de los turistas y el centro del producto turístico. Asimismo, Leiper (1990) indica que los visitantes se desplazan desde su lugar de residencia hacia un destino turístico sabiendo que allí encontrarán los atractivos que desean conocer.

El avance conceptual experimentado por el término patrimonio, el lento —aunque progresivo— reconocimiento de la riqueza y especificidad de los bienes patrimoniales que albergan el campo y la montaña así como la creciente revalorización turística de estos espacios permiten concebir el patrimonio rural como recurso turístico (Porcal, 2011)

Como expresan Cánoves y Villarino, el turismo como bien de consumo en las sociedades postindustriales se está tematizando, la experiencia turística toma valor en relación con el

contenido de la misma, así asistimos a las tematizaciones turísticas del territorio, ya no basta con el turismo rural, hay que vestirlo en relación con un producto temático, como pueden ser las rutas de senderos, la gastronomía del lugar, la observación de la fauna y la flora. El consumo del turismo ya no es solo la recreación sino que pasa por la lematización del producto.

H3 El cielo y la astronomía tiene variados atractivos turísticos que dan lugar a la creación de distintos productos en entornos rurales.

H4 El entorno rural permite distinguir el producto turístico con marchamos de calidad del cielo que no serían posibles en lugares con mayor población.

### **3. Metodología**

Se pretenden llevar a cabo tanto estudios de carácter exploratorio como descriptivo en función de los objetivos concretos de cada análisis desarrollando tres fases diferenciadas:

1º) Analizar el sector: mediante un estudio de carácter exploratorio se pretende conocer las diferentes ofertas turísticas y productos que se están comercializando en torno al turismo astronómico.

2º) Entrevistas en profundidad a expertos como metodología cualitativa con una finalidad también exploratoria de forma que ayuden a perfilar las encuestas a consumidores. También se realizarán entrevistas en profundidad con agentes sociales que puedan aportar luz al tema como científicos, responsables del observatorio de Teruel, hosteleros de la zona. Asimismo se desarrollarán estas entrevistas con profesionales que ya tengan experiencia en turismo astronómico astronómico en la isla de La Palma y dentro de la iniciativa starlight.

3º) Encuestas a clientes. Con carácter descriptivo se realizarán encuestas personales que aporten resultados cuantitativos que permitan definir segmentos de clientes así como las características de cada uno de ellos, estilos de vida, comportamiento en el consumo de productos turísticos, preferencias, etc.

## RESUMEN

*En momentos de cambios económicos, sociales y tecnológicos como los actuales y en un mundo cada vez más globalizado y fragmentado, seguir utilizando el concepto de cultura desde una perspectiva de nacionalidad como variable de segmentación, no parece adecuado ya que la cultura es algo más que un país de origen, es “el conjunto de normas, valores, creencias, costumbres y conocimiento que incide en cómo piensa, siente y se comporta un individuo, definiéndole como más afín a un grupo de personas o colectivo, que a otro. La cultura es la lente a través de la cual los consumidores ven los productos o servicios” (Solomon 2008, p. 542). La presente investigación tiene por objeto profundizar en el concepto de cultura como variable que influye en el comportamiento del turista que visita una región como destino cultural de interior. Determinar y caracterizar distintas tipologías de turistas con el fin de diseñar productos turísticos personalizados e innovadores. Y orientar adecuadamente las estrategias turísticas hacia su público objetivo.*

## 1. Revisión de la literatura sobre el constructo cultura

El término “cultura” ha suscitado el interés en diversas disciplinas desde hace más de un siglo, siendo considerado desde una perspectiva de investigación vinculada a la nacionalidad (Pizam y Sussmann, 1995). Esto es debido a que se trata de un concepto difuso, del que no existe una definición comúnmente aceptada, ni tampoco unos indicadores que permitan medirla y analizarla de forma precisa (Groeschl y Doherty, 2000). A continuación se recogen algunas definiciones de cultura a lo largo de estos años.

TABLA 1.  
Definiciones de cultura

Autor y Año	Definición
Tylor (1871, p. 1)	“ese todo complejo que incluye conocimiento, creencia, arte, moral, derecho, costumbres y cualesquiera otras habilidades y hábitos adquiridos por el hombre como miembro de una sociedad”.
Kluckhohn (1951, p. 86)	“formada por los patrones, explícitos e implícitos, de un comportamiento adquirido y transmitido por símbolos que constituyen la realización distintiva de los grupos humanos, incluyendo su personificación en artefactos; el núcleo esencial de la cultura está formado por ideas tradicionales y especialmente por los valores que conlleva. Por otro lado, los sistemas de cultura pueden considerarse como productos de acción y como elementos condicionantes de acciones futuras”.
Hofstede (1980, p. 25)	“la programación colectiva de la mente que distingue los miembros de un grupo o categoría de los miembros de otro”.
Nakata y Sivakumar (2001, p. 257)	“patrón de pensamiento, sentimiento y acción arraigados a los valores comunes y convencionalismos de una sociedad”.
House et al. (2004, p. 15)	“motivos, valores, creencias, identidades e interpretaciones o significados de eventos significativos que se derivan de las experiencias comunes compartidas por los miembros del colectivo y que son transmitidos de generación en generación”.
Leung et al. (2005, p. 357)	“valores, creencias, normas y patrones de comportamiento de un grupo nacional”.
Ferraro (2010, p. 20)	“es todo aquello que la gente posee, piensa y hace como miembro de su sociedad”.

Sin embargo, aunque la cultura es abstracta, presenta características definidas: (1) no es un fenómeno individual, sino que es compartido por varios individuos de una sociedad y (2) es un fenómeno aprendido, adquirido a través de la socialización. Por tanto, la cultura es observable en la conducta, en las tendencias generales de las personas y susceptible de descripción empírica (Gong, 2009), como lo demuestran las distintas dimensiones culturales analizadas por diferentes autores (tabla 2).

A pesar de la popularidad del modelo de Hofstede (1980) actualizado en Hofstede (2011) mediante la inclusión de dos nuevas dimensiones denominadas indulgencia vs restricción y monumentalismo, su origen deriva de un contexto considerablemente restrictivo relacionado con la dirección de recursos humanos, que se ha ido aplicando a otros ámbitos, entre los que se incluye el marketing y comportamiento del consumidor (Soares *et al.*, 2007; De Mooij, 2011).

Por este motivo y una vez revisada la literatura se llega a la conclusión que las investigaciones llevadas a cabo han identificado excesivamente el concepto de cultura con el de nacionalidad, descartando la posibilidad de diferenciar distintas culturas dentro de un mismo país, independientemente de la procedencia de los individuos, por lo que la presente investigación propone tener en cuenta un concepto más amplio de cultura, considerando que es “*el conjunto de normas, valores, creencias, costumbres y conocimiento que incide en cómo piensa, siente y se comporta un individuo, definiéndole como más afín a un grupo de personas o colectivo, que a otro. La cultura es la lente a través de la cual los consumidores ven los productos o servicios*” (Solomon 2008, p. 542).

TABLA 2.  
Dimensiones de cultura

Autor	Dimensiones
Kluckhohn y Strodtbeck (1961)	Relación con el entorno;Orientación temporal;Naturaleza de las personas;Orientación de la actividad;Enfoque en la responsabilidad;Concepción del espacio
Hall, 1976	Alto contexto vs Bajo contexto;Policrónico vs Mono crónico
Hofstede, 1980	Individualismo vs Colectivismo; Distancia al poder; Masculinidad vs Femenidad; Aversión a la incertidumbre Orientación a corto vs largo plazo
Schwartz, 1994	Autonomía (Intelectual y Afectiva) vs Conservación;Jerarquía vs Igualitarismo;Armonía vs Competencia
Triandis, 1996	Individualismo horizontal;Individualismo vertical Colectivismo horizontal;Colectivismo vertical
Trompenaars y Hampden-Turner (1998)	Universalismo vs Particularismo;Comunismo vs Individualismo Neutral vs Emocional;Cultura específica vs difusa;Logro vs adscripción;Relación hombre-tiempo;Relación hombre-naturaleza
Inglehart, 1998	Materialismo–Postmaterialismo;Modernización– Postmodernización
House <i>et al</i> , 2004	Orientación al futuro;Igualdad de género;Asertividad;Orientación al hombre;Colectivismo dentro del grupo;Colectivismo institucional;Orientación al rendimiento Distancia al poder;Aversión a la incertidumbre
Hofstede, 2011	Respecto al modelo Hofstede (1980) añade dos dimensiones: indulgencia vs restricción y monumentalismo

Desde esta perspectiva, se incorporan otros constructos relacionados con la cultura, como son los valores y los estilos de vida. La revisión de la literatura pone de manifiesto la existencia de diferencias en los valores de los consumidores debidas a razones culturales, que a su vez provocan diferentes comportamientos entre distintos grupos de consumidores (Valencia, 1989; Wood y Howel, 1991, De Juan, 2004, De Juan y Sarabia, 2003). Dicha revisión permite profundizar en la metodología de medición de los valores tanto desde una perspectiva académica como empresarial, donde destacan los macroestudios académicos y sociocientíficos *European Values Study* y *World Values Survey*, las aportaciones de Milton Rokeach –*Rokeach Value Survey*–, de Lynn R. Kahle –*List of Values*– y de Shalom H. Schwartz –*Schwartz Value Inventory*–. Y, respecto a las metodologías aplicadas por empresas, las aportaciones de ValueScope, Cofremca, Taylor Nelson Sofres, Environics, Yankelovich Group y SRIntrenational. La metodología que finalmente se decide utilizar en la presente investigación será la versión revisada y adaptada del *Schwartz Value Inventory*.

Respecto a los estilos de vida vienen determinados por los elementos distintivos y particularidades que describen la forma de ser de un grupo cultural y permite distinguirlo de otros grupos culturales, comprendiendo las estructuras que se desarrollan y emergen de la dinámica de la vida en sociedad. Revisando las diversas definiciones que hasta el momento se han difundido, así como la aplicabilidad de las mismas, se llega a la siguiente conclusión: *los estilos de vida abarcan diferentes aspectos vinculados a la forma de vivir del individuo, lo que le gusta, aquello que le interesa, cómo siente, con quién se relaciona, qué actividades realiza, incluso los productos/servicios y marcas que compra y dónde las adquiere*. Por lo tanto, los individuos que muestren comportamientos análogos constituirán un grupo homogéneo con un "estilo de vida" determinado, que se pondrá de manifiesto cada vez que los individuos realicen alguna actividad relacionada con el uso y consumo de productos y marcas, constituyendo éstas el reflejo del estilo de vida que tengan o quieran transmitir. Las corrientes metodológicas revisadas son las siguientes: Corriente psicográfica (metodología IPSOS y VALS), la corriente comportamental (A.I.O., CREDOC, PRIZM, BSBW, TNS y MOSAIC) y la corriente sociocultural (Monitor, Eurosocioestilos y, Sinus-Milieus) (Sarabia, de Juan y González, 2009). En el presente estudio se opta por aplicar la metodología A.I.O. por estar más próxima a la realidad comportamental del individuo

Respecto al ámbito de aplicación, durante la última década ha surgido un creciente interés por el análisis de la cultura en el sector turístico, considerando ésta como una herramienta eficaz para una mejor comprensión del turista que ayuda a identificar similitudes y diferencias entre los turistas y contribuye así al desarrollo de servicios más adecuados a las necesidades de los mismos y a una estrategia de gestión y marketing más efectiva (García y Gil, 2005; Reisinger y Turner, 2003).

## 2. Trabajo empírico

### 2.1. Objetivos

Se plantea como **primer objetivo** de esta investigación profundizar en el concepto de cultura, ampliando las aportaciones de Hofstede, como el conjunto de valores, ideas, actitudes y estilos de vida que dirigen el comportamiento del consumidor y subyacen en su toma de decisiones.

El **segundo objetivo** del presente estudio es desarrollar una metodología que permita comprender e investigar el concepto de cultura en turismo. Bajo estas premisas, la presente investigación se propone profundizar en el concepto de cultura como variable que influye en el comportamiento del turista de destinos culturales, dado que se trata de una tipología de creciente interés especialmente para las ciudades pequeñas de interior con recursos patrimoniales con el objetivo de ofrecer productos turísticos segmentados y orientar adecuadamente las estrategias turísticas hacia este público objetivo.

### 2.2. Metodología

La investigación se centra en una encuesta on line dirigida a viajeros de destinos culturales de interior. Aunque en un primer momento se elabora un solo cuestionario, más tarde se opta por dividirlo en dos partes con la finalidad de que la tasa de respuesta sea mayor y facilitar al encuestado la concluir del cuestionario. El criterio empleado para decidir las preguntas a incluir en una u otra parte se basa principalmente en la temática de las cuestiones.

Así, el primer cuestionario lanzado contiene preguntas relacionadas con el turismo e Internet, que analizan (1) los hábitos del turista en los viajes culturales (lugares visitados, alojamiento y transporte empleados, compañía en el viaje, organización y motivos del mismo, comportamiento y actividades en destino), (2) las fuentes de información consultadas (haciendo especial hincapié en canales online), y (3) aspectos relativos a las Tecnologías de la Información y las Comunicaciones (TIC's) ya que se ha detectado un gran potencial en su uso como fuentes de información turística.

El segundo cuestionario incluye las preguntas relacionadas con el constructo de cultura, incorporando cuestiones sobre estilos de vida, con la metodología A.I.O. (Actividades, Intereses y Opiniones), los valores con la metodología de Schwartz y las dimensiones de Hofstede. De esta manera, se hace mención a (1) temas sobre hábitos en el tiempo de ocio, y a (2) aspectos de índole personal, social, familiar y profesional donde se ve reflejada la cultura de los individuos.

Además, ambos cuestionarios incluyen la misma batería de cuestiones para describir el perfil socio-económico de los encuestados, con la finalidad de poder relacionar los hábitos en viajes culturales con la cultura. Una vez diseñado el cuestionario, se envía a un panel on line de encuestados en dos olas con las siguientes características.

TABLA 3  
Ficha técnica de la investigación

<b>Población:</b>	Turistas residentes en España mayores de 15 años que han realizado viajes de ocio a ciudades nacionales durante el último año, pernoctando de una a tres noches en alojamientos de pago.
<b>Tipo de encuesta:</b>	Por internet
<b>Número de encuestas:</b>	1ª ola: 727 recibidas, 640 encuestas válidas 2ª ola: 579 recibidas, 512 encuestas válidas
<b>Nivel de confianza:</b>	95,5% para valores de heterogeneidad = 50%
<b>Error muestral:</b>	3,8% para el conjunto de la población objeto de estudio

Sistema de muestreo:	Base de datos de panelistas on line de la empresa Toluna Selección por cuotas geográficas Nielsen, sexo y edad.
Ámbito geográfico:	Capitales de provincia/ciudades con más de 100.000 habitantes de España.
Período del trabajo de campo:	Abril a Septiembre 2013

### 3. Conclusiones

En épocas de cambio económico, social y tecnológico, como los actuales, se pretende obtener con la investigación realizada, dimensiones culturales que influyen en el comportamiento de turistas en destinos culturales, caracterizar segmentos de mercado diferenciados a partir de las dimensiones obtenidas y comparar los resultados en función de las diferentes metodologías de investigación de manera independiente: A.I.O., Schwartz y Hofstede.

**RESUMEN**

*La existencia de un cliente selectivo y conocedor de las nuevas tecnologías que brinda el sector turístico en el entorno online conlleva una necesaria evolución de las empresas para incrementar su competitividad. En este trabajo en curso se analiza la calidad del servicio online y la calidad de recuperación del servicio online ofertadas por las agencias de viajes. También se investiga la incidencia que tienen estas dos variables sobre la lealtad y la retención de clientes, profundizando de manera especial entre las posibles diferencias existentes entre ellas en función del tipo de dispositivo que se emplee: fijo y/o móvil. Además, se verifica si existen diferencias estadísticamente significativas en relación a la calidad del servicio online, la calidad de recuperación del servicio online, el valor percibido, la satisfacción y la lealtad, entre los usuarios de agencias de viajes online de España y Portugal.*

**Palabras clave:**

Calidad, servicio online, valor percibido, satisfacción, lealtad, dispositivos fijos y móviles, agencias de viajes.

## 1. Introducción

Una de las principales características del sector turismo es su dinamismo producido, en gran parte, por la rápida y constante evolución de las TIC (*e-commerce*, agencias online, compra mediante dispositivos móviles, etc.). A esta circunstancia se une la aparición de un consumidor formado en el uso de las nuevas tecnologías y, por tanto, más selectivo y conocedor de los diferentes servicios que ofrece el sector en el entorno online.

La introducción de las nuevas tecnologías en la empresa modifican su proceso de servicio y este cambio puede aprovecharse para lograr un mejor posicionamiento, pues proporcionan nuevas interacciones con el usuario (Padgett y Mulvey, 2007). Por otra parte, los datos del segundo trimestre de 2013 publicados por la Comisión del Mercado de Telecomunicaciones, sitúan al sector turístico (agencias de viajes y touroperadores), como la rama de actividad con mayor peso en las cifras de facturación mediante comercio electrónico, con un crecimiento del 16,4% (CMT, 2013).

Por lo tanto, el objetivo de este artículo es profundizar en la relación causal de la calidad percibida del e-servicio, el valor percibido, la satisfacción y la lealtad del consumidor en la contratación *online* del servicio turístico, analizando las posibles diferencias entre dispositivos fijos y móviles y contrastando los resultados obtenidos entre los países incorporados al estudio, España y Portugal.

El trabajo en curso se está aplicando en el contexto de los sitios webs a través de los cuales se contratan los productos turísticos. De esta manera, las empresas turísticas podrán identificar las fortalezas y oportunidades de sus sitios web para fidelizar a sus clientes.

### 1. Revisión de la literatura

Analizando la literatura, observamos la importancia que ha ido adquiriendo el marketing relacional en los últimos años, convirtiéndose en un elemento clave para el fortalecimiento de las relaciones entre las empresas y los clientes. Los clientes fieles a las empresas suponen un importante activo para las mismas, ya que su compra y gasto son más frecuentes (DeWulf *et al.*, 2001).

La fidelización de clientes está muy vinculada con las ideas de calidad y servicio, pues mediante su combinación se genera un círculo en el que la satisfacción crea fidelidad. A su vez, la fidelidad produce nuevas ventas a un menor coste, lo que incrementa la rentabilidad de la empresa, mejorando así el servicio (Guijarro, 2009).

La calidad del servicio se define como el juicio global del consumidor o usuario sobre la superioridad del servicio (Parasuraman *et al.*, 1988).

Según el estudio realizado por Vázquez *et al.*, (2009) la calidad percibida del servicio electrónico no puede reflejarse en una valoración unidimensional, debido a las particularidades que presenta el entorno online. Este hecho hace necesario adaptar las tradicionales escalas para medir la calidad del servicio.

Con la finalidad de compensar el inconveniente que genera la intangibilidad e impersonalidad de los servicios online -a la hora de definir indicadores que permitan evaluar la calidad percibida del servicio-, Parasuraman *et al.* (2005), apoyándose en Zeithaml *et al.* (2002), desarrollan una escala multidimensional destinada a medir la calidad online. Su elaboración está basada en la utilización de dos escalas para evaluar la calidad de e-servicio. La primera, denominada E-S-QUAL, tiene en cuenta aspectos vinculados al servicio básico o principal y distingue cuatro dimensiones: eficiencia, fiabilidad, disponibilidad del sistema y privacidad. La otra escala que propone la escuela de Parasuraman se utiliza para evaluar la calidad de recuperación del servicio: E-RecS-QUAL, compuesta por tres dimensiones: responsabilidad, compensación y contacto (Fuentes *et al.*, 2011).

Zeithaml (1988) considera el valor percibido como una evaluación global que el cliente desarrolla de la utilidad de un producto o servicio, basado en las percepciones de lo que ha recibido frente a lo que ha dado. Se trata de un constructo subjetivo en diversos sentidos: varía entre clientes, entre culturas y en diferentes situaciones temporales (Holbrook, 1994; Ravald y Grönroos, 1996; Woodruff, 1997). En esta última apreciación se concibe el valor percibido

como una variable dinámica, que se experimenta antes de la compra, en el momento de la compra, en el momento de su uso, y tras su utilización. Para cada intervalo la valoración es diferente (Gardial *et al.*, 1994). Por lo tanto, se trata de un concepto de elevada subjetividad, ya que depende esencialmente del juicio del cliente y dicho juicio depende, a su vez, de una serie de factores como son la información con la que cuenta el cliente, el contexto en el que se realiza la valoración y del momento en el que dicha valoración tiene lugar.

Los diferentes estudios orientados a la consecución de un modelo de valor percibido no se han materializado en un consenso único (Gallarza y Gil, 2006). Este hecho no ha impedido que la literatura turística afronte este constructo desde una perspectiva multidimensional. En esta línea, se han realizado investigaciones que han demostrado la validación de una escala de medición del valor percibido para obtener la identificación de las dimensiones que conforman el concepto. De este modo, se ha constatado la multidimensionalidad del valor percibido y su efectividad para emplearse como factor ponderador en la segmentación del mercado (Sales y Gil, 2007).

La revisión de la literatura muestra que el valor es la consecuencia de la calidad (Grewal *et al.*, 1998; Sirio *et al.*, 2008; Oh, 1999, 2000; Caruana *et al.*, 2000; Kashyap y Bojanic, 2000; Cronin *et al.*, 2000), entendiendo el valor como una construcción de orden superior.

La satisfacción es reconocida como el factor determinante del éxito en los mercados (Reichheld y Sasser, 1990; Teye y Leclerc, 1998). Se trata de un concepto ampliamente debatido y sobre el que se han propuesto múltiples definiciones, sin que exista un consenso en torno a las mismas (Oliver, 1980; Vanhamme, 2000). Entre todas ellas destaca la de Santos (1999), que define la satisfacción como un estado emocional susceptible de ser medido y que surge del acto de comparar las expectativas con los resultados.

Actualmente, la mayoría de los autores sugieren que la calidad de servicio y la satisfacción son constructos distintos (Bansal y Taylor, 1999; Bolton y Drew, 1991; Boulding *et al.*, 1993; Carman, 1990; Oliver, 1980; Parasuraman *et al.*, 1988), aunque relacionados.

La principal razón que justifica esta diferenciación es que la satisfacción representa una evaluación del consumidor ante una situación específica, vinculándose al corto plazo, ya que es susceptible de ser cambiada en cada transacción. En cambio, la calidad del servicio percibida representa un juicio más global y duradero a través de múltiples encuentros de servicios, vinculándose al largo plazo (Parasuraman *et al.*, 1988).

Algunos autores defienden que la satisfacción es un antecedente de la calidad percibida del servicio (Parasuraman, *et al.*, 1988; Grönroos, 1994; Bolton y Drew, 1991; Bitner, *et al.*, 1994). El argumento principal es que a través de la acumulación de evaluaciones específicas (satisfacción) se crea una valoración global (calidad percibida).

En la literatura existe un consenso generalizado acerca de que la satisfacción del cliente tiene una influencia positiva en la lealtad del mismo (Parasuraman *et al.*, 1988; Johnson y Fornell, 1991; Cronin y Taylor, 1992; Rust y Zahorik, 1993, entre otros). En el ámbito empresarial, y concretamente en el sector servicios, la lealtad de los clientes es considerada como una de las mayores fuentes de ventaja competitiva (Bharadwaj *et al.*, 1993). La lealtad del cliente se define como la conducta repetida de adquisición de un bien o servicio, debido a actitudes favorables o a la toma de decisiones de un proceso evaluativo (Jacoby y Kyner, 1973).

En resumen, la revisión de la literatura muestra que la calidad percibida del servicio y su recuperación, el valor percibido y la satisfacción influyen de manera significativa en las intenciones de compra de los consumidores y, por lo tanto en su lealtad (Zeithaml, Berry y Parasuraman, 1996).

## **2. Objetivos e hipótesis**

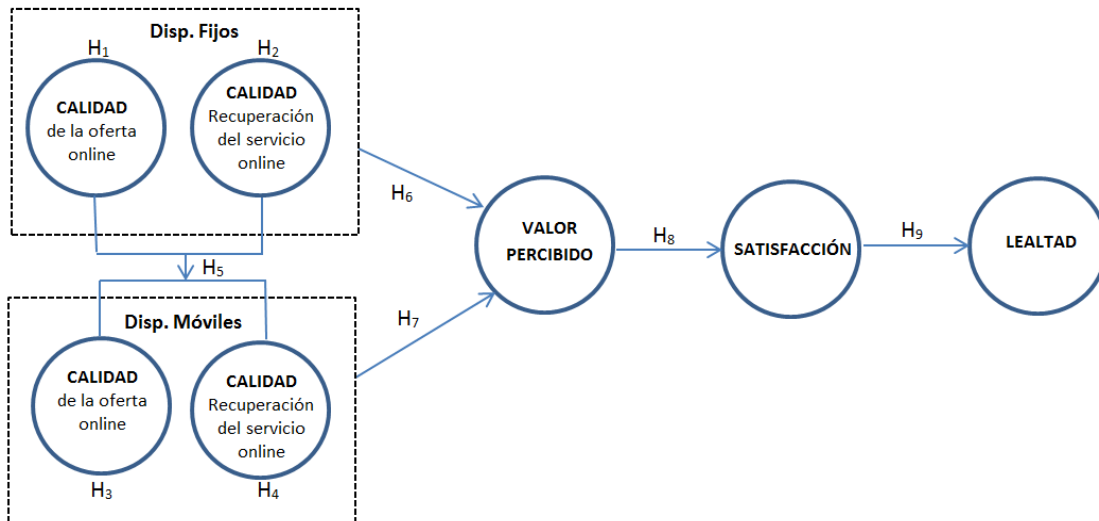

La investigación en curso que se plantea tiene como principal objetivo contribuir al estudio de la calidad del servicio online y la recuperación del servicio online ofertadas por las agencias de viajes, así como la incidencia que tienen estas dos variables sobre la lealtad y la retención de clientes.

A través de esta investigación queremos articular una línea de trabajo en torno a la influencia de la calidad del servicio online y su recuperación sobre la lealtad del cliente, en el contexto de las agencias de viajes, analizando la posible existencia de diferencias estadísticamente significativas entre los constructos analizados anteriormente, en relación a los dispositivos fijos

y dispositivos móviles. El objetivo es determinar si es necesario establecer dos estrategias diferentes en función del dispositivo empleado para acceder al sitio web de la agencia de viajes. Según este propósito, y teniendo en cuenta las variables más importantes de la literatura identificadas anteriormente, se plantea el siguiente modelo con sus respectivas hipótesis:

**IMAGEN 1**  
Modelo teórico propuesto

**Fuente:** *Elaboración propia.*

**H1:** La calidad del servicio online ofrecido por las agencias de viajes a través de dispositivos fijos es un constructo multidimensional.

H1<sub>b</sub>: No existen diferencias estadísticamente significativas entre los usuarios de España y Portugal.

**H2:** La calidad de recuperación del servicio online ofrecida por las agencias de viajes a través de dispositivos fijos es un constructo multidimensional.

H2<sub>b</sub>: No existen diferencias estadísticamente significativas entre los usuarios de España y Portugal.

**H3:** La calidad del servicio online ofrecido por las agencias de viajes a través de dispositivos móviles es un constructo multidimensional.

H3<sub>b</sub>: No existen diferencias estadísticamente significativas entre los usuarios de España y Portugal.

**H4:** La calidad de recuperación del servicio online ofrecida por las agencias de viajes a través de dispositivos móviles es un constructo multidimensional.

H4<sub>b</sub>: No existen diferencias estadísticamente significativas entre los usuarios de España y Portugal.

**H5:** A mayor calidad del servicio online y de su recuperación desde un dispositivo fijo mayor será la calidad del servicio online y de su recuperación desde un dispositivo móvil, y viceversa.

H5<sub>b</sub>: No existen diferencias estadísticamente significativas entre los usuarios de España y Portugal.

**H6:** A mayor calidad del servicio online y de su recuperación desde un dispositivos fijo mayor será el valor percibido por el cliente.

H6<sub>b</sub>: No existen diferencias estadísticamente significativas entre los usuarios de España y Portugal.

**H7:** A mayor calidad del servicio online y de su recuperación desde un dispositivos móvil mayor será el valor percibido por el cliente.

H7<sub>b</sub>: No existen diferencias estadísticamente significativas entre los usuarios de España y Portugal.

**H8:** A mayor valor percibido por el cliente mayor será su satisfacción.

H8<sub>b</sub>: No existen diferencias estadísticamente significativas entre los usuarios de España y Portugal.

**H9:** A mayor satisfacción del cliente mayor será su lealtad hacia la agencia de viajes.

H9<sub>b</sub>: No existen diferencias estadísticamente significativas entre los usuarios de España y Portugal.

### **3. Metodología**

Con el fin de alcanzar los objetivos mencionados y contrastar las hipótesis planteadas se ha diseñado una investigación cuantitativa mediante una encuesta personal ad-hoc con cuestionario estructurado.

En cuanto al contexto de aplicación, la muestra objeto de estudio estará formada por personas que hayan tenido en el último año experiencias de compra y/o búsqueda de información de productos turísticos en los sitios web de las diferentes agencias de viajes, tanto portugueses como españoles, con el fin de comparar posteriormente los resultados en función del país de origen.

El cuestionario se ha elaborado a partir de las escalas más relevantes de la literatura y se han adaptado a nuestro contexto con la finalidad de poder medir las variables objeto de estudio. Tras la adaptación, se han realizado varias pruebas tanto en Portugal como España, con expertos en la materia para depurar el contenido y los ítems del cuestionario y, de ese modo, verificar su funcionamiento antes de iniciar el trabajo de campo.

La muestra estará formada por 200 españoles y 200 portugueses de ambos géneros y diferentes edades, que hayan contratado o buscado información en una agencia de viajes online, en el último año. Con el objetivo de lograr la mayor representatividad posible, se realizará el muestreo por cuotas de edad, sexo y diferentes regiones de cada país.

### **4. Conclusiones**

Se espera que los resultados que se obtengan tras la realización de la investigación permitan identificar las variables de la calidad del servicio online y de su recuperación que tienen mayor incidencia sobre la lealtad posterior del cliente. A partir de las conclusiones que se obtengan, se extraerán importantes implicaciones para la gestión empresarial en el sector de las agencias de viajes que emplean un canal de distribución online.

Además, se podrán establecer los aspectos más importantes a tener en cuenta a la hora de definir la estrategia de marketing online; si es necesario establecer dos estrategias distintas en función del tipo de dispositivo o no, así como si son necesarias distintas estrategias en función del país desde el que se acceda al sitio web de la agencia de viajes.

## ABSTRACT

*Internet has changed tourism consumer behavior dramatically. Technological advancement and increased international competition thus affect the way in which tourism destinations are imagined, perceived and consumed. In this study we show how content generated by other users in a destination website generates emotions and thoughts that contribute to the destination image formation. Our results suggest that a correspondence exists between consumers' thoughts and the cognitive dimension of image, as well as between the emotions expressed by subjects and the affective dimension of image. Results also confirm that the image of a destination is an important predictor of destination preferences. While contributing to the body of knowledge of tourism destination image, our results are also relevant for Public Policy and tourism managers.*

## Keywords:

*User-Generated Content, Emotions, Cognitions, Destination Image, Cognitive Image, Affective Image, Tourist Destination.*

## 1. Introduction

The tourism industry has witnessed fundamental changes in the last years (Buhalis and Law, 2008; Minghetti and Buhalis, 2010). An increasing number of travelers are using the Internet for travel planning (Sigala *et al.*, 2001; Litvin *et al.*, 2008). Tourists have nowadays online resources that enable them searching for possible destinations, transportation, accommodation and leisure activities, as well as the purchase of these services (Akehurst, 2009). Online customer reviews are an important form of user-generated content (hereafter UGC). Consumers share their experiences with products and services in order to help others make informed purchase decisions. UGC includes online information sources that are created, initiated, circulated and used by consumers who intend to educate each other and share information about products, brands, services, personalities and other issues (Blackshaw and Nazzaro, 2006). Each year, hundreds of millions of potential visitors consult online reviews (Tripadvisor, 2013).

Image is also very relevant for tourism research, since the services associated to this industry are mainly intangible and cannot be tried before consumption. Previous research has shown online browsing influences both the cognitive and the affective dimensions of image, although most of that research has focused just on the cognitive component (Echtner and Ritchie, 1991; Walmsley and Young, 1998; Chen and Uysal, 2002). This lack of research is especially visible in the tourism sector, where the influence of Internet on destination image is yet to be fully revealed as the virtual environment is broad and boasts different platforms, such as blogs and web forums that might have differential effects on the images held by tourists (Jani and Hwang, 2011).

Destination and travel marketers are interested in influencing tourists' behavior to encourage them to favor and purchase their products and services, including destinations. However, despite the crucial role they play in the modern tourism industry, little work has been done on how web forums and blogs are used to build a destination image (Wenger, 2008), particularly those capturing destination image in a holistic manner (Echtner and Ritchie, 2003; Carson, 2008). To the best of our knowledge, no previous research has studied the relationship between perceived usefulness of UGC on a web destination and the emotional and cognitive responses evoked by such content.

In this study we propose that emotional and cognitive responses evoked by UGC may influence the affective and cognitive dimensions of the destination image, respectively. Following previous literature, we analyze the contribution of affective and cognitive components to the overall image. Finally, the effect of overall image on purchase intention and recommendation is also evaluated. According to these objectives, we first review the literature and propose a set of hypotheses, then describe the methodology and present the preliminary results. We end with a short comment about the implications derived from this research.

## 2. Literature review and hypotheses development

### 2.1 *User-generated content (UGC) in tourism*

The decision to research opinions of those who have visited and those who are planning to visit seems logical as the method captures both modified holistic images held by experienced tourists and the baseline and enhanced images held by potential tourists (Jani and Hwang, 2011). Liu *et al.* (2011) identified four objectives of online consumer reviews: (1) to assist consumers in making accurate choices, (2) to reduce the cognitive costs of making such choices, (3) to help consumers form an unbiased understanding of the product, and (4) to construct a set of evaluative criteria.

UGC is an electronic communication phenomenon enabled by Web 2.0, the second generation of web-based services, which allows people to collaborate and share information online (Cox *et al.*, 2009). Because of the experiential nature of tourism services for which previous quality cannot be ascertained, WOM and, more recently, e-WOM are much relied on by potential tourists in forming images (Gretzel *et al.*, 2007; Pan *et al.*, 2007; Cox *et al.*, 2009). Consequently, UGC much serves as an information source for potential tourists (Ye *et al.*, 2009).

Previous studies have shown that online travel reviews may influence the decisions of travelers (Gretzel and Yoo, 2008; Vermeulen and Seegers, 2009). Vermeulen and Seegers (2009) studied the

impact of online reviews on the attitudes of travelers to hotels, and found that exposure to online reviews enhanced hotel awareness, and that positive reviews improved the attitudes of travelers toward hotels. Gretzel and Yoo (2008) also examined the role of travel reviews in trip planning processes, and demonstrated the importance of online consumer reviews at an individual level. However, the influence of online user-generated reviews in the tourism industry is still largely unknown both to tourism researchers and practitioners (Ye *et al.*, 2011).

There are no published articles that have studied the direct relationship between perceived usefulness of UGC and cognitive-emotional responses generated by the receiver. However, recent literature on UGC (Dufresne *et al.*, 2010; Volo, 2010; Jani and Hwang, 2011) may be used to infer these effects. Given their importance as an information source (Ye *et al.*, 2009), UGC can help tourists and travelers develop emotions and cognitions about a destination before visiting it. Consumer's access to information related to attributes, experiences and feelings shared by other tourists might help them to form an impression about the destination. Therefore, based on that information, potential tourists can generate a series of cognitions and emotions, respectively, related to the tourism destination. We, thus propose:

**H1:** The usefulness of exposure to UGC on a web destination positively influences the emotions associated by that destination.

**H2:** The usefulness of exposure to UGC on a web destination positively influences the cognitions associated by that destination.

## ***2.2 Emotions and cognitions as antecedents of the affective and cognitive dimensions of destination image***

Emotions are now recognized to have a critical role in the consumption experience (Mora and Moscarola, 2010; Li *et al.*, 2012). Zajonc (1980) challenged us to consider more than cognition in our attempts to understand human behavior, while Holbrook and Hirschman (1982) have led the change to consider consumers "feelings, fantasies, and fun" as part of the overall consumption experience. Cognitive responses to a stimulus are an important antecedent of attitudes (Sicilia *et al.*, 2005; López and Ruiz, 2011). The cognitive approach has dominated persuasion research, whereas the affective processes have been given a relatively minor role, in spite of the wide use of emotional appeals in advertising (Morris *et al.*, 2002).

There are increasing attempts to understand the role of emotions in the context of tourism and hospitality. For example, past studies investigated the determinants of post- consumption emotions (Muller *et al.*, 1991), or the relationship between emotions and key consumer behavior constructs such as overall satisfaction (de Rojas and Camarero, 2008; del Bosque and San Martin, 2008), customer loyalty (Barsky and Nash, 2002), behavioral intentions (Bigné *et al.*, 2005; Jang and Namkung, 2009) and decisions to purchase tourism and leisure services (Chuang, 2007; Kwortnik and Ross, 2007). Emotions have been also used as a segmentation variable for leisure and tourism services (Bigné and Andreu, 2004). This paper is in line with Kwortnik and Ross (2007), who found that tourists experience a variety of positive emotions as they plan their vacations, such as comfort and pleasure. However, empirical studies that consider the role of emotions in the context of tourist destinations remain sparse.

Additionally, destination image is also viewed in this paper as an attitudinal construct that consists of cognitive and affective evaluations (Baloglu and McCleary, 1999a, b). The proposed model considers that the affective component, also known as hedonic dimension (Batra and Ahtola, 1990), is associated with the emotions generated by the stimulus or by the product displayed in the stimulus, while the cognitive or utilitarian component is related to the beliefs and perceived attributes about the stimulus or about the product. In a tourist context, where the product may be equivalent to the destination, the cognitive component refers to the beliefs or knowledge a person has of the characteristics or attributes of a tourist destination (Baloglu, 1999; Pike and Ryan, 2004), while the affective dimension is represented by the individual's feelings toward the tourist destination (Chen and Uysal, 2002; Kim and Richardson, 2003).

As our goal is to demonstrate the influence of consumers' responses on the two dimensions of destination image (cognitive and affective dimensions), these constructs should intervene in the model. Due to the convenience of incorporating emotions and the bi-dimensional perspective of the destination image, we will (a) use cognitive and affective dimensions of the destination image, and (b) use cognitions and emotions as antecedents of the two dimensions of image. Thus, in an attempt to reach a more favorable image, individuals who produce a higher number of net emotions (obtained by subtracting the number of negative emotions from the number of positive emotions) will generate a more favorable affective destination image. Similarly, individuals who produce a higher number of net thoughts will generate a more favorable cognitive destination image. As such, cognitions and emotions generated by a destination website (including UGC) will directly impact on the cognitive and affective dimensions of image towards the destination, respectively. Formally, we propose:

**H3:** Evoked emotions by potential tourists will have a positive influence on the affective dimension of a tourism destination image.

**H4:** Evoked cognitions by potential tourists will have a positive influence on the cognitive dimension of a tourism destination image.

### **2.3 Overall destination image**

As affirmed by Gartner (1993), people's perceptions of various attributes within a destination will interact to form a composite or overall image of that destination. The combination of cognitive and affective evaluations gives rise to an overall or composite destination image that is greater than the sum of the parts (Phelps, 1986; Calantone *et al.*, 1989; Fakeye and Crompton, 1991).

Recently, several studies have included cognitive and affective attributes in the measurement of destination image (Baloglu, 2001; Kim and Richardson, 2003; Beerli and Martín, 2004; Wang and Hsu, 2010). In line with this approach, destination image should be considered a multi-dimensional phenomenon that includes not only beliefs or knowledge about the place's attributes, but also the individual's feelings toward the tourist destination. Consequently, we also propose in our context that the cognitive and affective components would be positively related to the overall image of a destination. As such, we propose:

**H5:** The affective dimension of a tourism destination image positively influences the overall destination image.

**H6:** The cognitive dimension of a tourism destination image positively influences the overall destination image.

### **2.4 Destination image and tourist behaviors**

The tourist behaviors include the choice of a destination to visit and subsequent evaluations and future behavioral intentions (Chen and Tsai, 2007); including destination recommendation (Kneesel *et al.*, 2010). A positive WOM is not only an indicator of a tourist's intention to continue the relationship with the destination, but also a reliable source of information for potential tourists (Yoon and Uysal, 2005). Thus, the diffusion of the destination may be enhanced. Behavioral intentions have therefore become a fundamental strategic metric to evaluate the success of a tourism destination (Chen and Tsai, 2007; Wang and Hsu, 2010).

Similarly, intention to recommend the destination has been also considered as a good indicator of behavior in this context because most tourist decisions are based on WOM (Kneesel *et al.*, 2010). Word-of-mouth (WOM) is defined as "informal, person-to-person communication between a perceived noncommercial communicator and a receiver regarding a brand, a product, an organization, or a service" (Harrison-Walker, 2001, p. 63).

A positive overall assessment of the image of a tourism destination contributes to positive visit intentions (Bigné *et al.*, 2008; Prayag, 2009). Similarly, Lee *et al.* (2005) argued that individuals having a favorable destination image would lead to greater levels behavioral intentions. In summary, the intentions to visit the destination and to spread a positive WOM may be considered the two most important behavioral consequences of destination image (Qu *et al.*, 2011). Thus, we expect that if a

person holds a positive overall image of a particular destination, s/he would be more likely to visit the destination. Therefore, we propose:

**H7:** Overall tourism destination image positively influences intention to visit that destination.

Regarding the intention to recommend the destination, previous research has shown that destination image may condition the after-decision-making behaviors including the willingness to recommend (Ashworth and Goodall, 1988; Mansfield, 1992; Cooper *et al.*, 1993; Bigne *et al.*, 2001; Lee *et al.*, 2005). Therefore, research has established a positive influence of destination image on tourists' intention to recommend behavior (Ashworth and Goodall, 1988; Mansfield, 1992; Milman and Pizam, 1995; Bigné *et al.*, 2001). According to Bigné *et al.* (2001) a person with a perceived positive image of a destination is more likely to recommend it. Thus, we expect that if a person holds a positive overall image of a particular destination, s/he would be more likely to recommend the destination to others. Therefore, we propose:

**H8:** Overall tourism destination image positively influences intention to recommend that destination.

### 3. Methodology

The survey population consisted of individuals over the age of 18 who had not previously visited the destination and who did not belong to that area. We collected 242 valid questionnaires. The sample average age was 22 years (ranging from 18 to 28) and 51.7% of the participants were women. The main dependent variables such as destination image and intention to visit and recommend the destination were not significantly affected by these variables.

We used a real website of a rural destination as a contextual stimulus in this study. The selection of rural tourism services was motivated by the fact that image formation process mainly occurs through destination websites in this type of small touristic services.

On arrival at the computer lab, subjects were informed about the procedure. A pretest was run to ensure the statements were understood. Participants were instructed to freely visit the website of the rural destination as if they were looking for a weekend trip. After website exposure, individuals responded to the questionnaire which contained the variables of the proposed model. Among other questions, we asked participants whether they had accessed the online opinions section or not. This was a yes/no question. 66.1 % of the participants indicated that they had accessed online opinions generated by other users, which involved 160 individuals of the total sample. Since our independent variable is the usefulness of exposure to UGC for the next results we used only those 160 individuals who have accessed others' opinions regarding the destination.

Firstly, participants wrote down all the thoughts that came into their minds while they were on the destination website. Similarly, they were instructed to write down all the feelings and emotions they experienced during exposure (Coulter, 1998; López *et al.*, 2008).

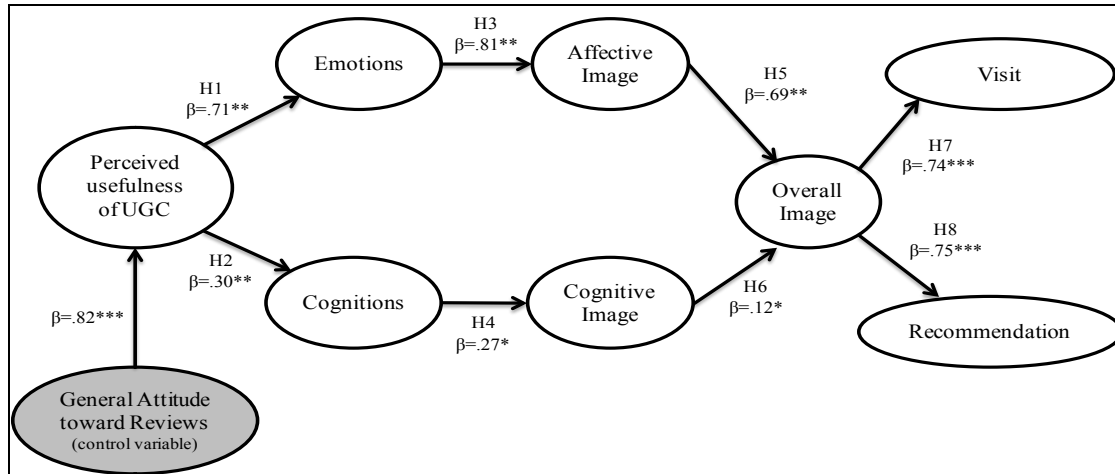

In order to ensure content validity, selected items for the constructs were primarily revised from prior studies in the tourism context. Image scales were based on 10-point semantic differential scales. Affective image was measured through Russell's (1980) four bipolar affective items. For the cognitive image dimension, items were borrowed from Ong and Horbunluekit (1997). Respondents also rated their overall image of the accommodation by three bipolar items (Baloglu and McCleary, 1999a). Behavioral intention was measured on a 10-points Likert scale. We used four items adapted from Kneesel *et al.* (2010). We used previously established scales to measure perceived usefulness of UGC (Mishra *et al.*, 1993; Gilly *et al.*, 1998). Moreover, in order to control for possible confounding effects, we also measured general attitudes toward reviews (Park *et al.*, 2007). At the end of the questionnaire, individuals provided some demographic information, including gender, age and city of residence.

### 4. Preliminary results

Results of the CFA (N=160) suggest that our measurement model provides a good fit to the data on the basis of a number of fit statistics (S-B  $\chi^2$  (df=216)=300.95,  $p < .01$ ; NNFI= .90; CFI= .92; IFI= .92; RMSEA= .050).

Once measurement has been checked, we tested the proposed conceptual model using structural equation modeling. Preliminary results indicate that the data fit our conceptual model acceptably. The empirical estimates for the main-effects model are shown in Figure 1. All the paths proposed in the hypotheses were statistically significant and in the expected positive direction.

FIGURE 1  
Results obtained for the structural model

S-B  $\chi^2$  (df=236) =349.33,  $p < .01$ ; NNFI=.89; CFI=.90; IFI=.90; RMSEA=.055

N=160. \* $p < .05$ , \*\* $p < .01$ , \*\*\* $p < .001$

## 5. Conclusions

Our results suggest that cognitive and affective image components are significant antecedents of overall image. In this sense, the mental representation of a tourist destination is formed on the basis of individuals' beliefs about the place (cognitive image), as well as their feelings toward it (affective image). Tourists will use these image dimensions to form their impressions and evaluate the considered destinations in their choice processes. Thus, as expected, cognitive image positively influences overall image. This result confirms the results of previous studies (Stern and Krakover, 1993; Baloglu and McCleary, 1999), arguing for the positive effect of cognitive image on overall image. This study also supports the results of Baloglu and McCleary's (1999) regarding the impact of the affective image on overall image. Moreover, contrary to others' research findings, which found the stronger impact of cognitive evaluation on overall image than that of affective evaluation (Qu *et al.*, 2011), this study shows that affective image is the most influential dimension of destination image.

In this study overall image stands out as an important predictor of destination preferences. Results confirm the previous argument that the image of a destination directly influences intentions to visit and recommend the destination to others (Tapachai and Waryszak, 2000; Bigné *et al.*, 2001; Lee *et al.*, 2005). Another contribution concerns the correspondence that exists between thoughts and the cognitive dimension of image, as well as the emotions expressed by subjects and the affective dimension of image. To the best of our knowledge, both links have been not empirically tested before in image literature.

Universidad de Cantabria

## RESUMEN

*Los autores describen la intensidad y orientación del reporting a grupos de interés (o reporting de Responsabilidad Social Corporativa, RSC) realizado por las empresas de cuatro industrias españolas y exploran la relación que existe entre ambos conceptos y una medición independiente de la reputación de RSC (CSRR). Los resultados demuestran que la presentación de informes de RSC es especialmente relevante y útil en la industria financiera. Las empresas financieras reportan mucha más información a sus grupos de interés que la mayoría de empresas en otras industrias en España y esta información está más estrechamente vinculada a su CSRR que la presentada en las industrias básica, de bienes de consumo y de servicios.*

## Palabras clave:

*Responsabilidad social corporativa, reputación, reporting, industria, grupos de interés*

## 1. Introducción

La reputación corporativa, entendida como “la percepción de cómo la empresa se comporta con sus grupos de interés y el grado de transparencia informativa con el que desarrolla sus relaciones con ellos” (de la Fuente y de Quevedo, 2003, p. 280), está ganando cada vez más atención por parte de las empresas (Brammer y Pavelin, 2006). Esta tendencia se justifica por las características competitivas de los mercados actuales. Se cree que los atributos intangibles e institucionales de las empresas son más perdurables y resistentes a las presiones competitivas que los atributos del producto y de servicio, que tienden a estar altamente estandarizado en la mayoría de las industrias. En esta línea, la creación, refinamiento o incluso la reparación de la reputación corporativa entre los grupos de interés es esencial para el éxito. Diversos autores explican cómo los activos reputacionales, aunque no están legalmente protegidos por derechos de propiedad, se consideran activos específicos que se caracterizan por altos niveles de complejidad y especificidad, creando así una fuerte barrera competitiva.

En su búsqueda de nuevos caminos para explicar la reputación, los investigadores han centrado recientemente su atención en el reporting a grupos de interés (o reporting de responsabilidad social corporativa o RSC) (de los Ríos et al., 2012). El reporting a grupos de interés se define como la presentación a los diversos grupos de interés de “la información financiera y no financiera en relación con la interacción de la empresa con su entorno físico y social, como se indica en los informes anuales o de RSC de las empresas” (Hackston y Milne, 1996, p. 78). Esta información incluye detalles sobre medioambiente, energía, recursos humanos, productos y asuntos de participación comunitaria. Los investigadores han considerado el reporting a grupos de interés como una herramienta de valor agregado, que no sólo indica la transparencia de una empresa, sino que también se considera cada vez más como un medio para mejorar la reputación de la empresa (Cormier y Magnan, 2003). De acuerdo con la teoría institucional (o de legitimidad), muchos investigadores consideran que la presentación de la información financiera, social y medioambiental es parte del diálogo entre la empresa y sus grupos de interés, que ofrece información sobre actividades corporativas que ayudan a legitimar la conducta de la empresa y está, pues, estrechamente relacionada con la gestión de la reputación (Bebbington et al, 2008; Michelon, 2011). En consecuencia, se ha producido un rápido crecimiento en el número de informes de RSC publicados en los últimos años, tanto en el plano internacional como en el contexto español, donde se lleva a cabo la presente investigación (Adams et al., 1998; Cormier y Magnan, 2003).

Diversos investigadores han considerado también que un tema crítico en el análisis de la reputación corporativa de RSC (CSRR) es el efecto de la variable industria (Melo y Garrido, 2012). Se ha demostrado que las industrias están sujetas a presiones específicas de diferentes grupos de interés y que la industria actúa como una variable de mediación entre la RSC y la reputación (Brammer y Pavelin, 2006). Así, es bien sabido que el reporting da grupos de interés no es homogéneo entre las industrias (Adams et al., 1998; Holder- Webb et al., 2009; Gamerschlag et al., 2011). Por ejemplo, los bancos “no producen sustancias químicas peligrosas ni vierten contaminantes tóxicos en el aire, la tierra o el agua” (Thompson y Cowton, 2004, p. 199) y, como tal, generalmente revelan poca información medioambiental en sus informes de sostenibilidad y RSC (Gamerschlag et al., 2011). Por el contrario, las empresas de las industrias contaminantes (tales como la automoción, productos químicos, construcción o las industrias de transporte y logística) proporcionan más información sobre cuestiones ambientales. Estas empresas tienen una larga tradición en la presentación de informes de RSC, ya que se han enfrentado a los actores poderosos del movimiento ecologista desde principios de 1980 (Gamerschlag et al., 2011). En consecuencia, de manera proactiva revelan mucha información sobre su desempeño ambiental para reducir los posibles costes políticos derivados de sus actividades contaminantes.

No obstante, y a pesar de todo el apoyo teórico para la relación entre el reporting a grupos de interés y la CSRR, los investigadores han reconocido que todavía hay poca evidencia empírica con respecto a cómo la información contenida en los informes de RSC influye en los procesos

por los que la reputación se construye o destruye. Se necesita específicamente nueva investigación sobre cómo se vinculan la comunicación de RSC y la CSRR en diferentes industrias. Sobre la base de las ideas previas, los autores de este artículo proponen que los efectos de la industria influyen en el reporting de RSC y en su relación con la CSRR, de tal manera que existen diferencias significativas en la intensidad de reporting de las empresas, los tipos de información sobre RSC contenidos en dicho reporting (orientación del reporting a grupos de interés) y el efecto del reporting a grupos de interés en la CSRR. El resto del trabajo está estructurado de la siguiente manera. En las secciones segunda y tercera se discute una visión teórica de la relación entre el reporting a grupos de interés y la CSRR y se presentan tres hipótesis de investigación. Los autores también presentan el método aplicado al estudio, discuten los resultados del trabajo y, por último, resumen las conclusiones, limitaciones y futuras líneas de investigación más relevantes.

## **2. Reporting a grupos de interés y reputación corporativa**

Aunque varias teorías han vinculado tradicionalmente el reporting a grupos de interés con la reputación corporativa, el enfoque más ampliamente aceptado para entender dicha conexión es el proporcionado por la teoría institucional (de legitimidad) (Patten, 1992). Esta teoría se utiliza con frecuencia para entender la adopción voluntaria por parte de las empresas de normas específicas para la presentación de información de RSC (Michelon, 2011). Desde esta perspectiva, los investigadores ven en el reporting de RSC una herramienta de gestión de la reputación que permite responder a las presiones de los grupos de interés a través de la comunicación de la identidad corporativa (Rodríguez et al., 2013). Diversos investigadores consideran que existe una considerable superposición entre la legitimidad y reputación corporativas, en el sentido de que una empresa no puede tener una buena reputación sin obtener antes la aprobación de sus grupos de interés a través de la comunicación corporativa y la presentación de informes (King y Whetten, 2008). Por lo tanto, el logro de la legitimidad es esencial para las empresas y es un requisito previo para la gestión de la reputación corporativa.

Los investigadores consideran que la legitimación social es un proceso que traduce los resultados pasados en una expectativa para el futuro. Así, la legitimación transforma el reporting de RSC, una variable de flujo objetiva, en reputación corporativa, una variable perceptual de stock. Los investigadores que se alinean con esta corriente de investigación consideran que las inversiones y comunicaciones homogéneas de RSC en diversos períodos sucesivos, y frente al cambio de los contextos institucionales, consolidan la reputación, porque los grupos de interés traducen los resultados anteriores de la empresa en expectativas respecto al desempeño futuro de la misma. En esta línea, King y Whetten (2008) creen que el vínculo que proporciona una base común para el tratamiento de la legitimidad y la reputación como conceptos complementarios es la noción de la identidad corporativa, que se refleja comúnmente en los informes de sostenibilidad y RSC (Pérez y Rodríguez del Bosque, 2012). Esta perspectiva se explica por las ideas de la teoría de las señales (Toms, 2002), que sostiene que las empresas presentan informes de RSC como una manera de proyectar su reputación hacia los grupos de interés (Michelon, 2011).

Sobre la base de las propuestas de esta teoría institucional, las últimas aportaciones en este campo de estudio han entendido el efecto del nivel de industria como un factor determinante en el reporting a grupos de interés (Adams et al., 1998; Ghazali, 2007; Holder-Webb et al., 2009; Gamerschlag et al., 2011). En concreto, se cree que la industria en la que se inscribe una empresa determina la intensidad (Reverte, 2009; Gamerschlag et al., 2011) y la orientación del reporting a grupos de interés (Ghazali, 2007), porque las presiones de los grupos de interés difieren significativamente de unas industrias a otras (Brammer y Pavelin, 2006). En este trabajo, los autores ya han puesto de manifiesto las diferencias que existen en las demandas de los grupos de interés para que las empresas informen sobre su impacto ambiental en función de que trabajen en industrias contaminantes o no contaminantes (Gamerschlag et al., 2011). Sobre la base de estas ideas, los autores proponen que la teoría institucional también proporciona los fundamentos para identificar diferencias significativas en la influencia del reporting a grupos de

interés sobre la CSRR en diferentes industrias. Sin embargo, esta idea no ha sido explorada empíricamente en estudios previos y este hecho contribuye a la originalidad del presente trabajo.

### **3. Hipótesis de investigación**

#### ***3.1. Industria e intensidad del reporting a grupos de interés***

Los investigadores han demostrado que la pertenencia a una determinada industria afecta a la intensidad del reporting a grupos de interés de las empresas (Gamershlag et al., 2011). Por ejemplo, las diferencias más significativas en la cantidad de información de RSC aportada en los informes de sostenibilidad y RSC se manifiestan entre las industrias de perfil alto y bajo (Hackston y Milne, 1996). A diferencia de las industrias de bajo perfil, las industrias de alto perfil son las que tienen mayor visibilidad en el mercado, alto nivel de riesgo político, y una competencia intensa y altamente concentrada (Roberts, 1992). Aunque las clasificaciones son en cierta medida subjetivas, la mayoría de los investigadores identifican el petróleo, la química, y la papelera como las industrias de alto perfil (Reverte, 2009). Éstas son todas industrias básicas de acuerdo con la Clasificación Nacional de Actividades Económicas disponibles en España. Las empresas de alto perfil tienen un mayor incentivo para proyectar identidades de RSC positivas a través del reporting a grupos de interés y, como tal, reportan significativamente más información sobre RSC que las compañías de bajo perfil (Hackston y Milne, 1996), ya que estas últimas no sufren de altas presiones por parte de sus grupos de interés para comportarse de manera ética y de conformidad con los principios de la RSC (Ghazali, 2007). Estas ideas están estrechamente relacionados con la teoría institucional, que según Reverte (2009) es la teoría más relevante para explicar las prácticas de reporting de RSC de las empresas españolas.

Por contra de las clasificaciones propuestas con anterioridad en contextos internacionales (Day y Woodward, 2009), en este trabajo los autores consideran que la industria financiera también puede ser considerada de alto perfil en España. En este sentido, una nueva corriente de investigación relacionada con la teoría institucional examina el papel que la cobertura de los medios de comunicación juega en el aumento de las presiones políticas a las que se enfrentan las empresas. El alcance de la cobertura de los medios de comunicación aumenta la visibilidad corporativa, invitando a una mayor atención y vigilancia del público (Greening y Gray, 1994). Del mismo modo, los medios de comunicación juegan un papel importante en la conformación o la erosión de la legitimidad de las empresas: los medios de comunicación pueden influir en la reputación corporativa y, al hacerlo, ejercer presión para que las empresas informen de forma más intensa sobre sus actividades de RSC (Cormier y Magnan, 2003). En esta línea, la industria financiera española ha recibido recientemente una gran cobertura mediática debido a la recesión económica que ha sacudido especialmente esta industria. Esta circunstancia genera nuevas formas de presiones coercitiva a cambio de una continua legitimidad para operar en el mercado y puede llevar a las empresas financieras a aumentar su intensidad de reporting a grupos de interés (Ghazali, 2007). Sobre la base de estas ideas se propone la primera hipótesis de investigación de la ponencia:

***H1: La intensidad del reporting a grupos de interés varía entre industrias. Las empresas de las industrias básica y financiera aportan significativamente más información sobre su RSC que las empresas en otras industrias.***

#### ***3.2. Industria y orientación del reporting a grupos de interés***

El tipo de información que se incluye en los informes de RSC también viene influido por la industria (Adams et al., 1998). En este sentido, la teoría institucional apoya la idea de que las empresas son recompensadas si desarrollan un reporting a grupos de interés “isomórfico”, es decir, que preste atención a las presiones institucionales externas de cada industria (Greening y Gray, 1994). El reporting a grupos de interés en las empresas con entornos altamente institucionalizados está formado por las respuestas a las presiones formales de otras organizaciones (isomorfismo coercitivo), por imitación de las estructuras adoptadas por otros en respuesta a las presiones (isomorfismo mimético), o por la conformidad con los estándares normativos establecidos por instituciones externas (isomorfismo normativo) (DiMaggio y

Powell, 1983). Por lo tanto, las empresas que se enfrentan al mismo entorno institucional proporcionado por su industria tendrán estructuras de informes de RSC similares, que difieren significativamente de los informes de RSC en otras industrias, ya que lo que es legítimo en un contexto no tiene por qué serlo en otro (Greening y Gray, 1994).

Por ejemplo, se ha demostrado que las empresas en industrias cuyo proceso de fabricación tiene una influencia negativa sobre el medio ambiente, tales como la industria básica, revelan y comunican mucha más información medioambiental y social que las empresas de otras industrias (Reverte, 2009). Por el contrario, la industria terciaria es donde se produce la mayor creación de empleo y es también la más intensiva en mano de obra. En consecuencia, cabe esperar que las empresas de la industria terciaria presenten una mayor preocupación por demostrar su responsabilidad social a los empleados, ya que es probable que dichas actividades mejoren la imagen corporativa e influyan en las ventas (Jones, 1999). Por último, las empresas de la industria de bienes de consumo son las más grandes e intensivas en capital y, como tal, también tienden a interactuar con la más amplia gama de grupos de interés (Jones, 1999). Sobre la base de estas ideas se propone la segunda hipótesis de investigación de la ponencia:

***H2: La orientación del reporting a grupos de interés varía entre industrias:***

***H2a: Las empresas de la industria básica aportan significativamente más información sobre su RSC para la comunidad (incluido el medioambiente) que las empresas en otras industrias.***

***H2b: Las empresas de la industria de bienes de consumo aportan significativamente más información sobre su RSC para clientes, inversores, socios, reguladores, activistas y medios de comunicación que las empresas en otras industrias.***

***H2c: Las empresas de las industrias financiera y de servicios aportan significativamente más información sobre su RSC para empleados que las empresas en otras industrias.***

### ***3.3. Efectos de la industria en la relación entre la intensidad y la orientación del reporting a grupos de interés y la reputación corporativa***

Por último, la industria en la que operan las empresas determina la forma en que la intensidad y la orientación del reporting a grupos de interés influye en la CSRR. En primer lugar, y de acuerdo con las ideas del enfoque de visibilidad de la teoría institucional, se cree que en aquellas industrias en las que la visibilidad corporativa y exposición a los medios son más altas el reporting a grupos de interés es más relevante y, consecuentemente, las empresas aportan más información (Brammer y Pavelin, 2006). Este reporting a grupos de interés influiría en la CSRR en mayor medida.

Del mismo modo, la teoría del coste político se basa en la premisa de que las empresas tienen visibilidad política y un incentivo para utilizar métodos contables y el reporting a grupos de interés para influir en su visibilidad política y reducir las presiones públicas (Ghazali, 2007). En línea con esta perspectiva, Patten (1992) argumenta que la industria influye en la visibilidad política y esto impulsa el reporting a grupos de interés para evitar una presión excesiva y las críticas de los activistas sociales. Se cree que debido a la industria en la que operan, las empresas tienen que hacer frente a grupos de interés más o menos potentes y, por lo tanto, están expuestas a diferentes niveles de costes políticos y sociales (Gamerschlag et al., 2011). Siguiendo esta línea de argumentación, las empresas de determinados tipos de industrias también pueden enfrentarse a distintos grados de presión para reportar ciertos tipos de información, debido a razones de competencia. En este sentido, los especialistas consideran que las empresas con un reporte más extenso en algunas industrias lo hacen así para gestionar su exposición a los costes regulatorios futuros que podrían ser perjudiciales para su reputación corporativa. Por ejemplo, se espera que las empresas de algunas industrias sean objeto de menores presiones por parte de los grupos de interés en relación a su comportamiento medioambiental o social y, como tal, el reporting a grupos de interés sobre aquellas cuestiones

que no son tan relevantes para ellos no afectaría a la CSRR tanto como en aquellas industrias en las que las presiones ambientales o sociales son más altas (Reverte, 2009).

Los autores de este artículo consideran que, si los diversos grupos de interés tienen diferentes expectativas puestas en las empresas en función de la industria en la que éstas se encuentran, no sólo la información proporcionada por las empresas en su reporting a grupos de interés puede ser diferente, sino que también el efecto de dicho reporting y de sus dimensiones en la CSRR será distinto. Sobre la base de esta idea se propone la tercera hipótesis de investigación:

**H3: La interacción entre la industria y el reporting a grupos de interés influye de manera significativa en la relación entre (a) la intensidad y (b) la orientación del reporting a grupos de interés y la CSRR.**

#### 4. Metodología

La muestra del estudio está compuesta por las empresas incluidas en el índice “MercoEmpresas Responsables”. Merco clasifica a las empresas españolas en función de su reputación después de ser evaluadas por más de 1.500 altos ejecutivos, analistas financieros, ONGs, sindicatos, asociaciones de consumidores y líderes de opinión. El cuestionario consta de tres ítems relacionados con la RSC y la ética empresarial, que se utilizan para construir el índice “MercoEmpresas Responsables”. Estos ítems son los siguientes: (1) Comportamiento Ético Empresarial; (2) Compromiso con la Comunidad y (3) Responsabilidad Social y Ambiental. En 2013, Merco ha clasificado a las 100 mejores empresas españolas en función de su desempeño en RSC. Sin embargo, para el propósito de este estudio se suprimen 16 empresas, ya que no publican informes de sostenibilidad o RSC de manera periódica. De forma similar a la clasificación propuesta por Melo y Garrido (2012), las empresas de la muestra se asignan a una de las siguientes industrias<sup>1</sup>: 1) básica, 2) de bienes de consumo, 3) financiera o 4) de servicios. El perfil de las industrias analizadas en este estudio se presenta en la Tabla 1.

TABLA 1  
Perfil de la muestra

Industrias	Muestra	Variables de control	Media	D.T.	Min.	Max.
<b>Básica</b>	21	Edad	53.90	31.46	5	111
	21	Tamaño (empleados)	30,566	41,138	378	164,923
	21	Performance financiera (ROA)	3.26	3.49	-2.53	11.69
	21	Riesgo (Ratio de deuda)	75.70	11.74	55.77	94.15
<b>Bienes de consumo</b>	26	Edad	44.12	24.60	20	103
	26	Tamaño (empleados)	5,963	19,412	64	100,138
	26	Performance financiera (ROA)	11.68	12.72	0.58	49.37
	26	Riesgo (Ratio de deuda)	67.04	17.20	34.63	96.11

	24	Performance financiera (ROA)	4.49	7.77	-13.26	22.58
	24	Riesgo (Ratio de deuda)	69.23	17.57	29.03	97.28

Para medir el reporting a grupos de interés, los autores realizan un análisis de contenidos de los informes de sostenibilidad y RSC referentes al ejercicio 2011 (Gamerschlag et al., 2011; de los Ríos et al., 2012). Los autores utilizan la categorización de Fombrun et al. (2000) para definir las ocho dimensiones del reporting a grupos de interés de las empresas del índice “MercoEmpresas Responsables”: (1) empleados, (2) clientes, (3) inversores, (4) comunidad, (5) reguladores, (6) socios, (7) activistas y (8) medios de comunicación. Los ítems de cada dimensión son tomados de trabajos anteriores que han tratado de medir las actividades de RSC en diferentes industrias (Brammer y Pavelin, 2006; Michelon, 2011; Melo y Garrido, 2012; de

los Ríos et al., 2012). Cada ítem se evalúa en función de si la empresa trabaja en él (1) o no (0). La valoración de cada ítem responde a la frase “Esta empresa informa de importantes actividades implementadas (o resultados logrados) en este dominio de la RSC”. La puntuación final de una empresa en una dimensión de reporting a grupos de interés es la media ponderada de las evaluaciones obtenidas en cada uno de los ítems que forman la dimensión. Los autores también calculan la puntuación global de reporting a grupos de interés de cada empresa. Esta variable representa la suma de los resultados que cada empresa obtiene en todas las dimensiones de reporting<sup>ii</sup>. Cada informe es revisado por dos jueces de forma independiente y el coeficiente de concordancia entre jueces, calculado de acuerdo con Perrault y Leigh (1989), reporta un nivel de acuerdo del 99.6%, notablemente por encima del valor mínimo recomendado del 90%. En el apéndice se muestra información adicional con respecto a los ítems del reporting.

Para probar las hipótesis H1 y H2, primero se realizan análisis univariantes que permiten a los autores determinar la intensidad y orientación del reporting a grupos de interés en cada industria. También se calculan varios estadísticos F (ANOVA) para analizar si existen diferencias significativas entre las industrias relativas a la intensidad y orientación de su reporting a grupos de interés. Para testar la hipótesis H3, se realizan análisis multivariantes. En este sentido, se implementan dos análisis de regresión donde la CSRR es la variable dependiente. Las estimaciones se realizan aplicando mínimos cuadrados ordinarios (MCO) a través del estimador robusto. Este estimador utiliza la corrección de White con el fin de controlar los problemas de heterocedasticidad que suelen aparecer en este tipo de análisis. El primer modelo (1) incluye una medida global de reporting a grupos de interés como factor independiente que ayuda a explicar las puntuaciones de CSRR. Además, la muestra se divide en cuatro grupos, de acuerdo a cada industria de pertenencia de las empresas del índice “MercoEmpresas Responsables”. La regresión utilizada se muestra en el modelo (1) .

$$CSRR_i = \beta_0 + (\beta_1 + \beta_2 Consumo + \beta_3 Finanzas + \beta_4 Servicios) Reporting_i + \beta_5 Edad_i + \beta_6 Tama\tilde{n}o_i + \beta_7 ROA_i + \beta_8 Riesgo_i + \varepsilon_{it} \quad (1)$$

Para llevar a cabo la prueba empírica, junto a la variable de reporting a grupos de interés en el modelo se incluyen tres variables de interacción. La incorporación de estas variables en el modelo permite a los autores obtener evidencia de la hipótesis H3. Para aquellas empresas que forman parte de la industria básica, se testa la hipótesis nula  $H_0: \beta_1=0$ . Si esta hipótesis nula es rechazada, entonces el coeficiente  $\beta_1$  es estadísticamente distinto de cero y mide la sensibilidad de la CSRR al reporting a grupos de interés para el caso de aquellas empresas que pertenecen a dicha industria. Con el fin de interpretar correctamente las variables de interacción, es necesario realizar una prueba de restricción lineal. Así, los autores ponen a prueba la hipótesis nula  $H_0: \beta_1 + \beta_2 = 0$  para la industria de bienes de consumo,  $H_0: \beta_1 + \beta_3 = 0$  para la industria financiera y  $H_0: \beta_1 + \beta_4 = 0$  para la industria de servicios. Si se rechazan estas hipótesis nulas, las sumas de los coeficientes son estadísticamente diferentes de cero y capturan la estimación de la sensibilidad de la CSRR al reporting a grupos de interés para cada industria.

El segundo modelo (2) incluye todas las dimensiones del reporting a grupos de interés como variables independientes, que interactúan con las variables ficticias de industria. Con el fin de interpretar correctamente las variables de interacción, es necesario realizar también pruebas de restricción lineales, como se ha comentado en la interpretación del modelo (1) .

$$CSRR_i = \beta_0 + (\beta_1 + \beta_2 Consumo + \beta_3 Finanzas + \beta_4 Servicios) Empleados_i + (\beta_5 + \beta_6 Consumo + \beta_7 Finanzas + \beta_8 Servicios) Clientes_i + (\beta_9 + \beta_{10} Consumo + \beta_{11} Finanzas + \beta_{12} Servicios) Inversores_i + (\beta_{13} + \beta_{14} Consumo + \beta_{15} Finanzas + \beta_{16} Servicios) Socios_i + (\beta_{17} + \beta_{18} Consumo + \beta_{19} Finanzas + \beta_{20} Servicios) Comunidad_i + (\beta_{21} + \beta_{22} Consumo + \beta_{23} Finanzas + \beta_{24} Servicios) Reguladores_i + (\beta_{25} + \beta_{26} Consumo + \beta_{27} Finanzas + \beta_{28} Servicios) Activistas_i + (\beta_{29} + \beta_{30} Consumo + \beta_{31} Finanzas + \beta_{32} Servicios) Medios_i + \beta_{33} Edad_i + \beta_{34} Tama\tilde{n}o_i + \beta_{35} ROA_i + \beta_{36} Riesgo_i + \varepsilon_{it} \quad (2)$$

Como se muestra en las ecuaciones (1) y (2), en los análisis también se incluyen variables de control para evitar cualquier sesgo en los resultados. En primer lugar, los autores controlan la edad de la empresa, diferenciando entre empresas “jóvenes” (10 años o menos) y “consolidadas” (más de 10 años). También se controla el tamaño corporativo, medido como el logaritmo del número de empleados (Gamerschlag et al., 2011). La tercera variable de control es el desempeño financiero, medido por la relación entre el beneficio antes de impuestos y los activos totales de la empresa (ROA) (Melo y Garrido, 2012). Por último, el ratio de deuda de las empresas se utiliza para controlar el riesgo corporativo.

## 5. Resultados

### 5.1. Análisis empíricos univariantes

Las Tablas 2 y 3 presentan los resultados de las estadísticas univariantes de CSRR e intensidad de reporting a grupos de interés. En primer lugar, se observa que no existen diferencias significativas en el índice de CSRR de las industrias básica, de bienes de consumo, finanzas y servicios ( $F=0.88$ ;  $p>0.1$ ), aunque sí que existen diferencias significativas en la intensidad del reporting ( $F=5.48$ ;  $p<0.01$ ). En concreto, las empresas financieras (media=0.53) y las empresas de la industria básica (media=0.48) aportan significativamente más información sobre su RSC que las empresas de bienes de consumo (media=0.38) y de servicios (media=0.39). Sin embargo, no se observan diferencias significativas entre la intensidad del reporting a grupos de interés de las empresas en las industrias de bienes de consumo y de servicios (dif.=|0.09|;  $p>0.1$ ) ni en las industrias financiera y básica (dif.=|0.43|;  $p>0.1$ ). Debido a que se esperaba que las empresas de las industrias básica y financiera aportasen significativamente más información a sus grupos de interés que cualquier otro tipo de empresas, la hipótesis H1 se acepta.

(1) Industria básica; (2) bienes de consumo; (3) finanzas; (4) servicio

La Figura 1 presenta los resultados relativos a la orientación del reporting a grupos de interés en cada industria. Los resultados muestran que en todas las industrias las empresas aportan la mayor cantidad de información a sus activistas ( $0.20 < \text{media} < 0.23$ ), empleados ( $0.18 < \text{media} < 0.20$ ) y a la comunidad ( $0.16 < \text{media} < 0.19$ ). En este sentido, la mayoría de las empresas en todas las industrias implementan actividades de voluntariado, participan en actividades de protección del medioambiente y se ocupan de las preocupaciones de sus empleados, como la diversidad, la formación, el desarrollo profesional, la igualdad de oportunidades o la prevención de riesgos. Por el contrario, la menor cantidad de información es la referida a los inversores ( $0.01 < \text{media} < 0.08$ ) y los socios, tales como proveedores y distribuidores ( $0.04 < \text{media} < 0.09$ ). Este tipo de información se refiere principalmente a resultados económicos que ya están incluidos en los informes financieros de las empresas o a

actividades realizadas por las empresas para garantizar que los proveedores y distribuidores se alinean con sus principios y objetivos en materia de RSC.

FIGURA 1

**Orientación del reporting a grupos de interés**

Al comparar las dimensiones del reporting a grupos de interés entre industrias (Tabla 4), se observa en primer lugar que no existen diferencias significativas en la cantidad de información aportada a la comunidad ( $F=1.68$ ;  $p>0.1$ ) y, como tal, se rechaza la hipótesis H2a. Por otra parte, tampoco existen diferencias significativas entre las industrias con respecto al reporting a clientes ( $F=1.28$ ;  $p>0.1$ ), socios ( $F=0.48$ ;  $p>0.1$ ) y activistas ( $F=2.05$ ;  $p>0.1$ ). No obstante, se observan diferencias significativas en el reporting a inversores ( $F=0.71$ ;  $p>0.01$ ), reguladores ( $F=3.07$ ;  $p<0.05$ ) y medios de comunicación ( $F=3.55$ ;  $p<0.05$ ). Sin embargo, los resultados son contrarios a las expectativas de los autores. Las empresas de bienes de consumo siempre aportan menos información en estas dimensiones que las empresas en las industrias básica y de finanzas. Con base en estos resultados, se rechaza la hipótesis H2b. Por último, no se observan diferencias significativas entre las industrias en el reporting a empleados ( $F=4.00$ ;  $p>0.01$ ). En concreto, las empresas financieras reportan significativamente más información a los empleados que las empresas de las industrias básica (dif.=|0.12|;  $p<0.1$ ), de bienes de consumo (dif.=|0.16|;  $p<0.1$ ) y de servicios (dif.=|0.22|;  $p<0.01$ ). Los autores esperaban que, junto con la industria financiera, las empresas de servicios también informasen notablemente más a sus empleados que el resto de las industrias. No obstante, se observa que las empresas de servicios reportan la menor cantidad de información a sus empleados (media=0.57) y, como tal, la hipótesis H2c sólo se acepta parcialmente.

## 5.2. Análisis empíricos multivariantes

Las Tablas 5 y 6 muestran los resultados de las dos regresiones aplicadas para testar la hipótesis H3. En primer lugar, se observa que la intensidad del reporting a grupos de interés influye positivamente en la CSRR de la industria financiera ( $\beta=0.07$ ;  $p<0.05$ ). Sin embargo, la intensidad del reporting no afecta significativamente a la CSRR en las industrias básica ( $\beta=0.05$ ;  $p>0.1$ ), de bienes de consumo ( $\beta=0.02$ ;  $p>0.1$ ) y de servicios ( $\beta=0.02$ ;  $p>0.1$ ). Cuando se analiza el papel de las dimensiones del reporting a grupos de interés sobre la CSRR, los resultados muestran que en la industria básica solamente el reporting a socios influye positivamente en la CSRR ( $\beta=0.83$ ;  $p<0.05$ ). En la industria de bienes de consumo sólo el reporting a clientes es importante para la CSRR, afectándola de manera negativa ( $\beta=-0.43$ ;  $p<0.1$ ). En las empresas de servicios, la CSRR viene influida positivamente por el reporting a empleados ( $\beta=0.94$ ;  $p<0.1$ ), pero está afectada negativamente por el reporting a reguladores ( $\beta=-0.82$ ;  $p<0.01$ ). Por último, hasta cuatro tipos de información a grupos de interés influyen en la CSRR en la industria financiera. En esta industria, la CSRR se ve afectada positivamente por el reporting a inversores ( $\beta=0.58$ ;  $p<0.01$ ) y activistas ( $\beta=0.58$ ;  $p<0.01$ ), pero se ve influida negativamente por la información a clientes ( $\beta=-1.04$ ;  $p<0.05$ ) y medios de comunicación ( $\beta=-0.78$ ;  $p<0.1$ ). Sobre la base de todos estos resultados, la hipótesis H3 es aceptada porque la influencia de (a) la intensidad y (b) la orientación del reporting a grupos de interés sobre la CSRR varía significativamente entre industrias.

En cuanto a las variables de control, se observa que las puntuaciones de la CSRR varían significativamente de acuerdo al tamaño de las empresas en las especificaciones I ( $\beta=0.05$ ;  $p<0.05$ ) y II ( $\beta=0.07$ ;  $p<0.01$ ). La CSRR también está influenciada significativamente por el riesgo corporativo en la especificación I ( $\beta=0.39$ ;  $p<0.05$ ). La edad y los resultados financieros son insignificantes al explicar cómo se construye la CSRR en las diferentes industrias.

## 6. Discusión

La mayoría de los resultados de este trabajo son de alguna manera consistente con los hallazgos previos en la literatura académica, lo que demuestra que el reporting a grupos de interés de las empresas en España es acorde a las tendencias internacionales de información de RSC. Por ejemplo, las empresas de todas las industrias comunican sobretodo acerca de sus recursos

humanos, la comunidad y el medioambiente (Ghazali, 2007; Holder-Webb et al., 2009). También se demuestra que las empresas de la industria básica aportan significativamente más información a sus grupos de interés que las empresas en la mayoría de las otras industrias analizadas, debido a las fuertes presiones sociales derivadas de su visibilidad, el riesgo político y la intensa competencia (Gamerschlag et al., 2011). Además, las empresas de la industria básica aportan más información en casi todas las dimensiones de reporting consideradas en este trabajo (sólo igualadas por las empresas financieras). Por el contrario, las empresas en las industrias de bienes de consumo y servicios reportan significativamente menos información a grupos de interés debido a su bajo impacto medioambiental y social (Adams et al., 1998; Gamerschlag et al., 2011). Por último, las empresas financieras, que forman parte de una industria altamente intensiva en mano de obra, aportan significativamente más información sobre su RSC a empleados que las empresas del resto de industrias (Melo y Garrido, 2012).

No obstante, se observan también algunas características distintivas con respecto a los tipos de información reportada a los grupos de interés por parte de las empresas españolas de diferentes sectores de actividad. Por ejemplo se observa que, contrariamente a los resultados de investigadores previos, las empresas de la industria básica no reportan significativamente más información medioambiental y/o social que otras industrias (Reverte, 2009). Los autores justifican este resultado recurriendo a las crecientes presiones sufridas por casi todo tipo de empresas para incorporar consideraciones sociales y medioambientales en sus actividades empresariales. Por ejemplo, los minoristas se ven cada vez más criticados por diversos grupos de interés debido a su creciente peso económico y la importancia de las externalidades generadas por sus actividades en la sociedad y el medioambiente (Mejri y de Wolf, 2012). También las decisiones de préstamos de las empresas financieras tienen un impacto en el medioambiente (Day y Woodward, 2009) y este hecho justifica la gran cantidad de información presentada a la comunidad en esta industria. Por otra parte, si bien se espera que las empresas de bienes de consumo reporten significativamente más información que otras industrias en la mayoría de las dimensiones de reporting a grupos de interés (debido a la gran cantidad de agentes económicos a los que tienen que satisfacer), se ha demostrado que esta hipótesis no se cumple en el contexto español. Una vez más, este resultado puede ser justificado por las crecientes presiones que los grupos de interés ponen en las empresas de todos los sectores de actividad para que éstas adopten una planificación integral de sus actividades de RSC.

Los resultados que contradicen las expectativas de los autores son en su mayoría justificados por el reporting a grupos de interés de las empresas financieras. En este sentido, los resultados del trabajo demuestran que el reporting a grupos de interés es una herramienta de gestión especialmente relevante en la industria financiera española. Contrariamente a los hallazgos previos en otros países (por ejemplo, Day y Woodward, 2009), no sólo las empresas financieras reportan significativamente más información sobre su RSC que la mayoría de las industrias en el país, sino que también la presentación de este tipo de informes está vinculada de manera más estrecha a la reputación de RSC que la presentación de informes de RSC en las industrias básica, de bienes de consumo y de servicios. Estos resultados concuerdan con las teorías institucional y del coste político. En este sentido, aunque los investigadores no han considerado tradicionalmente la industria financiera como un sector de alto perfil, los recientes acontecimientos en España demuestran que las empresas financieras tienen la mayoría de las características identificadas en las industrias de alto perfil en diversos países (Roberts, 1992). Por ejemplo, la industria financiera se enfrenta actualmente a una grave crisis de confianza muy relacionada con la recesión económica en España. Los investigadores consideran que las crisis crean una forma de presión institucional que refleja los males sociales, constituye una amenaza a la legitimidad de las empresas y genera presiones institucionales por parte de los grupos de interés (Greening y Gray, 1994). De este modo, la crisis ha llevado a la industria financiera a ser altamente visible y sus costes políticos han aumentado de manera significativa. Estas circunstancias generan demandas de rendición de cuentas que se traducen en nuevas formas de presión coercitiva a cambio de una continua legitimidad en el mercado (Ghazali, 2007). En resumen, por tanto, las crisis pueden incrementar las presiones institucionales e influir claramente en las percepciones de reputación corporativa de los grupos de interés. Este hecho

lleva a las empresas financieras a reportar mucho más que cualquier otra industria en el país, siendo este reporting altamente relevante para mantener su reputación.

Por último, se observa que la intensidad de reporting a grupos de interés no influye significativamente en la CSRR en tres de las cuatro industrias analizadas en este trabajo (básica, de bienes de consumo y de servicios). En algunas de estas industrias hay algunos efectos de las dimensiones específicas de reporting, tales como empleados, clientes, reguladores y socios, pero estos resultados se encuentran sin duda muy lejos de las expectativas de los directivos en estas industrias. En el caso de las industrias de bienes de consumo y servicios, los resultados podrían estar estrechamente relacionados con la baja intensidad de su reporting. En cuanto a la industria básica, los autores creen que las empresas no están enfocando correctamente sus informes de RSC. Por ejemplo, los resultados del estudio de Holder-Webb et al. (2009) demuestran que, en un contexto de recuperación de legitimidad, la única área importante para la industria básica se encuentra en la categoría de asuntos medioambientales. Sin embargo, este no es el caso en España, donde el reporting de información a la comunidad (incluyendo la información medioambiental) no es el más extenso. Las empresas aportan significativamente más información a otros colectivos, como los empleados. Al mismo tiempo, no existen diferencias significativas en el reporting a la comunidad entre la industria básica y el resto de industrias.

## **7. Conclusiones, limitaciones y líneas futuras de investigación**

En esta ponencia los autores describen las prácticas de reporting empresarial a grupos de interés en España y establecen la relación que existe entre este reporting y la reputación de RSC de las empresas. Los resultados demuestran que la presentación de informes de RSC es especialmente relevante y útil en la industria financiera, que recientemente ha sido acusada de ser el principal culpable de la actual recesión económica (de los Ríos et al., 2012; Rodríguez et al., 2013). Aun cuando es cierto que la industria financiera no tiene significativamente mejor reputación que otras industrias en España, los resultados del trabajo sugieren que si las empresas financieras no reportasen tanta y tan variada cantidad de información sobre su RSC como hacen, su reputación sería notablemente menor de lo que es. La crisis económica ha afectado seriamente a esta industria y el hecho de que el reporting a grupos de interés esté influyendo positivamente en su reputación implica que menos comunicación tendría efectos perjudiciales en su posicionamiento e imagen. Estos resultados son de gran interés para los directivos de la industria financiera porque justifican la utilidad y pertinencia de los informes de sostenibilidad y RSC que se están desarrollando en este contexto. Algunas otras consecuencias son también relevantes para el resto de industrias en España porque se ofrecen ideas interesantes sobre cómo las empresas pueden mejorar sus informes de RSC y su impacto en la reputación corporativa.

De todos modos, este estudio no está exento de limitaciones. En primer lugar, los investigadores han confirmado recientemente que hay un problema de endogeneidad en la relación entre la comunicación y la reputación de RSC. Esta relación es bidireccional, de tal manera que no sólo la presentación de informes de RSC influye en cómo la sociedad percibe la reputación corporativa, sino que también esta percepción determina las actividades adoptadas y comunicadas por las empresas en el dominio de la RSC (Michelon, 2011). En consecuencia, los investigadores futuros deben dedicar atención a la dirección de la relación entre la comunicación y la reputación de RSC con el fin de desarrollar modelos que puedan promover un conocimiento académico más profundo sobre la relación RSC-reputación. Además, los autores eligen una categorización de reporting a grupos de interés que sólo tiene en cuenta los elementos más generales de la RSC. El objetivo es tener una herramienta de medición que puedan aplicarse al análisis de diversas industrias. Sin embargo, los autores consideran que los futuros investigadores que estén interesados en profundizar en el estudio de una sola industria puede ser que necesiten desarrollar temas específicos que añadan a esta clasificación con el fin de captar todo el significado del reporting en cada industria. Por ejemplo, las microfinanzas son especialmente relevante en la industria financiera y nuevos ítems podrían ser considerados en la evaluación de los informes de RSC en este contexto. Por último, la calidad de la información proporcionada por las empresas es también relevante (de los Ríos et al., 2012). Futuras líneas de

investigación deberían buscar formas más sofisticadas de evaluación del reporting a grupos de interés, teniendo también en cuenta la calidad de los informes de RSC.

## 8. Notas

i **Industria básica** (productos químicos, materiales de construcción, silvicultura, papel y siderurgia); **Bienes de consumo** (automóviles y piezas, ropa y calzado, textiles, electrodomésticos, mobiliario y revestimientos de suelo, procesadores de bebidas, procesadores de alimentos y agricultura, mantenimiento de la salud, gestión de hospitales, equipos médicos, productos para el hogar, productos personales, productos farmacéuticos, biotecnología, tabaco); **Finanzas** (servicios bancarios, aseguradoras); **Servicios** (minoristas, ocio y entretenimiento, medios de comunicación y fotografía, servicios de apoyo, transporte, distribución de alimentos y medicamentos, telecomunicaciones fijas, telecomunicaciones inalámbricas).

ii Con el propósito de simplificar la interpretación de los resultados, todos los índices que se discuten en la sección de resultados se convierten a una escala de 0-1.

## RESUMEN

*De la compleja conceptualización del voluntariado, proponemos tres dimensiones que definen al voluntario: la no remuneración, la estructura y la temporalidad. Un ejemplo que reúne las tres condiciones es el voluntario en mega-eventos, ámbito de nuestro estudio empírico. Basándonos en la conceptualización del valor percibido, proponemos dos objetivos: la creación de un índice compuesto a partir de las diferentes dimensiones de valor de la experiencia de voluntariado, y estudiar si existen diferencias significativas en el valor del índice en función de factores socio-demográficos. Las escalas son testadas y el índice propuesto con técnicas multivariantes sobre una muestra de 1427 voluntarios.*

## PALABRAS CLAVE:

Voluntariado, valor percibido, índice, mega-eventos

## 1. Introducción

Son múltiples las manifestaciones reales que del fenómeno del voluntariado se pueden observar en nuestras sociedades contemporáneas. En este sentido, a lo largo del último siglo, diferentes actividades y situaciones se han ido agregando al concepto y lo van construyendo y completando (Handy et al., 2000). Así, en lo que respecta a la evaluación estadística del voluntariado por países, las diferentes formas culturales que, como fenómeno social, éste puede adoptar, dificultan considerablemente su medición y su comparación. En un nivel macroeconómico, existen por tanto notables dificultades para encontrar criterios uniformes para determinar qué es y qué no es voluntariado (García-Mainar y Marcuello, 2007; Rotolo y Wilson, 2012)

En un análisis micro, sin embargo, existe abundante investigación sobre la riqueza psicológica y social de este comportamiento, siendo explicado a través de diferentes variables sociodemográficas como la edad (e.g. Callow, 2004; Handy et al., 2006), lugar de residencia (e.g. Handy et al., 2006; Rotolo and Wilson, 2012), y la religión (e.g. García-Mainar y Marcuello, 2007; Tao y Yeh, 2007; Rotolo y Wilson, 2012; van Ingen y Dekker, 2011; van Tienen et al., 2011),

Esta doble realidad, a saber por un lado, una notable dificultad para delimitar conceptualmente el voluntariado, y por otro, el interés por comprenderlo y explicarlo mediante la existencia de diferencias personales en el comportamiento del voluntario es la que ha impulsado este trabajo. En él proponemos, a imagen de otros trabajos anteriores (Gallarza et al. 2009; 2010; 2013) que la actividad del voluntario sea concebida como una experiencia de consumo que puede ser analizada a través de una variable endémica en el estudio del comportamiento del consumidor: el valor percibido. Ésta es considerada por muchos estudiosos como la piedra angular del estudio del marketing y de la gestión estratégica de los mercados (Nilson, 1992; Band, 1994; Heskett *et al.*, 1997; Woodruff, 1997).

Dedicar tiempo y esfuerzo a una actividad de voluntariado es una opción personal de uso de nuestros recursos en el mercado del tiempo libre, y por ello puede entenderse como un tipo de “consumo”, y ser analizado a partir del valor percibido derivado de la experiencia. Así, bajo este prisma disciplinar (comportamiento del consumidor) y metodológico (valor percibido) en este trabajo buscamos aportar mayor conocimiento sobre el fenómeno del voluntariado, en primer lugar de manera teórica, al ofrecer una visión de la gran variedad de conceptualizaciones del voluntariado y profundizar en los ejes conceptuales que lo delimitan, y en segundo lugar con una aproximación aplicada, al ofrecer un estudio empírico realizado sobre una de las expresiones más recientes y completas del voluntariado: la participación de voluntarios en la organización de mega-eventos turísticos.

Para ello, en primer lugar, en el marco conceptual se aborda la complejidad de la conceptualización del voluntariado y se proponen, de acuerdo con la literatura, tres ejes o dimensiones básicas que definen al voluntario las cuales se consideraran para la elección del ámbito y universo a estudiar. A continuación, se plantean los objetivos del estudio empírico y la metodología utilizada para conseguirlos. Basándonos en la conceptualización del valor percibido, se propone como primer objetivo la creación de un índice compuesto a partir de las diferentes dimensiones de valor de la experiencia de voluntariado, siendo el segundo objetivo estudiar si existen diferencias significativas en el valor medio del índice en función cuatro diferentes factores socio-demográficos. Para la consecución de los objetivos se utilizarán dimensiones y escalas recogidas de la literatura académica y se tratará la información obtenida de una muestra de 1427 voluntarios con técnicas multivariantes y univariantes. Se presentarán los resultados obtenidos, y por último las conclusiones, limitaciones y futuras líneas de investigación.

## 2. Marco conceptual

En la actualidad, las acciones de voluntariado se orientan mayoritariamente no sólo a cubrir las necesidades básicas del entorno, sino a satisfacer intereses creados mucho más variados y heterogéneos, alcanzando sus intervenciones espacios más complejos e interactivos con otros agentes de la sociedad (García et al., 2011). El resultado es un sector heterogéneo y una realidad compleja en la que no sólo entran en juego diferentes instituciones (la empresa, la administración pública, etc.), sino que aparecen nuevas formas de hacer voluntariado, que necesitan de un reconocimiento y

reflexión por parte del sector: entre ellos por ejemplo, el microvoluntariado, el voluntariado cívico, o el voluntariado corporativo (Garrido, 2011). Como reflejo de esta realidad, institucionalmente Naciones Unidas reconoce cuatro tipos diferentes de actividad voluntaria: la ayuda mutua o autoayuda, la filantropía o el servicio a los demás, el compromiso de participación cívica, y la promoción o campaña (United Nations, 2011). Como señalan Mc Curley y Vesuvio (1985:14) “la única cosa que puede ser dicha con cierto nivel de certeza acerca del voluntariado es que éste no puede describirse como un algo monolítico”.

## 2.1. Difícil delimitación conceptual del voluntariado

De manera general, voluntariado es el conjunto de todas aquellas actividades realizadas sobre la base de un trabajo no remunerado y llevado a cabo tanto en un contexto de una empresa pública o privada, o de una asociación (Gallarza, 2000). No obstante, esta primera aproximación genérica, no siempre resulta ser coincidente con otras acepciones del término voluntario que encontramos tanto en la literatura científica, como en las expresiones más coloquiales. Es un concepto relativamente polisémico, y por tanto de difícil concreción.

Por todo ello, la delimitación conceptual de lo que es un voluntario, y por ende, del fenómeno del voluntariado no es siempre fácil y nítida. Muchas veces, incluso a nivel personal, es difícil definirse incluso a uno mismo en términos de voluntario porque no se sabe si las actividades que se realizan se pueden considerar realmente voluntariado o no (Cnaan, Handy y Wadsworth, 1996).

Las aproximaciones más normativas, como el diccionario María Moliner define voluntario como: “Persona que se presta voluntariamente a realizar un acto”. La Real Academia establece que voluntario es, “persona que, por su propia voluntad se presta a hacer un servicio o trabajo” (2011, XXII Edición); sin embargo, esta es sólo la cuarta de cinco acepciones que recoge el DRAE, lo que ilustra la complejidad y riqueza del concepto.

La perspectiva institucional tampoco es unívoca: el voluntariado se ha definido desde distintos organismos tanto internacionales (Naciones Unidas, La Declaración Universal sobre voluntariado de la Asociación Internacional por el Esfuerzo Voluntario, etc.), como nacionales (Ley española sobre voluntariado) o autonómicas (por ejemplo Ley autonómica de la Comunidad Valenciana sobre Voluntariado). Estas aproximaciones no son todas coincidentes, por lo que las hemos listado en forma de cuadro (Cuadro 1), junto con otras definiciones halladas en la literatura, con objeto de ilustrar nuestro objetivo de ofrecer una visión de esta variedad de conceptualizaciones del voluntariado.

Cuadro 1  
Distintas conceptualizaciones de voluntario y voluntariado

<i>Definición</i>	<i>Fuente</i>
Una persona voluntaria es aquella que, sensibilizada por la situación social de los colectivos desfavorecidos, excluidos o marginados, decide, de manera altruista y solidaria participar, junto con otras, en diferentes proyectos dentro de una organización de voluntariado, dedicando parte de su tiempo en beneficio de una acción enmarcada en proyectos concretos.	Plataforma del Voluntariado en España (2011) <sup>1</sup>
Se define voluntariado como el conjunto de actividades de interés general, desarrolladas por personas físicas, siempre que las mismas no se realicen en virtud de una relación laboral, funcionarial, mercantil o cualquier otra retribuida y reúna los siguientes requisitos.	Ley de voluntariado de 15 de enero de 1996
Aquella persona que se compromete (noción de compromiso), por iniciativa propia (noción de libertad), de manera desinteresada (noción de acto sin finalidad lucrativa) en una acción organizada (noción de pertenencia a un grupo o una estructura) al servicio de la comunidad (noción de interés común).	Ariño (1999)
Tres características clave definen el voluntariado. 1. No debe llevarse a cabo principalmente por una compensación económica, aunque el reembolso de gastos puede permitirse. 2. Debe llevarse a cabo de forma voluntaria, por propia voluntad individual. 3. Debe ser de beneficio para alguien que no sea el voluntario, o para la sociedad en general, aunque se reconoce que el voluntariado también aporta un	United Nations Volunteers Report, Geneva, February 2001

<sup>1</sup> Además de esta definición disponible en el glosario, en la dirección <http://www.plataformavoluntariado.org/web/s/6-voluntariado/9-guia-sobre-el-voluntariado>, se pueden encontrar otras 12 definiciones de voluntariado de distintos autores e instituciones

beneficio significativo para el voluntario.	
Voluntariado en sentido amplio: Todo aquel que dedica una hora al mes, como mínimo, a una organización no lucrativa. Voluntariado en sentido estricto: todo aquel que dedica más de 16 horas mensuales a una de estas organizaciones.	Ruiz de Olabuénaga (2001)
El concepto de voluntariado del VNU (Programa de Voluntarios de las Naciones Unidas, basado principalmente en trabajar por solidaridad, sin sentirse obligado y sin que la remuneración económica sea el principal estímulo.	SLE Centros de Estudios Avanzados para el Desarrollo Rural (2001)
Consideramos como persona voluntaria aquella que ofrece colaboración (tiempo u otro tipo de recursos) a una Institución sin fines de lucro con el propósito de producir un bien colectivo. Se trata pues de una acción libre, altruista, sin contraprestación económica, orientada al compromiso comunitario.	Ariño, Cuco y Giner (2001: 9)
El prototipo de voluntariado se identifica con una persona que elige libremente prestar algún tipo de ayuda o servicio a otros, que en principio son desconocidos, sin recibir ni esperar recompensa económica alguna por ello y que trabaja en el contexto de una organización formalmente constituida sin ánimo de lucro (o en una Administración).	Chacón y Vecina (2002:29)
Voluntario es aquella persona que ejerce una actividad que consiste en pasar un tiempo, no remunerado (a excepción de los viajes y el otro medio autorizado a los gastos de bolsillo), haciendo algo que tiene como objetivo beneficiar a un tercero que no sea un pariente cercano, o además de él.	The 1997 Police Act (Criminal Records Regulations, 2002) <sup>2</sup>
Voluntario es un individuo que ofrece su servicio o trabajo sin esperar una compensación monetaria a cambio, aunque el servicio prestado origina beneficios tanto al propio individuo como a terceros.	Shim y Kleiner (2003:69)
El voluntariado es la entrega de tiempo y energía a través de un tercero, que puede aportar beneficios cuantificables a los voluntarios, a beneficiarios individuales, grupos y organizaciones, comunidades, medio ambiente y la sociedad en general. Es una elección realizada por propia y libre voluntad, y no está motivada principalmente por fines de lucro o por un sueldo o salario.	Scottish Government – (Volunteering Strategy May 2004) <sup>3</sup>
Cualquier actividad no obligatoria que consiste en pasar el tiempo, no remunerado, haciendo algo en beneficio de los demás (con exclusión de los familiares), la sociedad o el medio ambiente.	(UK Government, 2007)
El voluntariado es una forma de participación de la ciudadanía en la sociedad a través de las organizaciones del tercer sector. De forma libre y por voluntad propia, estas personas deciden participar en la mejora de su entorno implicándose en diferentes causas a través de las entidades sin ánimo de lucro.	García et al. (2011)

## 2.2. Dimensiones definatorias del voluntariado

De la revisión de la literatura y del análisis del Cuadro 1, se pueden proponer una serie de dimensiones comunes a todas estas definiciones. Así, entendemos que las dimensiones definatorias de las actividades de voluntariado son: que tengan carácter altruista y solidario; que su realización sea libre, sin que tengan su causa en una obligación personal o deber jurídico; que se lleven a cabo sin contraprestación económica, sin perjuicio del derecho al reembolso de los gastos que el desempeño de la actividad voluntaria ocasione; y que se desarrollen a través de organizaciones privadas o públicas y con arreglo a programas y proyectos concretos.

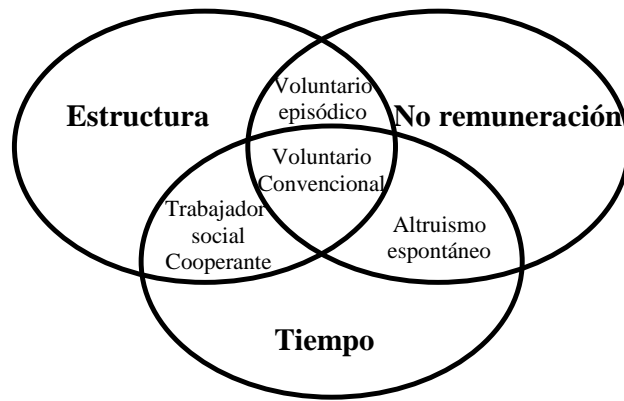

Como paso final en la progresión de nuestro propósito de describir la morfología dispar del concepto y fenómeno del voluntariado, proponemos la Figura 1: un diagrama de Venn construido a la luz de los diferentes criterios definatorios de la actividad de voluntariado revisados hasta ahora. Este diagrama busca evidenciar la existencia de una situación que llamaremos “convencional” cuando coinciden los tres ejes definatorios del voluntariado, y de tres situaciones afines, definidas por los tres círculos y por sus solapamientos. Con el siguiente diagrama buscamos explorar el amplio espectro de actividades relacionadas con el voluntariado con el fin de proporcionar una mejor comprensión de su idiosincrasia.

Figura 1.  
Ejes definatorios del voluntariado

<sup>2</sup> <http://www.legislation.gov.uk/uksi/2002/233/contents/made>

<sup>3</sup> <http://www.scotland.gov.uk/Publications/2004/05/19348/36996>

Del análisis del contenido de las definiciones de voluntariado recogidas, inicialmente dos dimensiones: la *necesidad de estructura* y la ausencia de *remuneración*, pueden ser consideradas como ejes conceptuales básicos del voluntariado. Una tercera dimensión, el *marco temporal*, es propuesta en varias de las definiciones contenidas en el Cuadro 1, además de en los trabajos de Handy et al. (2006), Smith et al. (2010) y Holmes et al. (2010).

De acuerdo con estos tres ejes, un voluntario "convencional" puede ser definido como una persona que ejerce una actividad no remunerada, dentro de una estructura formal (pública, privada o sin fines de lucro), y que implica algún tipo de compromiso de tiempo, es decir, una actividad que abarca las tres dimensiones de forma simultánea.

Si esta actividad es **remunerada**, teóricamente no puede considerarse como voluntariado, aunque la tarea emprendida sea exactamente la misma: estaríamos por tanto en la situación híbrida que refleja nuestro diagrama como es por ejemplo, la actividad de un cooperante o la de un asalariado de ONG. Es muy habitual que entre los recursos humanos de las organizaciones pertenecientes a la economía social cohabiten estos tipos de trabajadores con voluntarios. Cabe resaltar, que investigaciones tanto clásicas como muy recientes han destacado diferencias de percepción entre, las organizaciones con voluntarios, y las que disponen de personal remunerado (Kreutzer y Jäger, 2011; Pearce, 1980).

Por otra parte, si la actividad que realiza una persona consiste en llevar a cabo acciones no **estructuradas** se trata de un comportamiento altruista individual a menudo llamado "ayuda espontánea" (Clary y Snyder, 1991, p. 120). Es un cierto "voluntariado informal" que recoge acciones puntuales de solidaridad: ayudar a cruzar a un invidente o socorrer a un vecino en un momento dado pueden ser ejemplos de estas situaciones, que en nuestro diagrama hemos llamado "altruismo espontáneo". Se trata de un comportamiento no planificado que aparecen en entornos privados (Van Tienen et al., 2011). Académicamente estaríamos dentro del espectro de la llamada "generosidad conspicua" (Ellingsen y Johannesson, 2011, p. 1131). Este tipo de situación puede ser denominado un servicio *amateur* o "de aficionados", frente a una misma actividad más estructurada, llevada a cabo por voluntarios.

El origen de ambos comportamientos "amateur y más profesionalizado como es el del voluntario dentro de una estructura) es el mismo: expresiones de un comportamiento pro-social. En este sentido, algunos autores apuntan como ejemplo de la raíz de este comportamiento pro-social del voluntariado la parábola bíblica del buen samaritano (e.g. Clary y Snyder, 1991). No obstante, queda claro que esta ayuda espontánea no es considerada voluntariado por carecer de estructura. La ley del Voluntariado deja claro que quedan excluidas como voluntariado "las actuaciones voluntarias aisladas, esporádicas o prestadas al margen de organizaciones públicas o privadas sin ánimo de lucro, ejecutadas por razones familiares, de amistad o buena vecindad".

En nuestra opinión, esta delimitación entre ayuda "estructurada" o "no estructurada" es una zona gris en la conceptualización del voluntariado: es necesaria para la contabilización del fenómeno pero es la que está en la raíz de las manifestaciones tautológicas culturales que describíamos en el primer epígrafe, y que dejan a España en peor lugar que otros países en su comportamiento solidario. Tradicionalmente en España, el voluntariado se relacionaba con servicios sociales en aquellas áreas a

las que los gobiernos e instituciones públicas no llegaban (García-Mainar y Marcuello, 2007). En la actualidad, creemos que muchos ciudadanos no se consideran “voluntarios” y por ende no son contabilizados en las estadísticas oficiales, porque desempeñen actividades de carácter “amateur” (por ejemplo participaciones en asociaciones de padres de colegios, o asociaciones de barrio, culturales, religiosas u otras). Además, la ayuda a familiares o a vecinos es también una actividad que carece de estructura, pero la misma actividad en otros países como Australia, Reino Unido o EE.UU, puede pertenecer a estructuras gubernamentales de carácter más local, y por tanto si comprender a voluntarios convencionales. Este análisis pone en evidencia el juego que provocan las restricciones culturales y sociológicas en la definición y la medición de voluntariado.

En cuanto al tercer eje, en términos de **compromiso de tiempo**, no existe una delimitación unívoca de la necesaria dedicación temporal para ser considerado voluntario; aunque algunas instituciones y autores sí tratan de cifrarlo. Esta situación en la conceptualización del voluntariado se ha discutido en la literatura, diferenciando entre "voluntario regular" y "voluntario episódico" (Holmes et al., 2010, p. 265). Este último identifica a las personas que sólo desean ayudar en tareas cortas y bien definidas. Las diferencias específicas en el comportamiento episódico de voluntariado se han encontrado en términos de edad, lugar de nacimiento y de residencia (Handy et al., 2006).

**En definitiva**, cuanto más tratamos de delimitar el fenómeno, más situaciones híbridas escapan y más se empobrece la verdadera naturaleza del voluntariado. Ante estos debates, un cínico podría preguntar: ¿qué grado de consanguinidad debe alcanzar la persona receptora de nuestra solidaridad, y con qué frecuencia horaria debemos dispensarla para poder ser considerados formablemente voluntarios? Por ello consideramos que la necesidad de estadísticas, nacionales o transaccionales, no debe coartarnos en la descripción y análisis de la experiencia psicológica, social y económica del voluntariado.

Por todo ello, dada la amplitud (normativa y positiva) de comportamientos posibles de voluntariado, creemos que el investigador interesado en su comprensión debe adoptar una óptica subjetivista y fenomenológica: es voluntario, el individuo que se siente voluntario en algún momento, en la medida en que destina unos recursos personales a una actividad no remunerada. En este sentido, basándonos en algunos trabajos recientes que han estudiado el voluntariado desde el prisma disciplinar del comportamiento del consumidor (Gallarza et al., 2009; 2010; 2013), proponemos a continuación un estudio empírico que ilustre este fenómeno como comportamiento rico y complejo en una de sus manifestaciones particulares, el voluntariado en mega-eventos. En correspondencia con nuestro marco teórico, el perfil del voluntario elegido para la aproximación empírica reúne las siguientes características: actividad no remunerada, estructurada (la organización de un evento), y con duración temporal o voluntario episódico (cf. Figura 1). Este último rasgo definitorio de la actividad de voluntariado resulta de especial relevancia para el caso concreto investigado, como veremos más adelante, puesto que muchos de los voluntarios que participan en eventos son episódicos en un evento determinado evento (con duración obviamente limitada) pero también son voluntarios regulares en otras actividades, e incluso otros eventos similares. Las diferencias entre unos y otros en la evaluación de su experiencia resulta de interés. Metodológicamente, para el caso específico del tipo de voluntariado investigado, será la naturaleza multidimensional del valor la que nos permitirá, mediante la creación de un índice compuesto a partir de las diferentes dimensiones de valor de la experiencia de voluntariado, conocer mejor la particularidad de este comportamiento de voluntariado.

### **3. Objetivos y metodología del estudio empírico**

#### ***3.1. Ámbito elegido: la participación de voluntarios en mega-eventos***

Los mega-eventos y con ellos la necesaria y masiva participación de individuos como voluntarios en su organización y desarrollo, son expresiones, cada vez más complejas y espectaculares, del potencial de organización y gestión que poseen ciudades, países y administraciones públicas de todos los niveles (Ritchie, 1994; Elstad, 1996; Fayos-Sola, 1997). Además, desde el punto de vista del individuo son ocasiones de expresar un orgullo cívico y una voluntad de participación activa o pasiva como un rasgo de personalidad colectiva de nuestras sociedades modernas (Kemp, 2002; Gursoy y Kendall, 2006; García-Mainar y Marcuello, 2007). Constituyen por tanto un interesante campo de estudio de la riqueza del voluntariado como comportamiento humano descrita anteriormente, y nos permiten ilustrar

dicha riqueza en la medición de percepciones y evaluaciones que difieran por individuos.

La Jornada Mundial de la Juventud (JMJ) es un gran evento religioso y cultural que desde 1985 y cada tres años reúne a jóvenes de todo el mundo durante una semana. Es el evento más internacional y multitudinario que organiza la Iglesia Católica en todo el mundo.

En agosto de 2011, la JMJ congregó en Madrid a más de un millón de jóvenes procedentes de 139 países de los cinco continentes (Europa Press (14/08/2011)). Según datos de la organización de la JMJ Madrid 2011, siguiendo los porcentajes de otras JMJ, aproximadamente un tercio es del área metropolitana de la ciudad donde se celebra, otro tercio del país organizador, y el resto peregrinos de todos los países del mundo; la edad de los jóvenes oscila entre los 15-30 años, con media de edad de 23,9 años, de los cuales 43% son mujeres y 57% hombres. Según los organizadores, cerca de 22.400 voluntarios participaron en el evento; y también citando a Europa Press (14/08/2011) su edad está entre 20 y 23 años, y el país que más voluntarios aporta después de España (12.185), es Polonia (1.048) seguido de Italia (182), México (91), Francia (81), República Democrática del Congo (67), Eslovaquia (53), Croacia (52), Brasil (48), Portugal (40), y Estados Unidos (37). Los voluntarios se responsabilizaron de funciones de atención a los participantes y su acogida en estaciones de tren, autobús y aeropuerto; información a los peregrinos en puntos de la ciudad; gestión de plataformas y redes sociales; colaboración en el centro de prensa, traducción e interpretación; y en la logística de los eventos, así como en el servicio de orden de los actos, el acompañamiento de las autoridades y la coordinación de grupos.

### *3.2. Objetivos del estudio empírico*

El objetivo genérico del estudio empírico es el de mejorar nuestro conocimiento de la morfología del voluntariado, aproximándonos a una de sus manifestaciones más ricas como es el voluntariado en eventos. Este objetivo genérico, metodológicamente se subdivide en dos objetivos específicos:

- a) construir un índice del valor de la experiencia del voluntario, que refleje la naturaleza multidimensional de la actividad desarrollada
- b) estudiar si existen diferencias significativas en el valor medio del índice en función de determinados factores socio-demográficos: edad, género, nivel de estudios y experiencia previa como voluntario.

### *3.3. Elección de dimensiones y escalas de valor*

La revisión de la literatura sobre voluntariado y grandes eventos permitió hallar múltiples trabajos anteriores, centrados principalmente en la motivación (e.g. Callow, 2004; Monga, 2006; Farrell et al., 1998; Strigas y Newton-Jackson, 2003; Saleh y Wood, 1998; Hibbert, Piacentini y Al Dajani, 2003; Handy et al., 2006). Son más escasos aquellos que analizan percepciones posteriores al evento, como la satisfacción o el valor percibido. Entre estos últimos, se retuvieron los trabajos de Gallarza y colegas (2009; 2010; 2013), que proponen escalas de valor percibido de la experiencia de voluntariado en eventos religiosos, construidas ad-hoc sobre la base de la propuesta conceptual de valor de Holbrook, y se decidió replicar la misma escala sobre una nueva experiencia de voluntariado: las Jornadas Mundiales de la Juventud.

Dentro de la amplia línea de investigación conceptual sobre valor, Holbrook es reconocido como pionero en la exploración de la dimensionalidad hedonista en el consumo (Holbrook y Hirschman, 1982; Holbrook y Corfman, 1985), y su posterior tipología (Holbrook, 1999) ha sido alabada porque *“permite una adaptación más sencilla a otra serie de experiencias de consumo como la religión, los artes y las experiencias de ocio”* (Day y Crask, 2000), lo que la hace muy atractiva para el tipo de experiencia que investigamos: ser voluntario en un evento religioso.

Esta tipología contempla ocho diferentes valores sobre la base de una matriz 2\*2\*2 de tres ejes conceptuales (extrínseco vs. intrínseco, orientado hacia sí mismo vs. hacia otros, y activo vs. reactivo), lo que genera ocho tipos diferentes de valor: eficiencia, excelencia, entretenimiento, estética, estatus, estima, ética y espiritualidad. De manera más simplificada (eludiendo el eje activo vs. reactivo) esta estructura, engloba cuatro facetas del comportamiento humano: funcional, social, hedonista y altruista:

- a) En la dimensión altruista, es decir, orientada a los otros, se consideró la espiritualidad para analizar la implicación en un evento religioso: se consideraron 3 indicadores relacionados con el apoyo dado a las familias y a la Iglesia Católica, junto con el orgullo cívico de ayudar a los otros y a la ciudad.
- b) En la dimensión social, puesto que el voluntariado tiene mucho que ver con la interacción social y el “servir a otros” frente a “servirse a uno mismo” (Handy et al., 2006), se contempla una escala de 9 indicadores relacionados con el conocimiento de nuevas personas, enriquecimiento por el reconocimiento de otras personas, familiares y amigos, felicidad de la gente alrededor, relación con los peregrinos, relación entre voluntarios, personas felices por intereses similares, el grupo es más importante que la tarea.
- c) Respecto a la dimensión hedonista, esto es de disfrute (extrínseca y personal en la tipología de Holbrook) se consideró el entretenimiento o diversión (6 ítems) para recoger la vertiente lúdica o de disfrute personal que conlleva una actividad por definición voluntaria: vivir una experiencia única, intensidad de la experiencia, entretenimiento y diversión, experiencia excitante, buen ambiente y carácter universal del evento.
- d) En la dimensión funcional se escogió la variable activa (eficiencia) frente a la reactiva (calidad como excelencia) puesto que ser voluntario es una experiencia de carácter activo más que reactivo; se concibe la percepción de eficiencia como medida de utilidad, y se propone para su evaluación una escala de 4 ítems sobre la organización del evento: las tareas asignadas, la obtención de experiencia laboral, gestión del tiempo, información dada y trabajo en grupo.

Excepto para la espiritualidad, variable demasiado contextualizada en los eventos religiosos, esta estructura de cuatro dimensiones es consistente con las investigaciones previas sobre la experiencia de voluntariado en eventos especiales que también miden aspectos funcionales, sociales y de disfrute (e.g., Strigas y Newton-Jackson, 2003; Farrell et al., 1998; Handy et al., 2006).

Por último, a imagen de los trabajos anteriores de Gallarza et al. (2009; 2010; 2013) y siguiendo algunas conceptualizaciones del valor llamadas *trade-off*, esto es, como balance entre sacrificios y costes (Zeithaml, 1988) se introdujo el coste del esfuerzo y el tiempo realizado (3 indicadores), por ser un sacrificio o coste habitual en la literatura de valor (Berry y Yadav, 1997), y por ser éste aplicable a la experiencia investigada como el coste de oportunidad de dedicar tiempo al servicio de voluntariado en lugar de a cualquier otra actividad: de este modo el tiempo es considerado como el único precio pagado por consumir voluntariado.

### 3.4. Construcción del índice

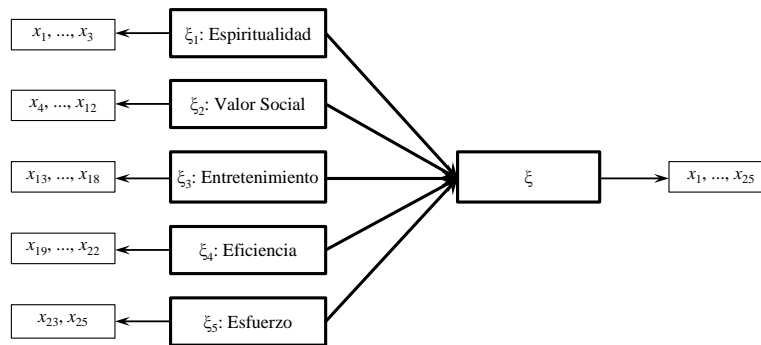

El cuestionario final contiene 25 indicadores que recogen, como describíamos anteriormente, los diferentes niveles de la experiencia de voluntariado: altruismo -espiritualidad- (comportamientos éticos, motivaciones religiosas); social -valor social- (conocer otra gente, establecer relaciones, amigos); hedonismo (diversión, entretenimiento); funcional -eficiencia- (hacer cosas útiles, ser útiles para otra gente); y sacrificio (costes de tiempo y esfuerzo realizados). Todos los indicadores, excepto en la dimensión de coste, fueron expresados positivamente con una escala Likert de 5 puntos. El cuestionario se envió por correo electrónico a todos los voluntarios de la base de datos de la organización de la JMJ (muestra de conveniencia), obteniéndose 1427 cuestionarios útiles.

El índice se ha creado especialmente para describir la auto-valoración de los voluntarios siguiendo el esquema de Guinot et al. (2001). El método se denomina Análisis Multi-Tabla y consiste en crear un modelo estructural en el que se agrupan los datos en varios bloques de indicadores, estando los indicadores incluidos en cada bloque relacionados entre sí de manera que cada bloque es, en esencia, unidimensional. El modelo estructural crea una variable latente para cada bloque y une todos los bloques, con el bloque resultante de la concatenación de todos los bloques.

En este caso los datos se disponen en 5 bloques, en consonancia con la dimensionalidad de valor propuesta: “espiritualidad”, “valor social”, “entretenimiento”, “eficiencia” y “esfuerzo”. En la Figura 2 se muestra el diagrama correspondiente al modelo estructural propuesto para la elaboración del índice.

Figura 2.

### Modelo estructural para el Análisis Multi-Tabla

Las variables latentes  $\xi_1$  a  $\xi_5$  representan un índice parcial (asociado a cada bloque de variables), de manera que  $\xi_1$  resume las variables asociadas a la espiritualidad,  $\xi_2$  resume las variables asociadas al valor social,  $\xi_3$  resume las variables asociadas al entretenimiento,  $\xi_4$  resume las variables asociadas a la eficiencia y  $\xi_5$  resume las variables asociadas al esfuerzo. La variable latente  $\xi$  representa un índice global de la percepción del gestor del valor entregado y se construye a partir de los 25 indicadores.

La forma de obtener el índice (su expresión explícita a partir de los indicadores) es estimar el modelo anterior, para lo cual emplearemos el método PLS, que nos proporciona el peso de los indicadores en la elaboración del índice. Para facilitar la lectura del índice, se ha normalizado a media 0 y varianza 1, de manera que, para calcular el valor del índice correspondiente a un individuo cuyas respuestas a las 25 preguntas son  $\{x_1, x_2, \dots, x_{25}\}$  se emplea la expresión:

$$t = Cte + \sum_{i=1}^{25} w_i x_i$$

Siendo  $Cte$  una constante y  $\{w_i\}_{i=1}^{25}$  los pesos de los 25 indicadores.

Los pesos  $w_i$  obtenidos nos permiten obtener, a partir de las respuestas originales a las 25 preguntas, el valor del índice, ya normalizado.

El índice se ha construido a partir de la valoración que hace el voluntario de su propia experiencia. Por consiguiente, el objetivo del índice es el de constituirse como una medida objetiva del valor de la experiencia, que de alguna manera, se mide a partir de los 25 indicadores. A mayor valor del índice, más altas (en cuanto al grado de acuerdo) son las valoraciones del voluntario.

La constante vale  $Cte = -7.0144$  y los pesos se muestran en la siguiente tabla:

Tabla 1.  
Pesos de los 25 indicadores

Espiritualidad	$w_1$	$w_2$	$w_3$							
	0.0360	0.0452	0.0367							
Valor Social	$w_4$	$w_5$	$w_6$	$w_7$	$w_8$	$w_9$	$w_{10}$	$w_{11}$	$w_{12}$

## 4. Análisis y Resultados

Para dar respuesta al segundo de los objetivos específicos anunciados, se ha utilizado el análisis de la varianza (ANOVA) para estudiar qué factores (edad, sexo, nivel de estudios y experiencia) tienen un efecto significativo sobre el valor medio del índice, y se han representado los intervalos LSD (Least-

Significant Differences) para mostrar en qué consisten las eventuales diferencias significativas encontradas.

#### 4.1. Estudio multivariante

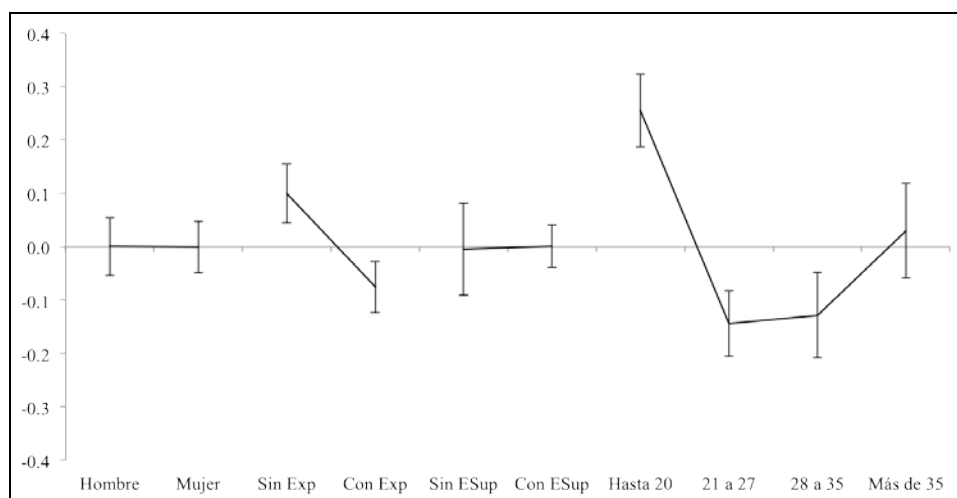

Tal y como se aprecia en la tabla 2 no se ha encontrado una evidencia lo suficientemente fuerte para rechazar la igualdad de medias. El valor medio del índice es significativamente mayor tanto para los individuos sin experiencia previa de voluntariado, como para los individuos con estudios superiores. Respecto a la edad, el valor medio del índice es significativamente mayor, para el grupo de los individuos de hasta 20 años que para el resto de los grupos. Por otra parte, el valor medio del índice para los mayores de 35 años es significativamente mayor que para los grupos de 21 a 27 años y de 28 a 35 años; mientras que no hay diferencia significativa de medias entre los grupos de 21 a 27 y de 28 a 35 años.

Tabla 2.  
Descripción de la muestra y significatividad de las medias.

<i>n</i>		<i>Media</i>	<i>p-value</i>
635	Hombre	0.0005	0.7767
729	Mujer	-0.0004	
616	Sin Experiencia previa	0.0998	0.0097
811	Con Experiencia previa	-0.0758	
251	Sin Estudios superiores	-0.0046	0.0032
1176	Con Estudios superiores	0.0010	
399	Hasta 20	0.2555	<0.0001
498	21 a 27	-0.1440	
291	28 a 35	-0.1285	
239	Más de 35	0.0299	

En la Figura 3 se muestra el gráfico de medias del valor del índice, con los intervalos LSD (Least Significant Differences), para cada segmento. La significatividad de la diferencia de medias se aprecia cuando los intervalos LSD correspondientes no se solapan.

Figura 3.  
Gráficos de medias e intervalos LSD para apreciar visualmente la significatividad de las diferencias de medias en los diferentes segmentos.

#### 4.2. Estudio univariante

Como un paso más en la consecución de nuestro objetivo, se realizó un estudio univariante, cuyo objetivo es estudiar el efecto de las variables de segmentación una a una, de forma que al estudiar, por ejemplo, el efecto del sexo, se agrupa a los individuos en hombres y mujeres, sin tener en cuenta la

edad, el nivel de estudios ni la experiencia previa. La diferencia con el estudio multivariante es que este último estudia el efecto de cada variable bloqueando el de las demás variables, es decir, como cambia el valor medio del índice con la variable de interés, fijando el valor de las demás variables. La diferencia es sutil, ya que en el estudio univariante se ignora el valor de las demás variables, mientras que en el multivariante se mantiene constante (se bloquea el efecto de las demás variables, para aislar el efecto de la que interesa estudiar).

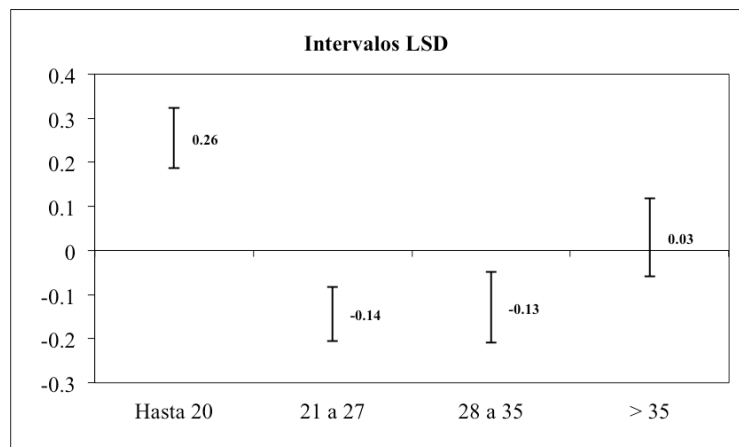

**Edad.** En la tabla 2 se recoge la distribución de la muestra por edades, mientras que la tabla 3 refleja que la edad tiene un efecto significativo sobre el valor medio del índice ( $p\text{-value} < 0,0001$ ).

Tabla 3.  
Efecto de la edad sobre el valor medio del índice (análisis univariante)

Fuente	SC	gl	CM	F-ratio	F-crítica	p-value
<b>Factor</b>	41.39	3	13.796	14.18	2.61	<b>&lt;0.0001</b>
<b>Residual</b>	1384.61	1423	0.973			
<b>Total</b>	1426	1426				

En la figura 4, se aprecia nítidamente que el valor medio del índice es significativamente mayor en el grupo de hasta 20 años que en los demás grupos. Para el grupo de mayores de 35 años el valor medio del índice es significativamente mayor que para los de los grupos entre 21 y 27 años y 28 a 35 años.

Figura 4.  
Gráfico de medias e intervalos LSD para el índice según la edad del voluntario

**Género.** El sexo no tiene un efecto significativo sobre el valor medio del índice ( $p\text{-value} = 0,9874$ ) tal y como se desprende de la tabla 4.

Tabla 4.  
Efecto del género sobre el valor medio del índice (análisis univariante)

Fuente	SC	gl	CM	F-ratio	F-crítica	p-value
<b>Factor</b>	0	1	0.000	0.00	3.85	<b>0.9874</b>
<b>Residual</b>	1426	1425	1.001			
<b>Total</b>	1426	1426				

Aceptamos que el valor medio del índice es el mismo en el grupo de los hombres y en de las mujeres, lo que se aprecia también claramente en la figura 5.

Figura 5.  
Gráfico de medias e intervalos LSD para el índice según el sexo del voluntario

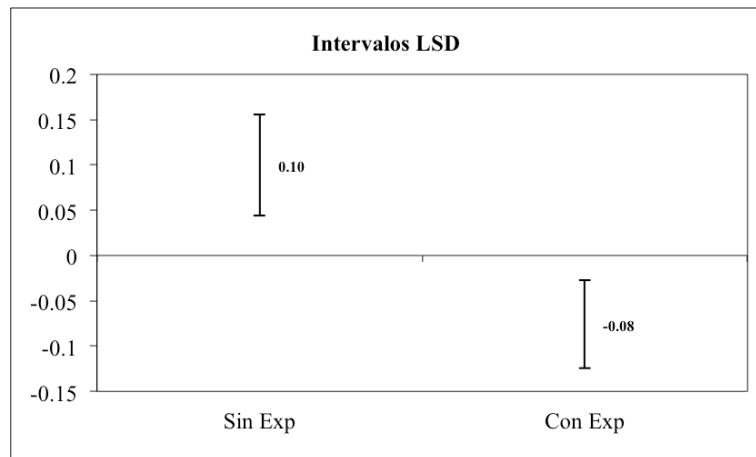

**Experiencia previa.** Tal y como se aprecia en la Tabla 5, la experiencia previa en cambio, sí tiene un efecto significativo sobre el valor medio del índice ( $p\text{-value}=0,0010$ ).

Tabla 5.  
Efecto de la experiencia previa sobre el valor medio del índice (análisis univariante)

Fuente	SC	gl	CM	F-ratio	F-crítica	p-value
<b>Factor</b>	10.8	1	10.800	10.87	3.85	0.0010
<b>Residual</b>	1415.2	1425	0.993			
<b>Total</b>	1426	1426				

En la figura siguiente (figura 6), se constata que el valor medio del índice es significativamente mayor en el grupo de voluntarios sin experiencia previa.

Figura 6.  
Gráfico de medias e intervalos LSD para el índice según la experiencia previa del voluntario

**Estudios Superiores.** El número de voluntarios en el grupo “sin estudios o estudios primarios” era muy escaso, por lo que se procedió a unir con el grupo de estudios secundarios tal y como se recogió en la Tabla 2.

Tabla 6.  
Efecto del nivel de estudios sobre el valor medio del índice (análisis univariante)

Fuente	SC	gl	CM	F-ratio	F-crítica	p-value
<b>Factor</b>	0.01	1	0.007	0.01	3.85	0.9355
<b>Residual</b>	1425.99	1425	1.001			

En la tabla 6 se aprecia que el nivel de estudios no tiene un efecto significativo sobre el valor medio del índice ( $p\text{-value}=0,9355$ ). Aceptamos que el valor medio del índice es el mismo independientemente del nivel de estudios tal y como se aprecia en la Figura 7.

Figura 7.

Gráfico de medias e intervalos LSD para el índice según el nivel de estudios del voluntario

## 5. Conclusiones

Este trabajo ha puesto de manifiesto como existen dificultades para normar y delimitar conceptualmente la actividad del voluntariado, actividad que por tanto resulta interesante analizar bajo el prisma del comportamiento del consumidor, y más concretamente a través del concepto de valor percibido. Así, nos hemos planteado, por una parte, el primer objetivo de construir un índice de valor percibido como medida objetiva de la auto-valoración de la experiencia de voluntario en un mega-evento religioso. Este índice se ha construido con una metodología particular que ha permitido agregar cinco dimensiones de la experiencia, combinando tanto valores positivos como negativos: eficiencia, espiritualidad, valor social, entretenimiento y esfuerzo realizado.

Por otra parte, en cuanto al segundo objetivo, al analizar los resultados sobre la valoración de la experiencia por diferentes variables sociodemográficas, hemos comprobado que no se aprecian diferencias por género o por edad entre los grupos, aunque los mayores de 50 años son los más positivos a la hora de valorar la experiencia. En cambio, si se aprecian diferencias significativas en el grupo de voluntarios con poca o nula experiencia, ya que este grupo valora la actividad de haber sido voluntario en este evento mucho más positivamente que el grupo con amplia experiencia en acciones de voluntariado. Este resultado es interesante en la medida en que la percepción de la tarea encomendada parece depender del carácter episódico o no del tipo de voluntariado: si la experiencia es repetida (voluntarios con experiencia en otros eventos), la valoración es menor, quizá por la pérdida de un efecto “novedad” que evidencia la diferente morfología del comportamiento del voluntario, que evidenciábamos en el marco teórico. En este caso, el estudio empírico ha refrendado la dimensión temporal en la medida en que hemos hallado diferencias significativas entre los voluntarios más episódicos, respecto de los más convencionales (que realizan la actividad con mayor frecuencia).

En lo que respecta a la gestión de los voluntarios, este resultado anima a plantearse cuál es el grado óptimo de rotación del personal voluntario, en la medida en que los que poseen experiencia pueden ser más críticos en su autovaloración, mientras que los menos experimentados pueden suplir su falta de conocimiento con una predisposición e ilusión mayores. De manera más generalizada, las diferencias significativas halladas en este estudio son de interés para la motivación y adiestramiento de voluntarios, en donde por ejemplo la eficiencia en los tiempos y tareas resulta un elemento importante, así como el componente de sociabilidad que este tipo de experiencia conlleva.

Apuntamos como limitaciones del trabajo, en primer lugar, la circunscripción del estudio empírico a un único evento, la JMJ, que además por su carácter religioso posee una idiosincrasia muy particular,

que hace difícil la extrapolación de una de las dimensiones del índice de valor (a saber, la espiritualidad) . En este sentido, en otros trabajos, esta dimensión podría sustituirse por un sentimiento de ética y/o de orgullo cívico, que podría encajar en la llamada dimensión altruista del valor. Además, aunque el tamaño de la muestra es importante, el tipo de muestreo es de conveniencia, lo que se añade a la dificultad de extrapolación de alguno de los resultados.

Las futuras líneas de investigación de este trabajo pueden venir de la explotación de la noción valor percibido, que se sabe crucial para la comprensión del comportamiento humano, en el mercado y también fuera de él. En este sentido, la estructura de valor de Holbrook, como argumentábamos más arriba, se elige como la más apropiada para la investigación en una experiencia de voluntariado religioso, puesto que engloba las facetas funcionales, sociales, hedonista y altruista del comportamiento humano. Pero entendiendo las múltiples morfologías que el fenómeno puede adoptar, tal y como se ha descrito en el marco conceptual, una tipología de valor tan amplia y rica permitiría estudiar también otras formas de voluntariado diferentes, en donde la relevancia de una u otra de las dimensiones, medidas también en forma de índice, podrían ilustrar la diversidad de valores derivados de este comportamiento. Un voluntariado corporativo, por ejemplo, conceptualizado dentro de una estructura, no remunerado y con una secuencia generalmente temporalizada, se espera que presente mejores puntuaciones en la dimensión funcional (eficiencia) y menos en las más sociales. Y otro tipo de acción voluntaria, de carácter más lúdico, como la de los grupos juveniles, o también el llamado turismo voluntario, debería puntuar mejor en las dimensiones hedonistas y sociales que en las funcionales y altruistas. Todas estas posibles adaptaciones de un índice de valor como el utilizado en este trabajo, que considera la multidimensionalidad de la actividad (con sus facetas funcionales, altruistas, sociales y hedonistas, además del coste esfuerzo asociados), se apuntan como futuras líneas de investigación en las que, a partir de una misma metodología (construcción de índices de valor, y búsqueda de diferencias sociodemográficas en las puntuaciones) se pudiera ilustrar y conocer mejor las diferentes manifestaciones de voluntariado.

# LA INNOVACIÓN SOCIAL COMO RESULTADO DE LOS ACUERDOS DE COOPERACIÓN EMPRESA-ORGANIZACIÓN NO LUCRATIVA

---

## RESUMEN

*Este trabajo proporciona evidencias sobre los mecanismos a través de los cuales los acuerdos de cooperación empresa-organización no lucrativa pueden dar origen a actividades de innovación social. En concreto, el estudio analiza el grado en que los acuerdos caracterizados por la presencia de confianza y compromiso fomentan un proceso de aprendizaje organizativo en la organización no lucrativa y promueven un conjunto de proyectos conjuntos de innovación social. La investigación empírica se basa en una encuesta realizada en dos etapas a una muestra representativa de fundaciones españolas. Los datos se han analizado a través de la técnica de los modelos de ecuaciones estructurales. Los resultados confirman la existencia de un vínculo positivo entre el grado de desarrollo relacional de la alianza y el nivel de aprendizaje organizativo sobre técnicas de gestión que tiene lugar en la fundación, así como el efecto positivo de este proceso de transferencia de conocimiento en las prácticas de innovación social.*

## Palabras clave:

*Acuerdos de cooperación empresa-ONG, proyectos colaborativos de valor añadido, aprendizaje organizativo, innovación social, fundaciones*

## 1. Introducción

La innovación social, entendida como “el desarrollo e implementación de nuevas ideas (productos, servicios y modelos) con el objetivo de satisfacer necesidades sociales” (Howaldt y Schwarz, 2010, p. 25), se ha convertido en una fuente de bienestar social y crecimiento económico. Como consecuencia, y a la luz de la evolución del concepto de Responsabilidad Social Corporativa (RSC) (Halme y Laurila, 2009; Porter y Kramer, 2011), representa un resultado crítico dentro de los enfoques que buscan generar valor económico para la empresa a través de su mejora competitiva, pero a la vez crear valor para las comunidades en las que opera la organización, a través del desarrollo de nuevos productos/servicios o modelos de negocio orientados a solucionar problemas sociales o medioambientales.

Aunque el término “innovación social” tiene varios significados, estos tipos de innovaciones comparten dos características básicas. La primera es que “para los emprendedores sociales, la misión social es explícita y central” (Gawel, 2013, p. 1076) y, tanto si se trata de organizaciones lucrativas que persiguen también un beneficio con estas iniciativas como de organizaciones sin ánimo de lucro (ONGs), su objetivo es desarrollar innovaciones que provoquen un cambio social. Por su parte, la segunda de las características comunes es que las prácticas de innovación social suponen la existencia de nuevas formas de colaboración entre las empresas, gobiernos, ONGs, ciudadanos, redes sociales, empleados y/o consumidores con relación a la innovación.

En general, se pueden distinguir tres grandes dimensiones en el concepto de “innovación social” (Moulaert et al., 2005): (1) la satisfacción de necesidades humanas que no están siendo cubiertas actualmente; (2) los cambios en las relaciones sociales (especialmente con relación a los sistemas de gobernanza) que incrementan el nivel de participación de todos, pero particularmente de los grupos más desfavorecidos de la sociedad; y (3) el incremento de la capacidad y el acceso a los recursos para mejorar los derechos a satisfacer las necesidades humanas y a la participación (empoderamiento). Estas dimensiones se vuelven más importantes en áreas en las que las empresas y las instituciones públicas presentan fallos (Howaldt y Schwarz, 2010) y es precisamente aquí donde el sector no lucrativo aparece como una fuente básica de innovación social. Sin embargo, no todas las ONGs son emprendedores sociales (Weerawardena y Sullivan Mort, 2006). Por lo tanto, analizar cómo las ONGs pueden incrementar su capacidad de innovación representa un tema de investigación relevante, no sólo para la literatura centrada en la gestión de estas organizaciones, sino también dentro de la llamada *Transformative Service Research* (TSR), una de las principales prioridades de investigación en el ámbito de los servicios (Anderson et al., 2013; Ostrom et al., 2010).

Las crecientes necesidades de los grupos a los que atienden las ONGs, la complicada situación financiera, y el mayor nivel de competencia intra- e inter-sectorial, están forzando a estas entidades a “buscar formas innovadoras de proporcionar mayor valor a sus públicos para obtener una ventaja competitiva para la organización social” (Weerawardena y Sullivan Mort, 2006, p. 21). Ante este tipo de entorno competitivo, la capacidad de las ONGs (y también de las empresas) para innovar y enfrentarse a los complejos problemas sociales no depende sólo de sus propios recursos y capacidades, y las alianzas con otras organizaciones, particularmente los acuerdos de cooperación con empresas, se están convirtiendo en una tendencia significativa (Austin y Seitanidi, 2012a, 2012b).

Las interacciones entre las empresas y las ONGs están generando modelos de relación que combinan la imitación, la cooperación y la competencia. La consecuencia es que están emergiendo nuevas formas de colaboración que van más allá de los meros roles de “donante” y “beneficiario”, tradicionalmente adoptados por las empresas y las ONGs, respectivamente, en sus relaciones. En este nuevo contexto, las alianzas pueden generar distintas clases de valor a la ONG (Austin y Seitanidi, 2012b), incluyendo no sólo el tradicional valor “asociativo” (mayor visibilidad, credibilidad, notoriedad pública de la causa social) o de “transferencia” (apoyo financiero, donaciones en especie, voluntariado, etc.), sino también otras clases de valor de mayor nivel, tales como valor de “interacción” (oportunidades de aprendizaje, desarrollo de capacidades únicas, acceso de redes, etc.) o valor de “sinergia” (innovación, liderazgo

compartido, etc.). Otro tanto cabría decir por lo que respecta al valor de la alianza para la empresa. Sin embargo, estas nuevas relaciones generan también desconfianza, especialmente dentro del sector no lucrativo (Reed y Reed, 2009), debido al temor a desvirtuar los objetivos sociales de la ONG o a que la empresa utilice la alianza exclusivamente para sus propios objetivos de marketing, con escasa contribución a la causa social.

Bajo este escenario global, el objetivo principal de la presente investigación es determinar si la colaboración entre empresas y ONGs da lugar a un proceso de transferencia de conocimiento y aprendizaje organizativo, favoreciendo el desarrollo de un abanico de actividades conjuntas de innovación social como resultado. Se trata de determinar qué características deben presentar los acuerdos para que se generen los tipos de valor de alto nivel (de “interacción” y de “sinergia”). Ambas clases de valor son importantes en tanto en cuanto “se deben únicamente a la existencia de la alianza y, por tanto, no son replicables” (Austin, 2000, p. 79). La investigación trata de proporcionar dos contribuciones a la literatura sobre RSC, gestión de ONGs y TSR.

La primera se centra en analizar si los efectos del desarrollo relacional de los acuerdos de colaboración se extienden más allá de los roles de donante y receptor asumidos habitualmente por las empresas y las ONGs. La mayoría de las investigaciones empíricas previas se han basado en estudios de casos, por lo que puede resultar interesante ampliar las evidencias con un enfoque diferente. Para ello, se parte del modelo de “Creación de Valor Colaborativo” (CVC) de Austin y Seitanidi (2012a, 2012b) y de su “continuo de colaboración” para caracterizar cómo evoluciona la alianza y sus efectos. La investigación analiza el grado en que un mayor desarrollo relacional favorece un proceso de aprendizaje organizativo en la ONG. El aprendizaje organizativo es una de las capacidades generadoras de ventajas competitivas más importantes y los estudios sobre “cómo las partes superan (o explotan) las diferencias sectoriales para aprender sobre la causa social, aprender de cada uno, o promover el aprendizaje de los grupos de interés serían contribuciones valiosas” (Selsky y Parker, 2005, p. 866). Según Prugsamatz (2010, p. 245), “queda aún mucho por investigar para comprender mejor lo que afecta al aprendizaje en las organizaciones y ayuda a mantenerlo a largo plazo dentro del contexto del sector no lucrativo”.

La segunda aportación consiste en evaluar la influencia del proceso de aprendizaje organizativo resultado de la colaboración en el nivel en que el acuerdo ha originado una serie de actividades de innovación social. El estudio de la innovación como consecuencia de las alianzas empresa-ONG es un tema escasamente estudiado, y tan sólo unos pocos trabajos fundamentalmente de corte conceptual o basados en estudios de casos se han centrado en el mismo (Brunner y Marxt, 2013; Dahan et al, 2010; Holmes y Moir, 2007; Holmes y Smart, 2009; Jamali et al., 2011; Ljung y Bengtson, 2012; Luxmore y Hull, 2011). Concretamente, la investigación actual contempla cinco clases de iniciativas conjuntas derivadas exclusivamente del acuerdo y, como tales, activos específicos de la colaboración.

El resto del trabajo se estructura del siguiente modo. En el siguiente epígrafe se propone el marco teórico. Seguidamente se explica la metodología seguida para desarrollar la parte empírica del estudio, para pasar después a presentar los resultados alcanzados, así como las principales aportaciones e implicaciones derivadas de los mismos. El trabajo finaliza con una relación de las limitaciones y de las líneas para futuras investigaciones

## **2. Marco teórico e hipótesis**

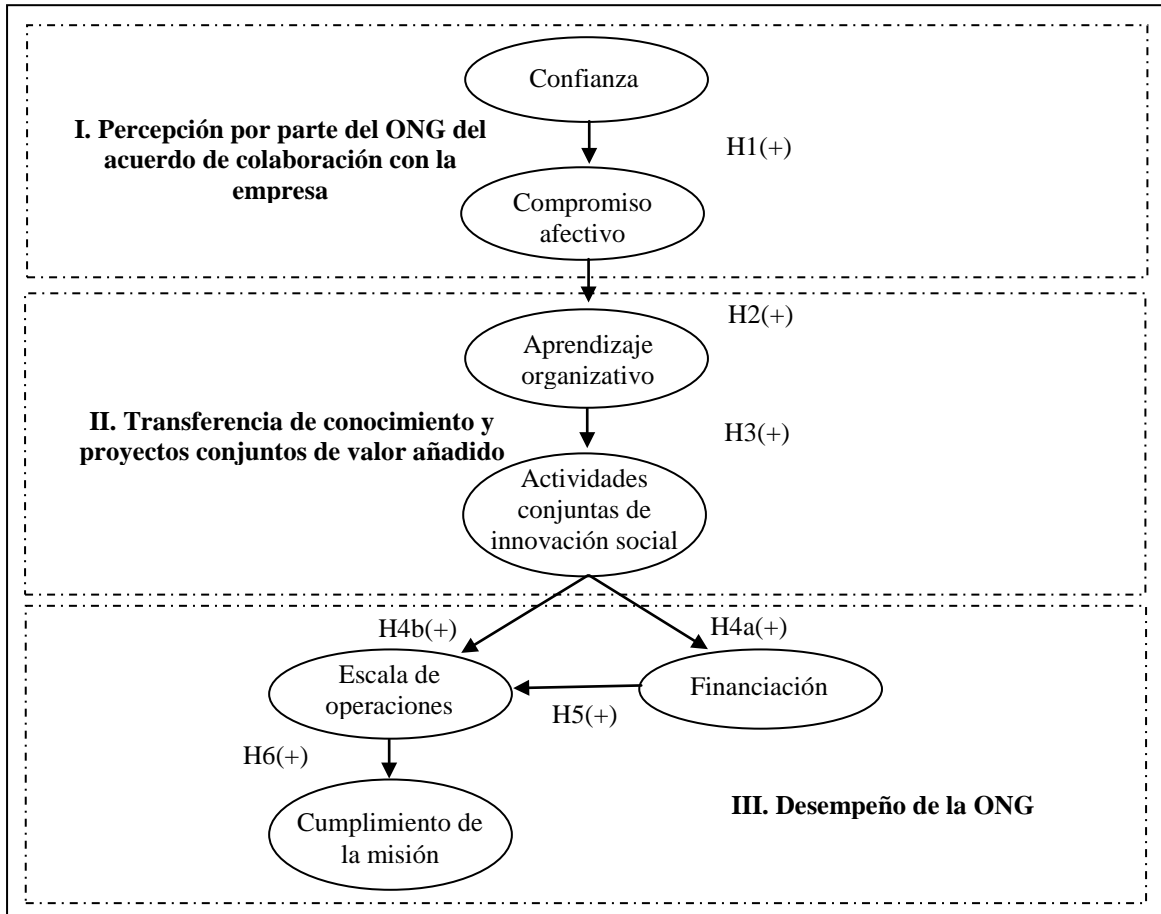

El modelo del trabajo aparece recogido en la Figura 1.

### ***2.1. El “continuo de colaboración” en los acuerdos empresa-ONG***

La tipología de acuerdos de colaboración empresa-ONG incluye diferentes alternativas, como la filantropía corporativa, las licencias, la esponsorización, las actividades de marketing con causa, las campañas de promoción conjuntas o las joint ventures (Wymer y Samu, 2003), entre otras. Cada una de ellas implica distintos niveles de compromiso y creación de valor, de forma que es posible distinguir un continuo integrado por cuatro etapas básicas: filantrópica, transaccional,

integrativa y transformadora (Austin y Seitanidi, 2012a). A medida que la relación se mueve a lo largo de este continuo, sus características cambian en términos de incremento del nivel de involucración/compromiso, importancia de la colaboración para la misión de las partes, magnitud de los recursos implicados, tipo de recursos (de dinero a competencias críticas), alcance de las actividades, confianza, intensidad de la interacción, cambio interno, complejidad de gestión, valor estratégico, co-creación de valor, sinergias e innovación.

FIGURA 1  
Modelo conceptual

Un gran número de investigaciones de marketing ha analizado los condicionantes y facilitadores de los intercambios relacionales exitosos, hasta llegar al reciente enfoque de *stakeholder marketing* (Grinstein y Goldman, 2011). Si bien la literatura de marketing de relaciones identifica diversas variables que interaccionan dentro del contexto colaborativo, dos de ellas sobresalen de forma esencial como factores que marcan la posición dentro del continuo relacional: la confianza y el compromiso (MacMillan et al., 2005; Morgan y Hunt, 1994).

La confianza integra tres dimensiones (Bakker et al., 2006, Bryson et al., 2006): *capacidad*, referida a la creencia en que la otra parte posee la experiencia necesaria para desarrollar su trabajo de manera efectiva; *honestidad*, o la creencia en que la otra parte cumplirá sus promesas y asumirá un conjunto de principios considerados aceptables; y *benevolencia*, o la creencia de que la otra parte está interesada en el bienestar del socio. La literatura sobre acuerdos de colaboración empresa-ONG ha resaltado el papel absolutamente primordial que juega la confianza en el éxito de los mismos (Bryson et al., 2006, p. 47-48). Por su parte, existen dos tipos básicos de compromiso, *calculado* y *afectivo*. El primero se basa en la evaluación racional de los beneficios y de los costes derivados de una determinada relación, mientras que el segundo se sustenta en una predisposición afectiva a mantener la relación resultado de la existencia de una identificación con los valores de la otra parte. La mayoría de los investigadores reconoce el papel preponderante que tiene el compromiso afectivo para mantener la relación, también en el

ámbito de las alianzas entre sectores (Berger et al., 2006). Consiguientemente, se usará este constructo en la presente investigación.

La literatura de marketing de relaciones y de alianzas inter-sectoriales asume ampliamente que la confianza es el principal condicionante del compromiso afectivo, puesto que “cuando los individuos desarrollan una relación personal de confianza dentro de la colaboración, entonces el nivel de integración de la relación se hace más evidente” (Seitanidi y Crane, 2009, p. 422). La primera hipótesis establece que:

**H1: La confianza de la ONG en el comportamiento de la empresa está asociada positivamente con el compromiso afectivo que manifiesta la ONG con la empresa.**

## ***2.2. Las consecuencias de los acuerdos empresa-ONG***

El objetivo (y consecuencia) de las colaboraciones empresa-ONG de alto nivel es “crear innovaciones sociales rompedoras” (Austin y Seitanidi, 2012a, p. 743). Múltiples trabajos han puesto de manifiesto los efectos positivos derivados de la existencia de una buena relación entre los participantes en un determinado proyecto sobre los intercambios y flujos de conocimiento y, en último término, sobre la innovación (Nygaard y Russo, 2008). En la fase “transformadora” de una colaboración se comparte conocimiento sobre las necesidades sociales y los roles de cada una de las partes en la satisfacción de esas necesidades. Por medio de ese clase de colaboración, las ONG pueden beneficiarse no sólo del apoyo directo a la causa social que le preste la empresa, sino también del “acceso a experiencia técnica, gerencial y/o de marketing, ampliación de redes, mayor ventaja y visibilidad, y desarrollo profesional y oportunidades de aprendizaje para los empleados y voluntarios actuales y futuros” (Van Tulder y Fortanier, 2009, p. 227). Por lo tanto, es probable que la traslación de los acuerdos de cooperación empresa-ONG en innovaciones sociales se realice como consecuencia de la existencia de un proceso de aprendizaje organizativo en ambas partes.

El aprendizaje organizativo es el proceso dinámico de creación, adquisición e integración de conocimiento con el objetivo de desarrollar recursos y capacidades que permitan a la organización lograr un resultado mejor (Rebelo y Gomes, 2008). El aprendizaje organizativo ocurre cuando se transfiere el conocimiento individual como consecuencia de las interacciones sociales que tienen lugar dentro de la organización y es resultado de la existencia de una interpretación compartida entre los distintos grupos de individuos. De tal forma, el aprendizaje implica un proceso con varias etapas principales. Aunque el mayor o menor desglose de estas fases depende de la investigación concreta, cabe destacar tres procesos básicos: adquisición de información, diseminación de esa información, e integración/institucionalización/interpretación compartida (Dixon, 1992; Huber, 1991; Senge, 1990; Weerawardena et al., 2006). En este sentido, los acuerdos de cooperación empresa-ONG pueden representar una fuente de conocimiento para ambas organizaciones sobre targets potenciales, habilidades específicas o actividades de innovación (Austin y Seitanidi, 2012b).

En el caso concreto de la ONG, la necesidad de ese proceso global de aprendizaje parece ser especialmente importante con relación a la adquisición de competencias de gestión en ámbitos como la administración, las finanzas, el marketing y los recursos humanos, ámbitos en los que estas organizaciones se encuentran en desventaja frente a las organizaciones lucrativas y en los que existe una demanda creciente de profesionalización dentro del sector (Hurrell et al., 2011).

La literatura previa defiende que el proceso de aprendizaje se ve intensificado a medida que el continuo de colaboración pasa de la etapa “filantrópica” a la etapa “transformadora” (Austin 2000; Austin y Seitanidi, 2012a, 2012b; Bennett et al., 2008), por lo que es de esperar que el grado de desarrollo relacional del acuerdo favorezca la existencia de aprendizaje. La confianza y el compromiso constituyen dos elementos básicos de una cultura que fomenta el conocimiento (Conner y Clawson, 2004; Nonaka, 1994; Prugsamatz, 2010). La existencia de confianza y compromiso incentiva la actitud de los participantes hacia la colaboración, el intercambio de información y la creatividad (Strätling et al., 2012; Swift y Hwang, 2008). Un buen clima de trabajo (dentro y entre organizaciones) hace que los empleados/voluntarios estén más comprometidos con el proceso y más dispuestos a aceptar los fallos y riesgos inherentes a los

entornos inciertos y turbulentos que suelen ir ligados a la innovación (Bstieler, 2006). Por el contrario, sin la existencia de confianza y compromiso mutuo, la otra parte se volverá escéptica sobre las intenciones del socio y probablemente retendrá y no compartirá su información.

En el contexto específico de los acuerdos de cooperación empresa-ONG, Bennett et al. (2008) destaca los factores que favorecen y/o impiden la efectiva transmisión de conocimiento, siendo la credibilidad de la fuente (es decir, el grado en que la fuente es percibida como experta y confiable) uno de ellos. Por su parte, Foster et al. (2009) identifican tres clases de empresas según cómo se relacionan con el sector no lucrativo, a las que denominan “donantes”, “sponsors” y “socios”. La involucración de las empresas del tipo “donante”, categoría similar a la “filantropía periférica” de Bruch y Walter (2005) y a la etapa “filantrópica” de Austin y Seitanidi (2012a), es meramente marginal con respecto a su negocio clave y “el conocimiento que se comparte entre las ONGs y las empresas es escaso, porque normalmente el apoyo consiste únicamente en dinero” (Foster et al. 2009, p. 452). Las dos restantes categorías implican un mayor esfuerzo por integrar la RSC dentro de la cultura y las estrategias de la empresa, y esta involucración se traduce en mayores flujos de comunicación y en la provisión de otros tipos de recursos más especializados, aparte de dinero.

En función de los argumentos anteriores, y considerando que el compromiso afectivo supone una consecuencia de la confianza, la segunda hipótesis de la investigación establece que:

**H2: El compromiso afectivo que manifieste la ONG hacia la empresa está asociado positivamente con la existencia de un aprendizaje organizativo sobre técnicas de gestión en la ONG.**

A su vez, el aprendizaje organizativo debería incentivar el desarrollo de iniciativas de innovación social entre ambas organizaciones, puesto que uno de los beneficios del aprendizaje es “la habilidad de las organizaciones no lucrativas para desarrollar la capacidad emprendedora que es importante para los procesos de innovación emprendidos con el fin de reaccionar ante oportunidades que ayudan a construir y a hacer crecer la organización. A través del aprendizaje, las organizaciones no lucrativas son capaces de reunir los recursos que son vitales para la implementación de los nuevos conceptos que crean” (Prugsamatz, 2010, p. 244).

La innovación social es un concepto amplio y fragmentado (Weerawardena y Sullivan Mort, 2006). Bouchard (2012) propone un marco básico que distingue dos aproximaciones principales. La primera “está interesada en las soluciones a los principales problemas sociales, basadas en las iniciativas emprendedoras que ponen énfasis en la filantropía, la responsabilidad individual, y en el mercado más que en el Estado” (Bouchard, 2012, p. 49). La segunda “pone mayor énfasis en la naturaleza colectiva de los procesos y productos de la innovación social. Ve las innovaciones como etapas que llevan al cambio social, es decir, a la transformación de las relaciones sociales que están en el origen de los problemas sociales” (Bouchard, 2012, p. 49). Este segundo enfoque se centra en la participación de los distintos actores sociales (los “usuarios”) en acciones cooperativas dirigidas a implantar nuevos valores, reglas y normas con relación a las condiciones de vida, los lugares de trabajo, el desarrollo local, etc.

La presente investigación analiza una serie de actividades de innovación social seleccionadas considerando las conclusiones del informe elaborado por el Comité para Fomentar la Filantropía Corporativa (Committee Encouraging Corporate Philanthropy’s, 2010, p. 26), basado a su vez en un estudio de McKinsey & Company, en el que se insiste en la necesidad de colaboraciones más sofisticadas “con un enfoque en la resolución de problemas, incluyendo el desarrollo conjunto de productos, estructuras de financiación conjuntas, creación de estándares voluntarios, y compartir activos”. Concretamente, en el trabajo actual se incluye el co-desarrollo de proyectos específicos entre la empresa y la ONG para (1) ofrecer nuevos productos y/o servicios con impacto social (que ayuden a resolver problemas sociales o medioambientales), (2) co-invertir en infraestructuras, (3) crear o adoptar estándares sectoriales voluntarios, (4) abogar y luchar por un cambio político o normativo, y (5) influir en grupos de interés clave. La tercera hipótesis del trabajo prevé una asociación positiva entre el grado en que dentro de la

ONG se genera un proceso de aprendizaje organizativo y el grado en que el acuerdo contribuye a desarrollar cada una de las actividades previamente señaladas.

**H3: El grado de aprendizaje sobre técnicas de gestión que se produce en la ONG está asociado positivamente con el grado en que el acuerdo contribuye al desarrollo de proyectos conjuntos de valor añadido para satisfacer necesidades sociales.**

Finalmente, en el modelo se espera que el desarrollo de los distintos tipos de proyectos conjuntos de valor añadido permita incrementar el desempeño de la ONG. La medición del desempeño de las ONGs no es una tarea sencilla. El indicador último de rendimiento es el grado en que la organización ha conseguido cumplir con su misión social (McDonald, 2007). No obstante, este objetivo depende de otras posibles variables de resultado intermedias. Si bien a partir de la literatura especializada se pueden identificar un gran número de indicadores (Sowa et al., 2004), considerando el reto actual que la crisis económica está suponiendo para las ONGs en términos de acceso a la financiación e incremento del alcance de sus operaciones (mayor número de beneficiarios y desarrollo de un mayor número actividades), en la presente investigación se han incluido dos indicadores que recogen estos resultados. Adicionalmente, también se ha contemplado el grado en que la ONG percibe que ha alcanzado su misión y satisfecho las expectativas de beneficiarios y donantes como medida de desempeño último.

La cuarta hipótesis establece que tanto la obtención de fondos como la escala de las operaciones se ven favorecidas por el desarrollo de proyectos colaborativos entre la ONG y la empresa. Estos proyectos permiten a ambas organizaciones combinar recursos financieros y no financieros y obtener acceso a las redes de los socios (Austin y Seitanidi, 2012b), por lo que es previsible que la ONG pueda tener acceso a nuevos grupos de stakeholders. Por tanto,

**H4: El desarrollo de proyectos conjuntos de valor añadido entre la empresa y la ONG está asociado positivamente con (a) la obtención de fondos por parte de la ONG, y (b) la escala de sus operaciones (número de beneficiarios y/o actividades).**

También se prevé que un mayor nivel de recursos financieros debería ayudar a la ONG a incrementar la escala de sus actividades, y que, a su vez, este incremento de la escala debería contribuir a mejorar las percepciones de cumplimiento de su misión social. Consiguientemente:

**H5: El incremento de fondos por parte de la ONG está asociado positivamente con la escala de sus operaciones (número de beneficiarios y/o actividades).**

**H6: La escala de las operaciones (número de beneficiarios y/o actividades) de la ONG está asociada positivamente con la percepción del cumplimiento de su misión social.**

### **3. Metodología**

#### **3.1. Recogida de datos y descripción de la muestra**

Se utilizó la encuesta como metodología básica. Para testar las hipótesis, la investigación se centró en las fundaciones como tipo particular de ONG (Hopt, et al., 2006) que se encuentra en rápido crecimiento (European Foundation Centre, 2013). Con el propósito de aminorar el sesgo debido al procedimiento (Podsakoff et al., 2003), se llevó a cabo un proceso de encuesta en dos etapas. Los datos sobre las partes 1 y 3 del modelo se recopilaron en una primera fase, mientras que la información detallada referida al grado de aprendizaje organizativo en la fundación sobre técnicas de gestión resultante del acuerdo y el grado en que el acuerdo había generado distintos tipos de proyectos colaborativos (parte 2 del modelo) se recopiló un año más tarde.

La primera de las encuestas se realizó entre septiembre y diciembre de 2011. En esta etapa se seleccionaron de forma aleatoria 525 fundaciones a partir del censo global de 9.050 fundaciones españolas identificadas por el Instituto de Análisis Estratégico de Fundaciones (INAEF). Para garantizar que esta muestra inicial fuera representativa del sector fundacional español, las fundaciones se seleccionaron proporcionalmente teniendo en cuenta la descripción del sector elaborada por el INAEF (tipo de actividades, tipo de beneficiarios, tamaño, antigüedad, etc.). A las fundaciones seleccionadas se les envió el cuestionario vía correo electrónico, previo contacto

telefónico. El cuestionario fue contestado por la persona que en cada fundación se encargaba de la gestión diaria. En esta etapa se obtuvieron un total de 325 respuestas válidas (error del  $\pm 5.34\%$  para un nivel de confianza del 95%). A las fundaciones se les preguntaba si habían colaborado con alguna empresa en algún momento a lo largo de los últimos tres años con el objetivo de cumplir su misión social. Si contestaban de forma afirmativa (185 fundaciones), se les pedía que evaluaran las características de la relación (confianza y compromiso).

Para valorar la posible existencia del sesgo de la no respuesta se comparó el perfil de la muestra de 325 fundaciones con los descriptores del sector fundacional español proporcionados por el INAEF (Tabla 1). No existen diferencias estadísticamente significativas entre la muestra y la población. Adicionalmente, también se compararon las respuestas de los encuestados que habían enviado el cuestionario al principio, sin necesidad de un esfuerzo adicional de refuerzo, y aquellos otros que sólo contestaron después de insistir con este refuerzo, evidenciándose que tampoco existían diferencias entre estos grupos de encuestados por lo que se refiere a las variables de modelo disponibles en esta fase.

	Grandes y mega (> 2,400,000 €)	11.6	16.9	21.0	21.7

a Estos límites corresponden a la primera Ley Española de Fundaciones (Ley 30/1994, de 24 de noviembre) y a la actual Ley Española de Fundaciones (Ley 50/2002, de 26 de diciembre).

La segunda encuesta se llevó a cabo un año más tarde. Se envió un segundo cuestionario a las 185 fundaciones que habían indicado que habían participado en un acuerdo de colaboración con una empresa para preguntarles sobre un conjunto de 15 aspectos relativos al proceso de aprendizaje organizativo resultado de la relación, y a su percepción sobre el grado en que el acuerdo de colaboración había contribuido a desarrollar cinco tipos de proyectos colaborativos con un enfoque concreto en la solución de un problema. De la muestra de 185 fundaciones, un total de 104 accedieron a participar en esta segunda etapa (ver Tabla 1).

### 3.2. Medición de las variables

En el Anexo se recogen las variables con detalle. En el caso de escalas multi-item, se han empleado constructos reflectivos, por medio de escalas Likert de siete puntos. Las escalas para medir la confianza y el compromiso se fundamentan en la literatura sobre marketing de relaciones y sobre alianzas empresa-ONG. La escala de aprendizaje organizativo incluye los tres procesos básicos que se utilizan para describir este constructo: adquisición, diseminación e integración (Jerez-Gómez et al., 2005). Para medir las actividades de innovación social, se preguntó a los encuestados su percepción sobre la intensidad con la que el acuerdo había contribuido a desarrollar las cinco clases anteriormente mencionadas de proyectos conjuntos (Committee Encouraging Corporate Philanthropy, 2010). Por último, el desempeño de la fundación se evaluó preguntando a los encuestados sobre el nivel en que ellos consideraban que se habían alcanzado en el último año los objetivos establecidos para un conjunto de indicadores (Carman y Fredericks, 2008). Para valorar la posible existencia de un sesgo debido al procedimiento, se calculó el test de Harman. La realización de un análisis factorial exploratorio con todas las escalas del modelo dio origen a una estructura de seis factores, con el factor principal suponiendo el 25% del total de la varianza. Por tanto, este sesgo no constituye un problema en esta investigación.

## 4. Resultados

Se evaluó la fiabilidad y validez de las escalas por medio de un análisis factorial confirmatorio (Tablas 2 y 3). Dado que la escala de aprendizaje organizativo era multidimensional, se calculó la media de cada una de las tres dimensiones para obtener un factor de tres ítems, que fue el que se utilizó en la estimación del modelo de ecuaciones estructurales.

En la Tabla 4 aparecen los resultados de la estimación del modelo casual empleando el programa EQS 6.2 para Windows. Puesto que se analizan cinco tipos de proyectos conjuntos entre la empresa y la ONG (INNSOC1, INNSOC2, INNSOC3, INNSOC4, INNSOC5), la H3 se ha dividido en cinco sub-hipótesis (H3.1, H3.2, H3.3, H3.4 y H3.5). Se ha hecho lo mismo para las hipótesis H4a y H4b.

<b>Bondad del ajuste: S-B<math>\chi^2</math>=261.50 (p=0.001); S-B<math>\chi^2</math>/df=1.34; BBNFI=0.91; CFI=0.93; RMSEA=0.06</b>			

\*\*\*  $p < 0,01$ . \*\*  $p < 0,05$ . \*  $p < 0,1$

La confianza está asociada de forma significativa con el compromiso afectivo, en línea con lo previsto por la hipótesis H1 ( $p < 0,05$ ). Por su parte, el grado de compromiso afectivo favorece el aprendizaje de la fundación sobre técnicas de gestión, tal y como establecía la hipótesis H2 ( $p < 0,01$ ). A su vez, este proceso de aprendizaje muestra un vínculo positivo y significativo con el desarrollo de las cinco clases de proyectos colaborativos, en apoyo de las sub-hipótesis H3.1 ( $p < 0,01$ ), H3.2 ( $p < 0,01$ ), H3.3 ( $p < 0,01$ ), H3.4 ( $p < 0,05$ ) y H3.5 ( $p < 0,01$ ).

Por lo que respecta al impacto de estos proyectos en los resultados de la fundación, sólo un tipo de proyecto, la inversión conjunta en infraestructuras (INNSOC2) tiene un efecto significativo (positivo) en la obtención de fondos (H4.2a,  $p < 0,10$ ). Todos los tipos de actividades, con la excepción de la creación de estándares sectoriales voluntarios (INNSOC3) impactan significativamente en la escala de operaciones de la fundación; tres de ellos de forma positiva, el co-desarrollo de productos y servicios destinados a solventar problemas sociales (INNSOC1,  $p < 0,1$ ), la co-inversión en infraestructuras (INNSOC2,  $p < 0,05$ ) y las actividades conjuntas para influenciar a *stakeholders* clave (INNSOC5,  $p < 0,01$ ), mientras que abogar por nuevas regulaciones (INNSOC4,  $p < 0,01$ ) aparece con un signo negativo. Es posible que este tipo de práctica centre la actividad de la ONG en ciertos lobbies o reguladores, lo que implica que la

escala de operaciones se vuelve más especializada y estrecha (al menos a corto plazo). Por último, tal y como se esperaba, los resultados ponen de manifiesto la fuerte relación que existe entre la obtención de fondos y la escala de operaciones ( $H5, p < 0,01$ ), y esa escala y el cumplimiento de la misión ( $H6, p < 0,01$ ).

## 5. Conclusiones

Este estudio ha examinado el grado en que las características de la colaboración entre las empresas y un tipo particular de ONG, las fundaciones, promueven el aprendizaje en la ONG, y, en último término, el desarrollo de una variedad de actividades colaborativas enfocadas a la solución de problemas sociales. Los resultados evidencian que cuanto mejor sea la relación en términos de confianza y compromiso, mayor es el nivel en que la ONG aprende sobre técnicas de gestión y mayor también el grado en que la colaboración da lugar a diferentes proyectos conjuntos de valor añadido. Son varias las contribuciones que se derivan de estos resultados.

Primero, los estudios que previamente se habían realizado sobre los acuerdos de colaboración empresa-ONG habían empleado mayoritariamente la metodología de los estudios de casos, por lo que la utilización de otras metodologías de carácter cuantitativo puede servir para hacer avanzar el estado de la cuestión.

Segundo, la investigación permite aportar varias sugerencias sobre cómo las empresas pueden extender sus esfuerzos de RSC más allá de las meras donaciones. El grado de implicación en el acuerdo favorece la transferencia de conocimiento a la ONG. El dinero suele constituir el tipo de contribución predominante, pero los resultados evidencian que la puesta en marcha de proyectos conjuntos de valor añadido depende de la intensidad con la que la ONG aprende sobre técnicas de gestión. Consiguientemente, y aparte de dinero, el acuerdo debe implicar otra clase de recursos y contactos que ayuden a ambas organizaciones a promover intercambios más profundos de información y vínculos más estrechos.

En este sentido, la gestión del conflicto surge también como un tema prioritario. En las alianzas empresa-ONG el conflicto potencial suele ser mayor que en las alianzas entre organizaciones dentro de un mismo sector, ya que las partes que proceden de diferentes sectores (en ocasiones, claramente adversarios) se enfrentan a contradicciones derivadas de las misiones, valores, motivaciones, estilos de gestión y características incompatibles. La existencia de estas diferencias normalmente supone falta de entendimiento y desconfianza. Para tratar de superar estos problemas y promover la confianza y el compromiso ambas partes deberían plantear desde el comienzo de las relaciones cuestiones como qué motivaciones tiene la otra parte, qué “lenguaje” utiliza, qué tipo de recursos puede aportar cada uno (superando la idea de que sólo la empresa es el “donante” y la ONG el “receptor”), cuál va a ser el objetivo y alcance del acuerdo, qué mecanismos de gobernanza se van a establecer, cuál va a ser el proceso de rendición de cuentas a seguir, etc. Además, iniciativas como la celebración de reuniones periódicas y el mantenimiento de contactos personales, formales e informales, o la rotación de personal entre ambas organizaciones, pueden favorecer también el entendimiento y la generación de confianza.

El análisis de las consecuencias de los acuerdos desde el punto de vista de la ONG representa la tercera contribución del estudio, puesto que dentro del sector no lucrativo existe un debate abierto sobre la conveniencia de mantener relaciones con empresas. Sin negar la posibilidad de posibles consecuencias negativas, los resultados del presente estudio muestran la existencia de una conexión positiva entre el desarrollo relacional de la colaboración y resultados deseables para la ONG como el aprendizaje organizativo o la innovación social.

Cuarto, otra contribución significativa se refiere al impacto positivo que ejerce el aprendizaje sobre técnicas de gestión en la ONG y el desarrollo de proyectos de valor añadido. De forma similar a la controversia existente en el sector no lucrativo sobre las ventajas y desventajas de colaborar con empresas, también existe un fuerte debate sobre los efectos de la profesionalización (Kreutzer y Jäger, 2011). Por un lado, la recesión económica y el incremento de la competencia intra- e inter-sectorial lleva a que las ONG necesiten incrementar sus capacidades y eficiencia para sobrevivir y cumplir su misión social. Estos esfuerzos requieren la

introducción de herramientas de gestión procedentes del sector lucrativo y la contratación de un mayor número de profesionales pagados. Por otro lado, la profesionalización en las ONG puede ocasionar externalidades negativas como la aparición de conflicto entre el personal remunerado (profesional) y los voluntarios o que los objetivos sociales pasen a segundo término. En general, los resultados del trabajo revelan que la profesionalización por medio de un proceso de transferencia de conocimiento sobre técnicas de gestión de la empresa a la ONG genera resultados positivos para la ONG, específicamente el desarrollo de actividades de valor añadido dirigidas al bien común.

## 6. Limitaciones y líneas para futuras investigaciones

La principal limitación de la investigación es que ha centrado el análisis en los efectos de los acuerdos empresa-ONG en la ONG. Sería interesante, consiguientemente, estudiar el impacto para las empresas involucradas. Adicionalmente, futuras investigaciones podrían también evaluar el efecto de posibles variables moderadoras, otros tipos de actividades de innovación social, o la influencia de los acuerdos de cooperación en otras clases de indicadores de desempeño (medidas de productividad y/o transparencia).

## Agradecimientos

Los autores agraden la financiación proporcionada por el Ministerio Español de Economía y Competitividad para el proyecto “El Papel del Marketing en la Estrategia de RSC y en sus Consecuencias sobre los Resultados Empresariales. Las Fundaciones como Elemento para Materializar el Compromiso Social de las Empresas Españolas” (MICINN-09-ECO2009-11377). También agradecen el apoyo prestado al mencionado proyecto por la Asociación Española de Fundaciones (AEF).

# ¿QUÉ ES UN CONSUMIDOR RESPONSABLE Y SUSTENTABLE? REFLEXIONES Y CONSIDERACIONES PARA COMO MEDIRLO

---

ENRIQUE CARLOS BIANCHI

*geomarket@arnet.com.ar*

*Universidad Nacional de Córdoba*

## RESUMEN

*Esta investigación tiene por objetivo contribuir a esclarecer el alcance del término consumidor responsable y sustentable (CRS) con vista a la generación futura de un nuevo instrumento a partir de una revisión de la literatura.*

*Por ello, en primer lugar se examina los antecedentes los estudios y el estado de situación actual.*

*Luego, se debaten los alcances, similitudes y diferencias de los términos consumidor “verde”, “ético”, “ecológico”, “responsable” y “sustentable”. Seguidamente se presentan los instrumentos de medición utilizados en el pasado desde la dimensión ética, ecológica y social que conforman el constructo.*

*Finalmente, se detallan una serie de consideraciones para la construcción de una nueva escala de medición integral y holística y los pasos para futuras investigaciones.*

## Palabras clave:

Consumidor Responsable, Consumidor sustentable, Consumidor verde, Marketing social,

## 1. Introducción

La **problemática ecológica ha sido estudiada por el marketing** desde la década de 1970 cuando el problema de la contaminación en las grandes ciudades junto con la posterior crisis petrolera pone en el tapete el tema de la escasez de recursos y obliga al mundo al ahorro de la energía y del petróleo.

Los investigadores de marketing han encontrado en estos temas una línea de investigación iniciadas hace ya más de 40 años (Chamorro et al., 2006). Esta ha ido tomando diferentes denominaciones (conciencia ambiental, marketing ecológico, verde, ecomarketing, marketing responsable y sostenibilidad, entre otras). Su objetivo es el estudio del impacto de las actividades de marketing en el entorno. En qué medida los consumidores son conscientes, están preocupados, qué motivaciones y actitudes asumen frente a la problemática ambiental y cuáles son las acciones de las empresas.

En nuestros días, estas temáticas se analizan según el paradigma de la sustentabilidad bajo denominaciones tales como: Responsabilidad Social Corporativa (RSC), donde las empresas han sabido conjugar sustentabilidad y negocio, haciendo de ello un eje fundamental de su estrategia y su ventaja competitiva. O desde la perspectiva del estudio de Consumidor Responsable y Sustentable (CRS), pues entendemos que son “los consumidores lo que han quedado en un segundo plano, dejando a ellos y a la demanda como elementos pasivos en la ecuación de concientizar y persuadir de adoptar un nuevo sistema de valores” (Havas Media y Fundación Entorno, 2013).

En concreto, pensamos a CRS en término de tres dimensiones claves que son: la conciencia ética, la acción pro-ambiente o ecológica y la acción solidaria. Un consumo responsable se centra en un consumo ético y solidario, no solo como respuesta ecológica, y no en un consumo por el consumo (MolledoPerfetti, 2007).

Teniendo en cuenta esta perspectiva, el objetivo del presente trabajo es profundizar en los antecedentes de la literatura académica para poder delimitar conceptualmente el alcance de lo que denominamos Consumidor Responsable y Sustentable (CRS). Todo esto a la luz de los acontecimientos pasados y recientes, así como reflexionar sobre un marco de referencia más general de la temática que implica los valores, la conceptualización de la sociedad y del mundo en que vivimos (Gilg, Barr y Ford, 2005)

Partiendo de la falta de estudios sobre el particular, encontrar fuentes de fundamentación para una posterior propuesta de una escala de medición del consumidor responsable y sustentable, (constructo diferente al que tiene por objeto medir solamente la percepción de las acciones de RSC) (Caruana y Chatzidakis, 2013; Oberseder et. al.,2013), queremos ver donde se sitúa el consumidor en este renovado escenario como actor “activo”, en lo que creemos como novedad que es la construcción de una “ciudadanía del consumo” (Cortina, 2002 y 2003). Es nuestra hipótesis que el denominado “marketing verde” y el “marketing social” fueron propuestas innovadoras de diferenciación competitiva que corrían en forma paralela en respuestas a los movimientos sociales denominados “consumidorismos”, “ambientalismo”, “el tercer sector”. Estas ideas hoy confluyen como nunca antes, en un movimiento más fuerte frente a la globalización y plantean un paso desde la sola mirada de un “green consumption” hacia “estilos de vidas sostenibles y saludables” (Gilg, Barr y Ford, 2005), más acorde a la necesidades del planeta.

Así también, el marketing se redefine como sustentable o responsable, satisfaciendo las necesidades actuales y futuras de los consumidores y de los negocios y al mismo tiempo conserva y respeta los derechos y las opciones de las generaciones futuras. (Kotler y Armstrong, 2012).

El artículo se estructura de la siguiente manera: en el epígrafe 2, en primer lugar se examina los antecedentes del los estudios sobre el “consumidor responsable y sustentable”. Luego, se describen los antecedentes de estudios más importantes desde los inicios hasta la última década. Posteriormente, se presenta un intento de clarificación conceptual de los alcances, similitudes y diferencias de los términos consumidor “verde”, “ético”, “responsable” y “sustentable”.

Seguidamente se presentan los instrumentos de medición utilizados en el pasado desde la dimensión de la actitud: cognitiva, afectiva y conativa. Posteriormente en el epígrafe 3, se analizan las consideraciones para la construcción de una nueva escala de medición integral y holística y se presentan las conclusiones, limitaciones del estudio y las implicaciones para futuras investigaciones.

## **2. Revisión de la literatura**

### **2.1. Antecedentes de estudios**

Inicialmente, los trabajos académicos se centraron en la “preocupación ambiental o ecológica” y su relación con el comportamiento: Kilbourne y Beckmann, (1998). Kassrajain (1971), Fisk (1973) y Kinnear (1974), son los pioneros. Nació así el marketing ecológico como “el estudio de los aspectos positivos y negativos de las actividades de marketing en la contaminación, el agotamiento de la energía y no energéticos y el agotamiento de los recursos” (Henion y Kinnear, 1976), en el contexto de la crisis del petróleo mundial. Fue un período de intensa actividad académica centrada en el medio ambiente que se produjo hasta la segunda mitad de la década de 1970, donde creció la conciencia en la problemática ambiental (Kilbourne y Beckmann, 1998) y se estudiaron las primeras conductas de reciclado y de compra verde. Se habla de un “nuevo segmento verde” (green segment) al cual se busca medir y definir su perfil.

Luego de un lapso, los gobiernos reaccionaron con una serie de regulaciones contra la contaminación y la protección ambiental (leyes ambientales, códigos de comunicación ecológica, etiquetado, etc.) hacia fines de los 70 e inicios de los 80. Los estudios fueron más focalizados en cuestiones de conservación de energía, las investigaciones prosiguieron centrándose en los mismos tópicos: preocupación ambiental, conocimiento del daño ambiental, creencias, actitudes, comportamientos, y la relación entre la intención y el comportamiento desde un punto de vista individual (Balderjahn, 1988). No obstante, los sociólogos Dunlap y VanLiere (1978) ya abogaron por una mirada más amplia y abarcadora del fenómeno social a través de lo que denominaron el “New Environmental Paradigm” (NEP).

La década de los 90 se ha identificado como la “década del medio ambiente” o “la década de la Tierra” con un énfasis en los programas de reciclado, conservación de energía y la publicidad verde. Se estudian nuevos tópicos como la efectividad percibida de los consumidores (Ellen, et al., 1991), los comportamientos cooperativos (Wiener and Doescher, 1994) y estrategias de alianzas (Milne et al., 1996) y se expande a nuevos conceptos a mediados de la misma: creencias ambientales, valores verdes, y factores institucionales como los sistemas de sustentabilidad (Van Dam and Apeldoorn, 1996; O’Hara, 1995). Se percibe un cambio desde la perspectiva micro a la macro en términos ambientales (Stern et al., 1995).

Sin embargo, la mayoría de los trabajos siguieron la línea de los estudios individuales centrados en las características demográficas, actitudes e intención que se derivan del grado de preocupación o conciencia ambiental, a los fines de poder segmentar el mercado (Kilbourne y Beckmann, 1998).

Las palabras claves que describen las primeras dos décadas fueron: conciencia ambiental, publicidad verde, reciclado y perfil socio-demográfico del consumidor verde. Creencias ecológicas, valores ambientales, paradigmas y la conciencia de un sistema de consumo en crisis en occidente y el análisis de la relación entre economía, ambiente e instituciones fueron expuestos por muy pocos. Fisk (1973) fue el pionero y junto con Antil (1984) se centró en el estudio de los perfiles de los consumidores “Socialmente Responsables” (Antil y Bennett, 1979) y sus implicaciones para el éxito de las políticas públicas y los programas de conservación. Por otra parte, la mayor conciencia, involucramiento en cuestiones ecológicas y ambientales fueron incentivos claves para la adopción de nuevas iniciativas de marketing y nuevas prácticas directivas (Finisterra do Paco et al., 2010).

En los países centrales de productos verdes, se produjo una proliferación creciente de los consumidores para apoyar a las empresas verdes. Un mayor compromiso con las acciones de

reciclado y de productos reciclados, la aparición de las primeras etiquetas que señalaban “amigable con el ambiente” y una fuerte presencia en los medios y en la agenda pública (Roberts, 1996). A pesar del fuerte movimiento verde, y la voluntad de los consumidores de seguir gastando en ellos, las góndolas de los supermercados británicos estaban sobre stockeadas de productos verdes (Pearce, 1990).

Desde la academia se comienza a revisar los trabajos de las dos décadas anteriores con la meta de actualizarlas al nuevo contexto social y con los objetivos de: a) **pulir los instrumentos de medición** intentando clarificar la relación entre intención y comportamiento o lo que se denominó la relación entre “EC- Environmental Concern” y “ECCB –Ecologically Conscious Consumer Behaviour” (Schwepke y Cornwell, 1991; Roberts, 1996; Roberts y Bacon, 1997; Bohlen, Schlegelmilch y Diamantopoulos, 1993; Schlegelmilch y Diamantopoulos, 1996; Kilbourne y Beckmann, 1998; Webb, Mohr y Harris, 2007); b) **clarificar el perfil del consumidor verde** desde los sencillos criterios socio-demográficos (Diamantopoulos, Schlegelmilch, Sinkovics y Bohlen, 2003; Shrum, McCarty and Lowrey, 1995; Roberts, 1996); y c) el intento por encontrar **un marco conceptual general para entender los avances y los campos de investigación aún no explorados** (Tilikidou y Zotos, 1999; Tilikidou, Andamson y Sarmaniotis, 2002; Stern et al., 1995; Kilbourne y Beckmann, 1998)

En el nuevo milenio, resurge el tema ambiental como problemática pero bajo el paradigma de las “sustentabilidad” por un lado, y de la “conciencia ética”, y un intento por generar modelos más holísticos e integrales respecto del comportamiento del consumidor que contemplen no solo la dimensión ambiental o ecológica, sino también lo social y lo ética. Algunos trabajos replican estudios y escalas anteriores en otros contextos (Hosta et al., 2010), mientras que la mayoría amplían la mirada hacia visiones más holísticas dentro de una concepción mayor a partir de la influencia de los valores sociales y la estructura social (Gilg et al., 2005), comparan la relación de valores de la economía tradicional versus la economía ecológica y los vínculos con la esfera política, cuestionando la lógica del marketing en la nueva sociedad sustentable (Varey, 2011)

## **2.2. El consumidor “ético”, “verde”, “responsable” o “sustentable”**

El consumidor que se podría llamar responsable es una persona consciente de que detrás de cada acto de consumo que realiza se pone en marcha una maquinaria compleja y que, precisamente con ese consumir, puede estar favoreciendo o bien ahondando más en determinadas desigualdades. El consumidor responsable es aquella persona que ante una determinada elección de compra se plantea una serie de criterios éticos que le hacen inclinarse su elección.

Es posible hablar de “consumo y consumidor responsable, crítico, ético, político, consciente y transformador, ciudadano de mercado, etc., y aunque no existe unanimidad dentro de la comunidad científica sobre su significado”, interpela Díaz (2011). Así, podríamos entender por consumidor responsable a aquella persona que, siendo consciente de sus hábitos de consumo, conoce y exige sus derechos como consumidor y además busca y elige (o reclama o propone a las empresas) opciones que tienen un menor impacto negativo y un mayor efecto positivo en la sociedad, el medioambiente y los animales no humanos.

Consumir en forma responsable y sustentable no se limita a reducir los deseos, sino a poder dominarlos, de manera tal que haya lugar para el placer, pero con mesura y conciencia ambiental y social sobre nuestro actuar (Cortes Funes, 2011). La persona ética pone su acento, fundamentalmente, en su bienestar moral. Se trata de solucionar situaciones muy claras de disonancia entre lo que se espera de una persona y lo que realmente le apetece, coherencia entre lo que uno piensa y como actúa. No es sino desde los valores desde donde se pueden plantear modelos de consumo y estilos de vida acordes como expresión más acabada de la democracia económica, sostiene Ballesteros (2011).

Antes de presentar, lo que entendemos por consumidor responsable y sustentable y cómo se puede operacionalizar, debemos clarificar los términos “ético”, “verde”, “responsable” y “sustentable”, pues aportan matices y perspectivas comunes y diferentes desde lo teórico, más allá que en la práctica se los usa muchas veces en forma indistinta.

Los Consumidores éticos se definen como "aquellos consumidores que consideran cuestiones ambientales, asuntos de animales y otras cuestiones éticas, como el origen del producto - países regímenes opresivos y armamentos - cuando compran" (Shaw et al., 2005). El consumo ético, implica la toma de decisiones, las compras, u otras experiencias de consumo que son afectados por las preocupaciones éticas de los consumidores (Cooper- Martin y Holbrook, 1993), o como define Carrigan et al. (2004) no es más que "la elección consciente y deliberada de tomar ciertas decisiones de consumo debido a las creencias personales y morales". Son ejemplos de prácticas comerciales que efectúan los consumidores éticos: los productos orgánicos, la inversión o banca ética, productos de comercio justo; y acciones como el "boicott", evitando comprar bienes con características poco éticas. La acción de los consumidores está asociada con actividades como lobby y acción directa sobre un tema (Tallontire et al. 2000). La ética ambiental en el consumo, se traduce en tener un mínimo impacto basado en una reducción en el uso de materiales y recursos naturales, y se ha llevado campañas de marketing social para reducir el consumo de energía y agua, entre otros.

El concepto de "sostenibilidad" o "sustentabilidad" proviene de la Brundtland Comisión (1987), que hace hincapié en la necesidad de comportamientos sostenibles para satisfacer las necesidades de las generaciones actuales sin comprometer la capacidad de las generaciones futuras, para satisfacer sus necesidades. Implica adoptar un estilo de vida sostenible es decir, un proceso gradual que es parte de un enfoque holístico (Gilg et al. 2005). Mientras que el consumo sostenible puede ser visto como una forma de "consumo ético". Por ejemplo, el boicot a una marca, ya que utilizar mano de obra barata es una decisión ética, más que una opción sostenible. Por lo tanto, el consumo sostenible se considera que es uno de los posibles resultados de una decisión ética, pero no conduce necesariamente al consumo ético. (Rex, 2008) Tales comportamientos se puede aplicar a las soluciones a corto plazo, tales como el reciclaje o la compra de alimentos orgánicos, así como para soluciones a largo plazo, tales como la construcción de nuevas represas (Routhe et al. 2005) y la instalación de paneles solares y la reducción de emisiones de efecto invernadero (Jackson, 2005).

Tabla 1  
Consumidor Responsable, ético, Sustentable

Características	Consumidor Responsable (y/o crítico)	Consumidor Ético (y/o verde)	Consumidor Sustentable
Impacto ambiental	✓	✓	✓
Huella ecológica			✓
Es crítico del consumo	✓		
Evita modalidades de producción y consumo	✓		✓
Cambio de estilo de vida	✓		✓
Reducir el consumo	✓		✓
Preservar recursos para generaciones futuras			✓
Mejora la calidad de vida	✓	✓	✓
Estilos saludables			✓
Compartir recursos entre ricos y pobres			✓
Minizar el uso recursos	✓		✓
Evitar la contaminación	✓	✓	✓
Compras en comercio Justo	✓		✓
Compras de Productos "verdes"		✓	✓
Agroecología	✓	✓	✓
Participar activamente de movimientos sociales	✓	✓	✓
Efectuar acciones de boicot a empresas	✓	✓	✓
Elegir productos por la conducta de las empresas	✓	✓	✓
Garantías laborales	✓	✓	
Respeto de la dignidad de las personas	✓	✓	✓
Busca la igualdad social			✓
Organizar boicot a empresas por uso de trabajo infantil o esclavo	✓	✓	

Opuesta al consumismo			✓
Busca la igualdad social			✓

Podemos decir que el consumo sustentable es, entonces, una nueva forma de consumir, que se opone al consumismo. Esto implica un nuevo consumidor: responsable, solidario y consciente de sus acciones y de la posibilidad de incidir en los hábitos sociales, económicos y ambientales. El consumo sustentable es a la vez un consumo crítico y un consumo ético. El consumidor crítico es aquel que se pregunta por las condiciones sociales y ecológicas en las que ha sido elaborado un bien o servicio, y exige calidad al mismo tiempo. Necesita ser incorporado como una actitud diaria, de modo de elegir y utilizar lo que se adquiere sobre la base de ciertos criterios, como la historia del producto, la conducta de la empresa productora, señalándole al mercado los métodos productivos que se aprueban y los que se condenan. Este mecanismo es un ejercicio de reflexión, que, formando un pensamiento crítico, permite tomar partido frente al consumo, erigirse como un consumidor activo, responsable e informado (Almiron et al., 2011). La Tabla 1, muestra a partir de esta reflexión, las temáticas, actitudes y comportamientos que implican cada uno de estos conceptos.

### **2.3. El consumidor socialmente responsable y sustentable**

Luego, de la aclaración de los términos descriptos, proponemos la conceptualización del término Consumidor Responsable y Sustentable como lo es la propia actividad de consumir. Tiene los siguientes rasgos según diversos autores (Carrero Bosch, I; Martínez, C; Rosa Duran, J., 2010): a) es un consumo consciente y deliberado (Szmigin, 2009), b) de forma rutinaria, siendo un hábito, c) se actúa buscando el interés externo, centrado en otros y d) se busca, como fin último, modificar el contexto o las estructuras de mercado (Micheletti, 2003). Puede sintetizarse en tres ejes: ético o consciente, ecológico y solidario (Iglesias, 2009):

- Un Consumo Ético, basado en valores, deliberado, consciente, en el que se introduzcan valores como una variante importante a la hora de consumir o de optar por un producto. Con especial énfasis en la austeridad como un valor en relación con la reducción para un consumo ecológico, pero también frente al crecimiento económico desenfrenado y al consumismo como forma de alcanzar el bienestar y la felicidad.
- Un Consumo Ecológico (3R's), que incluye, por este orden, las famosas "erres" del movimiento ecologista: Reducir, Reutilizar y Reciclar, pero en el que también se incluyan la agricultura y ganadería ecológicas y la opción por la producción artesanal, entre otros.
- Un Consumo Social o Solidario, en el que entraría también el Comercio Justo, es decir, el consumo en lo que se refiere a las relaciones sociales y condiciones laborales en las que se ha elaborado un producto o producido un servicio. Se trata de pagar lo justo por el trabajo realizado, a los trabajadores de cualquier país. Se intenta eliminar la discriminación, potenciar alternativas sociales y de integración y procurar un nuevo orden económico internacional.

En suma, el consumo responsable y sustentable es un término sombrilla, para el mejoramiento de la calidad de vida y la eficiencia de los recursos - energéticos renovables, reducción de desperdicios; respeto del ciclo de vida- y considerando la dimensión de equidad - para satisfacer las necesidades básicas de la vida y las aspiraciones de mejoras de las generaciones presentes y futuras, reduciendo el daño ambiental y el riesgo de la salud humana" (Lechner, 2002).

### **2.4. Principales escalas de medidas desarrolladas**

En este apartado, describimos las fuentes encontradas en la revisión de la literatura se efectuó principalmente a partir de los trabajos revisores de Webster (1975), Schwepker (1991), Tilikido y Zotos (1999), Kilbourne y Beckman (1998), Roberts (1996), Chamoro Mera et al. (2006), Webb et al. (2007) entre otros, y que se exponen a continuación en función de las dimensiones conceptuales del CRS descrita en el punto anterior.

### 2.4.1 Dimensión ética

En esta dimensión ética-consciente, los estudios revisados se desglosan en cuatro temáticas a saber: la conciencia o preocupación y las creencias, el conocimiento y la notoriedad de los problemas ecológicos, los valores personales y por último, los tipos de conducta de compra (conscientes- inconscientes, impulsivos-compulsivo, estilo frugal).

En la primera sub-dimensión, se destacan los trabajos iniciales para medir la conciencia y, creencias y de Tucker (1978), Van Liere y Dunlap (1981), Buttel y Flinn Murphy (1978), Gill, Lawrrence y Crosby (1983), la preocupación por la contaminación de Kassarjian (1971), y la preocupación ambiental, la conciencia de la gravedad en los estudios de Bohlen, Schlegelmilch y Diamantopoulos (1993), Belch (1979), Anderson and Cunningham (1972).

En la segunda, dos trabajos se destacan en medir el grado de conocimiento y notoriedad de problemas particulares respecto a la contaminación Bohlen, Schlegelmilch y Diamantopoulos (1993) y Buttel y Flinn (1978).

En la tercera, se destacan como valores pro-ambientales a) la escala de “Green Consumer Values” de Haws, Winterich, and Naylor (2010) donde definen a los consumidores verdes como aquellos que tienen una tendencia a considerar el impacto ambiental en sus comportamientos de consumo, y b) las escalas referidas al consumidor en sí mismo, como la de Bearden, Hardesty, and Rose (2001) que mide el grado en que un individuo se siente capaz y seguro en lo que respecta a sus decisiones de compra. Aparecen como valores contrarios, las escalas referidas a medir las tendencias a la valorización de lo material, que explica una vida consumista y hedonista, como el trabajo de Richins (1987) que describe el materialismo en cuanto a su papel en la cultura de consumo y la escalas de materialismo de Belk (1984, 1985)

Tabla 2

Revisión de Escalas de la literatura – Dimensión ética

Sub-dimension	Escala	Autores
Conciencia y creencia	Environmental Responsibility	Tucker, (1978)
	Environmental Concern	Van Liere y Dunlap (1981); Buttel y Flinn Murphy (1978); Gill, Lawrrence y Crosby (1983)
	Ecological Concern Index	Kinnear y Taylor (1973); Henion y Wilson (1976); Crosby an Taylor (1983)
	Concern for air pollution	Kassarjian (1971)
	Environmental Attitudes Scale	Bohlen, Schlegelmilch yDiamantopoulos (1993)
	Social-environmentally concerned consumers	Belch (1979)
	Social Responsibility scale	Anderson and Cunningham (1972)
Conocimiento y notoriedad de los problemas ecológicos	Environmental knowledge scale	Bohlen, Schlegelmilch y Diamantopoulos (1993)
	Awareness environmental problems	Buttel y Flinn (1978)
Valores personales	Green consumer values	Haws, Winterichan y Naylor, (2010)
	Consumer self-confidence	Bearden, Harvesty y Rose
	Consumer's need for uniqueness	Tian, Bearden y Hunter, (2001)
	Materialism Scales	Belck (1984 , 1985)
	Material values	Richins y Dawson (1992)
Tipo de compra y de conducta expresada	Frugal Scale	Lastovicka et al. (1999)
	Compulsive Buying Index (CBI)	Ridgway, Kukar-Kinney, y Monroe (2008)
	Compulsive Consumption	Faber yO'Guinn (1989, 1992)
	Buying Impulsiveness Scale	Rook y Fisher (1995)
	Impulsiveness: Consumer Impulsiveness Scale: CIS	Puri (1996)
	Consumer Spending Self-Control: CSSC	Haws y Bearden (2010)

En la cuarta, respecto de las conductas, tipo de consumo y estilos de vida que se desprenden de los valores personales, se encuentra el concepto de frugalidad, medido por Lastovicka et al. (1999), que se define como un estilo de vida no consumista y se caracteriza por el grado en que los consumidores son a la vez sobrios en la adquisición y hábiles con los bienes y servicios para

lograr objetivos a largo plazo. Como valores y actitudes personales, contrarios a que el consumidor sea responsable y consciente, encontramos los tipos de compras compulsivas e impulsivas, escalas desarrolladas por autores como Ridgway, Kukar-Kinney, y Monroe (2008), Rook and Fisher (1995) y Puri (1996), que estudian la tendencia a comprar de forma espontánea, irreflexiva, inmediata, y otras veces hedonista, sin considerar las consecuencias graves para el largo plazo.

#### 2.4.2 Dimensión ecológica

Esta dimensión ecológica se refiere a las acciones concretas para evitar el daño ambiental que se dividen en dos: acciones de reciclado y comportamientos de compra, véase la Tabla 3 modificando los ítems pertinentes según la época y la realidad del contexto (Vinning y Ebreo, 1990; Hopper y Nielsen, 1991; Bohlen, Schlegelmilch y Diamantopoulos, 1993).

En lo que se refiere a los comportamientos de compra se destacan varias escalas que además de la conciencia y la actitud, miden comportamientos concretos. La escala de Antil and Bennett (1979) sobre el “Comportamiento de Consumo Socialmente Responsable” (SRCB) integra aquellos comportamientos y decisiones de compra de los consumidores que están relacionados con los problemas ambientales y relacionados con los recursos y están motivados no sólo por el deseo de satisfacer las necesidades personales, sino también por la preocupación por el bienestar de la sociedad en general, considerando tanto la dimensión ecológica como la dimensión ética.

Tabla 3  
Revisión de Escalas de la literatura – Dimensión ecológica (3 R’s)

Dimension	Escala	Autores
Acciones de reciclado	Recycling	Webster (1975)
	Recycling	Vinning y Ebreo (1990)
	Recycling	Hopper y Nielsen (1991)
	Recycling Behaviour Scale	Bohlen, Schlegelmilch y Diamantopoulos (1993)
Comportamiento de compras	Ecologically Conscious Consumer Behaviour	Roberts (1996)
	Ecologically Responsible buying	Balderjahn (1988)
	Socially Responsible Consumption Behaviour	Antil y Bennett (1979), Antil (1994)
	Environmentally Responsible Consumer – ECOSCALE	Stone, Barnes, y Montgomery (1995)
	Ecologically Conscious Consumer Behaviour revisada	Tilikidou, Adamson y Sarmaniotis (2002)

Respecto del reciclado, son varios quienes lo han medido desde el trabajo de Webster (1975), Stone, Barnes, and Montgomery (1995) y desarrollaron la escala “Environmentally Responsible Consumers” o “ECOSCALE” donde postulan cinco dimensiones de la responsabilidad ecológica de los consumidores: (a) el conocimiento del consumidor y de la conciencia, (b) el deseo y la voluntad de actuar de los consumidores, (c) las opiniones de los consumidores y las actitudes relativas al medio ambiente, (d) la capacidad de los consumidores para actuar, y (e) el comportamiento del consumidor hacia el medio ambiente.

Tilikidou, Adamson y Sarmaniotis (2002) propone un marco conceptual más amplio y extensivo al que denomina “Ecological Conscious”, perfecciona la escala de “Ecological Conscious Consumer Behaviour” (ECCB) teóricamente presentada por primera vez por Roberts (1996). Sugiere agrupar las escalas revisadas en el punto anterior de la siguiente manera (Tilikidou, 2001). En la dimensión cognitiva consigna a) Environmental Knowledge y awareness b) Ethical and values c) Beliefs. En la dimensión afectiva a) las actitudes Pro-ambiente y b) las actitudes hacia el reciclado. Y por último, en la dimensión Conativa a) el comportamiento de compra pro-ambiente, b) el comportamiento de post-compra pro-ambiente y c) las actividades pro-ambiente. Tilikidou, Adamson y Sarmaniotis (2002) hacen un esfuerzo por validar el instrumento ECCB pero tan solo efectúan un análisis exploratorio y de la fiabilidad inicial de las escalas, sin avanzar en la confirmación.

### 2.4.3 Dimensión social

En los trabajos pioneros no se ha encontrado rastros de medir esta dimensión pues surge de la evolución de la temática desde la preocupación inicial por la contaminación ecológica, la producción “verde” hasta el concepto más evolucionado e integrador de sustentabilidad como señalamos en el punto 2, véase la Tabla 4.

Dos trabajos se encontraron respecto de la actitud del consumidor y la influencia de las Organizaciones de la Sociedad Civil (OSC) como de las intenciones de hacer donaciones monetarias. Webb, Green, and Brashear (2000) trabajaron sobre las actitudes para ayudar a los demás y las actitudes hacia las organizaciones de la OSC, como determinantes relacionados del comportamiento de donación: a) actitudes hacia la ayuda a los demás (AHO) se define como las evaluaciones globales y relativamente duraderas con respecto a ayudar a otras personas, b) actitudes hacia las OSC se definen como las evaluaciones globales y relativamente duraderas con respecto a las OSC, que ayudan a los individuos.

Respecto de la percepción de las conductas de las empresas, los trabajos son más recientes y vinculados al desarrollo de la RSC (Caruana y Chatzidakis, 2013; Oberseder et. al., 2013).

Sobre el grado de participación o de apoyo del consumidor a las propuestas de reformas y acciones regulatorias, encontramos solo menciones en dos trabajos de la época, de fuerte debate en este sentido (Buttel and Flinn, 1978; Sambahl and Robertson, 1989).

Respecto de la pertenencia, participación y apoyo a los movimientos de consumerismo y ecológico ambiental, no se encontraron trabajos.

Tabla 4  
Revisión de Escalas de la literatura – Dimensión social

Dimensión	Escala	Autores
Actitud ante las OSC	Attitudes Influencing Monetary Donations to Charitable Organizations	Webb, Green, and Brashear (2000)
	Attitudes to Charitable Organizations	Webb, Green, and Brashear (2000)
Percepción de las conductas de las empresa	Percepción de acciones de RSE Reacción ante la RSE	Alcami et. al.(2013), Almiron et. al. (2013), Bigne et. al.(2011), Caruana y Chatzidakis, (2013); Fernandez Kranz y Marino Castello (2005); Oberseder et. al., (2013), Vila y Gimeno-Martínez (2011)
Actitud ante el gobierno	Support for environmental reform	Buttel and Flinn (1978)
	Support for environmental regulations	Sambahl and Robertson (1989)
Acciones referidas al movimiento ecológico y del consumidorismo	Participación en acciones concretas Pertenencia a movimientos Financiamiento	No encontrado escalas específicas.

### 3. Conclusión y implicancias gerenciales

Este estudio se propuso clarificar el concepto de consumidor responsable y sustentable (CRS) con miras al desarrollo a futuro de una escala de medición. Esto es de vital importancia para el mundo académico, y no así para el mundo empresarial donde estos términos de “verde” “responsable”, “ético” o “sustentable” son intercambiables, pues el “verde” sigue siendo el color y la bandera que identifica al movimiento ecológico y al del consumerismo.

La revisión de los trabajos efectuada ha permitido visualizar como las temáticas señaladas han ido respondiendo a las necesidades del contexto: primero, la conciencia del daño de la contaminación, luego el involucramiento con los programas de reciclaje, posteriormente la necesidad de comprender la relación entre la intención y la conducta, más tarde, medir la actitud hacia la ecología, los productos verdes, el comercio justo, para finalmente, en esta última etapa, aparece la necesidad de un instrumento para medir la relación del consumidor con otros actores, como la empresa, las OSC, los movimientos sociales y los entes gubernamentales. El mundo académico está respondiendo a esta demanda de evaluar el impacto de la RSE sobre el consumidor abandonando la caracterización del consumidor como un ser social, independiente, inserto en una sociedad con un nuevo desafío la sustentabilidad.

Hemos presentado el concepto de consumidor socialmente responsable y sustentable (CSR) como las dimensiones que la componen. Se desprende de allí que la dimensión social necesita de profundizarse en sus sub-dimensiones y pensar en nuevos instrumentos de medida que le den forma.

Otra limitación de esta propuesta es que no hemos avanzado en una propuesta concreta. Sin embargo, podemos decir que nuestro objetivo fue abrir el debate sobre el alcance del concepto, destacando que desde las posturas éticas parece exigírsele, ya no solo reciclar, comprar verde, comprar justo sino también ayudar a otros, participar activamente en boicot, educar al consumidor, y otra serie de acciones que llevan a un cambio en el estilo de vida saludable y sostenible.

Ya hay proyectos que están avanzando fuertemente en la creación de estos nuevos estilos de vida saludables que se proponen a los más jóvenes (Youthxchange, 2005). Por ello, una línea de investigación futura podrá trabajar desde lo normativo, definiendo cuál debería ser el consumidor del futuro en una sociedad sustentable y cuál es el proceso social de su construcción y medición. Otra línea que se abre es comparar los consumidores de hoy con los “verdes” de antaño tanto en cuanto a sus características socio-demográficas, psicográficas como actitudinales.

La recomendación para el mundo empresarial es que los tiempos por venir, el consumidor va a jugar un rol cada vez más activo en la construcción de este mundo.

## RESUMEN

¿Los consumidores tienen las mismas expectativas y perciben de igual modo los esfuerzos realizados por las empresas socialmente responsables? Investigaciones previas se han interesado por estudiar cómo la RSC influye en el comportamiento de los consumidores. La mayoría de estudios se han centrado en antecedentes relacionados con las características de las empresas. Sin embargo, la diferencia en las expectativas y percepciones de los consumidores frente a la RSC puede venir determinada por las características intrínsecas de los individuos. En el ámbito español, este trabajo en curso analiza cómo el perfil sociodemográfico influye en la respuesta del consumidor ante la RSC.

## PALABRAS CLAVE

*Responsabilidad Social; características sociodemográficas; comportamiento del consumidor*

---

<sup>1</sup> Trabajo en curso financiado por Consellería de Educación, Cultura y Deporte de la Generalitat Valenciana a través del Proyecto de Investigación GV/2013/055

## 1. Introducción

En los últimos años, la investigación académica se ha interesado en conocer cómo las iniciativas de Responsabilidad Social Corporativa (i.e., RSC) de las empresas son aceptadas por el consumidor e influyen en sus respuestas emocionales y comportamentales. Sin embargo, la mayoría de trabajos en esta línea (eg. Du, Bhattacharya y Sen, 2011; Lichtenstein, Drumwright y Braig, 2004; Mohr, Webb y Harris, 2001; Sen y Bhattacharya, 2001) se han centrado en analizar antecedentes que tienen que ver con características propias de la organización empresarial (su reputación, credibilidad, motivaciones, confianza, etc.) sin prestar demasiada atención a la influencia de las propias características intrínsecas del consumidor en el mecanismo de respuesta de este a las iniciativas de RSC. La propia noción de RSC, inherentemente cultural y ligado a las especificidades de los sujetos (Boxenbaum, 2006; Carroll, 1991), invita a proponer que las diferencias personales de los sujetos deberían influir en qué se espera y cómo son percibidas las iniciativas de RSC de las empresas (García de los Salmones, Herrero y Rodríguez del Bosque, 2005; Maignan, 2001).

Por ello, el objetivo general de este trabajo en curso es analizar un conjunto de antecedentes intrínsecos al individuo de carácter sociodemográfico que influyen las respuestas del consumidor a las iniciativas de RSC, en un estudio contextualizado en España. En concreto, se pretende estudiar cómo varían las expectativas y percepciones de las iniciativas RSC en función de tres características sociodemográficas del consumidor: (i) sexo, (ii) edad, y (iii) nivel de estudios.

## 2. Revisión de la literatura y cuestiones a investigar

A lo largo de las últimas décadas se han desarrollado varias aproximaciones conceptuales (Brown y Dacin, 1997; Carroll, 1991), surgidas de distintos enfoques, para intentar capturar la noción de la RSC (las dimensiones que lo componen) y su relación con el comportamiento del consumidor. Una de estas aproximaciones es la basada en el modelo del Desarrollo Sostenible (Choi y Ng, 2011; Chow y Chen, 2011; van Marrewijk, 2003). El enfoque apoyado en la perspectiva del Desarrollo Sostenible se fundamenta en los ejes que componen la triple línea base de la misma, es decir, el eje económico, el social y el medioambiental (van Marrewijk, 2003; Chow y Chen, 2011). Esta es la perspectiva que ha sido adoptada en este trabajo. Tal y como se desprende de la conceptualización basada en el Desarrollo Sostenible, la RSC es un concepto maleable, inherentemente cultural y ligado a las especificidades de cada sujeto (y cada sociedad): lo que las personas y sociedades “esperan” o “les preocupa” de la actividad de las empresas en materia económica, social y medioambiental varía a lo largo del tiempo, y difiere de un contexto cultural a otro (Boxenbaum, 2006). Y esta diferente *expectativa social* fruto de las diferencias personales debería influir en cómo *son percibidas* las iniciativas de RSC por el sujetos (García de los Salmones et al., 2005; Maignan, 2001; Maignan y Ferrell, 2003).

En este sentido, tal y como es concebida la RSC, las respuestas del consumidor ante la misma deben de seguir la lógica de la disconfirmación de expectativas (Parasuraman, Zeithaml y Berry, 1985): el común denominador de las dimensiones de la RSC es la congruencia entre las expectativas que el individuo tiene sobre el comportamiento de la empresa y el resultado real o percibido de esta. La idea de comparar las expectativas de los consumidores sobre la RSC respecto a sus percepciones de RSC ha sido escasamente estudiado en la literatura en marketing (Alvarado et al., 2010; Swaen, 2003). Así, en este aspecto, la primera cuestión a investigar de este trabajo en curso sería:

**CII.** ¿Qué relación se establece entre las expectativas del comportamiento RSC de la empresas y lo que perciben los consumidores españoles?

En segundo lugar, es razonable pensar que los consumidores en España tendrán distinto nivel de expectativa y percepción de la RSC en función de sus características sociodemográficas. Apenas existen estudios en esta línea que permitan plantear hipótesis de partida. En otros trabajos se ha demostrado que las mujeres tienden a aceptar mejor las iniciativas de RSC que los hombres

(Valor, 2005), y que estos esperan mejores comportamientos responsables de las empresas (Webb y Mohr, 1998). Por otro lado, parece razonable esperar que las personas con mayor nivel de estudios, más formadas e informadas, esperen comportamientos más responsables de las empresas. En resumen, en este trabajo en curso se plantean las siguientes cuestiones a investigar:

**CI2abc.** ¿Cómo son las expectativas y percepciones de RSC de los consumidores españoles en función de su (a) sexo, (b), edad y (c) nivel de estudios?

### 3. Metodología de la investigación

Este trabajo se basa en una investigación cuantitativa online, con cuestionario estructurado, en base a una muestra de consumidores reales a nivel nacional. Se han seleccionado actividades de RSC de dos compañías, de dos ámbitos distintos, como estímulos para elicitación de la percepción de imagen de RSC en la encuesta: Inditex (sector textil) y Danone (sector alimentación). Ambas son compañías que realizan habitualmente iniciativas de RSC (con experiencias positivas y negativas) y de sectores no estigmatizados socialmente. El cuestionario online ha sido distribuido a un panel de consumidores residentes en España, mayores de 16 años, y que han comprado/consumido algún producto de Inditex o Danone en el último año. El tamaño muestral final es de 661 casos, lo que implica trabajar con un  $e = 3,38\%$  para la situación de máxima incertidumbre ( $p = q = 0,5$ ) y un nivel de confianza del 95%. En relación a las características de la muestra, el 50,4% son hombres y el 49,6% mujeres; la edad media es de 41,85 años y un 45,6% posee estudios universitarios.

Las expectativas (“*Las empresas deberían de...*”) y percepciones (“*La empresa X intenta...*”) de las iniciativas de RSC se han medido siguiendo el modelo del Desarrollo Sostenible, diferenciando por tanto las dimensiones económica, social y medioambiental de la RSC. Para su medición, se ha utilizado una batería de ítems en base a los trabajos de Alvarado y Schlesinger (2008), Brown y Dacin (2007) y Lichtenstein et al. (2004), distinguiendo 5 ítems para la dimensión económica ( $\alpha = 0,92$ ), 4 para la dimensión social ( $\alpha = 0,95$ ), y otros 4 para la medioambiental ( $\alpha = 0,94$ ).

### 4. Primeros resultados

Cada una de las dimensiones de la RSC, tanto en lo relativo a las expectativas como a las percepciones, se sintetizó en un único indicador, calculado como el promedio de los ítems de la escala. Hecho esto, se calculó la disconfirmación respecto a cada dimensión, restandose para ello al valor de las expectativas sobre la RSC de la empresa en sus tres dimensiones, la valoración de las percepciones (ver tabla 1).

**Tabla 1. Valores medios de las dimensiones de la RSC (1=bajo a 7=alto)**

	Percepciones (P)	Expectativas (E)	Disconfirmación (P-E)
Social	4,80	5,43	-0,63
Medioambiental	4,79	5,63	-0,84
Económica	5,19	5,73	-0,53

El primer resultado que merece ser destacado es que la disconfirmación es negativa, es decir, los consumidores españoles tienen unas expectativas sobre las acciones de RSC de las empresas superiores a lo que perciben. En la tabla 1 se observa que los individuos españoles esperan más en el ámbito económico de la RSC, seguido de las cuestiones medioambientales y en menor nivel, de las sociales. En el caso de las percepciones, reconocen que las empresas llevan a cabo en mayor medida acciones de ámbito económico, por delante de medidas medioambientales y sociales, que las perciben de manera similar. En esta línea, donde más discrepancia se produce entre lo que se percibe de la empresa y lo que se espera de ella en materia de RSC es en la dimensión medioambiental, mientras que en la dimensión económica esta disconfirmación es la que menor valor refleja.

Si analizamos estos mismos resultados considerando el sexo del encuestado (tabla 2), constatamos que las mujeres perciben pero también esperan significativamente más que los hombres en materia de RSC en sus tres dimensiones.

**Tabla 2. Valores medios de las dimensiones de la RSC según el sexo**

	PERCEPCIONES (P)			EXPECTATIVAS (E)		
	Hombre	Mujer	Prueba t	Hombre	Mujer	Prueba t
Social	4,66	4,93	-2,969**	5,31	5,56	-2.628**
Medioambiental	4,64	4,94	-3,094**	5,50	5,76	-2.518*
Económica	5,11	5,29	-1,972*	5,58	5,87	-2.864**

\*\*Sig. ≤0.01; \* Sig. ≤0.05

En relación a la edad del individuo (tabla 3), son los mayores de 40 años los que significativamente perciben y también esperan más de la empresa en relación a las acciones de RSC. Además, la dimensión económica de la RSC es la que más protagonismo cobra, dado que es la dimensión de la que más se espera y de la que más se percibe.

**Tabla 3. Valores medios de las dimensiones de la RSC según la edad**

	PERCEPCIONES (P)			EXPECTATIVAS (E)		
	<40	≥40	Prueba t	<40	≥40	Prueba t
Social	4,59	4,97	4,230**	5,29	5,55	2,679**
Medioambiental	4,52	5,01	5,180**	5,49	5,75	2,406*
Económica	4,95	5,40	5,477**	5,57	5,86	2,862**

\*\*Sig. ≤0.01; \* Sig. ≤0.05

Por último, tal y como se observa en la tabla 4, el nivel de estudios del individuo no determina las expectativas que éste tiene en materia de RSC, pero sí algunas de las percepciones; en concreto, se tengan o no estudios universitarios, el individuo percibe al mismo nivel las acciones de ámbito económico, pero no las de carácter medioambiental o social, que son significativamente más percibidas por los individuos con menor nivel de estudios.

**Tabla 4. Valores medios de las dimensiones de la RSC según el nivel de estudios finalizado**

	PERCEPCIONES (P)			EXPECTATIVAS (E)		
	No universitarios	Universitarios	Prueba t	No universitarios	Universitarios	Prueba t
Social	4,90	4,67	-2,509*	5,37	5,51	1,519 <sup>ns</sup>
Medioambiental	4,92	4,63	-3,003**	5,57	5,70	1,286 <sup>ns</sup>
Económica	5,24	5,14	-1,142 <sup>ns</sup>	5,72	5,74	,283 <sup>ns</sup>

\*\*Sig. ≤0.01; \* Sig. ≤0.05; ns No significativo

## 5. Conclusiones y resultados esperados

Los primeros resultados de este trabajo ponen en evidencia que, para el caso español, parece existir una disconfirmación negativa entre lo que se espera y lo que se percibe en el comportamiento socialmente responsable de las empresas. Además, estas expectativas y percepciones en material social, medioambiental y económico varían según el sexo, edad y nivel de estudios del consumidor. Este trabajo en curso tiene su continuación natural en la profundización del papel moderador de las características sociodemográficas en la relación establecida entre la disconfirmación de expectativas de RSC y posteriores respuestas emocionales (por ejemplo, actitud hacia la marca o compromiso con la marca) y comportamentales (intención de compra o intención de recomendar) del sujeto. Estos efectos de moderación se testarán mediante modelos Finite Mixture Partial Least Squares (SmartPLS).

Se espera que, mediante los resultados posteriores de este trabajo en curso, se puedan ofrecer explicaciones alternativas o más sofisticadas a investigaciones previas sobre la influencia de antecedentes de la propia empresa en la influencia de la RSC sobre el comportamiento del consumidor: estos responden más negativa o positivamente a las iniciativas de RSC en función de sus propias características sociodemográficas, y lo que esperan y perciben de las propias

iniciativas de RSC. Desde la óptica de la gestión, los resultados tendrán implicaciones para las empresas en lo que a la toma de decisiones de segmentación se refiere, enfocando sus comunicaciones de RSC hacia el segmento de consumidores más afines con su responsabilidad social.

# MEDIA EFFECTS ON ENVIRONMENTAL ACTIVISM: THE MODERATING ROLE OF OPTIMISTIC BIAS

## **ABSTRACT**

*This paper adopts a novel optimistic bias-based approach to improve understanding of media effects on environmental activism. The main research question here concerns ‘if and how’ optimistic bias moderates media effects on environmental activist behavior. A complementary question is whether optimistic bias sheds light onto the differential effectiveness of some media, relative to others, in influencing environmental activism. Consequently, the authors postulate that optimistic bias moderates the effect of perceived media influence (on self) on environmental activism—so that media influence on environmental activism will be less intense for individuals ‘high’ in optimistic bias. Personal interviews will be conducted to gather quantitative data from a sample based on designated age and gender quotas. Most measurement items are drawn or adapted from validated scales. Hierarchical regression analysis will be used to test the relationships of the study. Important implications for theory, policy, and practice will be drawn.*

## **Keywords:**

Media effects, optimistic bias, environmental activism, hierarchical regression

## 1. Introduction

Engaging the public in environmental activism is recognized as an essential step in the move towards the sustainability goals of industrialized countries. Increased media coverage has substantially raised public awareness and concern about environmental issues, but has typically failed to induce effective and persistent behavioral changes (e.g., Whitmarsh, 2009). Thus, public and private organizations continue to face the challenge of effectively using media and communication technology to promote more environmentally significant behavior.

Although the above arguments question the validity of media as a method of effecting large-scale pro-environmental behavior change, this study asserts that not only the type of media used to deliver pro-environmental messages but also the psychological mechanisms that emerge when people receive the communication stimuli may account for people's behavioral reactions. Specifically, scholars have argued that there is a tendency of people to underestimate their likelihood of suffering from environmental risks, which is called optimistic bias (e.g., Hatfield and Job, 2001; Pahl et al., 2005). This psychological mechanism leads a person to judge one's own risk as less than the risk of others and, thus, reinforces self-esteem in evaluating external negative stimuli such as media messages of negative events (e.g., environmental hazards) in such a way that inhibit the adoption of protective actions. Accordingly, optimistic bias regarding environmental hazards may hinder the adoption of pro-environmental behaviors, such as environmental activism, and can enlighten why a commensurate public involvement in pro-environmental behavior is lacking (Hatfield and Job, 2001). Yet, empirical evidence suggests that optimistic bias does not directly relate to intended or actual pro-environmental behavior (Pahl et al., 2005).

A novel optimistic bias-based approach is adopted in this study to explain how media effects are linked to environmental activism. On the one hand, and consistent with prior findings in communication research, perceived media influence (on self) is considered to be a direct predictor of environmental activism behavior. On the other hand, this relationship between media and activism is argued to be contingent on people's optimistic bias. The view of optimistic bias as a moderator moves away from its traditional, controversial conception as a direct predictor of pro-environmental behavior, and delves into the idea that the optimistic bias mechanism acts as a psychological barrier that may attenuate or annul media effects on pro-environmental behavior change.

Considering also that some media are more effective than others in influencing pro-environmental perceptions and behaviors (e.g., Nixon and Saphores, 2009; Nonami et al., 1997), a complementary research question is whether optimistic bias is a factor that helps better understand these differential media effects. Although the analysis of different media sources of information is lacking in studies on optimistic bias for environmental risks, the importance of understanding the interplay between media, optimistic bias, and pro-environmental activism is valuable not only from a scientific but also from a practical point of view (e.g., efficient resource allocation in environmental communication campaigns).

## 2. Background

### 2.1. Media effects on pro-environmental behavior

The importance of media effects largely stems from the view of environmental awareness and knowledge as necessary preconditions for most pro-environmental actions (Mobley et al., 2010). However, 'information deficit' approaches to behavior change—depicted largely as linear-sequential models [environmental knowledge → awareness and concern (environmental attitude) → pro-environmental behavior]—have been criticized as being too simplistic or ineffective (Kollmuss and Agyeman, 2002). Thus, communication efforts to promote voluntary, public engagement in pro-environmental actions appear to have had limited success (Howell, 2011; Poortinga et al., 2011). A review of the literature uncovers that most of environmental 'media effects' studies have focused on analyzing how media *coverage* and *exposure* to environmental issues and problems affect public awareness and pro-environmental action (e.g., Sampei and Aoyagi-Usui, 2009). Alternatively, other authors have examined how media *usage* relates to individual-level pro-environmental outcomes (e.g., Arlt et al., 2011). It is the authors' contention that measures of media coverage, exposure and usage

fail to account for the actual influence of media environmental messages on the public, and is partly responsible for the inconsistency of the results regarding the influence of media on pro-environmental behavior. *Perceived media influence* should be more strongly associated to the various outcomes considered in environmental studies. In particular, the presumed effect of media coverage on self has been shown to directly elicit pro-environmental behavior changes (e.g., Jensen and Hurley, 2005). Therefore, it is argued that measures of perceived media influence on self allow researchers to more fully account for the strength and actual efficacy of environmental messages and campaigns.

## **2.2. The optimistic bias**

Optimistic bias regarding environmental hazards (i.e., environmental optimistic bias) has received little direct theoretical and empirical consideration in comparison to other personal risks such as contracting AIDS, smoking risks, suffering accidents, the Y2K problem, etc. Optimistic bias has been defined as a psychological tendency that leads people to think they are less likely to experience negative future events but more likely to experience positive future events as compared to others (Gifford et al., 2009). According to this definition, though beneficial messages such as pro-environmental messages might gear actions toward personal protection from (environmental) risk perceptions, the optimistic bias would make people believe that the risk is higher for others than for oneself, which could lead to human inaction. Despite the importance of this phenomenon, it is significant that the influence of media variables has been neglected in environmental optimistic bias research, even though communication processes have been commonly linked to self-other differences in the risk perception domain (see, e.g., Chapin, 2000; Morton and Duck, 2001).

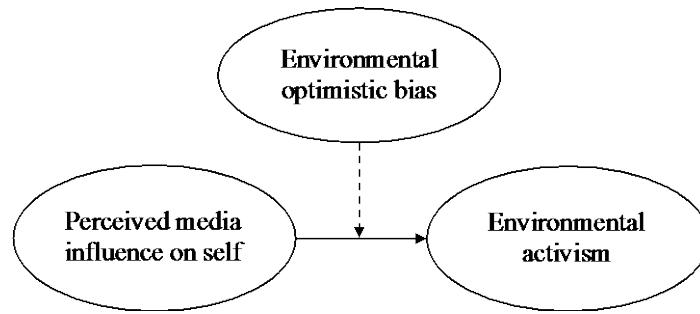

Considering the above arguments, two questions that arise from studies that show that media effects are not enough for environmental behavior change to occur are (1) whether the optimistic bias may be acting as an inhibitor of these effects and (2) whether this mechanism holds this power regardless of the type of media used to deliver an environmental message. Regarding the first concern, Gifford (2011) stressed that optimistic bias, as a psychological barrier, has become a contingency factor that may hinder pro-environmental behaviors. Accordingly, the cognitive underestimation of the likelihood of suffering from environmental risks can lead people to reject the behavioral changes that environmental media messages encourage. This view reflects the idea that there is “a human tendency to see the world through optimistic or self-serving lenses” (Gunther and Mundy, 1993: 58). This study follows this conception that considers optimistic bias as a contingency to claim that the interplay of this mechanism with media influences would determine environmental activism. Regarding the second concern, it seems logical to believe that the effect of environmental optimistic bias on the relationship between perceived media influence on self and environmental activism will be more or less intense depending on the message delivery channel. This assumption can be supported by results that show that social judgment biases can be interrelated to the characteristics of the source of communication (e.g., Morton and Duck, 2001) and also by studies that show differential effects of media on people’s environmental knowledge, attitudes and/or behavior (e.g., Corral-Verdugo, 2003; Nixon and Saphores, 2009).

## **3. The current study**

Based on the above discussion, in the current study it is proposed an interactive fit argument or moderating view that argues that environmental activism behavior is attributable to a match between the psychological mechanism of optimistic bias and media influences. In particular, it is suggested that the optimistic bias moderates the effect of perceived media influence (on self) on environmental activism. Given the focus on environmental hazards, it is postulated that media influence on environmental activism will be less intense in those individuals whose optimistic bias is greater. Figure 1 illustrates the conceptual model.

FIGURE 1  
Research model

#### 4. Method and expected contributions of the study

Next, the methodology that will be used in this research is explained and the expected contributions of the study are discussed.

To test the research model, we will utilize the questionnaire survey method. Personal interviews will be conducted to gather quantitative data from a sample based on designated age and gender quotas. For the measurement of the variables in the model, adapted scales of prior studies are used. The scale of *environmental activism* comprises six statements relating to individual-level activism actions (e.g., participation in environmental demonstrations); environmental activism items will be adapted from key environmental studies (i.e., Stern et al., 1999; Whitmarsh and O'Neill, 2010) and rate on 7-point scales from 1 to 7—where 1 denotes 'never' and 7 denotes 'always'. A composite index of environmental activism—the outcome (dependent) variable of interest here—will be constructed by computing factor scores from a principal components analysis of the six activism items. The *perceived influence of media on self* is measured with 26 ratings, on a 1 to 7 scale, of the extent to which different communication formats (e.g., campaigns, news, ads, series, documentaries, or interviews)—conveyed by different media and communication technology (i.e., television, radio, print media, and the Internet)—influenced participants to adopt pro-environmental actions (1 = 'no influence'; 7 = 'extreme influence'). A separate composite index of perceived influence of media will be created from principal components analysis of communication items. The procedure performed by Pahl et al. (2005) to develop a measurement instrument for *environmental optimistic bias* or comparative optimism is going to be followed in this study. Participants will be asked to rate 19 environmental risks (e.g., pollution, genetically modified food, pesticides and herbicides, water shortage) for the self, followed by ratings of the same risks for a typical person of the same background as respondents. Respondents will be asked "How much at risk do you think you [a typical person (of your age, sex and background)] are [is] of experiencing harmful effects of each of the following hazards sometime in the future?" Again, responses will be given on 7-point scales ranging from 'not at risk at all' (1) to 'strongly at risk' (7). Comparative optimism (i.e., the difference score between self and other-rating) will be computed for the 19 environmental risks. Additionally, a composite index of optimistic bias will be constructed by computing factor scores from a principal components analysis of the 19 comparative optimism items. The questionnaire will also comprise questions on socio-demographic information that will be used as covariates in the empirical analysis.

A hierarchical regression analysis procedure will be performed to test the proposed relationships. Specifically, this technique will allow to assess the magnitude and significance of the interactions involving perceived media influence on self (differentiating among distinct media) and optimistic bias. From this analysis, the study attempts to provide valuable insights into how optimistic bias determines the strength of the effect of different media on pro-environmental activism or, in other words, to shed light onto the effectiveness of different media under different levels of biased optimism. In this sense, it is expected that the findings lead to improve the theoretical understanding of the process of media influence on environmental activism. The study can also have useful practical implications because those in governments, businesses and environmental organizations could use the findings for designing ambitious environmental campaigning.

*Universidad de Murcia*

## RESUMEN

*El objetivo de este estudio de investigación es el desarrollo de una nueva escala para medir la Responsabilidad Social del Consumidor (RSCn), una escala que incluye no sólo lo que otros autores han aceptado previamente sino que incorpora nuevas actitudes alineadas con la evolución del sistema económico y social. El concepto se ha desarrollado a partir del establecido en la literatura para la Responsabilidad Social Corporativa (RSC) de las empresas. Se ha seguido la metodología para el desarrollo de escalas y, posteriormente, se ha procedido a su contraste mediante un modelo de antecedentes y consecuencias. En este documento se describe la metodología utilizada y se muestran los primeros resultados del estudio, correspondientes a las primeras fases de investigación.*

## Palabras clave:

Responsabilidad Social del Consumidor, Responsabilidad Social Corporativa, desarrollo de escala.

## 1. Introducción

El comportamiento responsable de los consumidores se ha estudiado en la literatura durante las últimas décadas desde distintas perspectivas, tales como consumo ético, responsable, consciente, sostenible o verde. Sin embargo, aunque el análisis del perfil de un consumidor responsable ya se ha hecho en relación a sus características demográficas y personales, ninguno de los trabajos anteriores ha analizado el comportamiento del consumidor socialmente responsable desde la perspectiva de la Responsabilidad Social Corporativa (RSC) de las empresas. De hecho, Öberseder et al (2011) indican que el enfoque más valioso, aunque difícil, sería la de segmentar a los consumidores de acuerdo con sus intereses personales y comunicar diferentes esfuerzos de RSC a diferentes grupos objetivo.

Por esta razón, en el presente trabajo se desarrolla una nueva escala para medir la Responsabilidad Social del Consumidor (RSCn) a través de la traslación de las dimensiones establecidas por Carroll (1979) para la RSC de las empresas, incluyendo el análisis del comportamiento responsable del consumidor en sus dimensiones *económica, legal, ética, filantrópica o discrecional, y medioambiental*. Además, plantea un modelo de antecedentes y consecuencias que hasta ahora no se ha desarrollado en la literatura, permitiendo una comprensión más global del comportamiento del consumidor y una mejora de la identificación entre éste y la empresa. De esta forma las empresas serán capaces de conocer mejor el comportamiento socialmente responsable de sus consumidores y podrán no sólo de elegir, sino comunicar mejor sus acciones de RSC.

## 2. Revisión de la literatura

Existen numerosas definiciones y términos relativos al comportamiento responsable de los consumidores como consumo responsable (Fisk, 1973), consumidor socialmente consciente (Webster, 1975); consumo socialmente responsable (Antil, 1984; Antil y Bennet, 1979; Mohr et al, 2001); consumo ecológicamente consciente (Straughan y Roberts, 1999); responsabilidad social del consumidor (Devinney et al, 2006) o consumo ético (Cooper-Martin y Holbrook, 1993; Fraj y Martínez, 2007). Aunque tradicionalmente se ha relacionado principalmente con cuestiones de respeto al medioambiente o filantrópicas, todas estas definiciones hacen referencia al comportamiento responsable de los consumidores desde otras perspectivas. Esta variedad de definiciones es un indicador de la falta de consenso sobre el concepto, situación que también podemos encontrar ante el término de la RSC y que responde a la continua evolución del papel del consumidor y de la empresa en su entorno económico y social.

Por su parte, la RSC ha sido ampliamente analizada y definida en la literatura previa. Desde la perspectiva de Bowen (1953) hasta la teoría de los grupos de interés, la definición que ha sido más ampliamente aceptada es la realizada por Carroll (1979), quien sostiene que para abordar plenamente toda la gama de obligaciones que una empresa tiene con la sociedad, debe incorporar las dimensiones económica, legal, ética y discrecional. En consonancia con ello, y al igual que la RSC se describe en cuanto a la relación que tienen las empresas con la sociedad en general, la responsabilidad social de los consumidores debe describir el comportamiento y la influencia de éstos hacia su entorno social y ecológico.

Por tanto, la Responsabilidad Social del Consumidor puede ser definida como toda decisión de consumo consciente, basada en las creencias éticas y morales del consumidor e impulsada por una respuesta a las actuaciones de la empresa, y que contribuye a minimizar sus impactos negativos sobre su entorno social y ecológico pudiendo inducir a un cambio social. Al igual que en las empresas, estas acciones de consumo deben incorporar las responsabilidades económicas, legales, éticas y discrecionales derivadas del papel que juega el consumidor en el mercado.

## 3. Metodología

Para el desarrollo de la escala de RSCn se ha seguido la metodología desarrollada por Churchill (1979), a través de los pasos que se muestran a continuación:

### **3.1. Especificación del dominio del constructo**

Esta fase se ha desarrollado a partir de la revisión de la literatura previa y entrevistas en profundidad a tres investigadores expertos en comportamiento del consumidor, que han contribuido a adaptar las dimensiones de Carroll de la empresa al consumidor y a incorporar ciertos matices en cada dimensión que no contemplaba éste. A través de estas entrevistas se ha decidido incorporar a las cuatro dimensiones planteadas por Carroll (*económica, legal, ética y filantrópica o discrecional*) una quinta dimensión (que en RSC se utiliza de forma transversal en todas las dimensiones) referida a la *responsabilidad social medioambiental*, dada la importancia de este aspecto en las decisiones de consumo.

### **3.2. Generación de ítems**

Un total de 232 ítems se identificaron en el primer paso correspondiente con la revisión de la literatura, relacionados con el consumidor socialmente responsable (Antil and Barnett, 1979; Antil, 1984; Durif et al, 2011; Roberts, 1996), justificaciones éticas del consumidor (D'Astous and Legendre, 2008), respuesta del consumidor al comportamiento ético de las empresas (Deng, 2011), ideologías éticas (Forsyth, 1992), ciudadanía corporativa (Maignan y Ferrell, 2001), percepción sobre ética y responsabilidad social (Singhapakdi et al, 1996), comportamiento “verde” del consumidor (Straughan y Roberts, 1999; Roberts, 1996), responsabilidad social corporativa (Turker, 2009; Boal and Peery, 1985) y consumidores medioambientalmente responsables (Stone, Barnes, and Montgomery, 1995).

Tras la revisión de la literatura, se realizaron entrevistas en profundidad a investigadores y consumidores para ayudar a la definición de las dimensiones del constructo, generar nuevos ítems, evaluar la comprensión de éstos y eliminar aquellos que resultaran redundantes o ambiguos. A partir de las entrevistas se incorporaron 14 ítems adicionales referentes a comportamientos del consumidor socialmente responsable que no estaban recogidos en la literatura previa.

Los 246 ítems se agruparon provisionalmente en las cinco dimensiones identificadas de la responsabilidad social del consumidor. Fueron analizados por un panel de expertos para comprobar su validez de contenido, considerando su ambigüedad, claridad, trivialidad y redundancia. Se eliminaron aquellos en los que al menos dos de los tres expertos estaban de acuerdo en que no representaban la dimensión indicada u otra, aquellos para los que no se ponían de acuerdo o aquellos que presentaban dudas. Además, se eliminaron los ítems redundantes, ambiguos o demasiado específicos. Tras este análisis, los expertos estuvieron de acuerdo en que los 66 ítems seleccionados representaban de forma adecuada las cinco dimensiones. La escala revisada se presentó en un cuestionario con los 66 ítems a los que los consumidores podían responder de 0 “totalmente en desacuerdo” a 10 “totalmente de acuerdo”.

### **3.3. Primer estudio**

#### *Muestra y recolección de datos*

La unidad de análisis de este primer estudio o pretest destinado a la eliminación de ítems y purificación de la escala es el consumidor individual, mayor de edad, con capacidad para tomar decisiones de consumo. La encuesta se diseñó con formato online y se distribuyó por correo electrónico a alumnos y profesores de una universidad española. Tras la eliminación de observaciones no válidas, se obtuvieron un total de 166 respuestas.

#### *Análisis factorial exploratorio*

La prueba de Kaiser-Meyer-Olkin (KMO) para medir la adecuación del análisis factorial fue de 0,83, indicando que las variables presentan una estructura de correlaciones que permite la reducción eficiente de dimensiones. El análisis inicial exploratorio, correspondiente al análisis factorial de componentes principales usando rotación varimax, dio lugar a los cinco factores inicialmente propuestos en los objetivos del estudio: *responsabilidad económica, responsabilidad legal, responsabilidad ética, responsabilidad filantrópica o discrecional, y responsabilidad medioambiental*. Los ítems se mantuvieron siempre y cuando tuvieran una

carga de 0,48 o superior en un factor, no cargaran más de 0,50 en dos factores, y si el análisis de fiabilidad indica una correlación ítem-total mínima de 0,40. Sólo un ítem, correspondiente a la dimensión “responsabilidad económica” obtuvo una correlación ítem-total inferior a 0,40 (0,35), pero por no cumplir uno sólo de los criterios se decidió mantener.

En resumen, de todos los ítems utilizados en el cuestionario 47 fueron eliminados. Como se muestra en la Tabla 1, el análisis factorial exploratorio dio lugar efectivamente a los cinco factores que se habían previsto, con una varianza total explicada del 67,29%. La carga de los factores osciló entre 0,49 y 0,86. El coeficiente alfa varió de 0,91 a 0,65.

TABLA 1  
Dimensiones resultado del análisis factorial exploratorio (Estudio 1; n=166)

	FIL	MED	ETI	LEG	ECO
Colaboro con una ONG	,825				
Apoyo con dinero o tiempo a actividades sociales y culturales	,819				
Animo a mis amigos y familiares a que participen en actividades solidarias	,795				
Hago donaciones a organizaciones benéficas que apoyan causas sociales o medioambientales	,786				
Dedico esfuerzo y dinero a ayudar a los demás	,658				
Presto atención a la protección del medio ambiente en la vida diaria y en el consumo		,859			
Hago sacrificios personales para disminuir la contaminación		,846			
No compro productos que dañan potencialmente el medio ambiente		,806			
He dejado de comprar ciertos productos por razones ecológicas		,785			
La ética ha sido esencial para que me vaya bien en la vida			,824		
Educo a mis hijos (o los educaría si los tuviera) teniendo en cuenta la ética			,820		
En nuestra familia se educa a todos sus miembros a ser honestos con los demás			,595		
Nunca he hecho daño a los demás, aunque me pudiese haber beneficiado de ello			,487		
Cumplo con mis obligaciones legales				,815	
Siempre pago mis impuestos				,747	
Trato siempre de cumplir la ley				,710	
No consumo más de lo necesario					,838
Compro productos que sé que luego voy a utilizar					,738
No gasto más de lo que ingreso					,676

El primer factor que mide la RSCn es “responsabilidades filantrópicas” (FIL,  $\alpha=0,88$ ), y explica el 18,04% de la varianza. El segundo factor, “responsabilidades medioambientales” (MED,  $\alpha=0,91$ ), explica el 17,17% de la varianza. El tercer factor es “responsabilidades éticas” (ETI,  $\alpha=0,72$ ), y explica el 11,72% de la varianza. El cuarto factor que mide la RSCn es el de “responsabilidades legales” (LEG,  $\alpha=0,67$ ), y explica el 10,69% de la varianza. El quinto y último factor está compuesto por las “responsabilidades económicas” del consumidor (ECO,  $\alpha=0,65$ ), explicando el 9,67% de la varianza.

### 3.4. Segundo estudio

Una vez obtenidas las cinco dimensiones del constructo, se ha diseñado un nuevo cuestionario que incluye las medidas de las variables independientes (antecedentes de la RSCn) y de las dependientes (consecuencias de la RSCn). Estas variables se utilizarán para plantear y contrastar el modelo de investigación, fase que está actualmente en desarrollo.

## 4. Conclusiones y resultados esperados

Posibilitar a las empresas entender mejor el comportamiento socialmente responsable de los consumidores puede ayudar a mejorar los resultados de su desempeño de RSC y sus efectos en el consumidor. Como señala Roberts (1996), el éxito del marketing como respuesta social se basa en gran medida en una mejor comprensión del consumidor socialmente responsable. De

esta manera, las empresas no sólo lograrán que sus esfuerzos sean más eficaces y por lo tanto una posición más competitiva, sino que tendrá una mayor influencia en las decisiones de compra de sus consumidores.

## **ABSTRACT**

*This article details the purposes, scope, and structure of an “ongoing” literature review of anti-consumption for environmental sustainability, an overarching term that includes various forms of environmentally-orientated anti-consumption (EOA). The authors draw from the disciplines of marketing, management, environmental studies, and psychology to review EOA research at three levels (i.e., individual, organizational, and industry/national levels). First, the authors review the main manifestations and targets of EOA among citizens/consumers, and summarize research that has explored antecedents to individual EOA. Second, the authors analyze previous studies addressing the issue and present the potential of anti-consumption to advance knowledge in the field of organizations and the natural environment. Third, the article discusses studies focused on the consequences and reactions to EOA across industry, national levels (e.g., governments and policy). Additionally, this review explores how EOA has been conceptualized and operationalized in the literature. The authors finally outline fruitful avenues for future research.*

## **Keywords:**

Anti-consumption, environmental sustainability, literature review.

## **1. Anti-consumption for Environmental Sustainability**

Excessive consumption contributes to the depletion of natural resources and generates huge amounts of waste (Thøgersen & Grunert-Beckmann, 1997); in fact, unsustainable consumption patterns can be linked to both local and global environmental problems, such as climate change. Faced with this situation, more effective solutions to environmental degradation lie in changing the dominant lifestyles and (unsustainable) consumption patterns and levels (Peattie & Peattie, 2009). This has sparked interest in discovering and investigating alternative forms of consumption, as a means of achieving greater environmental sustainability—as exemplified by the publication of special issues devoted to ‘sustainability’ and ‘anti-consumption’, in leading business and marketing journals such as *Journal of Business Research* (2009), *International Journal of Consumer Studies* (2009), *Journal of Consumer Behavior* (2010), or *Journal of Macromarketing* (2010).

Anti-consumption has been defined as “phenomena that are against the acquisition, use and dispossession of certain goods” (Chatzidakis & Lee, 2013, pg 2.). A wide range of environmentally-orientated anti-consumerist practices is comprised under the overarching term of ‘anti-consumption’, such as environmental boycotts, green activism, or consumer resistance and avoidance actions (Iyer & Muncy, 2009). Anti-consumption practices can be targeted against consumption in general, or against specific products/brands, product categories, companies, industries or even countries (Lee et al., 2009). From a theoretical standpoint, the interest of analyzing anti-consumption stems from the idea that the drivers and motivations for anti-consumption behavior—the reasons for—are different from those influencing consumption—the reasons against (Chatzidakis & Lee, 2013). That is, an individual who decides not to perform certain consumption actions—e.g., not to purchase an environmentally harmful product—not only may lack sufficient motivation to do it (for consumption), but s/he may also hold additional and stronger motivations for not doing so (for anti-consumption) (Richetin et al., 2012). The above discussion highlights the importance of anti-consumption as a distinct perspective and worthy field of investigation that: first, pertains to a particular set of reasons against consumption; and second, can be approached at differing levels of aggregation—both in scope and targets of anti-consumption practices (Chatzidakis & Lee, 2013).

Following the conceptualization forwarded by Chatzidakis & Lee (2013), the authors review EOA in the areas of environmental boycotts, green activism, consumer resistance and avoidance, at three levels of analysis (i.e., individual, organizational, and industry/national levels).

## **2. Anti-consumption, organizations, and the natural environment**

A growing literature addresses the reasons why companies adopt proactive environmental strategies and how it relates to corporate performance (e.g., see Ambec & Lanoie, 2008; Berchicci & King, 2007; Eztion, 2007 for reviews on the topic). In general, this literature assumes a positive relationship between environmental responsiveness and economic performance via –among other advantages– differentiation advantages and better access to markets (e.g., Ambec & Lanoie, 2008). However, previous studies have focused on the positive edge of reputation and have mostly overlooked the phenomena of anti-consumption—i.e., customers avoiding a particular company or industry for its harmful behaviour—and how it affects the potential of a proactive environmental strategy to generate competitive advantages.

There is evidence in the field of marketing (Black & Cherrier, 2010; Cherrier et al., 2011) and recently also in management journals (Allen & Shonard, 2011; Flemmer, 2013) showing that external pressures towards environmental conforming have increased tremendously over the last decades, and that positive reactions to pro-environmental behaviours of firms are being attenuated while negative reactions to environmentally-harmful behaviours are being exacerbated over time. For example, Flemmer (2013) found that shareholder’s positive reactions to the announcement of eco-friendly corporate initiatives are decreasing over time while negative reactions to eco-harmful initiatives are increasing.

Anti-consumption phenomena relate very well and potentially extend theoretical approaches that are central in the field of organizations and the natural environment. The concept that companies react to external pressures (i.e., environmentally-orientated consumption avoidance) by implementing more

responsible environmental strategies is consistent with the institutional theory. Institutional scholars suggest that companies do what is legitimized in their field and institutional pressures may lead companies to be more environmentally responsible (e.g. Bansal, 2005; Bansal & Roth, 2000; Delmas & Toffel, 2004; Hoffman, 1999; Jennings & Zandbergen, 1995). Anti-consumption phenomena may constitute a significant part of the normative framework of environmental issues because it exerts strong pressures for companies going green. As Flemmer (2013) point, the more environmental responsiveness is institutionalized as a norm, the more environmentally damaging organizational behaviours have a negative effect on perceptions on the firm, because firms are punished for not following the norm.

Similarly, anti-consumption can be observed through the lenses of stakeholder theory applied to the field of environmental responsiveness (e.g., Kassinis & Vafeas, 2006; Sharma & Henriques, 2005). Customers are relevant stakeholders and, obviously, have the ability to drive companies to introduce environmental initiatives.

### **3. Purpose, Scope, and Structure of the *ongoing* Literature Review**

The purpose of the literature review detailed here is thus threefold: A first goal is to detail how EOA has been conceptualized. This is salient because there is still no settled idea of what anti-consumption for environmental sustainability (EOA) actually is. As shown in recent research (Chatzidakis & Lee, 2013; Cherrier et al., 2011), anti-consumption should be viewed as intentional or volitional (i.e., non-incident or unintended) individual decision not to consume. Arguably, EOA could be viewed as comprising broad, voluntary, and environmentally-significant responses, with impacts across multiple levels.

Another major purpose of the article is to review the antecedents of anti-consumption, as well as its effects at an individual (micro), organizational (meso) and industry/national (macro) levels. At the micro level, the review aims to cover the main manifestations and targets of EOA among citizens and consumers, synthesizing the research that has explored antecedents to individual environmentally-significant anti-consumption. At the meso and macro levels, the authors attempt to discuss studies that focused on the consequences and reactions to EOA across organizational, industry, national levels (e.g., governments and policy).

In addition to better understanding the implications of EOA, the third goal of this review is to present anti-consumerist phenomena to organizational scholars. Hence, the authors aim to relate the EOA phenomenon with current conversations in the management field. The goal in doing this is to identify what is known to date and, more importantly, to identify previously unexplored avenues and lay out a plan for future research in this domain.

With these goals in mind, the paper selectively reviews relevant works in the disciplines of marketing, management, environmental studies and psychology. The scholars and works presented in this review are chosen for their prominence in the four areas of anti-consumption being reviewed (i.e., environmental boycotts, green activism, or consumer resistance and avoidance actions). Specifically, the authors are conducting a comprehensive multilevel review of the body of knowledge on environmentally-significant and orientated anti-consumerism, resistance, and activism.

The review will be organized in the following preliminary sections:

#### 1. Introduction

2. Following the introduction of the literature review, the second section will clarify the concept of anti-consumption for environmental sustainability at the various levels addressed in this work, differentiating it from related and often overlapping phenomena such as consumer resistance, non-consumption or alternative consumption.

Given the multi-faceted nature of anti-consumption for environmental sustainability, the authors will determine the scope of such responses against consumption considering the environmental impact of different actions (i.e., private vs. public, stable vs. transitory, generalized vs. targeted) (Chatzidakis & Lee, 2013; Iyer & Muncy, 2009).

3. In the third section, the authors explore the antecedents of individual-level anti-consumption

practices. These include a variety of factors, ranging from socio-demographics, psychographics, to broader sociocultural processes (see Bamberg & Moser, 2007) that contribute to environmentally-significant anti-consumption phenomena. Importantly, the authors look at the antecedents of individual, micro-level anti-consumption through the lens of the ‘reasons for’ and ‘reasons against’ that, as recently advocated by Chatzidakis & Lee (2013), so as to provide fuller account of the drivers of anti-consumption for environmental sustainability.

4. Looking beyond the micro level of individual (consumer) decision making is particularly important in the analysis of the consequences and reactions of anti-consumption. Thus, in the fourth and fifth sections, the authors discuss studies that focused on the consequences and reactions to EOA across organizational, industry and national levels (e.g., governments and policy). Thus, the focus here is primarily on the meso and macro levels. As explained above, the goal of these sections is to relate EOA phenomena with current conversations in the field of organizations and the natural environment, specifically with institutional and stakeholder approaches.

5. In the fifth section, the authors suggest avenues for future research that are important to advancing current understanding of anti-consumption for environmental sustainability at various levels of analysis, which are summarized in Table 1.

TABLE 1.  
Summary of Future Research Opportunities

Micro-level	Meso	Macro	Multilevel
<ul style="list-style-type: none"> <li>▪ Examine the interactive effects of psychographic dimensions on specific EOA behaviors.</li> </ul>	<ul style="list-style-type: none"> <li>▪ Analyze best ways to use anti-consumption discourses to company advantage.</li> </ul>	<ul style="list-style-type: none"> <li>▪ Explore nationally-activated EOA behaviors.</li> </ul>	<ul style="list-style-type: none"> <li>▪ Examine micro, meso, and macro antecedents of EOA within the nomological network of the behavior reasons theory (i.e., reasons for vs. reasons against).</li> </ul>
<ul style="list-style-type: none"> <li>▪ Examine conspicuous EOA and its possible manifestations (i.e., activism, WOM...).</li> </ul>	<ul style="list-style-type: none"> <li>▪ Determine the manner in which anti-consumption phenomena alters and evolve with the institutional framework.</li> </ul>	<ul style="list-style-type: none"> <li>▪ Determine the evolution of EOA over time.</li> </ul>	<ul style="list-style-type: none"> <li>▪ Interactions between micro, meso, and macro reasons for EOA.</li> </ul>

Universidad de Zaragoza

## RESUMEN

*Las características propias de los equipos de trabajo virtuales representan un verdadero reto para el desarrollo de liderazgos confiables. En este sentido, la presente investigación considera diferentes factores antecedentes de la confianza hacia el líder de un equipo virtual agrupados en dos bloques: características físicas (atractivo) y comportamentales (justicia y empatía) del líder. Asimismo, se analiza como el estilo de liderazgo (transaccional o transformacional) puede moderar las relaciones anteriores. Entre otros, los resultados constatan la mayor capacidad de un líder empático para crear confianza así como que líderes más atractivos físicamente generan más confianza. Estos resultados tienen interesantes implicaciones para la gestión de equipos en el área de marketing, las cuales son discutidas junto con las principales líneas de investigación futuras.*

## Palabras clave:

*Equipos virtuales, liderazgo, atractivo, empatía, justicia.*

## **1. Introducción**

Los grandes avances tecnológicos que las sociedades modernas han experimentado en las últimas décadas han creado un nuevo paradigma de trabajo que hace posible trabajar en cualquier momento y en cualquier lugar, gracias a la comunicación mediada tecnológicamente (Cascio y Shurygailo, 2003). Las organizaciones han adoptado esta nueva forma de trabajo basada en la deslocalización de sus empleados de cara a crear equipos de trabajo más flexibles que les permitan competir en un entorno económico cada vez más complejo y competitivo. Nace pues una nueva forma organizativa, denominada equipo de trabajo virtual, caracterizada por la distribución temporal y espacial de sus miembros y con el uso de la tecnología como pilar fundamental en la comunicación (Jarvenpaa y Leidner, 1999). Estos equipos aportan a las organizaciones una gran flexibilidad, fomentando la creación de conocimiento y las habilidades en sus empleados. De hecho, es habitual el uso de equipos virtuales en proyectos de alto valor añadido como en el desarrollo de nuevos productos o en la gestión de la fuerza de ventas, ambas ligadas directamente al ámbito de la dirección de marketing.

El crecimiento de los equipos virtuales ha sido constante desde finales de la década de los '90, donde sólo en Estados Unidos se estimaba que unos 9,2 millones de empleados trabajaban desde el hogar en 1997, con un notable incremento hasta los 13,4 millones en 2010 (Mateyka *et al.*, 2012). Datos más recientes señalan que el 40% de las mayores empresas de Estados Unidos o pertenecientes al índice Fortune 500 tienen al 40% de sus empleados involucrados en equipos virtuales (Bullock y Tucker Klein, 2011), una tendencia que estas empresas pretenden fortalecer en el 61% de los casos.

Sin embargo, estos nuevos equipos traen consigo una serie de retos para la gestión. La literatura previa incide en que no es posible utilizar los patrones de liderazgo tradicionales en el nuevo entorno virtual (Santos, 2013; Cascio, 2000), siendo por tanto necesario adaptar la gestión del equipo a la nueva realidad virtual, donde el liderazgo del equipo tiene un papel clave en el éxito del mismo. En este sentido, la importancia de la confianza en el líder de un equipo, reconocida como clave en un entorno tradicional, cobra ahora una nueva dimensión, siendo necesario adaptar los patrones de liderazgo a un nuevo entorno donde la comunicación pasa a ser una importante barrera en el desarrollo de las relaciones entre los miembros de un equipo. De hecho, la confianza ha sido propuesta como el principal desafío al que se enfrentan los equipos virtuales en la actualidad (Bullock y Tucker Klein, 2011).

Si bien trabajos previos han analizado la confianza desde una perspectiva organizacional, así como el papel que juega el líder en la creación de un entorno confiable, todavía no existe un cuerpo teórico y empírico consistente en lo que se refiere al estudio de la confianza en el líder en entornos virtuales y en las variables que influyen en la misma (Zhang y Fjermestad, 2006). La confianza es uno de los factores más determinantes del desempeño dentro de una organización y, en especial, del éxito o fracaso de un equipo de trabajo. Según Mayer, Davis y Schoorman (1995), la confianza surge como consecuencia de tres tipos de percepciones: habilidad, benevolencia e integridad percibidas en la otra parte. Centrando la atención en la confianza hacia el líder de un equipo, cabe destacar que ésta puede depender de diferentes factores precursores, algunos de ellos tratados en profundidad por la literatura previa (e.g. integridad del líder). No obstante, existen otros factores que no han sido analizados con suficiente profundidad, algunos de los cuales son objeto de estudio en este trabajo.

El presente trabajo propone dos tipos de factores antecedentes de la confianza en el líder de un equipo virtual: las características físicas del líder (grado de atractivo) y el comportamiento del líder (grado de empatía y de justicia). Por otro lado, cabe señalar que algunas de las relaciones entre los factores antecedentes y la confianza pueden verse moderadas por la presencia de aspectos como el estilo de liderazgo. En este sentido, la teoría apunta a dos estilos de liderazgo fundamentales: líderes con estilo transformacional, que establecen una relación de intercambio social con sus subordinados (Pillai, Schriesheim y Williams, 1999), y líderes con un estilo transaccional, que dedican más esfuerzo a asegurarse de que los subordinados cumplen con sus tareas.

En definitiva, el presente trabajo pretende contribuir al desarrollo un modelo de gestión de la confianza en el líder dentro de un entorno de trabajo virtual. Desde un punto de vista práctico y de gestión, esta investigación pretende desarrollar una guía de gestión de la confianza para líderes de equipos virtuales, creando una base de conocimientos que permita a los líderes de equipos virtuales delimitar que acciones llevar a cabo para maximizar la confianza que generan en su equipo.

Para alcanzar los objetivos previamente establecidos, el trabajo se estructura de la siguiente forma. En primer lugar se realiza una revisión de la literatura relativa a las variables de estudio. En segundo lugar, se formulan las diferentes hipótesis de investigación. Más adelante, se explican los procesos de recogida de datos y validación de las escalas de medida utilizadas. Posteriormente, se realizan los contrastes de hipótesis. Finalmente, se presentan las conclusiones del estudio, así como las principales implicaciones para la gestión, limitaciones y futuras líneas de investigación.

## **2. Revisión de la Literatura.**

### ***2.1. Confianza en el Líder.***

La confianza es uno de los pilares básicos de las relaciones entre las personas por lo que el análisis de la misma está tomando una importancia cada vez mayor dentro de los estudios orientados a las empresas (Mayer, Davis y Schoorman, 1995). En las últimas décadas, investigaciones de distintas disciplinas han llegado al consenso de que un nivel elevado de confianza en el líder de un equipo tiene una relación directa y positiva con los resultados del equipo, consiguiendo éste una mayor eficiencia (e.g., Bennis y Nanus, 1985; Fairholm, 1994).

Una de las definiciones más utilizadas en la literatura es la propuesta por Mayer *et al.* (1995), según la cual la confianza es el deseo de una parte de ser vulnerable a las acciones de otra, de acuerdo con la esperanza de que ésta última lleve a cabo una determinada acción relevante para la primera. Focalizándonos dentro del análisis de la confianza en el líder de un equipo, muchos estudios empíricos han conceptualizado y medido la confianza como la expectativa o creencia de que se pueden confiar en las acciones y palabras de otra persona y que esa persona tiene buenas intenciones hacia uno mismo (e.g., Cook y Wall, 1980; Cummings y Bromiley, 1996; Dirks, 1999). Adaptando esta definición al estudio de la confianza en el líder de un equipo, la conceptualización de confianza se definiría como la *expectativa o creencia de que el equipo puede confiar en las acciones y palabras del líder y que este último mantendrá en todo momento unas buenas intenciones hacia el equipo*. La confianza en el líder es un concepto muy significativo en los equipos de trabajo, dado que el líder ostenta el poder formal dentro del equipo (Bass, 1990), haciendo que los subordinados sean vulnerables a las acciones del líder.

El nivel de confianza en un líder se asocia con la percepción por parte de los subordinados de una serie de patrones de comportamiento (Whitener *et al.*, 1998; Dirks y Ferrin, 2002). Estos patrones corresponden a las diferentes dimensiones de la confianza: la benevolencia (Mayer *et al.*, 1995; Dirks y Ferrin, 2002), la competencia y la integridad (Whitener *et al.*, 1998; Palanski y Yammarino, 2007). La benevolencia es la percepción de que existe una orientación positiva hacia un individuo que es digno de confianza, es decir, una relación en la que hay buena fe entre ambas partes (Mayer *et al.*, 1995). La competencia se refiere a las habilidades personales de una persona para realizar una tarea específica de acuerdo a las expectativas de una tercera persona (Mayer *et al.*, 1995). La integridad es la percepción de que la persona de confianza se adhiere a los principios éticos que se consideran fundamentales para el establecimiento de una relación (Butler, 1991).

### ***2.2. Empatía.***

Afecto, estado de ánimo, emociones y todos los aspectos relacionados con la inteligencia emocional han suscitado un amplio debate en la literatura en lo que se refiere a su definición y componentes básicos (e.g. Barrett, 2006; Izard, 2009). El concepto de inteligencia emocional, introducido por Salovey y Mayer (1990), ha surgido unido al énfasis en las características interpersonales de las emociones (Frijda y Mesquita, 1994). La empatía, es decir, la habilidad para comprender los sentimientos de los demás e interiorizarlos como si fueran de uno propio, representa el concepto central del comportamiento de inteligencia emocional (Salovey y Mayer, 1990). Plutchik (1987) describe la empatía como un intercambio de emociones positivas y negativas que promueve la unión entre las personas. Investigaciones dentro del campo de la psicoterapia han demostrado la importancia de la empatía a la hora de establecer relaciones personales (Rogers, 1951), en la gestión del cambio y el aprendizaje (Rogers, 1975).

El concepto de empatía ha sido analizado también en la gestión empresarial. Así, Goleman, Boyatzis y McKee (2002) afirman que la empatía es la competencia fundamental de la conciencia social y la

condición *sine qua non* de toda eficacia dentro de la vida laboral en la empresa. Del mismo modo, argumentan que los líderes efectivos crean una repercusión en sus subordinados que los guía para tener una respuesta emocional más fuerte y una mayor eficiencia en su trabajo. Por otro lado, Bass (1998) sugiere que la empatía se asocia directamente con un liderazgo transformacional, por la consideración individualizada que un líder muestra a sus seguidores, lo cual es uno de los elementos del liderazgo transformacional (Avolio y Bass, 2002).

### **2.3. Justicia Percibida.**

La justicia organizacional y la confianza son dos focos importantes de investigación en la gestión de empresas. La popularidad en el estudio de la justicia organizacional ha aumentado de manera constante en los últimos 30 años (Wong, Ngo y Wong, 2006). Gran parte de este interés se debe a las importantes implicaciones en el ámbito laboral de la percepción de justicia organizacional por parte de los empleados (Cohen-Charash y Spector, 2001). Estas implicaciones de la justicia percibida incluyen la satisfacción con el trabajo y con el líder (Alexander y Ruderman, 1987), el compromiso organizacional (Masterson, Lewis, Goldman, y Taylor, 2000), el afecto del empleado (Cropanzano, Weiss, Suckow, y Grandey, 2000) y el rendimiento en el trabajo (Ball, Trevino, y Sims, 1994).

En general, la literatura sugiere que las personas desean ser tratadas de forma justa y consistente, y esto les lleva a confiar (Ambrose y Schminke, 2003).

### **2.4. Grado de Atractivo.**

La literatura señala que un mismo mensaje puede tener diferentes resultados en función de los atributos del emisor (e.g. Crano y Willian, 1970). En este sentido, los individuos más atractivos físicamente generalmente tienen más éxito que los poco atractivos. Existe la creencia de que personas más atractivas poseen una serie de características positivas (Riggio, 1986) que les conducen a disfrutar de una vida más satisfactoria (Feingold, 1992). Dion, Berscheid y Hatfield (1972) afirman que en la percepción de otras personas, “*lo que es bello es bueno*” es un estereotipo ampliamente exhibido en la vida cotidiana, como así lo documenta abundante investigación.

La percepción del grado de atractivo de un individuo ha sido utilizada en diferentes áreas de las ciencias sociales, como el marketing y la psicología (Mishra, Clark y Daly, 2007), con la finalidad de analizar en qué medida estas percepciones afectan a la conducta de los individuos, aunque es un aspecto escasamente estudiado en la gestión de equipos de trabajo y en la relación de confianza entre el líder y sus subordinados. En este sentido, la literatura ha estudiado el grado de atractivo de una persona para valorar la influencia de los agentes de ventas en la intención de compra (Ohanian, 1990), medir la influencia del uso de avatares dentro de una tienda online (Holzwarth, Janiszewski y Neumann, 2006) o incluso en mundos virtuales como *Second Life*, para medir el valor de la información que proporcionan los agentes.

### **2.5. Estilo de Liderazgo.**

La literatura en gestión de empresas ha centrado su atención en diferentes estilos de liderazgo (e.g. Bass, Jung, Avolio y Berson, 2003), sin embargo, dos de los paradigmas de estilo de gestión más destacados en la literatura son los enfoques de liderazgo transformacional y transaccional (Smith, Andras y Rosenbloom, 2012).

La teoría del *liderazgo transaccional* sostiene que los líderes se centran exclusivamente en el logro de sus metas a corto plazo y utilizan el sistema de recompensas para inducir en sus subordinados el comportamiento deseado para lograr esos objetivos. Por otra parte, la teoría del *liderazgo transformacional* sostiene que los líderes pueden motivar a los empleados considerando aspectos que van más allá del propio interés del empleado por el trabajo. Bass (1985) sugiere que el liderazgo transformacional es un enfoque más apropiado para liderar los recursos humanos de un equipo. Los líderes transformacionales son flexibles, entienden la necesidad de colaborar con sus empleados y se adaptan fácilmente a los cambios en el entorno.

Zaleznik (1977) distingue el enfoque transformacional del transaccional a través de una conceptualización diferente de la figura del gerente y del líder. Así, sostiene que los gerentes son más transaccionales mientras que los líderes tienden a ser más transformacionales. Avolio y Gibbons (1988)

sostienen que los líderes transformacionales van mucho más allá de una mera gestión del equipo y se implican en las necesidades y deseos de sus subordinados.

### **3. Formulación de las hipótesis de trabajo**

#### ***3.1. Efecto del grado de atractivo percibido en el líder en la confianza hacia el mismo.***

Los seres humanos frecuentemente atribuyen características positivas para el atractivo y las características negativas a la falta de atractivo (Eagly, Ashmore, Makhijani, y Longo, 1991), es lo que se conoce como el estereotipo “*lo que es bello es bueno*”. Este estereotipo conduce a sesgos sistemáticos de percepción y juicios erróneos y errores de atribución. Características fácilmente observables, como el atractivo, pueden ser utilizadas para categorizar a los individuos sobre la base de estereotipos (Jones, Moore, Stanaland, y Wyatt, 1998), y las percepciones de estas atribuciones son a menudo instantáneas, instintivas y automáticas (Willis y Todorov, 2006). Por todo lo anterior, es de esperar que líderes con un aspecto atractivo sean más capaces de generar confianza ante sus subordinados. De esta forma, se propone la siguiente hipótesis de trabajo:

***H1: Un mayor grado de atractivo físico percibido en el líder incidirá directa y positivamente sobre el nivel de confianza en el mismo.***

#### ***3.2. Efecto del grado de empatía percibida en el líder en la confianza inicial hacia el mismo.***

A pesar de que el liderazgo de equipos ha sido ampliamente estudiado en la literatura, los aspectos relacionados con las emociones hacia el líder no suelen ser incluidos en el estudio de los procesos de liderazgo (Gooty, Connelly, Griffith y Gupta, 2010). Los trabajos de Mayer, Caruso y Salovey (1999) han destacado la importancia de la inteligencia emocional y el liderazgo, siendo la empatía emocional uno de los componentes más importantes dentro de la inteligencia emocional y que muchos estudios asocian con el liderazgo transformacional. Varias perspectivas teóricas dentro del área del liderazgo han tomado las emociones en el curso de sus investigaciones. La importancia de las emociones en el marco de un liderazgo carismático y transformacional ha sido reconocida en trabajos teóricos y empíricos (e.g. Bono, Foldes, Vinson y Muros, 2007).

Dentro de la literatura referida a la gestión de equipos y liderazgo se reconoce que existe una relación entre la comunicación personal y la confianza que se percibe en otra persona (Zolin, Fruchter y Hinks, 2003). De hecho, Feng, Lazar y Price (2004), sostienen que desde la gestión del grupo se han de promover mecanismos para que sus integrantes se identifiquen con otros miembros de cara a tener una actitud empática que ayude a la construcción de la confianza. Por todo esto, líderes más empáticos con sus subordinados deberían ser capaces de generar mayor confianza. Por tanto, se propone la siguiente hipótesis de trabajo:

***H2: Un mayor grado de de empatía percibida en el líder incidirá directa y positivamente sobre el nivel de confianza en el mismo.***

#### ***3.3. Efecto del grado de justicia percibida en el líder en la confianza inicial hacia el mismo.***

La justicia está considerada como un juicio evaluativo acerca del trato que se le brinda a una persona (Furby, 1986). A nivel organizativo existen tres dimensiones de justicia organizacional (distributiva, procedural e interaccional), existiendo estudios que relacionan las dos primeras con la confianza en la propia organización y la interaccional con la confianza hacia el líder. Estudios previos han contrastado empíricamente que la justicia organizacional se encuentra positivamente relacionada con el compromiso y la confianza en la organización y los empleados (Sweeney y McFarlin, 1993).

La confianza y la justicia organizacional son focos de interés dentro de la investigación en gestión de empresas. La confianza activa los comportamientos cooperativos entre los trabajadores, reduce los conflictos y reduce los costes de transacción en el trabajo (Rousseau, Sitkin, Burt y Camerer, 1998). La justicia organizacional también se relaciona positivamente con el compromiso y la confianza en la organización y entre sus empleados (Sweeney y McFarlin, 1993). De esta forma, es razonable pensar que una mayor justicia percibida redundará en un nivel de confianza hacia el líder mayor. En consecuencia se realiza la siguiente hipótesis de trabajo:

**H3:** *Un mayor grado de de justicia percibido en el líder incidirá directa y positivamente sobre el nivel de confianza en el mismo.*

### **3.4. Relación entre el grado de atractivo y la empatía percibida en el líder.**

Las personas físicamente atractivas tienden a generar una mejor respuesta ante otras personas que las menos atractivas físicamente (Shinners y Morgan, 2009). Este estereotipo viene determinado por el denominado “efecto halo” (*halo effect*). Este efecto halo se refiere a un sesgo cognitivo por el que la percepción de un rasgo concreto de una persona (en este caso el atractivo del líder) influye en la percepción del resto de rasgos del individuo. En términos del estereotipo “*lo que es bello es bueno*”, las personas frecuentemente otorgan atributos positivos a las personas atractivas y atributos negativos a personas menos atractivas (Eagly, Ashmore, Makhijani y Longo, 1991). En este sentido, Mathes y Kahn (1975) argumentan que las personas más atractivas físicamente tienen un mayor poder empático que las menos atractivas, precisamente por el efecto halo que desarrollan a su alrededor. De estos argumentos se desprende la siguiente hipótesis de trabajo.

**H4:** *Mayores niveles de atractivo percibidos en el líder incidirán directa y positivamente sobre el nivel empatía percibida.*

### **3.5. Efecto moderador del estilo de liderazgo sobre los antecedentes de la confianza en el líder.**

La apariencia personal y el atractivo físico influyen de manera especial en los juicios acerca de la personalidad de un individuo. Investigaciones previas muestran de forma consistente que las personas tienden a atribuir características de personalidad deseables a individuos atractivos físicamente, siendo percibidos como más sensibles, amables, agradables, simpáticos e interesantes que las personas menos atractivas (Dion, 1986). Las personas atractivas también son juzgadas como más competentes e inteligentes (Ross y Ferris, 1981). En un análisis realizado por Eagly, Ashmore, Makhijani y Longo (1991) se demostró que las personas atractivas estaban fuertemente correlacionadas con características como la competencia social y la capacidad intelectual, y negativamente con la modestia. Por estos argumentos el ser humano tiende a asociar en mayor medida una habilidad social como la empatía a individuos atractivos.

La literatura ha demostrado un gran interés por demostrar de manera empírica cuándo y cómo el efecto del atractivo se hace más fuerte o más débil (Ahearne *et al.*, 1999). De esta manera, investigaciones en el área de la dirección comercial proponen que el efecto del atractivo disminuye a medida que se desarrolla la relación entre ambas partes (Reingen y Kerman, 1993). En este sentido, el efecto del atractivo es especialmente relevante en los primeros estadios relacionales, en los que el individuo realiza valoraciones muy rápidas en base a los estereotipos y primeras impresiones. Una vez la relación avanza, el individuo utiliza otro tipo de señales para efectuar sus valoraciones, como por ejemplo el comportamiento de la otra persona con el propio individuo o con otras personas. Si nos centramos en las relaciones líder-subordinado podríamos esperar resultados similares.

Un resultado lógico del desarrollo de la relación entre líder y subordinado es que con el paso del tiempo y el mayor número de interacciones, el subordinado será capaz de definir con mayor claridad el estilo de liderazgo de su superior. Cuando el estilo de liderazgo esté bien definido, el subordinado dispondrá de señales más eficaces que el mero grado de atractivo, como por ejemplo si el líder es capaz de resolver los problemas o el tipo de trato que tiene con sus trabajadores. En consecuencia, es razonable pensar que cuando los estilos de liderazgo están más definidos el peso específico del grado de atractivo del líder en la formación de las percepciones entre sus subordinados será menor. Por otro lado, independientemente del grado de desarrollo de la relación entre líder y subordinado, el peso del atractivo en la formación de actitudes debe ser menor cuando los estilos de liderazgo son más extremos. Dicho de otra forma, el atractivo tendría mayor influencia cuando el subordinado no tiene señales claras del tipo de comportamiento de su líder. En base a estos argumentos se propone la siguiente hipótesis de trabajo:

**H5:** *Ante estilos de liderazgo bien definidos, la influencia del atractivo del líder sobre la confianza en el mismo será menor.*

Investigaciones recientes han estudiado el papel de la inteligencia emocional mostrando que existe una relación directa entre la inteligencia emocional y un liderazgo efectivo, especialmente cuando el líder

ejerce un liderazgo de estilo transformacional (e.g., Sunindijo, Hadikusumo y Ogunlana, 2007). Por el contrario, en un liderazgo de estilo transaccional, basado en un sistema de recompensas muy formalizado, la empatía es una cualidad mucho menos asociada.

Por otro lado, dentro del área de la Psicología las expectativas se asocian a la posibilidad razonable de que un determinado hecho ocurra. En el caso de que la expectativa no se cumpla es posible que se genere una decepción, mientras que si finalmente la realidad supera a las expectativas se genera una sorpresa. La Teoría de las Expectativas desarrollada por Vroom (1964) sostiene que los individuos tienen creencias y esperanzas sobre los sucesos futuros en su vida y que, por tanto, tienen una conducta resultado de la elección entre alternativas y elecciones basadas en creencias y actitudes, siendo el objetivo de estas elecciones maximizar las recompensas y minimizar las decepciones. Asimismo, Oliver (1980) propone a la satisfacción como resultado de una disconformidad positiva de expectativas que surge cuando el resultado de una situación es mejor de lo esperado.

En base a los argumentos anteriores, el hecho de que un subordinado tenga una percepción de empatía en su líder y además éste ejerza un liderazgo transaccional, podría reforzar la relación entre empatía y confianza. Esto se podría explicar por el hecho de que la empatía es una característica no esperada en un líder transaccional y por tanto se podría generar un efecto sorpresa que refuerce la mencionada relación. Por otro lado, ante la presencia de un líder muy transformacional las expectativas de sus subordinados en relación con el nivel de empatía del líder deberían de ser elevadas. Ello es debido a que la empatía es un rasgo claramente asociado a este estilo de liderazgo. De esta forma, el poder de la empatía como generador de confianza debería caer conforme aumente la percepción de un estilo de liderazgo transformacional. Dicho de otra forma, ante un líder transformacional la percepción de empatía no representa una señal especialmente valiosa ya que está implícita en el propio estilo de liderazgo. En base a estos argumentos se propone la siguiente hipótesis de trabajo.

**H6:** *La influencia de la empatía percibida en el líder sobre la confianza en el mismo será: (a) mayor cuando el líder ejerza un liderazgo de estilo más transaccional o (b) menor cuando el líder ejerza un liderazgo más transformacional.*

Una de las características fundamentales de un líder transaccional es su capacidad para clarificar los roles y los requerimientos de las tareas entre sus subordinados (Bass, 1998). En este sentido, mientras que el liderazgo transformacional da lugar a la identificación de los seguidores con las necesidades del líder, los líderes transaccionales dan a sus subordinados lo que quieren a cambio de lo que el líder quiere. La literatura argumenta que los líderes transaccionales son propensos a crear y fortalecer las percepciones de equidad compartida entre los miembros del equipo, gracias al establecimiento de reglas claras de intercambio que facilitan la consistencia y exactitud (Vroom, 1964). Este tipo de liderazgo aclara los requisitos de trabajo para que los subordinados sean capaces de alcanzar las expectativas de desempeño acordadas y administrar recompensas y reconocimiento (Bass, 1998). Por tanto, es de esperar que el comportamiento anteriormente descrito contribuya a fomentar la percepción de justicia entre los subordinados gracias al esfuerzo del líder por clarificar los requisitos, intercambios y premios que se dan en un equipo. En base a los argumentos anteriormente descritos, es razonable pensar que cuando un líder presente un estilo poco transaccional, la percepción de mayor justicia actúe con mayor intensidad como generador de confianza.

Por otro lado, el estilo de liderazgo transformacional implica que la atención del líder se focaliza en el interés colectivo y al mismo tiempo tiene que conseguir los objetivos propuestos por la organización (Bass, 1999; House y Shamir, 1993). Ello no quiere decir que un liderazgo transformacional no esté asociado a la idea de justicia. De hecho, son varios los trabajos que señalan como un líder transformacional puede actuar con justicia con sus subordinados (e.g., De Cremer, Van Dijke y Bos, 2007). Sin embargo, sí que es cierto que la justicia no es un rasgo tan definitorio del estilo transformacional como lo es en el estilo transaccional. Por este motivo, en la presente investigación se propone que la influencia de la percepción de justicia sobre la confianza en el líder no se vería afectada por el grado de liderazgo transformacional observado. En base a los anteriores argumentos se expone la última hipótesis de trabajo.

**H7:** La influencia de la justicia percibida en el líder sobre la confianza en el mismo será: (a) mayor cuando el líder ejerza un liderazgo de estilo menos transaccional o (b) no habrá diferencias cuando el líder ejerza un estilo más transformacional o menos transformacional.

#### 4. Proceso de recogida de información y validación de las escalas de medida.

La obtención de los datos necesarios para realizar este estudio se realizó a través de una encuesta autoadministrada a través de Internet hecha a personas que trabajaban habitualmente en equipos virtuales. La recogida de información se realizó entre los meses de noviembre y diciembre de 2013 y enero de 2014. En total se recibieron 248 cuestionarios, de los cuales, tras analizar casos ausentes y atípicos, se quedaron en 241 cuestionarios válidos. Se utilizó la metodología de ecuaciones estructurales para el análisis de los datos. Dado que esta técnica presenta una gran sensibilidad ante la presencia de casos ausentes y atípicos, fue necesario un profundo análisis previo de la base de datos antes de seguir con el proceso estadístico de análisis de los mismos.

El proceso de validación de las escalas propuestas para la medición de las variables componentes del modelo de investigación está compuesto por las siguientes fases:

##### 4.1. Validez de contenido y validez aparente.

El desarrollo de las escalas de medida se basó en una revisión de la literatura previamente realizada (ver Tabla 1). Gracias a esta revisión de la literatura fue posible realizar una primera propuesta de escalas. No obstante, las escalas debieron ser adaptadas al contexto de los equipos de trabajo virtuales.

TABLA 1. Validez de contenido

Variable	Adaptado de
Confianza en el líder	Roberts y O'really (1974); Korsgaard, Schweiger, y Sapienza (1995).
Grado de empatía percibida	Kellett, Humphrey y Sleeth (2006).
Grado de justicia percibida	Niehoff y Moorman (1993).
Estilo de liderazgo	Bass y Avolio (1990).
Grado de atractivo	Ohanian (1990).

El objetivo de esta adaptación era el de garantizar la validez aparente, que se define como el hecho por el cual la escala de medida refleja aquello que se pretende medir. La validez aparente se confunde en multitud de ocasiones con el concepto de validez de contenido. Sin embargo, la validez de contenido es el grado en el que los ítems representan correctamente el contenido teórico del constructo y que está garantizada gracias a la profunda revisión bibliográfica efectuada. El nivel de validez aparente fue contrastado a partir de una variación del modelo de Zaichkowsky (1985) en el que cada ítem es calificado por un grupo de expertos como “claramente representativo”, “algo representativo” o “no representativo”. Finalmente, de acuerdo con Lichtenstein *et al.* (1990) cada ítem era retenido si existía un alto grado de consenso entre los expertos.

##### 4.2. Análisis exploratorios de fiabilidad y dimensionalidad.

El proceso de validación incluyó un análisis exploratorio de la fiabilidad y la dimensionalidad de los instrumentos de medida. En primer lugar, el método de la alpha de Cronbach fue utilizado para valorar la fiabilidad de las escalas, considerando un valor mínimo de 0,7 (Nunnally, 1978). Las variables consideradas superaron con comodidad este umbral mínimo. Asimismo, se comprobó que la correlación ítem-total, que mide la correlación de cada ítem con la suma del resto de ítems de la escala, era superior al mínimo de 0,3 (Nurosis, 1993).

En segundo lugar, se procedió a valorar el grado de unidimensionalidad de las escalas consideradas mediante un análisis factorial. La extracción de factores se basó en la existencia de autovalores superiores a la unidad, a la vez que se exigía a cada ítem cargas superiores a 0,5 y que la varianza explicada por cada factor extraído fuera significativa. De esta forma, se extrajo un único factor correspondiente a cada una de las escalas propuestas.

##### 4.3. Análisis confirmatorios de dimensionalidad.

Con el fin de confirmar la estructura dimensional de la escala se recurrió al Análisis Factorial Confirmatorio. Para realizar los análisis se recurrió al software estadístico EQS 6.1, y como método de estimación se utilizó el de Máxima Verosimilitud Robusto debido a que permite operar con mayor seguridad en muestras que pudieran presentar algún tipo de anormalidad multivariante. Se diseñó un modelo factorial que incluía la totalidad de las variables consideradas y se siguieron los criterios propuestos por Jöreskog y Sörbom (1993):

El criterio de convergencia débil por el que se eliminan a los indicadores que no presenten coeficientes de regresión factorial significativos ( $t$ -student  $> 2,58$ ;  $p = 0,01$ ). El criterio de convergencia fuerte por el que se eliminan todos los indicadores cuyos coeficientes estandarizados sean inferiores a 0,5. Se eliminan aquellos indicadores que menos aporten a la explicación del modelo. En concreto, se excluyen aquellos indicadores cuya  $R^2$  sea inferior a 0,3.

En esta etapa fueron eliminados 8 items. El ajuste del modelo confirmatorio presentaba valores aceptables (Chi-square = 3385,039 325 d.f.  $p < 0,001$ ; Satorra-Bentler Scaled Chi-Square = 564,8194, 284 d.f.  $p < 0,001$ ; Bentler-Bonett Normed Fit Index = 0,833; Bentler-Bonett Nonnormed Fit Index = 0,895; Comparative Fit Index (CFI) = 0,908; Bollen (IFI) Fit Index = 0,909; Root Mean Sq. Error of App. (RMSEA) = 0,064; 90% Confidence Interval of RMSEA (0,056, 0,072).

Por último, con el objeto de confirmar la existencia de multidimensionalidad en la variable confianza en el líder se desarrolló una Estrategia de Modelos Rivales (e.g. Anderson y Gerbing, 1988) según la cual se compara un modelo de segundo orden en el que varias dimensiones miden el constructo multidimensional considerado con otro modelo de primer orden en el que todos los ítems cargan sobre un único factor (Steenkamp y Van Trijp, 1991). Los resultados obtenidos corroboraron la estructura multidimensional de la variable confianza (integridad, benevolencia y habilidad) ya que el modelo de segundo orden se ajustaba mucho mejor que el modelo de primer orden alternativo.

#### 4.4. Fiabilidad de Constructo

Aunque el indicador generalmente aceptado para valorar la fiabilidad de las escalas es el estadístico alpha de Cronbach, algunos autores esgrimen que este indicador puede infravalorar la fiabilidad (e.g. Smith, 1974). Por ello, el uso de un estadístico adicional como la fiabilidad del constructo es recomendada por diversos autores como Jöreskog (1971). Tomando como valor mínimo 0,7 (Steenkamp y Geyskens, 2006), los resultados son positivos tal y como se observa en la tabla 2.

TABLA 2. Fiabilidad de constructo y análisis de la validez convergente

	Fiabilidad de Constructo (FCC)	Análisis de la varianza extraída (AVE)
Grado de atractivo del líder	0,93	0,74
Empatía percibida en el líder	0,88	0,72
Justicia percibida en el líder	0,90	0,74
Confianza - Integridad	0,94	0,72
Confianza - Benevolencia	0,92	0,70
Confianza - Habilidad	0,91	0,71

#### 4.5. Validez de Constructo

La validez de constructo se analizó utilizando dos criterios fundamentales de validez:

Validez convergente: Indica si los ítems que componen las escalas convergen hacia un único constructo. La validez convergente se constató al observar que la carga factorial de cada indicador era superior a 0,5 y significativas al nivel de 0,01 (Steenkamp y Geyskens, 2006). Además, se utilizó el Análisis de la Varianza extraída (Ping, 2004), siguiendo el criterio de Fornell y Larcker (1981) que exponen que las mediciones con un nivel adecuado de validez convergente deberían contener menos de un 50% de la varianza del error (lo que supone un valor del estadístico AVE superior al 0,5). Los resultados obtenidos fueron satisfactorios como se observa en la tabla 2.

Validez discriminante: Verifica si el constructo objeto de análisis está significativamente alejado de otros constructos con los que no se encuentra relacionado teóricamente. La validez discriminante se valoró mediante dos criterios: (1) comprobar que el valor 1 no se encontraba en el intervalo de

confianza de las correlaciones entre las distintas escalas, y (2) comprobar que la correlación entre cada par de escalas no era superior a 0,8 de forma significativa. Los resultados son satisfactorios ya que todos los pares de constructos cumplen los dos criterios mencionados.

## 5. Resultados.

Con el fin de contrastar las hipótesis anteriormente propuestas se desarrolló el modelo de ecuaciones estructurales que se refleja en la Figura 1. El ajuste del modelo presentaba valores aceptables (Chi-square = 2043,863, 91 d.f.  $p < 0,001$ ; Satorra-Bentler Scaled Chi-Square = 227,9545, 71 d.f.  $p < 0,001$ ; Bentler-Bonett Normed Fit Index = 0,888; Bentler-Bonett Nonnormed Fit Index = 0,897; Comparative Fit Index (CFI) = 0,920; Bollen (IFI) Fit Index = 0,921; Root Mean Sq. Error of App. (RMESA) = 0,092; 90% Confidence Interval of RMESA (0,082, 0,110).

Centrándonos en los antecedentes de la confianza en el líder virtual, observamos que el atractivo físico ejerce un efecto positivo y significativo sobre la confianza en el líder ( $\beta = 0,077$ ;  $p < 0,05$ ) por lo que la hipótesis H1 queda aceptada. Del mismo modo, las características comportamentales del líder virtual como son la empatía ( $\beta = 0,362$ ;  $p < 0,01$ ) y la justicia percibida ( $\beta = 0,413$ ;  $p < 0,01$ ) ejercen un efecto positivo y significativo sobre la confianza, por tanto las hipótesis H2 y H3 son también aceptadas. Asimismo, los resultados obtenidos ponen de manifiesto la existencia de una relación positiva y significativa entre el grado de atractivo percibido en el líder y la empatía percibida en el mismo ( $\beta = 0,486$ ;  $p < 0,01$ ), lo que nos permite aceptar la hipótesis H4.

FIGURA 1. Modelo de Investigación.

Nota: (\*) Indica que los coeficientes son significativos a un nivel de 0,01.  
 (\*\*) Indican que los coeficientes son significativos a un nivel de 0,05.

Con la finalidad de contrastar el efecto moderador del estilo de liderazgo se llevó a cabo un análisis multimuestra. Para cada análisis, la muestra total de individuos se dividió en dos grupos. Para crear los grupos en cada caso se tomó la media del ítem correspondiente, y se eliminó alrededor de este valor una serie de casos ( $\pm \frac{1}{2}$  desviación estándar). En segundo lugar, se aplicó el análisis LM-Test para comprobar si existían diferencias entre los parámetros obtenidos en los dos grupos y si éstas eran significativas. En concreto, se analizó la variación experimentada por el estadístico Chi-cuadrado al eliminar la restricción relativa a igualar un determinado parámetro en ambos grupos en el modelo más restringido

La relación entre el grado de atractivo y la confianza en el líder se ve moderada en el caso de que el líder ejerza un liderazgo de estilo transformacional ( $p < 0,01$ ). Sin embargo, no se produce moderación cuando el líder ejerce un estilo transaccional, si bien el parámetro apunta en la dirección propuesta (ver Tabla 4). Por tanto, la hipótesis H5 es aceptada parcialmente. En lo que se refiere a la relación entre la empatía percibida en el líder sobre la confianza en el mismo, podemos observar como existe una débil moderación ( $p < 0,1$ ) en el caso del liderazgo transformacional pero en sentido contrario al esperado. En el caso del liderazgo transaccional no se observa moderación alguna. Por todo ello, la hipótesis H6 se acepta parcialmente. Por último, la relación entre justicia percibida en el líder y confianza en el mismo la modera un estilo de liderazgo transaccional ( $p = 0,053$ ), si bien se produce en sentido contrario al esperado. Por su parte, no existe moderación en el caso del liderazgo transformacional ( $p = 0,683$ ), tal y como se apuntaba (ver Tabla 4). De esta forma, la hipótesis H7 es aceptada parcialmente.

TABLA 4. Análisis multimuestra

Restricciones Propuestas TRANSFORMACIONAL	Coefficientes (Más Transformacional)	Coefficientes (Menos Transformacional)	gl	Diferencias Chi-square	Prob.

## 6. Conclusiones.

La confianza en el líder juega un papel determinante en el éxito de un equipo de trabajo (Kayworth y Leidner, 2000). Por este motivo, la construcción de relaciones basadas en la confianza entre los miembros del equipo debe ser una preocupación fundamental de los líderes. A pesar de que la literatura ha reconocido la importancia de la confianza en la labor realizada por el líder de un equipo virtual (e.g. Greenberg *et al.*, 2007), todavía es necesario profundizar en las características que ha de poseer un líder confiable. En este sentido, la literatura ha propuesto que ciertas características de un individuo pueden afectar a las actitudes hacia el mismo y por tanto al desarrollo de la confianza. El presente trabajo analiza cómo determinados aspectos físicos y comportamentales de un líder pueden afectar al desarrollo de la confianza hacia sus subordinados, así como el papel del estilo de liderazgo como factor que modera las relaciones propuestas.

En primer lugar, los resultados confirman la influencia que ejercen tanto las características físicas del líder como las características comportamentales del mismo en la confianza en el líder virtual. En concreto, el grado de atractivo percibido en el líder de un equipo virtual ejerce una influencia en la confianza que se genera hacia el mismo. Por otro lado, las características de comportamiento del líder hacia sus subordinados ejercen también un efecto positivo sobre la confianza. En concreto, la empatía que los subordinados perciben en su líder hace que estos últimos le otorguen más confianza. Del mismo modo, la justicia percibida en el líder ejerce un efecto positivo sobre la confianza. En este punto es interesante destacar como la comunicación electrónica es capaz de transmitir ciertos comportamientos que ejerce el líder hacia sus subordinados, por lo que el presente estudio valida la comunicación electrónica como vía para transmitir variables comportamentales. Asimismo, el grado de atractivo con que los subordinados valoran a su líder ejerce un efecto positivo sobre la empatía, este hecho demuestra que en un entorno virtual se siguen cumpliendo los estereotipos de atractivo que propone la literatura clásica.

La literatura reconoce el estilo de liderazgo como una de las variables que pueden moderar las relaciones que se dan dentro de un grupo de trabajo (Vries, Roe y Taillieu, 2002), por esto el presente trabajo pretende analizar si estas moderaciones también se dan dentro de un entorno virtual. En este sentido, el estilo de liderazgo transformacional y transaccional podría ejercer de efecto moderador entre la confianza y los antecedentes de la confianza en el líder. Más en concreto se ha analizado en qué medida un comportamiento inesperado del líder pueden ejercer una moderación precisamente por el efecto sorpresa que se genera. El estilo de liderazgo transformacional ejerce de moderador entre la relación confianza en el líder y empatía, siendo los líderes que ejercen un estilo transformacional bajo en los que la relación entre empatía y confianza es más fuerte. Por otro lado, son los líderes que ejercen un estilo más transaccional en los que ejercen la relación entre la confianza en el líder y la justicia percibida es más intensa. Finalmente, observamos como el peso de atractivo como generador de confianza disminuye en el supuesto de estilos de liderazgo transformacionales.

### 6.1. Implicaciones para la gestión.

El presente trabajo analiza en profundidad las relaciones entre el líder y subordinado que se dan en un entorno de trabajo virtual con el objetivo de crear confianza entre las partes, así como las consecuencias de esta relación en lo que a eficiencia organizativa se refiere. Las conclusiones derivadas de este trabajo

han de servir a los líderes de las organizaciones para mejorar la relación con sus subordinados en el sentido de que estos últimos sean capaces de establecer una relación de confianza con el líder. En este sentido, los resultados de este estudio se pueden interpretar como un punto de referencia para los líderes de equipos virtuales que pretendan construir un equipo de trabajo eficiente y comprometido.

Una primera implicación práctica se refiere a la imagen que el líder da a sus subordinados. Dado que el entorno de trabajo es virtual y la comunicación entre los miembros es mediada telemáticamente, es recomendable que el líder del equipo muestre a sus subordinados su forma más atractiva posible a través de los canales de comunicación del equipo (perfil de usuario, etc.). Asimismo, una actitud empática del líder hacia sus subordinados, así como que el líder sea justo con sus subordinados provocará una mayor confianza, por lo que se recomienda que el líder virtual tenga estas cualidades y que además sea capaz de transmitir las hacia sus subordinados.

Por último, el hecho de ejercer un liderazgo transformacional muy marcado puede disminuir el efecto del grado de atractivo del líder sobre la confianza, por lo que esta puede ser una herramienta que pueden utilizar los líderes que no deseen ser juzgados por sus características físicas. Asimismo, los líderes de equipos virtuales pueden ejercer un liderazgo menos transformacional de cara a reforzar la relación entre empatía y confianza; y un liderazgo más transaccional para reforzar la relación entre confianza y justicia.

### ***Futuras líneas de investigación.***

En primer lugar, sería una buena idea analizar en mayor detalle los factores determinantes de la confianza en el líder ya que es posible que analizando un modelo más complejo se pudiese incrementar el valor  $R^2$  de la principal variable endógena de nuestro estudio. De hecho, es razonable pensar que aspectos como las características personales de cada individuo afecten de manera significativa a la confianza que el subordinado otorga a su líder.

En segundo lugar, sería interesante replicar el estudio con una muestra que representase una mayor diversidad de nacionalidades. Dado que existen grandes diferencias en los comportamientos de los individuos de distintas zonas del mundo, sería interesante analizar posibles diferencias en los antecedentes de la confianza entre subordinados de diferentes entornos culturales.

Por último, también sería interesante analizar en el futuro no sólo los antecedentes de la confianza en el líder qué efectos se derivan del desarrollo de dicha confianza. En concreto, sería muy interesante analizar la relación entre la confianza en el líder y la eficiencia que alcanza un equipo a nivel social.

# EXAMINING THE IMPACT OF EMOTIONAL INTELLIGENCE ON SALESPERSON ADAPTIVE AND PROACTIVE PERFORMANCE

---

BELÉN BANDE VILELA  
PILAR FERNÁNDEZ FERRÍN

## ABSTRACT

*Salesperson adaptivity and proactivity are two emergent forms of sales performance which are particularly important nowadays. This study explores the effect of Emotional intelligence (EI), an ability which is considered pivotal in customer interactions, on salesperson adaptive and proactive performance.*

*A dyadic sample of industrial salespeople and their direct supervisors reveals that EI has a positive influence on salesperson adaptivity and proactivity through the effect on perceived self-efficacy and salesperson intrinsic motivation. Additionally, the indirect effect of self-efficacy on adaptive and proactive sales performance depends on salesperson perceived organizational support and on his ability to bounce back. Certain implications of this study as well as suggestions for future research are also addressed.*

## Key words:

*Emotional intelligence, intrinsic motivation, adaptivity, proactivity, resilience, perceived organizational support*

## 1. Introduction

Much has been written over the past 50 years about the determinants of salespeople's performance. However, extant literature can explain a relatively small variance in sales performance, suggesting an opportunity for improving the understanding of sales performance and also a need for new theoretical models to advance marketers' understanding of the sales performance domain (Evans, McFarland, Dietz & Jaramillo, 2012).

Researchers in recent years are trying to identify behaviors that not only contribute to individual task performance but also enhance the effectiveness of groups and organizations over time (Griffin, Parker & Mason, 2010). In this vein, it has been suggested that as market dynamics become more complex, companies need employees that are adaptable and proactive and can, therefore, deal with complex situations (Baba, Tourigny, Wang & Liu, 2009; Griffin, Neal & Parker, 2007). In this study we focus on salesperson adaptivity and salesperson proactivity as two emergent forms of sales performance which are particularly important nowadays, when most organizations are facing an increasing interdependence and uncertainty of work systems (Howard, 1995).

Emotional intelligence (EI), conceptualized as the ability to acquire and apply knowledge from one's emotions and those of others to produce beneficial outcomes (Kidwell, Hardesty, Hurtha & Sheng, 2011), has been identified as especially important in those jobs where employees interact with customers as it happens with the sales positions (O'Boyle et al., 2010). Considered to be a skill possessed by successful leaders of organizations, EI has been identified as an important predictor of work-related outcomes (O'Boyle et al., 2010).

Despite past research has shown that employees with greater levels of EI perform better at work (e.g., Kidwell et al., 2011; O'Boyle et al., 2010), little is known about the influence of EI on adaptive and proactive sales behaviors and how employees, and, in particular, how salespeople translate their emotional intelligence into enhanced outcomes. Moreover, recent literature has highlighted the importance of considering context in relation to how useful EI might be given different situations (Jordan et al.; 2010; O'Boyle et al., 2010).

This study tries to contribute to the literature by exploring the underlying mechanism that links emotional intelligence and proactive and adaptive performance. We hypothesize that salespeople with higher emotional intelligence should perceived themselves as more self-confident which will increase their intrinsic motivation leading them to carry out more adaptive and proactive behaviors. We also propose that salespeople EI results in better adaptive and proactive performance under certain circumstances but not others.

Specifically, we theorize and test how perceived organizational support (POS) interacts with salesperson self-efficacy in order to increase salesperson intrinsic motivation. Sales force motivation is cited as a key issue managers have to deal with when directing salespeople (Brown, Evans, Mantrala & Challagalla, 2005; Miao, Evans & Shaoming, 2007). Intrinsic motivation might be particularly important for change-oriented behaviors as adapting to changing conditions and proactively acting to anticipate new challenges, as these behaviors are usually initiated by individuals rather than directed or imposed by others (Grant & Ashford, 2008). Further, salespeople's ability to bounce back can serve as a boundary condition that affects the relationship between intrinsic motivation and salespeople adaptivity and proactivity. Our study is consistent with the notion that, like most predictors of performance, the influence of EI may best be understood by examining the influence of potential moderators (Van Rooy & Viswesvaran, 2004).

Researchers (e.g. Law, Wong & Song, 2004; Pettijohn, Rozell & Newman, 2010) have also suggested that despite IE being a universal construct, not culturally determined; individual behaviors resulting from it might vary depending on the distinct culture of the individual. Our study tries to address this issue by presenting a model (see figure 1) which is tested using dyadic data that matches survey responses from salespeople and their managers within the Spanish context, which culturally differs from the United States, that has been the context considered in most published studies.

Firstly, we offer a theoretical background and hypotheses. Secondly, we describe our research method. Finally, the study findings are presented, and the managerial and research implications are discussed.

## 2. Theoretical Background

Emotional Intelligence (EI) is defined as a “a type of social intelligence that involves the ability to monitor one’s own and others’ emotions, to discriminate among them, and to use the information to guide one’s thinking and actions” (Mayer & Salovey, 1993, p. 433). People high in EI display strong self-awareness and high levels of interpersonal skills. They are more grounded, better performers and they feel more satisfied at work (Allan, 2011).

Along with Mayer and Salovey (1997), EI represents a composite of emotional reasoning abilities: perceiving, understanding, and regulating emotions. *Perceiving emotions* relates to the capacity to recognize emotions in others’ facial and postural expressions. *Understanding emotions* involves the capacity to analyze emotions, appreciate their probable trends over time, and understand their outcomes. Finally, *regulating emotions* encompasses the control of emotions in oneself and in others.

According to the social cognitive theory (Bandura, 1997), self-awareness, self-regulation and control of emotions are critical in the development of self-efficacy perceptions. EI refers to the ability to process information competently and to use it to focus energy on required behaviors (Salovey et al., 2002). EI, through its influence on the causal reasoning process and emotions involved in reacting to important workplace outcomes, might have an impact in the development of self-efficacy among individuals (Gundlach, Martinko & Douglas, 2003). Efficacy beliefs are the product of cognitive processing of diverse sources of information conveyed by physiological and emotional states, that is, referring to a person’s own perception of their emotional and psychological position (Bandura, 1997). The extent to which salespeople are able to deal effectively with their own and other emotions is a reflection of their EI. Thus, we propose the following hypothesis:

*H<sub>1</sub> : Salesperson EI is positively related to salesperson self-efficacy*

Intrinsic motivation is the motivation to do something for one’s own sake, for the pure enjoyment of a specific activity (Hennessey & Amabile, 2005). In accordance with the cognitive evaluation theory, feelings of competence while performing a certain task can increase intrinsic motivation for that specific task since such feelings satisfy the innate psychological need of humans to feel competent (Deci & Ryan, 1985).

High levels of self-efficacy boost individuals’ expectations of their potential, as well as their motivation to take action (Yang, Kim & McFarland, 2011). When individuals feel capable of carrying out a certain kind of behavior, they experience an intrinsic satisfaction resulting from their own judgments of competence, which promotes choice and the generalization of new behaviors and personal development (Taberner & Hernández, 2011; DeYoung, 2000). Empirical evidence has confirmed that salespeople are more willing to put in greater effort when they believe in their ability to perform their sales job (Jaramillo & Mulki, 2008). Accordingly, we put forward the following hypothesis:

*H<sub>2</sub>: Salesperson self-efficacy is positively related to salesperson intrinsic motivation*

According to the cognitive evaluation theory (Deci & Ryan, 1985), feelings of competence will not enhance intrinsic motivation unless accompanied by a sense of autonomy, which requires immediate contextual supports for autonomy (Reeve, 1996). Social environments can facilitate intrinsic motivation by supporting people’s innate psychological needs. The salespeople perception of organizational support, that is, the perception that the organization values their contributions and cares about their well-being might constitute a secure relational base does, according to Ryan & Deci (2000), seem to be important for the expression of intrinsic motivation to be in evidence. POS, described as trusting employees, it is likely to make employees more autonomous (Mitchell et al., 2012).

POS can be defined as general beliefs developed by employees “concerning the extent to which the organization values their contributions and cares about their well-being” (Eisenberger et al., 1986, p. 501). The literature has confirmed that POS is related to many positive employee outcomes, as job

satisfaction, affective commitment, loyalty, performance or organizational citizenship behaviors (Rhoades & Eisenberger, 2002).

If salespeople perceive the organization as providing them with a vehicle for developing personal skills and accomplishing personal goals, they will take personal interest in carrying out assigned tasks (Tyagi, 1982). POS might increase employees' interest in their work by enhancing employees' perceived competence (Rhoades & Eisenberger, 2002). Thus, we state the following hypothesis as follows:

*H<sub>3</sub>: POS moderates the influence of self-efficacy on salesperson intrinsic motivation, so that POS augments the positive effect of perceived self-efficacy on salesperson intrinsic motivation.*

The meta-analysis of Churchill et al. (1985) found motivation, as well as salesperson role perceptions (i.e., role conflict and role ambiguity), to be among the strongest determinants of sales performance. In comparison with extrinsic motivation, individuals who are intrinsically motivated have better initiative, concentration skills, learning abilities, cognitive flexibility and creativity than individuals who are extrinsically motivated (Deci & Ryan, 2000). The empirical evidence confirms that intrinsic motivation is a strong predictor of task performance (e.g. Kuvaas & Dysvik, 2009) and organizational citizenship behavior (e.g. Chiu & Chen, 2005), as well as a most important and powerful influence on employee creativity (Amabile et al., 1996).

Adaptivity refers to the extent to which an individual adapts to changes in a work system or work roles, while proactivity describes the degree to which the individual takes self-directed action to anticipate or initiate change in the work system or work roles (Griffin et al., 2007). Examples of adaptive performance are creative problem solving, coping with complex and unpredictable work situations, adjustment to technological innovations, and interpersonal adaptability (Jong & de Ruyter, 2004). On the contrary, proactive behavior involves "creating change, not merely anticipating it" (Bateman and Crant, 1999, p. 63). Proactive behavior involves behavioral initiative aimed at improving the current work circumstances in general or creating new ones (de Jong & de Ruyter, 2004).

Regarding the relationship between intrinsic motivation and proactive and adaptive behaviors, it has been suggested that individuals will be more likely to set and strive for proactive goals when they find their tasks enjoyable, and intrinsically interesting (Parker, Bindl & Strauss, 2010). In addition, people who are intrinsically oriented are interested in the work itself and try to be creative by looking for different and more adequate ways for achieving success (Weitz, Sujan & Sujan, 1986).

Accordingly, we put forward the following hypotheses:

*H<sub>4a</sub>: Salesperson intrinsic motivation is positively related to salesperson adaptive performance*

*H<sub>4b</sub>: Salesperson intrinsic motivation is positively related to salesperson proactive performance*

Resilience is defined as the ability to bounce back from hardship, recover, emerge stronger and successfully and develop social, academic and professional skills despite having been subjected to severe physiological stress (Csikszentmihalyi, 1999). In this vein, resilience implies not only reactive recovery but also proactive learning and growth through successful challenges (Youseff & Luthans, 2007). Although resilience is just emerging in the organizational behavior literature (Youseff & Luthans, 2007) it has been shown to be related to important work outcomes (e.g. Harland, Harrison, Jones & Reiter-Palmon, 2005; Luthans et al., 2005; Luthans, Vogelgesang & Lester, 2006; Youseff & Luthans, 2007).

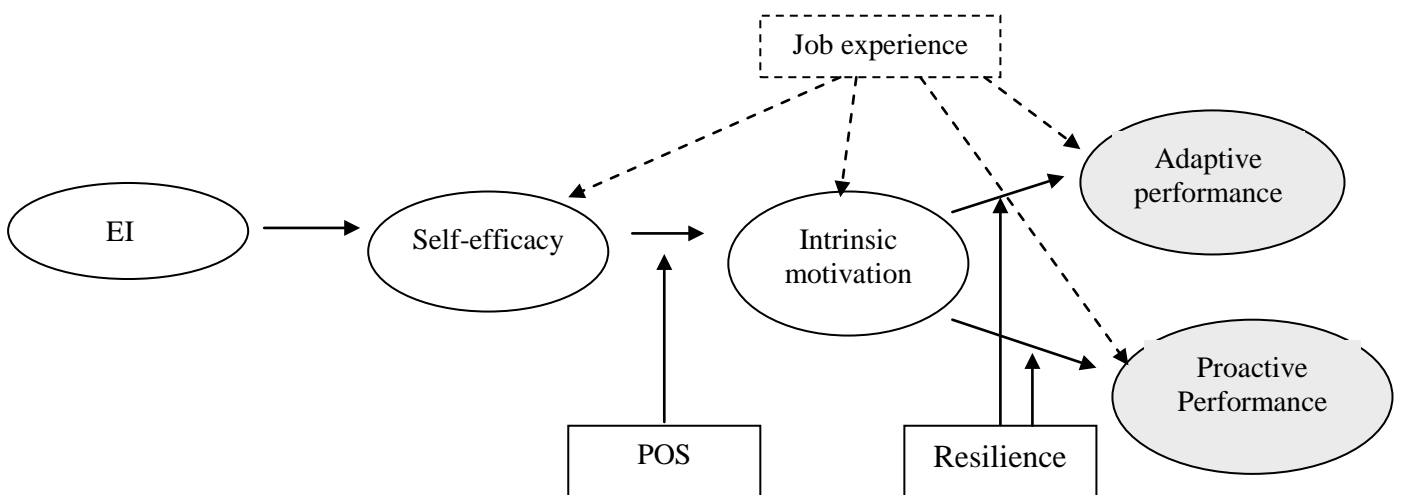

As a positive psychological resource capacity, resilience places a unique positive value on risk factors that may otherwise be viewed as threats that increase the probability of negative outcomes or decrease the probability of positive ones (Masten, 2001). In fact, resilience can lead to enhanced performance, adaptation, and wellbeing, even when adversities are encountered as it can have a positive impact on these outcomes by downfaling some of the destructive impact of negativity (Fredrickson & Joiner, 2002). In relation to adaptive and proactive behaviors, it has been suggested that resilience recognizes the need for flexibility, adaptation, and even improvisation in situations predominantly characterized by change and uncertainty (Luthans et al., 2007).

Thus, we expect that salesperson resilience will act as a coping resource that augments the positive effect of intrinsic motivation on sales adaptive and proactive performance by neutralizing the negative impact of adversities and negativity that can be present when carrying out these change-orientated behaviors. As it has been suggested in an educational context, although motivation is critical to academic success, academic gains that students make can be lost if they are not resilient to setback, study pressure, and stress in the school setting (Martin, 2002). Accordingly, we put forward the following hypotheses:

*H<sub>5a</sub>*: Salesperson resilience augments the positive impact of salesperson intrinsic motivation on sales adaptive performance

*H<sub>5b</sub>*: Salesperson resilience augments the positive impact of salesperson intrinsic motivation on sales proactive performance

### 3. Method

#### 3.1 Sample and survey procedure

Data were gathered from 145 salespeople and their respective supervisors. Participants worked at 145 different enterprises located in Spain. The study population comprised a list of large companies from the autonomous community of Galicia in Spain. The sample met the following criteria: (1) firms had commercial recognition and had been in business for at least ten years; (2) salespeople performed the sales activities described in Moncrief (1989) and Marshall, Moncrief & Lassk (1999), and (3) salespeople attended to business customers. This process rendered 151 firms from a variety of industries including manufacturing, technology, financial services, construction, wholesale or retail and insurance. A senior sales manager from each firm was contacted by one of the authors and only 6

(4 percent) refused to partake in the study. A researcher then approached the participating firms and personally gave the survey to a sales manager and a randomly selected salesperson. Of the participating salespeople, 72.4 percent were male and 27.6 percent were female. Their average age was 39.5 years old (S.D. =7.7) and average tenure was 8 years (S.D. =7.7). Of the participating supervisors, 88.3 percent were male and 11.7 percent were female, with an average age of 44.9 (S.D. = 9.3) and average tenure of 13.2 years (S.D. = 8.9).

The survey used in this study was originally written in English and then underwent a back-translation process. It was first translated into Spanish and then back-translated into English. This translation procedure is in compliance with the framework established by Brislin (1986) regarding the equivalence of language translations. Once the translation process was completed, pilot tests were carried out in order to ensure the survey had been accurately translated. Pre-test of all the measurement items were performed in two steps. Firstly, several experts were asked to examine the questionnaire in order to identify any questions that may have been confusing or difficult to answer; secondly, we conducted of content validity using salespeople belonging to enterprises from different sectors.

### 3.2 Measures and measure assessment

Appendix Table 1A describes the constructs used in this study. All the indicators of the self-report scales use a seven-point Likert scale (1=totally disagree; 7=totally agree). EI, intrinsic motivation and resilience were measured with information provided by the salespeople. Adaptive and proactive performance was measured with information provided by the direct supervisor.

We assessed salespeople's *emotional intelligence* with Wong and Law Emotional Intelligence Scale (WLEIS) (Wong and Law, 2002). The WLEIS represents one of the most stringently developed and validated self-report measures on EI available to date (Lievens, Klehe & Libbrecht, 2011). In line with Law et al. (2004), we considered EI as a second-order factor with four dimensions: self-emotions appraisal, regulation of emotion, use of emotion, and others-emotions appraisal. Cronbach's alpha for the self-emotions appraisal dimension was 0.80; for the others-emotions appraisal dimension it was 0.79; for the use of emotion dimension it was 0.80; and for the regulation of emotion dimension it was 0.79. Composite reliabilities were, respectively, 0.81, 0.80, 0.81 and 0.86.

*Intrinsic motivation* was measured with three items from Cravens, Ingram, LaForge & Young (1993), adapted from Tyagi (1985). Cronbach's alpha was 0.91 and composite reliability was 0.87. We assessed *self-efficacy* with a 4-item scale developed for a selling context by Krishnan, Netemeyer and Boles (2002). Cronbach's alpha was 0.86 and composite reliability was 0.84.

Salesperson *adaptive performance* was measured using a 3-item scale adapted from Griffin, Neal & Parker's (2007) scale. Cronbach's alpha and composite reliability for individual task adaptivity were, respectively, 0.86 and 0.75. Griffin et al., (2007) 3-items scale for individual task proactiveness was used to assess salesperson *proactive performance*. Cronbach's alpha was 0.94 and composite reliability was 0.85.

Following Luthans et al., (2006) recommendation, we considered *resilience* as a unidimensional construct, assessing salesperson's perceived resilience with the six items Brief Resilience Scale developed by Smith et al., (2008). To refine the scales we eliminated items whose item total correlation was less than 0.3, the commonly accepted minimum value (Nurosis, 1993) or items whose elimination would lead to a substantially higher alpha being obtained. Following this criteria, three items from the measurement scale of resiliency were eliminated. Cronbach's alpha was 0.76 and composite reliability was 0.74.

Finally, *Perceived organizational support (POS)* was measured with 4-items adapted from Eisenberger et al., (1986) and used successfully in previous studies (e.g. DeConinck & Johnson, 2009). Cronbach's alpha was 0.85 and composite reliability was 0.90.

We used CFA<sup>1</sup> to assess the properties of the resulting latent variables (Anderson and Gerbing, 1988). The parameters of the latent construct CFA model were estimated using the maximum likelihood method, AMOS 20.0. Results suggest a good fit:  $\chi^2 = 824.18$ ; d.f.= 559;  $\chi^2 /df = 1.47$ ;  $p < 0.05$ ; RMSEA=0.05; CFI = 0.90; IFI = 0.90.

In relation to the *convergent validity* of the scales, all indicators loadings were significant ( $p < 0.01$ ), thus providing validity evidence in favor of the items used to represent the constructs. As shown in Table 1 Cronbach's alpha and composite reliability were both above 0.7, which provides evidence of adequate reliability (Gerbing and Anderson, 1988). In addition, average variance extracted statistics were above the desirable 0.5 level (Fornell and Larcker, 1981).

To assess *discriminant validity*, Fornell and Larcker's (1981) approach was used. The confidence intervals for the correlations between pairs of variables were calculated. As none of the intervals included the value one, discriminant validity between constructs was assumed. Additionally, we compared the AVE for each construct with the shared variance between latent variables. The AVE for each construct was greater than its shared variance with any other construct.

### 3.3 Hypotheses testing

A structural equation model with AMOS was used to test the relationships described in Figure 1. Researchers have found that job tenure impact salesperson attitudes and behaviors (Flaherty and Pappas, 2002). In view of this, work experience with the firm was treated as a control variable to account for the variances on all endogenous latent variables.

The maximum likelihood structural estimates of the hypothetical model are presented in Figure 2. The proposed structural model had the following levels of fit:  $\chi^2 = 558.84$ ; d.f.= 385;  $\chi^2 /df = 1.45$ ;  $p < 0.05$ ; RMSEA=0.05; TLI = 0.90; CFI = 0.92; IFI = 0.92. The structural model exhibited acceptable levels of fit in terms of the sample size and model complexity (Bagozzi and Yi, 1988). The squared multiple correlations were 0.56 for self-efficacy, 0.34 for intrinsic motivation, 0.15 for proactivity, and 0.17 for adaptivity.

As predicted, Emotional intelligence was positively related to salesperson perceived self-efficacy ( $H_1$ :  $\beta = 0.54$ ,  $p < 0.01$ ). The positive impact of self-efficacy on salesperson intrinsic motivation was also supported ( $H_2$ :  $\beta = 0.50$ ,  $p < 0.01$ ). Salesperson intrinsic motivation was hypothesized to have a direct impact on sales adaptivity and proactivity. As expected, intrinsic motivation had a positive influence on salesperson adaptive performance ( $H_{4a}$ :  $\beta = 0.40$ ,  $p < 0.01$ ) and on salesperson proactive performance ( $H_{4b}$ :  $\beta = 0.35$ ,  $p < 0.01$ ), thereby confirming  $H_{4a}$  and  $H_{4b}$ .

### 3.4 Test of competing models

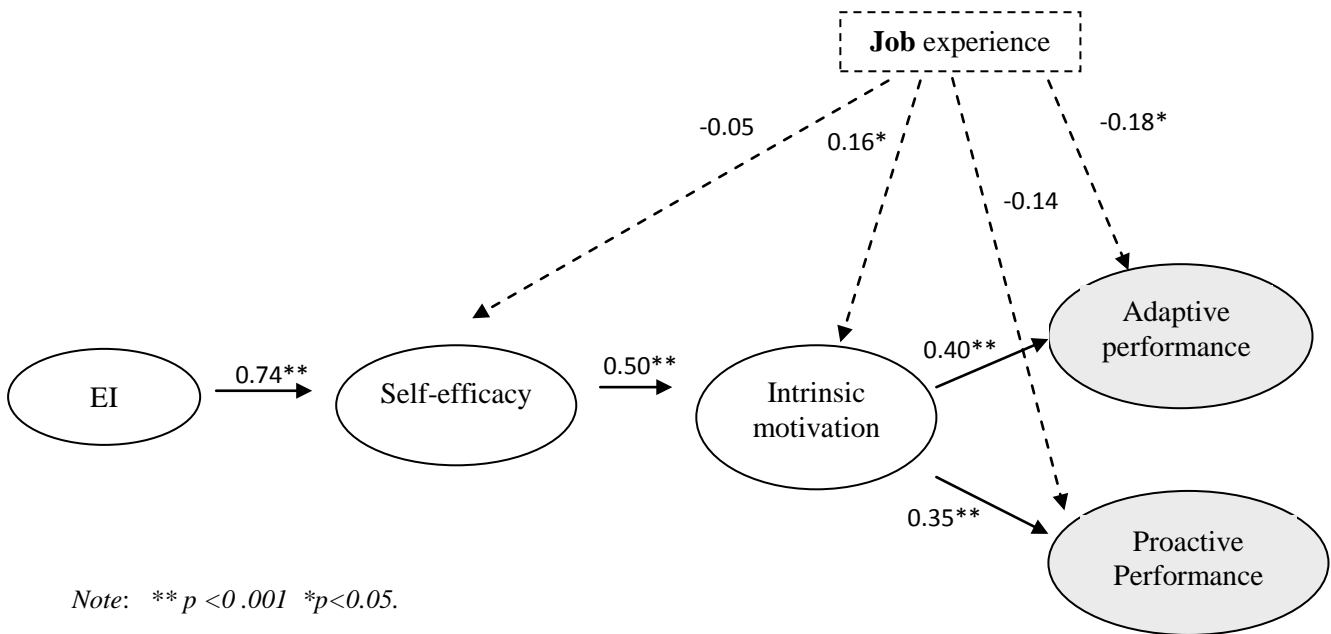

Test of competing models and the selection of a model which best fits that data is generally conducted if the competing models have theoretical support (Jöreskog, 1993). Previous research, although limited, has focused on "emotions as a consequence rather than an antecedent" of efficacy beliefs (Sutton & Wheatley, 2003). For Saarni (2000), for example, emotional competence is the demonstration of self-efficacy in expressing emotions in social transactions. In fact, one might speculate that individuals' high self-efficacy beliefs might help promote and enhance the development of EI (Chan, 2004). In addition, EI might influence intrinsic motivation directly. With these considerations in mind, we tested an alternative model in which self-efficacy was positively related to EI and salesperson intrinsic motivation. In addition, salesperson EI was hypothesized to have a positive direct effect on salesperson intrinsic motivation. We found that this model, although presenting an adequate fit to the data ( $X^2 = 555.81$ ,  $df = 384$ ,  $p < 0.05$ ,  $X^2/df = 1.45$ ; RMSEA = 0.06, CFI = 0.92; TLI = 0.90; IFI = 0.92), it had not a significantly better fit than our hypothesized model ( $\Delta\chi^2 [1] = 3.03$ ,  $p > 0.05$ ) and the direct path from EI to salesperson intrinsic motivation was not significant ( $\beta = 0.28$ ,  $CR = 1.72$ ,  $p = 0.08$ ).

---

<sup>1</sup> In order to avoid problems due to possible non-fulfilment of the conditions of multivariate normality, the bootstrapping technique was used.

FIGURE 2

Structural estimates of the causal model

### 3.5 Moderating effects

SEM multigroup analysis has been widely used in the literature to compare moderator effects. However, this approach has been heavily criticized particularly in the last decade (Hayes, 2005; MacCallum et al., 2002; Preacher et al., 2005), especially when the moderating variable is numerical, as it is considered that the “artificial categorization of a continuum prior to analysis is almost always difficult to defend, for the splits point usually is determined arbitrarily and thus produces groups that are not psychometrically meaningful (e.g., why the mean or the median as opposed to some other number?), it throws out information by treating people who are nearly indistinguishable (i.e., those close to the mean or median) as if they are maximally distinct on the dimension measured, it reduces statistical power of tests, and it can increase Type I error rate in some circumstances” (Hayes, 2013, p. 299).

Therefore, testing hypotheses H3, H5a and H5b, which consider moderator effects in some of the relations of the model, will be jointly addressed using the methodology coined by Hayes (2013) as conditional process analysis or conditional process modeling. This methodology is suitable when the aim is to understand and describe the mechanisms where a variable transmits an effect to another variable, as well as when the aim is to test hypotheses on the variable nature of those effects.

In the model proposed in this paper, the self-efficacy variable affects the intrinsic motivation, and this in turn affects two performance measurements: the adaptive performance and the proactive performance, with it being recognized that the effect of the self-efficacy on the performance is indirect, and it is mediated by the intrinsic motivation. In other words, the intrinsic motivation acts as a transmitting variable of the effect of the self-efficacy on performance. However, as the two effects involved in this indirect relation are moderated in turn by the perceived organizational support (POS) and the resilience, we are assuming that those effects can be conditional and depend on those moderated variables. Thus, we argue that the effect of self-efficacy on intrinsic motivation is function of the POS degree and that the effect of the intrinsic motivation on performance is dependent on the degree of resilience.

In order to test these effects, a conditional process analysis is proposed, following Model No. 21 written by Hayes (2013) available at [www.afhayes.com](http://www.afhayes.com), where in this specific case variable X is self-efficacy, M intrinsic motivation, and Y adaptive performance (this same model will subsequently test for the proactive performance variables). Furthermore, W is the first moderating variable (POS) and V the second (degree of resilience of the seller). The job experience variable is likewise introduced to the model as a control variable. We used the PROCESS Procedure for SPSS Release 2.11 written by Andrew F. Hayes and available in [www.afhayes.com](http://www.afhayes.com), documented in Hayes (2013), to test these hypotheses.

This model matches the following system of equations:

### Hypothesis 3 and Hypothesis 5a

$$\text{INTRINSIC MOTIVATION} = a_0 + a_1 \text{ SELF-EFFICACY} + a_2 \text{ POS} + a_3 \text{ SELF-EFFICACY X POS} + a_4 \text{ JOB EXPERIENCE} + e_{IM}$$

$$\text{ADAPTIVE PERFORMANCE} = b_{01} + b_{11} \text{ INTRINSIC MOTIVATION} + b_{21} \text{ RESILIENCE} + b_{31} \text{ INTRINSIC MOTIVATION X RESILIENCE} + b_{41} \text{ JOB EXPERIENCE} + c'_1 \text{ SELF-EFFICACY} + e_{AP}$$

### Hypothesis 3 and Hypothesis 5b

$$\text{INTRINSIC MOTIVATION} = a_0 + a_1 \text{ SELF-EFFICACY} + a_2 \text{ POS} + a_3 \text{ SELF-EFFICACY X POS} + a_4 \text{ JOB EXPERIENCE} + e_{IM}$$

$$\text{PROACTIVE PERFORMANCE} = b_{02} + b_{12} \text{ INTRINSIC MOTIVATION} + b_{22} \text{ RESILIENCE} + b_{32} \text{ INTRINSIC MOTIVATION X RESILIENCE} + b_{42} \text{ JOB EXPERIENCE} + c'_2 \text{ SELF-EFFICACY} + e_{PP}$$

Although some authors recommend mean centering the predictor variables (Cohen et al., 2003; Dawson, 2013), others believe that it is not necessary to test the interaction and that such a practice is a myth in the literature, even though the X and M coefficients can be more easily interpreted if it is performed (Hayes, 2013). Therefore and in order for there to be no interpretation problems with some coefficients, given the measurement scales of the variables (which do not include a value of zero), the mean centering is performed of the SELF-EFFICACY, INTRINSIC MOTIVATION, POS, and RESILIENCE variables, which are precisely those that are involved in the SELF-EFFICACY X POS and INTRINSIC MOTIVATION X RESILIENCE interaction terms.

The results of the analysis by means of Ordinary Least Squares (OLS) shows certain evidence of the moderator effect of the POS variable in the relation between self-efficacy and intrinsic motivation ( $a_3 = 0.117$ ,  $p = .086$ ). With some caution and assuming a level of significance of 10%, we can accept H3, which argues that the POS moderated the positive relation between self-efficacy and intrinsic motivation.

The results likewise supports the H5a and shows the existence of a moderator effect of the resilience of the salesperson in the relation between intrinsic motivation and adaptive performance ( $b_{31} = 0.177$ ,  $p = .033$ ). The effect of the intrinsic motivation in the adaptive performance, therefore, cannot be quantified with a fixed parameter, but is rather a function of the degree of resilience, as can be seen from the fact that the interaction between intrinsic motivation and resilience is statistically significant (See Table 1). Moreover, given that this coefficient is positive, we can anticipate that the positive effect of intrinsic motivation on the adaptive performance will be stronger among those salespeople with a greater degree of resilience.

The results likewise indicate that the positive effect of the intrinsic motivation on the proactive performance is contingent upon the degree of resilience, as can be seen from the fact that the interaction between intrinsic motivation and resilience is statistically significant ( $b_{32} = 0.440$ ,  $p < .001$ ) (See Table 2). These results support H5b and conclude that the positive effect of the intrinsic motivation on the proactive performance is more intense on salespeople with a greater degree of resilience.

The interest of the conditional process analysis is to be able perform statistical interference of the conditional indirect effects. Preacher et al. (2007) propose dos approaches, a normal theory-based approach, similar to the Sobel test (used in the mediation analysis) and an approach based on bootstrapping. Hayes (2013, p. 350), based on the results obtained by means of simulation by Preacher et al. (2007), advise the use of the normal theory approach, alleging that this method is lower in strength and that the distribution that uses normal distribution as the benchmark, is not appropriate.

The second approach consists of constructing bootstrap confidence intervals for the conditional indirect effects, obtaining numerous sub-samples of the original data sample and based on the distribution of the estimated indirect effects in those sub-samples to calculate the bias-corrected bootstrap confidence intervals. If those intervals do not include the value of zero, it can be assumed that the conditional indirect effects are different from zero. This second approach is used in this study.

Tables 3 and 4 include the estimates of the conditional indirect effects of self-efficacy on adaptive performance and on proactive performance by means of the intrinsic motivation variable and considering the POS moderator effect and resilience, along the ninety-five percent bias-corrected bootstrap confidence intervals (1000 bootstrap samples) for the 10th, 25th, 50th, 75th, and 90th the percentiles of the moderator variables (POS and resilience). Yet again, the PROCESS Procedure for SPSS Release 2.11. is used to perform those estimates.

As can be seen in Table 3, the conditional indirect effect of self-efficacy on adaptive performance is positive and can be considered to be different to zero when the salespeople have a POS level equal or higher to the median (50th percentile = 5.500) and in turn the degree of resilience is also equal or

superior to the median (50th percentile = 5.333)<sup>2</sup>. In other words, both moderator variables need to have a level equal or higher than the median for self-efficacy to positively affect the adaptive performance by means of the intrinsic motivation. However, when the seller has a high POS (for example in the 90th percentile) but low resilience level (for example, 25th percentile), it cannot be ruled out that the indirect effect is equal to zero. The same occurs for low POS and high resilience levels.

TABLE 3  
Conditional indirect effects of self-efficacy on adaptive performance (through intrinsic motivation) at values of POS and resilience

Estimating the conditional indirect effects of the self-efficacy variable on proactive performance is a means to check that those effects are different from zero when the first moderator variable (POS) is equal or higher than the median and in turn, the second moderator variable (resilience) is equal or superior to the median. Therefore, only positive and significantly different from zero effects can be expected on those sellers that show high POS and resilience values (see Table 4). Furthermore, it should be noted that when resilience has a very low value, in the 10<sup>th</sup> percentile, the conditional indirect effect is always negative, a result that supports the interpretations of Graph 3, that show a slightly negative slope of the function for low resilience values.

TABLE 4  
Conditional indirect effects of self-efficacy on proactive performance (through intrinsic motivation) at values of POS and resilience

POS	Resilience	Effect	Boot SE	BootLLCI	BootULCI
4.250	4.000	-0.017	0.063	-0.285	0.044
4.250	4.667	0.001	0.034	-0.055	0.086
4.250	5.333	0.019	0.045	-0.050	0.143
4.250	6.000	0.037	0.082	-0.111	0.227
4.250	6.667	0.056	0.124	-0.175	0.328
5.000	4.000	-0.040	0.065	-0.265	0.034

<sup>2</sup> Estimating the ninety-five percent bias-corrected bootstrap confidence intervals from 1,000 bootstrap samples shows that the combination of 5,000 values in the POS variable and 5,333 in resilience variable, results in a confidence interval which excludes the value of zero. The conditional indirect effect could therefore be taken to be different from zero. However, we believe that it is an isolated case that does not determine the existence of a significant region.

#### 4. Discussion

Emotions and feelings constitute an essential component of social life in general and particularly in organizations. How people feel at work affects their motivation, creativity and performance (Furgas & George, 2001). Our results confirm that emotions not only influence what people think and how people think, but they also have a deep effect on what occurs at work and in other settings of life (McEnrue, Groves & Shen, 2010).

Emotional intelligence is an important factor that contributes to the development of self-efficacy beliefs among individuals. This is consistent with the idea that emotional states might influence salespeople judgments on their own competence (Salanova et al., 2005). Salespeople often face rejection, role conflict and role ambiguity; and frequently face these challenges without support groups that are common in other jobs. To succeed, salespeople need to have control of and self-awareness of their own feelings (Rozell et al., 2006). One's EI levels are open to measurement and change (Goleman, 1995); thus, salespeople can enhance their EI levels. Moreover, understanding what EI entails is a critical requirement for someone in a leadership position. Evaluation of applicant scores on EI might provide valid information for selection decisions and might yield information regarding training needs.

Our research supports the idea that a combination of self-efficacy and intrinsic motivation is needed to explain individual's adaptive and proactive performance. Adaptivity and proactivity become especially important whenever a work context involves uncertainty and some aspects of work roles cannot be formalized (Griffin et al., 2007); something that is common among the sales positions. Salespeople are more willing to put in greater effort when they believe they have the abilities needed to perform their jobs successfully, what leads them to carry out more adaptive and proactive behaviors.

Due the fact that salespeople are often directly unsupervised, self-motivation becomes a critical determinant of success (Rozell et al., 2006). However, our findings confirm that maintenance and enhancement of salespeople intrinsic motivation requires supportive conditions. As the cognitive evaluation theory states, self-determination, referring to the perception of choice when engaging in behavior, moderates the effects of perceived competence on intrinsic motivation. Perceived organizational support might act as a contextual support for autonomy factor which is essential for intrinsic motivation to be present (Deci & Ryan, 1985). POS interacts with salespeople feelings of competence increasing salespeople interest in carrying out assigned tasks. As Ryan & Deci (2000) state, "intrinsic motivation is more likely to flourish in contexts characterized by a sense of security and relatedness".

Our results are consistent with the notion that resilience forms a part of a workers' "psychological capital" which helps them adapt to the numerous changes that organizations typically undergo

(Luthans et al., 2006). The salesperson ability to bounce back augments the positive effect of salesperson intrinsic motivation on adaptive and proactive performance by contributing in a positive manner to adaptation and wellbeing, even when adversities are encountered. Resilience is considered an ability of an emotional nature, more of a state than a trait and, therefore, it is modifiable. In this respect, it has been suggested that resilience can be developed through asset-focused, risk-focused and process-focused strategies that are relevant and applicable to the workplace (Masten & Reed, 2002).

Our study also supports the notion that emotional competences do not act in isolation (Abraham, 1999). Adaptive and proactive sales performance might be enhanced with EI competencies. However, in order to obtain this result, a supportive context as well as the presence of resilient skills on the side of the salesperson need to be in evidence. The indirect effect of self-efficacy on adaptive and proactive sales performance cannot be calculated as the product of two fixed parameters, but rather it depends on the two moderating variables and is greater for the salespeople that present high POS and resilience values.

## 5. Limitations and directions for future research

This study is not free from limitations. First, it is of a cross-sectional nature and its data were collected at one point in time, making it difficult to arrive at any conclusions regarding the causal nature of the examined relationships. Second, it uses a convenience sample and while the response rate was fairly high, we were unable to determine whether or not those that responded provided an accurate representation of those that did not. Third, the sample size for this study was relatively small and focused only on Spanish salespeople. Any possible future studies using larger and more diverse samples would yield findings that are more representative of salespeople working in other countries.

As regards EI, future research should explore the relationship between EI and marketing exchange variables as adaptive selling or customer orientation. Everyone has resilience potential, but its level is determined by individual experiences, qualities, the environment and personal balance or risk and protective factors (Tugade & Fredrickson, 2004). Thus, it would be interesting to analyze what sales factors, influence salesperson resilience. Another potential line of future research would be to analyse the influence of self-efficacy overtime using a longitudinal study. In this respect, it has been noted that the perceived personal capability to do overtime can lead to overconfidence and, therefore, impede performance (Thompson, Kaslow, Short & Wyckoff, 2002).

# THE INFLUENCE OF ADAPTIVE SELLING ON CUSTOMER SATISFACTION

PEDRO JUAN MARTÍN CASTEJÓN<sup>1</sup>  
*Universidad de Murcia*

SERGIO ROMÁN NICOLÁS  
*Universidad de Murcia*

## ABSTRACT

*Firm The first objective is to analyze the influence of adaptive selling, as perceived by customers, on customer satisfaction -both with the salesperson and the company- and loyalty to the supplier. In addition, this study aims to examine to what extent the organizational position occupied by the buyer (general manager or purchasing manager) moderates the results obtained (i.e., satisfaction and loyalty) as a consequence of a salesperson's adaptive selling behavior. Data obtained from a survey of organizational buyers from a wide range of industries is analyzed through structural equation modelling. Findings from the study indicate that adaptive selling significantly increases satisfaction with the salesperson, satisfaction with the supplier and loyalty to the supplier while controlling for length of the buyer-seller relationship. Also, these effects are stronger when the contact person at the buying company is the general manager as opposed to the purchasing manager.*

## KEYWORDS:

*Sales force, Adaptive selling, Relational outcomes, Hierarchical position of the buying person*

## 1. Introduction.

Though business relationships are established between organizations, they are actually managed by individuals, and the salesperson is still the primary point of contact for the customer in industrial markets (Stock and Hoyer, 2005; Schwepker and Good, 2011). Academic and practitioner interest has long focused on understanding the adaptive nature of personal selling. Research stemming from the Adaptive Selling framework (Weitz et al., 1986) has paid a considerable amount of attention to study the relationship between adaptive selling and sales performance (e.g., Boorum et al., 1998; Porter et al., 2003; Franke and Park, 2006; McFarland et al., 2006). Results from the meta-analysis conducted by Franke and Park (2006) reveal that adaptive selling increases self-rated, manager-rated and objective measures of performance.

Because of its adaptive capability, personal selling has traditionally been the most effective communication vehicle (Spiro and Weitz, 1990). However, this effectiveness is achieved at significant costs. For example, the average cost of making a personal sales call ranges from \$250 to \$500 in the USA (Kotler, 2003, p.638). Hence, sales managers are putting renewed emphasis on optimizing the productivity of their salespeople. But more importantly, practitioners and scholars have increasingly focused their attention on understanding how salespeople's behavior contributes to the development of buyer-seller relationship (Jones et al., 2003). Despite today's emphasis on relationship selling, the research on the consequences of adaptive selling has employed primarily sales related criteria (e.g., sales, quota). As shown in the Appendix, only recently scholars have paid attention to the influence of adaptive selling on relational outcomes (Rapp et al., 2006; Román and Iacobucci, 2010; Evanschitzky et al., 2012; Wang, 2012). This stream of research represents a remarkable effort while offering interesting research opportunities to the field of industrial marketing since: (1) these studies have solely focused on customers' satisfaction with the sales interaction, the salesperson or the selling company, thus ignoring other stronger indicators of relationship quality such as customer loyalty (Palmatier et al., 2007); (2) adaptive selling is assessed through salespeople's own evaluations. Importantly, prior research has shown that industrial customers' assessment of the salespeople's behaviors in the sales interaction are more objective than self-assessment by salespeople (Michaels and Day, 1985); (3) salespeople surveyed in these studies belong to a limited number of selling companies (ranging from 1 to 12), which limits the generalizability of the findings, and (4) most of these studies have been conducted in business-to-consumers environments. From a management perspective, given the significant costs of the industrial salesforce mentioned earlier, industrial sales managers would like to have some evidence that adaptive selling not only leads to short-term sales and satisfaction, but also to building and maintaining relationships with customers through loyalty to the selling company. Therefore, our first objective is to analyze the influence of adaptive selling, as perceived by customers, on customer satisfaction -both with the salesperson and the company- and loyalty to the company in a business-to-business context.

Prior research has shown that buyers' expectations regarding salesperson's behaviors vary across functional areas (e.g., Qualls and Rosa, 1995; Germain and Droge, 1998; DeVecchio et al., 2003; Román and Martín, 2008). For example, findings from Qualls and Rosa (1995) showed that purchasing personnel and corporate management used different criteria to evaluate suppliers. Interestingly, DeVecchio et al. (2003) suggest that the buyers' level of authority within their firm has a direct influence over their expectations and evaluations of salespeople. Our second objective is to analyze to what extent the organizational position occupied by the buyer (general manager or purchasing manager) moderates the results obtained (i.e., satisfaction and loyalty) as a consequence of a salesperson's adaptive selling behavior. Such analysis may provide industrial marketers with valuable information on the effectiveness of adaptive selling behaviors in terms of relationship quality.

## 2. Research model

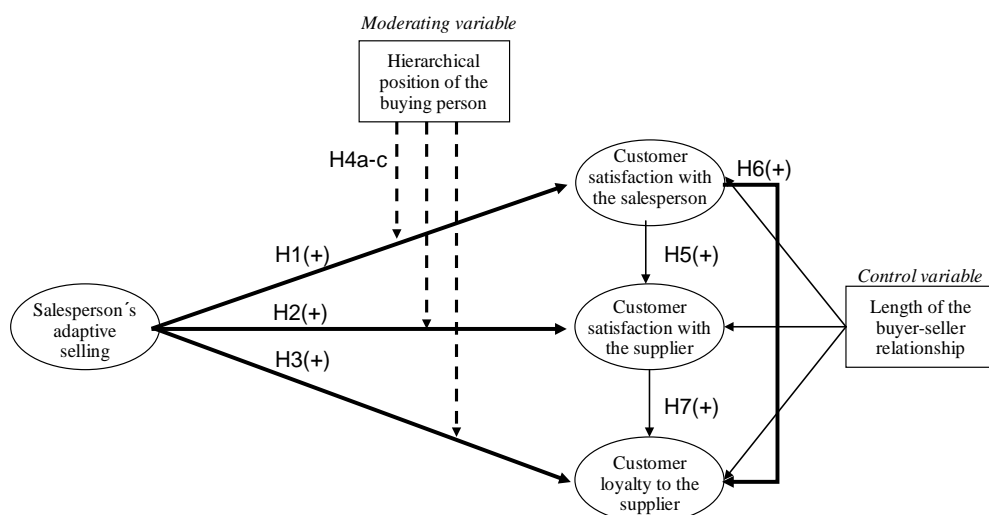

Salespeople exhibit a high level of adaptive selling behavior when they use different sales presentations across sales encounters and when they make adjustments during the encounter based on real-time feedback and perceived information about the nature of the selling situation (Weitz et al., 1986; Spiro and Weitz, 1990). Adaptive selling includes shaping the content and amount of

information shared with different customers who have different needs, e.g., a repeat customer does not need the background information required by a new purchaser (Román and Iacobucci, 2010). Salespeople also adapt their selling tactics to the buyer’s communication style (Williams and Spiro 1985; McFarland et al., 2006).

The above implies that the successful adaptation of a sales approach can be a difficult task that requires an extra effort on behalf of the salesperson (Weitz et al., 1986; Spiro and Weitz, 1990; Porter and Inks, 2000). More precisely, not only must the salesperson gather and analyze information from the customer, but he/she must then implement appropriate behaviors to match the characteristics of the sales situation.

As shown in Figure 1, our research model proposes that adaptive selling, as perceived by the customer, directly influences customer satisfaction, both with the salesperson and the company, and loyalty to the supplier (H1-H3). The hierarchical position of the buyer is hypothesized to moderate the influence of adaptive selling on these relational outcomes (H4a-c). As for the indirect effects of adaptive selling, it is suggested that satisfaction with the salesperson influences satisfaction with the company (H5) and loyalty to the company (H6). Satisfaction with the company in turn enhances loyalty to the company (H7). Consistent with prior research in industrial markets (Stock and Hoyer, 2005), the framework also includes the length of the buyer-seller relationship as a control variable. The reasoning for these hypotheses is explained below.

**Figure 1** Conceptual model

### 3. Hypotheses development

#### 3.1. Direct consequences of adaptive selling

Customer satisfaction with the salesperson reflects an emotional state that occurs in response to an evaluation of the interaction experience that the customer has with the salesperson (Crosby et al., 1990). It is hypothesized that adaptive selling increases customer satisfaction with the salesperson. As discussed earlier, adaptive selling not only entails adapting the content of the presentation, but also the sales tactics to the buyer’s communication style. For example, the adaptive salesperson may tailor a presentation to focus on the bottom-line when talking to a “task-oriented” buyer (Williams and Spiro, 1985). These adaptations are likely to improve communication between parties, which implies that problems are more easily and rapidly addressed (Mohr et al., 1996), and consequently customer satisfaction is likely to increase. Indeed, recent evidence from Román and Iacobucci (2010) and Wang

(2012) in the retail financial services industry shows that adaptive selling increases customer satisfaction with the salesperson. Accordingly:

H1. Adaptive selling behavior, as perceived by the customer, is positively related to customer satisfaction with the salesperson.

Satisfaction with the supplier is an overall evaluation of performance based on all prior experiences with the firm (Anderson et al., 1994). Preliminary evidence in a business-to-business context from Evanschitzky et al. (2012) shows that the adaptive selling behaviors of 18 salespeople of one financial service provider positively influenced customer satisfaction.

Industrial salespeople are the selling organization in the customer's eyes. Each of the salesperson-customer interactions has the potential of positively or negatively impacting customer's satisfaction with the company (Schwepker and Good, 2011). More specifically, research suggests that customer satisfaction with the selling company may be largely determined by the quality of the sales interaction since customer perceptions of salespeople will affect their perceptions of the company (Ganesh et al., 2000). The quality of the sales interaction, in turn, is likely to improve when the salesperson implements an adaptive selling approach because the salesperson's behaviors are modified with the goal of more exactly meeting customer needs related to the sales interaction (Weitz et al., 1986). Therefore, we propose that:

H2. Adaptive selling behavior, as perceived by the customer, is positively related to customer satisfaction with the supplier.

Customer loyalty refers to customer commitment to continue the relationship with the selling company (Ganesh et al., 2000). We expect a positive effect of adaptive selling on customer loyalty. This expectation is based on *equity theory*, which states that buyers compare their inputs/outcomes to those of the salesperson (cf. Oliver and Swan, 1989). In this vein, adaptive selling can be considered to be a salesperson's input in the equity formulation. This is because the adaptive salesperson has to conduct a "market research" on each customer by asking questions and listening carefully (Weitz et al., 1986). That is to say, when customers perceive that a salesperson is making an effort to adapt to their communication style and needs, customer's feelings of equity are likely to increase. Prior research has shown that buyer equity perceptions, in turn, increase the probability of dealing with the salesperson in the future (Swan and Oliver, 1991). Importantly, qualitative data from Brennan and Turnbull (1999) reveal that seller adaptation to the buyer contributes to the development of the relationship in industrial markets. Therefore, we propose that:

H3. Adaptive selling behavior, as perceived by the customer, is positively related to customer loyalty to the supplier.

### ***3.2. The moderating influence of the hierarchical position of the buying person***

As argued earlier, adaptive selling plays a major role in making the customer feel that the salesperson is willing to sacrifice short-term sales to maintain customer satisfaction and increase the probability of future sales (Weitz et al., 1986). That is to say, adaptive selling is a relationship signal that indicates to the buyer that he or she is important to the seller (Porter et al., 2003). We believe that the salesperson's effort in adapting to the buyer and the characteristics of the sales situation will be further valued in proportion to the hierarchical position of the buying person.

Findings from Qualls and Rosa (1995) revealed that functional areas (i.e., purchasing and corporate management) have different factors that determine their satisfaction with suppliers. In a similar fashion, Hayes and Hartley's (1989) results indicate that buyers in strategic positions (such as those who are at higher levels of authority) tend to take a "broader perspective" when interacting with salespeople. The broader perspective moves beyond the technical aspects of the product to a problem-solving approach that focuses on achieving the goals of the organization as a whole (DelVecchio et al., 2003). Román and Martín (2008) found that the effect of an increase in sales call frequency on customer satisfaction was stronger the higher the hierarchical position of the contact person in the buying company (general manager vs. purchasing manager). Overall, these studies suggest that a buyer who carries a high level of authority within the buying company may be more responsive (and consequently more satisfied and more loyal) to an extra effort on the part of the salesperson in terms of adaptive selling. Based on the above discussion, we propose that:

H4a-c: The higher the hierarchical position of the contact person in the buying company, the stronger the effect of adaptive selling behavior, as perceived by the customer, on (a) customer satisfaction with the salesperson, (b) customer satisfaction with the supplier and (c) customer loyalty to the supplier.

### ***3.3. Relationships among the relational outcome variables***

Perceived value is Prior evidence in retailing contexts has shown that satisfaction with the salesperson positively influences satisfaction and loyalty to the selling company (e.g., Goff et al., 1997; Reynolds and Beatty, 1999). We expect these relationships to hold in business-to-business settings because customers' positive feelings towards their salesperson (i.e., satisfaction with the salesperson) often "transfer" to the company given the crucial boundary-spanning role of industrial salespeople. Also, *associative learning theory* (Furedy and Riley, 1987) can provide an explanation of such relationships. Associative learning refers to the individuals' ability to make connections between temporally and/or propositionally contingent events. In particular, pairing of the unconditioned stimulus (e.g., positive experiences with the adaptive salesperson) with a conditioned stimulus (e.g., the supplier) create liking and positive attitudes towards the conditioned stimulus (the supplier), resulting in higher levels of satisfaction and loyalty to the company the salesperson represents. Accordingly:

H5. Customer satisfaction with the salesperson is positively related to customer satisfaction with the supplier.

H6. Customer satisfaction with the salesperson is positively related to customer loyalty to the supplier.

Based on extant research in business-to-business markets (e.g., Liu and Leach, 2001; Jeffrey and Johnston, 2008; Cater and Cater, 2009) we expect satisfaction with the company to have a positive influence on loyalty to the company. Satisfied customers are less sensitive to competitors' offers and are more likely to continue the relationship with the selling firm. Therefore:

H7. Customer satisfaction with the supplier is positively related to customer loyalty to the supplier.

### ***3.4. Length of relationship as a control variable***

Length of relationship refers to the amount of time that the buyer-seller business relationship has existed (Stock and Hoyer, 2005). As mentioned earlier, we include the length of relationship as a control variable. This variable has been identified as a key antecedent of customer satisfaction and loyalty in several studies (e.g., Dwyer et al., 1987; Ganesan, 1994). The inclusion of this control variable is particularly important because it is highly plausible that it is positively correlated with both the salespeople's adaptive selling behavior and customer satisfaction and loyalty. Including this construct as an additional predictor of the customer relational outcomes allows us to determine whether adaptive selling has a significant impact on satisfaction and loyalty after accounting for the variance explained by this control variable.

#### 4. Method

Most research on adaptive selling has been conducted from the salesperson's perspective. This study focuses on the relationship between a single buyer and a single seller from the buyer's perspective. The questionnaire was pre-tested in two stages. First, it was reviewed by six buyers through in-depth interviews. Each pretest subject in this stage was asked to evaluate the clarity, reveal any latent problems, and offer suggestions for improvements. Several modifications were made (particularly in the adaptive selling measure) to fit the measures to the context of the study (i.e., the buyer's point of view). In the second pretest thirty buyers were asked to first complete the survey, and then to note any problems found in the instrument. Two items from the adaptive selling measure were eliminated as they were found redundant.

From a mailing list (in SIC codes 33, 34, 35, and 36) purchased from a commercial list house, we randomly selected 1000 small and medium-sized firms located in a southeastern Region of Spain. We followed established literature in determining the industries (Colwell et al., 2011), respondents (Román and Martín, 2008) and requests of the respondents with respect to which salesperson they considered (Newell et al., 2011). More specifically, in the instructions of the survey, the respondents were asked to think of a salesperson selling industrial machinery and components with whom their company currently has a relationship (for a similar procedure see Newell et al., 2011). Particularly, it was specified that the salesperson had to call on the buyer at least once a month. This condition to facilitate buyer's evaluations of the salesperson's behavior.

A letter explaining the nature and purpose of the research as well as a copy of the questionnaire was sent to the firms. We then made telephone contact to confirm that the companies had received the questionnaire and were willing to participate. A follow up letter and survey were sent 2 weeks later to non-respondents. Discarding all incomplete and inconsistent responses (20), the final number of usable questionnaires was 264, representing an effective response rate of 26.4%. Non-response bias was assessed by comparing early and late respondents (Armstrong and Overton, 1977). No significant differences were found on any of the constructs ( $p > .10$ ).

The responding firms come from a wide range of industries, including mining, utilities, manufacturing (motor and generators, wood and metal products), construction, engineering, metal forgings and stampings. Sample profile is shown in Table I. 72% of the responding companies consisted of small firms (less than 50 employees). Most of the respondents were male (96.6%), had a mean age of 45 years and 36.4% of them had a college education. 52.7% of them were general managers and 47.3% were purchasing managers.

**Table I** Sample profile (Percentage)

Size of participating companies (number of employees)	
< 10	37.1
10 to 50	34.8
> 50 to 250	28
Profile of respondents

Male	96.6
Female	3.4
Age	
< 35	12.1
36-50	54.2
> 50	33.7
Mean = 45 years	
Education	
Low (primary school)	.04
Middle (high school)	63.2
College/University	36.4
Hierarchical position	
General manager	52.7
Purchasing manager	47.3

#### 4.1. Measures

When possible, validated existing scales were used (all items are presented in Table II). As argued earlier, we finally adapted 5 items from Spiro and Weitz's (1990) ADAPTS scale to assess customers' perceptions of the salesperson's adaptive selling behavior. Customer satisfaction with the salesperson was measured using a three-item scale adapted from Ramsey and Sohi (1997) and Reynolds and Beatty (1999). Three items from Liu and Leach (2001) were used to measure customer satisfaction with the supplier. Four items from Ramsey and Sohi (1997) and Palmatier et al. (2007) were used to capture customer loyalty to the supplier. Following Stock and Hoyer (2005), length of relationship was measured by one item that captured the age of relationship between the supplier and the customer company in years. In order to facilitate buyer's response, relationship length was measured through four intervals (less than 2 years, 2 to 5 years, 6 to 10 years, more than 10 years).

#### 4.2. Data analysis

A confirmatory factor analysis (CFA) by means of LISREL 8.72 was conducted to assess measurement reliability, convergent and discriminant validity. The measurement model had a good fit ( $\chi^2(95)=215.83$   $p<.01$ ; GFI=.91; CFI=.98; RMSEA=.06; RMSR=03.; TLI (NNFI)=.98).

**Table II** Construct Measurement Summary: Confirmatory Factor Analysis

Item Description and Source	Std. Loading
Salesperson's adaptive selling behavior as perceived by customers (adapted from Spiro and Weitz, 1990)	
This salesperson tailors the sales presentation to the nature of the selling situation.	.91
This salesperson adapts his/her communication style and approach to meet my needs.	.92
<i>This salesperson often uses the same sales techniques.</i> (r) <sup>a</sup>	.87
If necessary, this salesperson makes adjustments during the encounter to improve my level of understanding.	.95
This salesperson experiments with different sales approaches. (scale: 1 = "never" to 10 = "always").	.87
Customer satisfaction with the salesperson (Ramsey and Sohi, 1997; Reynolds and Beatty, 1999)	
I am pleased with this salesperson.	.91
I am satisfied with the level of service this person has provided.	.94
In general, I am pretty satisfied with my dealings with this salesperson.	.91
Customer satisfaction with the supplier (Liu and Leach, 2001)	
My company likes this supplier.	.93
My company is satisfied with this supplier.	.91
My company is pleased with this supplier.	.93
Customer's loyalty to the supplier (Ramsey and Sohi, 1997; Palmatier et al., 2007)	
It is probable that my company will contact this supplier again.	.94
My company is willing to discuss business with this supplier again.	.93
My company plans to continue doing business with this supplier.	.92
We will do more business with this supplier.	.91
Length of relationship (Stock and Hoyer, 2005)	
Number of years your company has been dealing with this supplier	-

Notes: <sup>a</sup> Reverse-scored item. <sup>b</sup> Unless indicated otherwise, scales are from 1 = "strongly disagree" to 10 = "strongly agree.";

Reliability of the measures was confirmed with composite reliability index higher than the recommended level of .60 (Bagozzi and Yi, 1988) and average variance extracted was higher than the recommended level of .50 (Hair et al., 1998) as shown in Table III. Following the procedures suggested by Fornell and Larcker (1981) and Bagozzi and Yi (1988), convergent validity was assessed by verifying the significance of the *t*-values associated with the parameter estimates (the lowest *t*-value was 17.76). All *t*-values were positive and significant ( $p < .01$ ). Discriminant validity was tested by comparing the average variance extracted by each construct to the shared variance between the construct and all other variables. For each comparison, the explained variance exceeded all combinations of shared variance (see Table III).

**Table III** Means, standard deviations, scale reliability, AVE<sup>a</sup> and correlations

	Means	s.d.	AVE	1	2	3	4	5
1. Adaptive selling	6.5	1.36	.82	<b>.96</b>	.26	.18	.22	.06
2. Satisfaction with the salesperson	6.9	1.11	.84	.51	<b>.94</b>	.22	.26	.07
3. Satisfaction with the supplier	6.7	1.14	.85	.43	.47	<b>.95</b>	.44	.13
4. Loyalty to the supplier	7	1.15	.85	.47	.51	.67	<b>.96</b>	.18
5. Length of relationship	2	1.22	-	.25	.28	.36	.43	-

**Notes:** <sup>a</sup> Average variance extracted. Scale composite reliability (Bagozzi and Yi, 1988) is reported along the diagonal. Correlations are reported in the lower half of the matrix Shared variances are reported in the upper half of the matrix. All correlations are significant at  $p < .01$ .

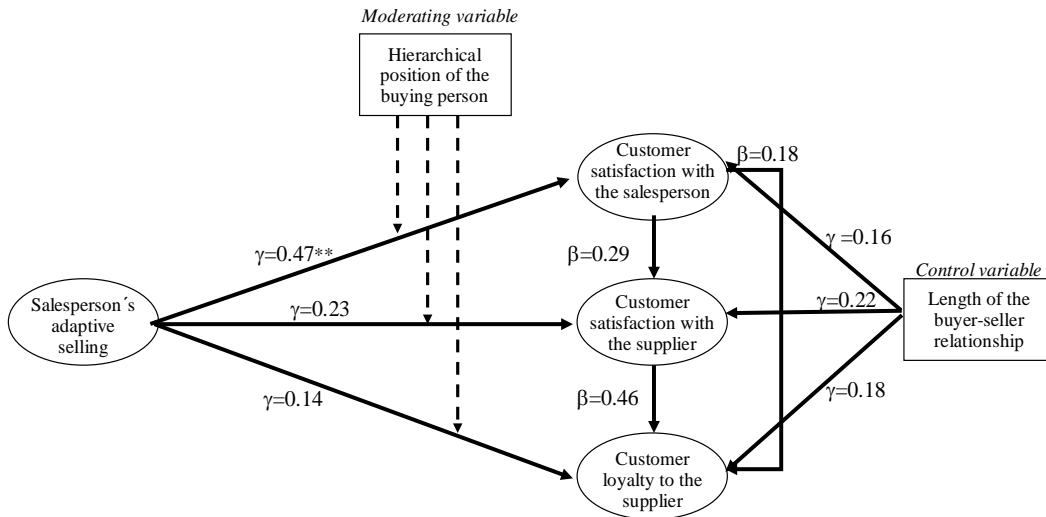

<sup>b</sup> Relationship length was measured through four intervals (1="less than 2 years", 2 ="from 2 to 5 years", 3 ="from 6 to 10 years", 4 = "more than 10 years").

## 5. Results

### 5.1. Direct and indirect effects

The hypothesized relationships were estimated via LISREL 8.72. The results indicated a good fit between the model and the observed data ( $\chi^2(95)=215.92$   $p < .01$ ; GFI=.91; CFI=.98; RMSEA=.06; RMSR=.03.; TLI (NNFI)=.98). The model explained 28% 25% and 32% of the variance in satisfaction with the salesperson, satisfaction with the supplier and loyalty to the supplier respectively. As shown in Figure 2, the analyses provided strong support for the direct positive effect of adaptive selling on the relational outcomes (H1-H3), as well as the relationships among the relational outcomes (H5-H7). In addition, the results indicated a significant and indirect influence of adaptive selling on supplier satisfaction (Std. coeff =.13; *t*-value=3.80) and on supplier loyalty (Std. coeff =.25; *t*-value=5.8).

### Figure 2 Results of main effects

**Note:** \*\*Fully standardized coefficients are reported (all significant at  $p < .01$ )

## 5.2. Moderating effects

We tested moderating effects through multigroup LISREL analyses. The sample was splitted into subsamples according to whether the contact person in the customer company was the general manager ( $n=139$ ) or the purchasing manager ( $n=125$ ). Then, two models that are different only with respect to the effect of adaptive selling on the dependent variable were compared. One model restricts this parameter to be equal across groups, whereas the more general model allows this parameter to vary across groups. The question is whether the improvement in chi-square when moving from the restricted to the more general is significant. Significance can be assessed on the basis of the chi-square difference between the two models with the use of a chi-square distribution with one degree of freedom.

The results of the multi-group LISREL analyses are shown in Table IV. As anticipated, the positive influence of adaptive selling on satisfaction with the salesperson, with the supplier and loyalty to the supplier was stronger among general managers as compared to purchasing managers. In all these cases the decrease in chi-square when moving from the restricted (equal) model to the more general model was significant, providing support for Hypothesis 4a-c.

**Table IV** Results of moderating effects

Relationship	Subsample		Chi-Square Difference (6df=1)
	General managers (n=139)	Purchasing managers (n=125)	
Adaptive selling → Satisfaction with the salesperson	$\gamma=.70$ ( $t=9.15$ )	$\gamma=.21$ ( $t=2.68$ )	$6\chi^2=8.93^{**}$
Adaptive selling → Satisfaction with the supplier	$\gamma=.46$ ( $t=3.63$ )	$\gamma=.15$ ( $t=2.01$ )	$6\chi^2=5.23^*$
Adaptive selling → Loyalty to the supplier	$\gamma=.32$ ( $t=2.99$ )	$\gamma=.06$ (n.s)	$6\chi^2=4.87^*$

**Notes:** ns=not significant \* $p < .05$ ; \*\* $p < .01$

## 6. Discussion and managerial implications

In the light of the paradigm shift that has moved the field's focus from transactional-based selling to one focused on developing and maintaining relationships with customers, this study represents an initial step into the analysis of the consequences of adaptive selling behavior on customer's satisfaction and loyalty in a business-to-business context. Only Evanschitzky et al. (2012) have analyzed the influence of adaptive selling on satisfaction with the company in industrial markets. Yet they measured adaptive selling through the evaluations of eighteen salespeople from one single company and they did not control for the length of the buyer-seller relationship. They acknowledged that: "our findings might not be generalizable to all business-to-business settings" and encourage future research to control for the length of the buyer-seller relationship (Evanschitzky et al., 2012, p.502). In particular, our findings from a random sample of 264 organizational buyers from a wide range of industries, reveal that adaptive selling has positive relational outcomes at two levels, namely at the level of the individual salesperson (satisfaction with the salesperson), and at the level of the buyer-seller relationship (satisfaction and loyalty to the supplier) while controlling for length of the buyer-seller relationship.

Our study's results may help to explain the mixed findings of previous research regarding the effect of adaptive selling on satisfaction with the sales interaction. While Román and Iacobucci (2010) and Wang (2012) found a positive relationship between adaptive selling and satisfaction in the financial services industry, Rapp et al. (2006) failed to do so in the pharmaceutical industry. Importantly, early evidence in the services marketing literature has linked employee adaptability with customers' positive perceptions of the service encounter (Bitner, 1990). In a similar fashion, we found that adaptive selling significantly increased customer satisfaction in a business-to-business context. Taken together, all these results may suggest that adaptive selling is particularly relevant in contexts, such as services selling and industrial markets, where the salesperson is the primary –if not sole– contact point for the customer both before and after the purchase.

Another contribution of the study is related to the analysis of the moderating effects. Consistent with DelVecchio et al. (2003) and Román and Martín (2008), it seems that at higher levels of buying authority, buyers consider more issues and criteria than just product attributes and prices. Our findings suggest that buyers at higher levels of authority are more responsive to adaptive selling practices. In particular, general managers, as opposed to purchasing managers, seem to be more aware of the effort that implies adapting the sales strategy to the selling situation, and more willing to compensate such effort in terms of commitment to continue the relationship, for example.

Interestingly, the analysis of the moderating role of the hierarchical position occupied by the buying person also revealed that adaptive selling did not have a direct influence on loyalty when the contact person is the purchasing manager instead of the general manager. One possible reason is that purchasing managers, as opposed to general managers, may not realize that such adaptation implies an extra effort for the salesperson. Therefore, according to *equity theory*, the purchasing manager may have more difficulty in perceiving adaptive selling as a salesperson's input in the equity formulation. This may be particularly the case in small and medium sized companies where there are not that many management positions. In fact, it is quite common that the sales manager simply does not exist, and the general manager acts as the sales manager (Román et al., 2002). Consequently, the general manager (as compared to the purchasing manager) is more aware of the effort that implies adapting the sales strategy, and more willing to compensate such effort in terms of loyalty to the company the salesperson represents.

This research has several implications for practitioners. Our results show that adaptive selling has a major impact on the development and maintenance of the buyer-seller relationships. Therefore sales managers need to foster the adaptive selling behaviors of their salespeople. In doing so, we

recommend the following activities. First, salespeople need to be trained to categorize industrial customers, and to be sensitive and focused on their needs as well as their buying motive. These training programmes should take into account the knowledge structures of more experienced and better performing salespeople. The appropriate order of training should be formal classroom training to provide the necessary customer knowledge, followed by participative training that creates/reinforces the ability to use such knowledge. This participative training may take place in two steps. First, through role playing sessions where typically one trainee plays the role of the salesperson and another trainee acts as the buyer. Then, the knowledge and abilities learned in previous training sessions need to be consolidated through on-the-job training.

Second, adaptive selling is hard work and takes time, sales managers should not reward salespeople on a 100% commission based on the sales made. We do not imply that companies should avoid incentive programs, rather they could use a combination of base salary plus incentive pay in the form of commissions, bonuses or both based not only on the sales performance, but on how well long-term objectives such as customer satisfaction have been achieved. Third, we suggest that sales managers should take time to communicate with their salespeople, assisting and guiding them to effectively adapt their sales strategy, and include adaptive selling as a criterion in the performance evaluation process.

We also encourage sales managers to maximize the time their salespeople spend calling on customers. For example, this can be implemented by providing salespeople with company support to carry out the office work. The salesperson, then, may become the leader of a team in order to better serve customer needs through adaptive selling. Finally, our results suggest that salespeople have to make an extra effort to adapt the sales strategy the higher the hierarchical position of the customer in the buying organization.

## **7. Limitations and further research directions**

Despite insights gained through our results, future research should aim to overcome a number of limitations inherent to this study. First of all, since the data were collected cross-sectionally using self-report measures, the potential for common methods variance exists. Following Podsakoff and Organ (1986), we tested for this bias using Harman's one-factor approach. A principal components analysis (unconstrained number of factors with varimax rotation) on the 15-questionnaire items (variables measured with one item were not included) yielded four factors with eigenvalues greater than 1.0, accounting for 86% of the total variance. Given the emergence of several factors and given that the first factor accounted for only 27% of the total variance, common methods bias does not appear to be present in the dataset (Podsakoff and Organ, 1986).

This study represents an initial step into the analysis of the moderating variables on the consequences of adaptive selling on customer satisfaction and loyalty. Further research is needed to extend the conceptual model to examine other potential moderator variables such as the size of the buying company. Finally, to the best of our knowledge, the ADAPTS scale has always been used to assess adaptive selling from the sellers' point of view. In fact, this scale was developed to measure adaptability during a sales interaction or across sales interactions when adaptability is assessed from the salesperson's perspective. Through in-depth interviews with industrial buyers we modified the adaptive selling behavior items to reflect the customers' point of view. Additional research is needed to further assess the validity of this modified measure with other samples of industrial buyers.

Overall, the present study examines how the adaptive behaviors implemented by salespeople in the sales interaction contribute to the development of buyer-seller relationships in industrial markets. Importantly, Evans et al. (2012; p.93) have recently noted that: "despite a significant amount of influential research in this area, what happens within the buyer-seller interaction remains an underresearched area".

## Notes

[1] The higher proportion of corporate management respondents responsible for buying decisions was expected given the relatively small size of the surveyed companies as compared to large companies.

## RESUMEN

*Cada vez es más frecuente encontrar minoristas – especialmente en la distribución con base alimentaria – que han decidido eliminar la totalidad de las marcas nacionales de sus surtidos y ofrecer únicamente su marca propia. Parece que la aceptación de esta estrategia por parte de los consumidores se ha visto condicionada, en gran parte, por la situación de crisis económica que vivimos en los últimos años. Pero, ¿es esto realmente así?, ¿hasta qué punto la actitud del individuo hacia la crisis económica está influyendo en la aceptación de la estrategia de reducción de surtido desarrollada por muchos minoristas? En este trabajo analizamos el papel moderador que la actitud del individuo hacia el clima económico está jugando en las consecuencias que la estrategia de reducción del surtido de los minoristas están teniendo sobre el comportamiento de compra, en particular, sobre la intención de cambio de establecimiento del individuo. Para ello, en este trabajo mostramos los resultados obtenidos a partir de un experimento desarrollado con 1.400 individuos que pertenecen a un panel de consumidores existente en España en el ámbito de cuatro categorías de producto: yogur, pan de molde, papel higiénico y detergente de máquina en polvo*

## Palabras clave

Surtido, marcas nacionales, marca de distribuidor, crisis económica

## 1. Introducción

El surtido es, sin lugar a dudas, una de las herramientas competitivas más poderosas con las que cuenta el minorista para lograr diferenciarse de sus competidores (Stassen et al., 1999). De hecho, el surtido junto con la localización y el nivel de precios del establecimiento se configura como uno de los aspectos determinantes, no solo para atraer clientes al establecimiento (Kahn, 1999), sino también para lograr retenerlos (Grewal et al., 1999).

Después de varios años en los que la variedad y el número de ítems ofrecidos únicamente crecían, los minoristas han comenzado a entender que, muchas veces, “menos es más”. Tal y como podemos observar en la figura 1, y después de que en 2006 y 2007 los minoristas añadieran en sus lineales más productos de los que eliminaron, 2008 fue el primer año en que dicha tendencia se invirtió. Así, mientras los productos nuevos incorporados se incrementaron en un 8,2%, los productos eliminados se redujeron en un 9,1% (Rider, 2010:34).

FIGURA 1  
Ítems incorporados vs. Ítems eliminados (2006-2008)

Fuente: Rider (2010:36)

El tamaño del surtido no va a depender solo de la propia estrategia del distribuidor y del formato de la tienda, sino que existen, además, aspectos externos como la situación económica o los hábitos de consumo que son igualmente relevantes. En particular, la situación de crisis económica que llevamos sufriendo desde hace unos años ha provocado un cambio importante en los hábitos de compra del consumidor. Así, el consumidor se ha vuelto más sensible al precio, lo que ha favorecido – entre otras cosas – la consolidación de las marcas de distribuidor (MdD) y la reducción de la compra de productos y servicios innecesarios (Deloitte Touche Tohmatsu, 2011). Es lo que Granfield (2009) denomina “efecto Aldi”, referido a la búsqueda por parte del consumidor de los mismos productos a un precio más bajo.

Así, desde el inicio de la crisis económica el consumidor ha cambiado drásticamente sus hábitos de compra. El “nuevo” consumidor que ha surgido tras la crisis compra con mayor frecuencia cantidades menores, y tiene como principal objetivo ahorrar lo máximo en la compra de cada cesta (Vila y Giménez, 2012). En este contexto de ahorro, los minoristas están poniendo especial énfasis – junto con el desarrollo de promociones – en la revisión de sus surtidos y *portfolios*. El objetivo es lograr un mejor ajuste entre lo que busca el consumidor y lo que busca el establecimiento. Esto ha provocado una “guerra” intensa entre minoristas por ofrecer el precio más bajo posible en la cesta de la compra. Entre los elementos utilizados para lograr ese menor precio, el surtido se configura en el momento

actual como un elemento fundamental. En este sentido, gran parte de la reducción de precios se ha conseguido a través de la eliminación de referencias del lineal y la oferta de productos más básicos, provocando una disminución del surtido (Steenkamp y Kumar, 2009). Así, a nivel mundial, cadenas como *Wal-Mart* o *Tesco* han recurrido a estrategias de surtido basadas en una reducción del inventario y un incremento de la rotación, lo que les ha permitido incrementar sus ventas anuales (Banker, 2009). En España, *Mercadona* – diciembre de 2008 – decide retirar de sus lineales aquellas referencias que no tenían rotación diaria, que estaban duplicadas o que no respondían a las necesidades del consumidor.

Este proceso de “racionalización” del surtido parece haberse convertido en una de las principales prioridades de los minoristas líderes a nivel mundial (tabla 1).

TABLA 1  
Decisiones de racionalización del surtido tomadas por algunos de los principales minoristas mundiales

<b>Walmart</b>	Reducción del surtido global en el Reino Unido en un 30%. En EE.UU. se reduce el surtido en un 7,6% con un incremento de las ventas en un 1,1%, si bien se volvieron a incorporar los items con posterioridad
<b>Grupo Casino</b>	El proyecto ‘ADS 2’ ha provocado la expansión de las categorías más rentables (e.g., productos de maquillaje) a expensas de categorías más “deficitarias” (e.g., textil, perfumes)
<b>Supervalu</b>	El número total de SKUs se reducirá en un 25% en algunas categorías
<b>Mercadona</b>	Eliminación de más de 700 referencias “duplicadas” (MdD vs. marcas nacionales)
<b>Grupo Coles</b>	Mantenimiento del 50% de SKUs que supone el 90% de las ventas
<b>Grupo Carrefour</b>	El “programa de optimización de categorías” de Carrefour está dirigido a reducir el número de referencias en un 15%

Source: Berg y Queck (2010:31)

A partir de los argumentos anteriores, parece que la crisis económica y la actitud del consumidor hacia dicha crisis están siendo uno de los “aliados” que los minoristas han encontrado a la hora de implantar sus estrategias de eliminación de marcas nacionales (MNs); ¿es esto realmente así? ¿cómo influye la actitud del consumidor hacia la crisis en la aceptación de surtidos sin marcas nacionales (i.e., surtidos compuestos únicamente por la marca propia) por parte del mismo? La respuesta a estas preguntas es el objetivo de este trabajo. Para ello, se ha desarrollado un experimento online controlado en un panel de consumidores españoles propiedad de la consultora *IRI Worldwide*. El experimento analiza, entre otros aspectos, de qué manera la composición de los surtidos (surtidos compuestos únicamente por la marca de distribuidor vs. surtidos “mixtos” compuestos por la marca propia y las marcas nacionales) influye sobre la intención de cambio de establecimiento del consumidor, y el papel de la actitud del consumidor hacia la situación económica como moderadora de dicha influencia.

## 2. Revisión de la literatura

La ‘exclusión’ de una marca<sup>2</sup> es una modalidad de reducción del surtido que supone la eliminación de todas las referencias de la misma<sup>3</sup>, lo que va a provocar la imposibilidad para el comprador de encontrar dicha marca en el establecimiento (Sloot y Verhoef, 2008).

Desde hace unos años – fundamentalmente desde el comienzo del período de recesión económica – la “expulsión” de marcas nacionales o marcas de fabricante de los lineales de los minoristas es algo cada vez más frecuente, especialmente en el ámbito de los grupos de distribución con base alimentaria. Varios ejemplos. El antiguo minorista holandés *Edah* decidió eliminar 2.000 referencias de marcas de fabricante para introducir 1.000 referencias de su marca propia. Después de las múltiples consultas y quejas de sus clientes recibidas en los seis meses siguientes a la eliminación de las referencias, *Edah* tuvo que volver a “recuperar” aproximadamente 1.000 de esas referencias, fundamentalmente las que pertenecían a marcas de elevado valor y notoriedad (Sloot y Verhoef, 2008). El minorista británico *ASDA* renunció a vender la marca *Charmin* (*Procter & Gamble*), mientras que las cadenas alemanas *Edeka* y *Metro* excluyeron varias marcas de fabricante por su descontento con la política de precio y distribución de dichos fabricantes (Sloot y Verhoef, 2011). En España, *Mercadona* (diciembre de 2008) decidió “expulsar” casi 800 referencias de marcas de fabricante de elevado valor y notoriedad como *Nestlé*, *Sara Lee*, *Calvo*, *Pascual* o *Vileda*. Según la cadena valenciana, esta decisión fue

<sup>2</sup> *Brand delisting*

<sup>3</sup> Es necesario diferenciar entre una “no disponibilidad temporal”, i.e. cuando se produce una ‘rotura’ de stock y una “no disponibilidad definitiva”. La exclusión de una marca puede incluirse en este último grupo

consecuencia de la escasa rotación de estas referencias; sin embargo, parece que detrás de la exclusión de estas marcas del lineal de *Mercadona* se esconden múltiples conflictos con los fabricantes implicados.

La investigación previa en el ámbito de la reducción de surtido analiza el efecto de la exclusión permanente de una referencia a través del desarrollo de experimentos naturales que asumen un porcentaje importante de referencias eliminadas en una categoría de producto concreta. Broniarczyk et al. (1998) sugieren que los minoristas pueden hacer reducciones sustanciales en el número de referencias que ofrecen sin que ello afecte las intenciones de elección del establecimiento, siempre que las referencias eliminadas sean de marcas con una baja preferencia y se mantenga constante el espacio del lineal. Drèze et al. (1994) obtienen un incremento de las ventas del 4% en las ocho categorías analizadas una vez que se elimina un 10% de las referencias menos compradas. Los resultados de Boatwright y Nunes (2001) parecen indicar que los compradores dan la bienvenida a reducciones del número de referencias redundantes, si bien su reacción a la reducción en el tamaño de los surtidos es divergente. Los trabajos más recientes combinan la experimentación con otras fuentes de información (e.g., encuestas o datos de escáner) con el objetivo de analizar las consecuencias de la exclusión de una o más referencias (e.g., Borle et al., 2005; Sloot et al., 2006; Sloot y Verhoef, 2008). Borle et al. (2005), por ejemplo, obtienen una reducción global de las ventas del establecimiento, del número de visitas y del tamaño total de la cesta de la compra cuando el tamaño del surtido se reduce – resultado que contrasta con las conclusiones de la mayor parte de estudios previos. No obstante, esta reducción varía en función de la categoría, de modo que son aquellas categorías de producto compradas menos frecuentemente las que se ven más afectadas por la reducción de surtido. Sloot et al. (2006) obtienen como la reducción de tamaño de un surtido consecuencia de la exclusión de referencias pertenecientes a aquellas marcas menos vendidas tiene un efecto negativo sobre las ventas en el corto plazo; según estos autores, esto se debe al cambio de establecimiento de aquellos compradores que adquirirían dichas marcas. Sin embargo, en el largo plazo el efecto negativo se disipa de forma rápida.

Sloot y Verhoef (2008) sugieren que las reacciones del comprador a la exclusión de marcas de distribuidor difieren de las reacciones derivadas de la exclusión de marcas de fabricante; esta diferencia se debe al hecho de que las marcas de distribuidor están disponibles de forma exclusiva en un establecimiento concreto. Por lo tanto, si alguna referencia de una marca de distribuidor es excluida del surtido de una determinada categoría de producto, los consumidores no pueden cambiar de establecimiento para encontrar dicha referencia (cosa que sí es posible en el caso de la eliminación de referencias de una marca de fabricante). Por este motivo, estos autores asumen que la intención de cambio de establecimiento será menor en las situaciones de exclusión de referencias de marcas de distribuidor que en el caso de marcas de fabricante. Otro de los argumentos que ofrecen estos autores se relaciona con la percepción de lo que un surtido “completo” significa para el consumidor. En este sentido, Sloot y Verhoef (2008) sugieren que un surtido que no incluya varias marcas de valor y notoriedad elevados será considerado “incompleto” por parte del consumidor. Es por ello que cuando una marca de alto valor es excluida de un surtido y el número de marcas de similar notoriedad que permanecen en el surtido es relativamente pequeño, el número de alternativas consideradas como “aceptables” por parte del comprador será mucho menor que cuando permanecen un número mayor de referencias con alto valor de marca. En esta situación, por tanto, es probable que la intención del individuo de cambiar de establecimiento sea mucho menor.

Siguiendo este razonamiento, es de suponer que un consumidor considerará como incompleto un surtido en el que todas las marcas de fabricante (algunas de ellas con alto valor de marca) sean excluidas. Esta decisión debería llevar a una intención de cambio de establecimiento ciertamente elevada – al menos para aquellos consumidores que muestren una elevada preferencia por este tipo de marcas. Por el contrario, para aquellos consumidores que habitualmente adquieren la marca de distribuidor, tal decisión no debería tener influencia alguna en su comportamiento de compra, si bien es posible que su percepción de la variedad del surtido resultante cambiara. Además, la exclusión de todas las marcas nacionales del surtido de una categoría de producto específica podría tener consecuencias negativas para el surtido global del minorista. Esto se debe a la tendencia del consumidor de comprar el mismo tipo de marcas (e.g., marcas de distribuidor) en diferentes categorías (Batra y Sinha, 2000; Richardson et al., 1996).

### **2.1 La situación de crisis económica y el comportamiento del consumidor**

La literatura económica ha analizado la respuesta del consumidor a períodos de crisis. Así, los estudios previos sugieren que durante períodos de contracción económica los consumidores toman las decisiones con más cautela y de manera más cuidadosa (Cravens, 1974). En este sentido, McKenzie y Schargrodsky (2005) hallan como durante la crisis argentina de 2002, los consumidores empleaban más tiempo en sus actividades de compra; este incremento no era consecuencia de un mayor nivel de consumo, sino de una búsqueda intensa de los mejores precios y de los productos sustitutivos más baratos. Zurawicki y Nestor (2005) analizaron la misma crisis y encontraron un descenso gradual (en términos absolutos) en el consumo total, de modo que algunos de los productos menos esenciales fueron eliminados de la cesta de la compra de los argentinos. El análisis de estos autores se centraba en el comportamiento de las clases medias. Kang y Sawada (2008) muestran como los consumidores coreanos – en el contexto de la crisis asiática de 1997 – trataron de mantener su nivel de gasto en alimentación, educación y salud, reduciendo el gasto en productos de lujo.

Sin embargo, los trabajos en el ámbito del marketing centrados en el impacto de una crisis económica son muy escasos. Ang et al. (2000), en el contexto de la crisis asiática, concluyen que las estrategias más efectivas son la introducción de líneas de productos más “competitivas” que permitan mantener los precios bajos, el desarrollo de estrategias de posicionamiento adaptadas a la situación y la eliminación de los canales de distribución “marginales”. Estos autores hallan como los consumidores durante esta crisis incrementaron sus compras en los discounters. Fiszbein et al. (2003) identificaron tres estrategias de “supervivencia a la recesión”. Una de ellas – la denominada estrategia “adaptativa” – implica un cambio en los patrones de consumo de las familias. Este cambio es consecuencia de la frustración y la incertidumbre que los consumidores sienten y que les afecta psicológicamente (Shama, 1981). De manera más reciente, Kaytaz y Gul (2013) en su análisis de la respuesta de las familias turcas a la crisis económica global, descubren como la principal respuesta de los consumidores en Turquía ha sido la sustitución de los productos más caros por los más baratos, tanto en categorías de alimentación como en otras (e.g., higiene y cuidado personal o droguería).

En este contexto de mayor preferencia por los productos más económicos durante los períodos de crisis económica, las marcas propias parecen adaptarse mucho mejor que las marcas nacionales (Walsh y Mitchell, 2010). Algunos autores confirman que en períodos de recesión económica el consumidor está más preocupado por la adquisición de información sobre el precio, incrementando su conciencia por el precio (Estelami et al., 2001); esto va a influir de manera importante en su preferencia por las marcas propiedad del distribuidor (Lamey et al., 2007). De hecho, algunos trabajos previos han confirmado que la preocupación por el precio es un antecedente muy significativo del éxito de las marcas de distribuidor (Ailawadi et al., 2001). Consecuentemente, en contextos recesivos, la mayor importancia del atributo precio y la mayor necesidad del consumidor de reducir la frecuencia de compra y de ajustar el tamaño de la cesta de la compra afectan las preferencias por el surtido y la elección de establecimiento (Dekimpe et al., 2011). Incluso una vez que la situación económica mejora, muchos consumidores parecen mantener su “comportamiento de recesión”, en particular en lo que se refiere a la compra de productos de marca de distribuidor (Nielsen, 2010). De hecho, tal y como señala el informe de Nielsen “cerca del 88% de los compradores a nivel mundial manifiesta su intención de mantener la compra de productos de marca de distribuidor aún cuando la economía comience a mejorar”.

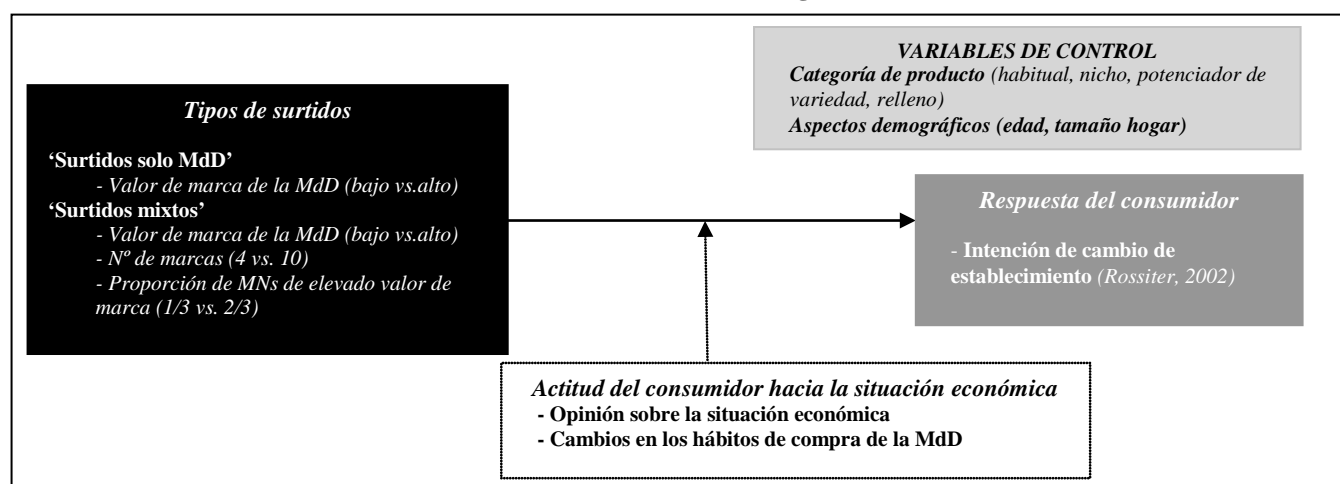

## **3. Metodología**

La figura 2 muestra el marco teórico que conduce nuestra investigación.

Mil cuatrocientos individuos pertenecientes a un panel de consumidores<sup>4</sup> existente en España y propiedad de *IRI Worldwide* han participado en un experimento online controlado. El 59,7% de los individuos participantes son mujeres, mientras que el 40,3% son hombres. La edad media es de 41,75 años, variando entre los 24 a los 70 años de edad.

<sup>4</sup> Mayor información y detalle sobre el panel utilizado está a disposición del lector mediante petición al autor de contacto de este trabajo

FIGURA 2  
Marco teórico de investigación

En el experimento controlado se han diseñado 10 surtidos diferentes, manipulándose, para ello, dos aspectos: (1) el tamaño del surtido, y (2) la composición del surtido. En relación al primero de los aspectos, existen tres tipos de surtidos: compuestos por una marca, i.e., solo la MdD, compuestos por 4 marcas y compuestos por 10 marcas. En relación a la composición del surtido, las condiciones experimentales incluían surtidos compuestos únicamente por la MdD (i.e., los surtidos de 1 marca), y surtidos “mixtos” (compuestos por la MdD y marcas nacionales, i.e., los surtidos de 4 y 10 marcas). Adicionalmente, tanto para los surtidos compuestos por una sola marca (MdD) como para los surtidos “mixtos”, se ha manipulado el valor de la MdD (alto vs. bajo). Finalmente, y en el caso de los surtidos “mixtos”, estos varían en cuanto a la proporción de MNs de alto valor que incluyen (un tercio vs. dos tercios). Por tanto, los diez surtidos mostrados a los individuos son los siguientes:

1. (1 marca) Marca de distribuidor (MdD) de alto valor
2. (1 marca) MdD de bajo valor
3. (4 marcas) MdD de alto valor + 3 marcas nacionales (MNs) (un tercio de alto valor)
4. (4 marcas) MdD de alto valor + 3 MNs (dos tercios de alto valor)
5. (4 marcas) MdD de bajo valor + 3 MNs (un tercio de alto valor)
6. (4 marcas) MdD de bajo valor + 3 MNs (dos tercios de alto valor)
7. (10 marcas) MdD de alto valor + 9 MNs (un tercio de alto valor)
8. (10 marcas) MdD de alto valor + 9 MNs (dos tercios de alto valor)
9. (10 marcas) MdD de bajo valor + 9 MNs (un tercio de alto valor)
10. (10 marcas) MdD de bajo valor + 3 MNs (dos tercios de alto valor)

El experimento ha sido desarrollado utilizando cuatro categorías de producto: (1) *yogur*; (2) *pan de molde*; (3) *detergente de máquina en polvo*, y (4) *papel higiénico*. Estas categorías se corresponden con la tipología desarrollada por Dhar et al. (2001), quienes establecen cuatro clases de categorías de producto en base a su frecuencia de compra (número medio de veces que la categoría es comprada en un período determinado de tiempo) y su penetración (porcentaje de individuos que compran la categoría). En particular, estos autores distinguen entre (1) *productos habituales* (elevada frecuencia y penetración; yogur en nuestro caso), (2) *productos nicho* (elevada frecuencia y baja penetración; pan de molde), (3) *productos potenciadores de variedad* (baja frecuencia y elevada penetración; papel higiénico), y (4) *productos de relleno* (baja frecuencia y baja penetración; detergente de máquina en polvo). La selección de las cuatro categorías (y su inclusión en cada una de las cuatro tipologías de Dhar et al., 2001) se ha realizado a partir de una muestra de 53 categorías que representan más del 60% de las ventas de bienes de consumo envasados en España. A partir de los datos de rotación y volumen de ventas del conjunto de las 53 categorías utilizadas, hemos establecido un ranking que nos

ha permitido clasificar cada categoría en función de su frecuencia de compra y su nivel de penetración. A partir de este *ranking* hemos seleccionado las cuatro categorías señaladas anteriormente (una por tipología), considerando la presencia de productos de alimentación (los más importantes en la cesta de la compra de los españoles) (*yogur y pan de molde*), pero también productos de higiene y cuidado personal (*papel higiénico*) y productos de limpieza/droguería (*detergente de máquina en polvo*). La consideración de una categoría por tipo de producto nos va a permitir, no solo conocer si la intención de cambio de establecimiento del individuo varía o no en función del tipo de categoría de producto, sino además, hacer extensibles los resultados a otras categorías de producto que comparten los mismos niveles de frecuencia y penetración que los utilizados en este trabajo.

Los 1.400 individuos han sido aleatoriamente asignados a cada uno de los diez surtidos; por tanto, 140 individuos han sido asignados a cada tratamiento experimental (35<sup>5</sup> por categoría). Dentro de cada categoría, las marcas utilizadas (tanto la MdD como las marcas nacionales) han sido seleccionadas y clasificadas en función de su cuota de mercado en España y de la valoración proporcionada por la consultora para cada marca. Las MdD utilizadas han sido comunes para las cuatro categorías utilizadas. En particular, y después de un análisis entre la consultora y los autores de este trabajo, se han utilizado *Mercadona* y *Auchan* como MdD de alto y bajo valor, respectivamente. Las MNs son, obviamente, diferentes en función de la categoría de producto. Así, las marcas de fabricante seleccionadas para cada categoría<sup>6</sup> han sido las siguientes (véase anexo 1):

1. Yogur: *Danone, Activia, Actimel, Kaiku, C.L.Asturiana y La Lechera* (alto valor de marca); *La Fageda, Nestlé, Sveltesse, Pascual, Hoya de la Iglesia y Feiraco* (bajo valor de marca)
2. Pan de molde: *Bimbo, Panrico, Silueta, Ortiz, Semilla de Oro y La Bella Easo* (alto valor); *Beiker, Dulcesol, Pasticely, Gotri, Ketlerer y Hornada Casera* (bajo valor)
3. Papel higiénico<sup>7</sup>: *Scottex, Colhogar, Foxy, Renova* (alto valor); *Dodot, Charmin, Moltex Soft y Hello Kitty* (bajo valor).
4. Detergente de máquina en polvo: *Ariel, Wips, Skip, Elena, Colón y Dixán* (alto valor); *Flota, Puntomatic, Luzil, Lord, Lagarto y Limpión* (bajo valor).

Mientras observan cada surtido (los surtidos están siempre presentes en la parte de arriba de la pantalla), los participantes van respondiendo a un cuestionario en el que se incluyen diferentes aspectos incluidos en el marco empírico de este trabajo y que, a continuación, pasamos a describir.

### **3.1. Variable dependiente: intención de cambio de establecimiento (ICE)**

Para el minorista, la ICE es uno de los principales aspectos, dado que si los consumidores visitan otro establecimiento para adquirir alguna de las marcas no incluidas en el surtido que ofrece, esto supone consecuencias negativas en términos de tráfico dentro de la tienda, y, por tanto, en términos de ventas y beneficios (Borle et al., 2005; Sloot y Verhoef, 2008). Dado que se trata de una variable relativamente sencilla, hemos utilizado un único ítem en el que los individuos indican (escala Likert de 5 puntos), la probabilidad de que cambien de establecimiento para las compras futuras de la categoría de producto (Rossiter, 2002). La tabla 2 muestra el valor medio de la ICE para cada uno de los diez surtidos utilizados. Cuanto mayor es el número de marcas (1, 4 ó 10 marcas) en un determinado surtido, menor es la intención del individuo de cambiar de establecimiento para la compra de la categoría de producto en cuestión ( $F=4,867$ ,  $p<0,000$ ).

<sup>5</sup> Cantidad considerada por la consultora como suficiente para que los resultados puedan ser generalizados para el conjunto de la población española

<sup>6</sup> En cada caso (excepto en el caso del papel higiénico en que se han seleccionado solo ocho marcas) se han seleccionado doce MNs (seis de alto valor y seis de bajo valor), con objeto de poder completar cada uno de los surtidos diseñados en función del porcentaje de marcas de alto y bajo valor que contienen (e.g., el surtido de diez marcas que contiene un tercio (tres) de marcas de alto valor tiene seis marcas de bajo valor (dos tercios de las nueve marcas de fabricante que el surtido contiene)

<sup>7</sup> En el caso del papel higiénico se ha sustituido el surtido de 10 marcas por uno de 7 marcas, como consecuencia de la estructura de mercado de esta categoría en España. Según datos de IRI, el 83% de cuota de mercado lo posee la MdD, siendo la primera marca de fabricante *Scottex* con un 11%, seguida de *Colhogar* (2,5%), *Foxy* (1,5%) y *Renova* (1,3%). A partir de ahí existen solo otras cuatro marcas más que tienen algo de cuota de mercado (siempre menor del 0,4%). Dada esta estructura, no es realista diseñar un surtido con diez referencias (nueve marcas de fabricante), dado que no existe un número suficiente de MNs en el mercado como para ello. Por esta razón, hemos optado por un surtido "largo" de siete referencias

TABLA 2  
Media (desv. estándar) de la ICE por tipo de surtido (datos agrupados)

Tipo de surtido		ICE categoría (escala 1-5 <sup>a</sup> )	
<b>'Sólo MdD' (1 marca)</b>	MdD alto valor	2,38 (1,153)	2,50 (1,170)
	MdD bajo valor	2,62 (1,178)	
<b>4 marcas</b>	MdD alto valor & 1/3 MNs alto valor	2,29 (1,141)	2,41 (1,120)
	MdD alto valor & 2/3 MNs alto valor	2,27 (1,105)	
	MdD bajo valor & 1/3 MNs alto valor	2,62 (1,122)	
	MdD bajo valor & 2/3 MNs alto valor	2,45 (1,088)	
<b>10 marcas</b>	MdD alto valor & 1/3 MNs alto valor	2,13 (1,180)	2,26 (1,125)
	MdD alto valor & 2/3 MNs alto valor	2,11 (1,093)	
	MdD bajo valor & 1/3 MNs alto valor	2,49 (1,141)	
	MdD bajo valor & 2/3 MNs alto valor	2,30 (1,051)	
<i>F-value (significatividad)</i>		3,584 (0,000)	4,867 (0,008)

<sup>a</sup>1=Definitivamente seguiré comprando en este establecimiento; 5=Definitivamente haré mi compra en otro establecimiento

### 3.2. Variables moderadoras: actitud del consumidor hacia el clima económico

Si bien existen varios trabajos que analizan el comportamiento del consumidor en situaciones de crisis (véase el punto 2.1.), ninguno de ellos ha desarrollado una escala que mida la actitud del consumidor hacia el clima económico o si las estrategias de reducción del surtido de los minoristas están relacionadas con el clima económico.

El desarrollo de estas escalas es una de las contribuciones originales de este trabajo. Después de un proceso de generación y validación de dieciséis ítems<sup>8</sup> obtuvimos dos escalas para medir la actitud del consumidor hacia el clima económico: (1) opinión del consumidor sobre la situación económica actual, y (2) cambio durante la situación económica del comportamiento de compra de la MdD por parte del consumidor. Las dos escalas fueron medidas a partir de escalas Likert de 7 puntos. Los ítems utilizados en cada caso fueron los siguientes:

#### Opinión del consumidor acerca de la situación económica actual (OCSE)

Por favor, señale su opinión (1=totalmente de acuerdo; 7=totalmente en desacuerdo) acerca de cada una de las siguientes afirmaciones en relación a la situación económica actual:

*OCSE 1: La situación económica actual es muy buena*

*OCSE 2: La situación económica actual es cada vez mejor*

*OCSE 3: La situación económica actual es muy positiva*

#### Cambio durante la situación económica actual del comportamiento de compra de la MdD (CCMD)

Por favor, señale su opinión (1=totalmente de acuerdo; 7=totalmente en desacuerdo) acerca de cada una de las siguientes afirmaciones en relación a la situación económica actual:

*CCMD 1: Ahora mismo las MdD son cada vez más importantes en mi cesta de la compra, principalmente como consecuencia de la situación económica*

*CCMD 2: Si la situación económica fuera favorable, los productos de MdD serían menos importantes en mi cesta de la compra de lo que lo son en la actualidad*

*CCMD 3: Ahora mismo compro más MdD debido a la situación económica actual*

### 3.3. Variables de control: variables sociodemográficas y categoría de producto

Se han incluido variables de control relacionadas con la categoría de producto (se ha utilizado el detergente de máquina en polvo como la categoría de referencia) y con los aspectos sociodemográficos del consumidor (edad y tamaño del hogar).

<sup>8</sup> La información detallada sobre el proceso de desarrollo y validación de ambas escalas está a disposición del lector previa petición al autor de contacto de este trabajo

### 3.4. Diseño experimental

Como se ha indicado anteriormente, se han manipulado tres tamaños de surtido diferentes (1, 4 y 10 marcas). Por tanto, podemos diferenciar dos grupos de surtidos: (a) surtidos ‘solo MdD’, y (b) surtidos ‘mixtos’. Mientras que en los primeros existe únicamente un atributo (valor de la MdD) de dos niveles (alto vs. bajo), en los surtidos mixtos existen tres atributos de dos niveles cada uno (valor de la MdD [alto vs. bajo], número de marcas [4 vs. 10] y proporción de marcas nacionales de alto valor (un tercio vs. dos tercios). Los atributos y sus niveles se muestran en la tabla 3.

TABLA 3  
Atributos y niveles experimentales

Atributo	Niveles
Nº de marcas <sup>a</sup> (C)	+1 Diez marcas -1 Cuatro marcas
Valor de la MdD (D)	+1 Alto valor -1 Bajo valor
Proporción de marcas nacionales de alto valor <sup>a</sup> (N)	+1 Dos tercios del nº total de marcas nacionales -1 Un tercio del nº total de marcas nacionales

<sup>a</sup> Solo para aquellos surtidos compuestos por la MdD y marcas nacionales

Para los surtidos compuestos sólo por la MdD existe un único atributo de dos niveles; por tanto, solo se definen dos escenarios ( $2^1=2$ ). Para los surtidos “mixtos” existen tres atributos con dos niveles cada uno, por lo que el número de posibles escenarios es igual a  $2^3=8$ . En este caso, hemos incluido, además, las interacciones dobles y triples (tabla 4).

TABLA 4  
Matriz de diseño experimental

Escenario	Nº de marcas(C)	Valor de la MdD (D)	Proporción de MNs de alto valor (N)	CD	CN	DN	CDN
(1)		-1					
(2)		+1					
(3)	+1	-1	-1	-1	+1	-1	+1
(4)	+1	-1	+1	-1	-1	+1	-1
(5)	-1	-1	-1	+1	+1	+1	-1
(6)	-1	-1	+1	+1	-1	-1	+1
(7)	+1	+1	-1	+1	-1	-1	-1
(8)	+1	+1	+1	+1	+1	+1	+1
(9)	-1	+1	-1	-1	-1	+1	+1
(10)	-1	+1	+1	-1	+1	-1	-1

De forma previa a la estimación de los modelos, se ha contrastado la posible existencia de multicolinealidad a partir de la correlación entre las variables independientes. Igualmente, hemos computado los *factores de inflación de la varianza (FIV)*. Todos los factores calculados se encuentran claramente por debajo del valor 10 señalado como límite para la existencia de problemas de multicolinealidad<sup>9</sup> (véase Hair et al., 1998), con la excepción de la variable edad para las dos regresiones de la categoría papel higiénico, que superaban el valor límite de 10. En estos dos casos, hemos optado por eliminar la variable edad del modelo y volver a estimarlo con el resto de variables consideradas. Igualmente, cabe destacar que se ha confirmado la consistencia interna de las dos escalas *multi-ítem* utilizadas (opinión sobre la situación económica actual,  $\alpha$  Cronbach= 0,919 y cambio en el comportamiento de compra de la MdD,  $\alpha$  Cronbach= 0,779).

## 4. Resultados

### 4.1. Surtidos “sólo MdD” (1 marca)

La tabla 5 muestra los resultados de la estimación del modelo de regresión para el caso de los surtidos compuestos exclusivamente por la MdD, cuya variable dependiente es la ICE para la categoría de producto.

Los resultados obtenidos muestran como el valor de marca de la MdD influye en la probabilidad de que el individuo cambie de establecimiento. Así, el parámetro negativo (-0,061,  $p=0,031$ ) indica que cuando la MdD que compone el surtido es de baja notoriedad o valor, la ICE del individuo es superior

<sup>9</sup> Información más detallada sobre los FIV está a disposición del lector previa petición al autor de contacto de este trabajo

(en un 6,1%) que en el caso de que la notoriedad de la MdD sea elevada. Respecto a los aspectos relacionados con la crisis, la opinión del consumidor sobre la crisis en términos generales no parece influir en su ICE cuando se enfrenta a estos surtidos. Sin embargo, el valor significativo y negativo (-0,052,  $p=0,066$ ) de la variable interactiva entre este aspecto y la notoriedad de la MdD indica que la opinión acerca de la situación económica influye en la compra de la MdD, cuando esta es de elevada notoriedad; es decir, la aceptación de los surtidos compuestos únicamente por la MdD cuando esta es de alta notoriedad es mayor como consecuencia de la opinión negativa que el individuo tiene acerca de la situación económica actual. En cuanto al cambio en el comportamiento de compra de la MdD, el valor negativo y significativo (-0,054,  $p=0,059$ ) sugiere que el consumidor está dispuesto a aceptar estos surtidos (la ICE es menor) como consecuencia de un cambio en los hábitos de compra de la MdD. Este resultado parece bastante lógico; ante un cambio en los hábitos de compra de estas marcas propias, la aceptación de un surtido en el que únicamente exista este tipo de marcas será mayor.

<i>Tamaño hogar</i>	<b>0,262</b>	<b>0,000</b>
F-value (signif.)	<b>205,553 (0,000)</b>	
R <sup>2</sup> (ajustado)	<b>0,785</b>	

<sup>a</sup>Las relaciones significativas ( $p<0,1$ ) están marcadas en negrita

Los resultados obtenidos ponen de manifiesto la existencia de dos aspectos relevantes relacionados con el diseño de los surtidos “mixtos” que influyen sobre la ICE del individuo: el número de marcas y el valor de la marca propia presente en los mismos. Así, en relación al primero de los aspectos, el valor negativo y significativo del parámetro ( $-0,039$ ,  $p=0,005$ ) indica que los surtidos compuestos por 4 marcas generan mayor intención de cambiar de establecimiento que los surtidos compuestos por 10 marcas (un 3,9% más). En la misma línea, el valor del parámetro de la variable relacionada con la notoriedad de la MdD ( $-0,059$ ,  $p=0,000$ ) indica que aquellos surtidos mixtos en los que la marca propia es de elevada notoriedad generan una menor intención de cambiar de establecimiento en el consumidor. La proporción de marcas nacionales de alto valor no parece ejercer un efecto significativo en la intención de cambiar de establecimiento del consumidor. En cuanto a los aspectos relacionados con la actitud del individuo hacia la situación económica, las dos variables analizadas ejercen un efecto moderador directo en la ICE del individuo. Así, el parámetro relacionado con la opinión del consumidor sobre la situación económica muestra un valor positivo ( $0,089$ ,  $p=0,000$ ), lo que indica que una opinión negativa sobre la situación económica incrementa la intención de cambiar de establecimiento en este tipo de surtidos; dicho de otra manera, el hecho de que el individuo piense que la situación económica no es positiva provoca una menor aceptación de los surtidos compuestos por la marca propia y marcas nacionales, incrementando la intención de cambiar de establecimiento por parte del individuo. Parece, por tanto, que la situación económica provoca una menor aceptación de los surtidos compuestos por ambos tipos de marcas. No obstante, parece que el hecho de que el consumidor haya modificado sus hábitos de compra de la MdD lleva a aceptar estos surtidos mixtos. Eso sí, el valor absoluto del parámetro en estos surtidos mixtos es menor que en el caso de los surtidos formados solo por la marca propia ( $0,027$  vs.  $0,054$ , respectivamente), lo que sugiere que el hecho de que el consumidor se haya “habituado” a la compra de la MdD le lleva a aceptar en mayor proporción (el doble, exactamente) los surtidos formados únicamente por la marca propia que aquellos en los que existen, igualmente, marcas nacionales.

## 5. Conclusiones

La crisis ha modificado muchos hábitos de compra de los hogares españoles (Giménez y Vila, 2012). Los compradores pasan menos tiempo en la tienda y compran más frecuentemente menos productos. En este sentido, la cesta “típica” de la compra tiene un tamaño medio de 22 referencias. En esta cesta, la marca de distribuidor juega un papel cada vez más importante; para el resto de marcas, el precio, las promociones y los descuentos han ganado peso como factores de decisión. En el contexto actual, por tanto, la racionalización del surtido de los fabricantes y las cadenas de distribución es un paso lógico para reducir los costes de inventario, maximizar el (menor) espacio en el lineal y, por tanto, ofrecer precios más reducidos que satisfagan las necesidades de un comprador más preocupado por el precio. No obstante, cabe preguntarse si la actitud del individuo hacia la situación económica es un aspecto que va a condicionar el éxito de estas estrategias de racionalización.

Los resultados obtenidos ponen de manifiesto que la actitud del individuo hacia la situación económica actual sí que condiciona la aceptación de las estrategias que están desarrollando los minoristas y que, en muchos casos, supone, incluso, eliminar la totalidad de marcas nacionales y ofrecer, únicamente, su marca propia. En este sentido, parece que el cambio en los hábitos de compra de la marca propia son el elemento que más está “ayudando” a los minoristas a conseguir el éxito en sus estrategias de racionalización. Este hábito está provocando en el consumidor una mayor aceptación de los surtidos “monomarca”, compuestos únicamente por la marca propia que de los surtidos “mixtos” integrados, además, por marcas nacionales. Adicionalmente, la opinión negativa del individuo hacia la situación económica actual parece generar un mayor sentimiento de rechazo de los surtidos mixtos, independientemente de aspectos como el número de marcas, la notoriedad de la marca propia o la proporción de marcas nacionales de alto valor que componen dicho surtido. No obstante, el hecho de que esta variable no ejerza influencia significativa alguna en el caso de los surtidos “monomarca” nos lleva a pensar que la influencia no es tan intensa como se podría pensar, y que es más el cambio de hábito en el comportamiento de compra lo que lleva al consumidor a una mayor aceptación de los surtidos sin marcas nacionales, más allá de que el individuo piense realmente que la situación económica no es del todo positiva; dicho de otro modo, parece que el hecho de que el consumidor muestre un comportamiento de lealtad (hábito) frente a la compra de la marca propia

genera una actitud positiva hacia los surtidos que incluyen la marca propia y, si puede ser incluso, que no incluyan marcas nacionales. No es una cuestión de pesimismo acerca de la situación económica del país, es más una cuestión del valor que la marca propia parece tener para el individuo. Esto se confirma, incluso, con el hecho de que la notoriedad de la marca de distribuidor en el caso de los surtidos “monomarca” es un factor relevante a la hora de cambiar de establecimiento. Es decir, el comportamiento repetitivo de compra de la marca propia – y más aún si esta es de elevado valor – es el que lleva al consumidor a una mayor aceptación de la estrategia de racionalización del surtido y de eliminación de las marcas nacionales de los minoristas.

Por tanto, nuestra recomendación a los minoristas es clara: seguir trabajando la marca propia con objeto de conseguir afianzar la lealtad del consumidor, dado que ello va a permitir, no solo la aceptación por parte del consumidor de la reducción (e, incluso, eliminación) de marcas nacionales de sus surtidos, sino también, el mantener sus niveles de venta una vez que la situación económica – o, al menos, la opinión que el consumidor tenga de la misma – mejore.

## 6. Limitaciones y futuras líneas de investigación

Como cualquier investigación, este trabajo no está exento de limitaciones. La primera de ellas es la derivada de la propia metodología utilizada. Si bien la experimentación es una técnica habitualmente utilizada en trabajos relacionados con el comportamiento del consumidor, no deja de ser una simplificación de la realidad a partir del control de determinados aspectos. En este sentido, y además de la composición del surtido, pueden existir ciertos aspectos relacionados con la localización o el ambiente físico de la propia tienda que pueden influir en intención del consumidor de cambiar de establecimiento y que en situaciones ‘reales’ pueden tener una influencia importante en la aceptación de los surtidos. Por tanto, creemos que en futuros trabajos sería interesante considerar otros aspectos relacionados con el minorista y que pueden determinar el comportamiento final del individuo. Otra de las limitaciones se deriva de la utilización de una única variable independiente (intención de cambio de establecimiento) como medida de “aceptación” de los surtidos. El análisis de otras variables (e.g., la intención de compra de la MdD o la imagen del establecimiento) que recojan la reacción del consumidor ante diferentes tipos de surtido puede ser también de mucho interés.

# **EFFECTIVIDAD DE LAS TÉCNICAS DE MERCHANDISING PARA CATEGORÍAS HEDÓNICAS & UTILITARIAS**

---

Álvaro Garrido-Morgado, Óscar González-Benito y Mercedes Martos-Partal  
Universidad de Salamanca

## **RESUMEN**

*Este trabajo analiza comparativamente la efectividad de diferentes técnicas de merchandising sobre las ventas de 22 categorías de producto de alimentación. En concreto se estudian las tres técnicas más habituales en el punto de venta: islas, cabeceras de lineal y carteles. Para analizar sus efectos sobre las categorías, éstas se clasifican en categorías de naturaleza hedónicas y categorías de naturaleza utilitarias. Se utilizan datos diarios recogidos en un establecimiento de una de las diez cadenas líderes en alimentación en Europa. Se combinan datos de escáner y datos de observación. Los resultados muestran que las tres técnicas analizadas pueden aumentar las ventas de cualquiera de las 22 categorías de producto, pero que su efectividad viene moderada por la motivación de compra hedónica o utilitaria. Para las categorías hedónicas son más efectivas las islas, mientras que para las categorías utilitarias lo son los carteles.*

## **PALABRAS CLAVE**

Retail, Merchandising, Hedónico y Utilitario

## 1. INTRODUCCIÓN

La importancia y la inversión de las técnicas de merchandising continúa creciendo año tras año (Bell et al. 2011; Infoadex 2014). Estas herramientas, que tienen por objeto aumentar la percepción y las ventas de los productos dentro del establecimiento, son cada vez más analizadas y estudiadas por los fabricantes y distribuidores (Chandon et al. 2009; Inman et al. 2009; Stilley et al. 2010). Este incremento de la inversión en las técnicas de merchandising llega a situarse en un 20% anual en estudios internacionales como el de Inman et al. (2009). No obstante en España, el aumento ha sido cifrado en un 1,2% en el último año (Infoadex 2014), lo que pone de manifiesto su importancia también en nuestro país al compararlo con la inversión general en comunicación, que por cuarto año consecutivo desciende, en este caso un 3,5% según la misma fuente.

Una de las principales causas de que se preste más atención al merchandising es el aumento de la compra no planificada o la toma de decisiones de compra en el interior del establecimiento, que ya representa alrededor del 70% de la totalidad de las compras realizadas (Stilley et al. 2010; Bell et al. 2011). De hecho, Bezawada et al. (2009) mantiene que la compra no planificada por sí misma representa un 46% y que son las técnicas utilizadas en el interior del establecimiento las que incrementan este porcentaje hasta el 70%. A este fenómeno se le une la proliferación de nuevas marcas, las restricciones en el consumo y el consecuente aumento de la competencia, lo que hace crucial para los fabricantes el ser percibidos por el consumidor en el momento de su decisión de compra (Valenzuela et al. 2013).

Diferentes estudios analizan cómo puede el fabricante ser mejor percibido y evaluado utilizando estas técnicas (Drèze et al. 1994; Chandon et al. 2009; Bezawada et al. 2009; Valenzuela et al. 2013), las cuales suponen un alto ratio beneficio coste, tanto para ellos como para los distribuidores (Buttle 1984). No obstante, la mayoría de estos trabajos se centran en el efecto de la posición que ocupa una marca en el lineal de una categoría respecto al resto (Chandon et al. 2009; Valenzuela et al. 2013), no ocupándose de analizar diferentes estímulos relacionados con la colocación del producto en un lugar diferente al habitual. De entre los trabajos más recientes sobre las técnicas de merchandising, destacan los trabajos de Inman et al. (2009) y Bezawada et al. (2009). Estos trabajos tratan de aportar conocimiento sobre estas técnicas analizando por un lado, que modificando el lugar donde se sitúa una categoría de productos se pueden obtener mayores rendimientos (Bezawada et al. 2009) y, por otro lado, que las técnicas de merchandising pueden variar su efectividad en función de ciertas características de la categoría de producto (Inman et al. 2009).

El objetivo de nuestro trabajo es aportar teórica y empíricamente a este campo incluyendo el análisis de diferentes técnicas de merchandising según su posición en el establecimiento, para el posterior análisis empírico comparado de la eficacia de cada una de ellas. Este análisis se realizará a un número considerado de categorías de productos con el fin de establecer cómo pueden matizar las características de las categorías la efectividad de cada una de las técnicas. Para finalmente, obtener conclusiones sobre la gestión de las diferentes técnicas de merchandising que nos permitan aconsejar a distribuidores y fabricantes sobre la utilización de las mencionadas técnicas.

## 2. LITERATURA PREVIA

### 2.1. *Merchandising*

Merchandising es definido por la American Marketing Association como cualquier técnica que toma lugar en el interior del establecimiento y que es llevada a cabo por los distribuidores o fabricantes para estimular la venta de un producto. Algunas de estas técnicas son definidas por trabajos académicos como Buttle (1984) o Varley (2006).

Estas técnicas pueden aumentar las ventas de un producto entre un 77 y un 400% en el corto plazo (Woodside y Waddle 1975; Wilkinson et al. 1982), mientras que las promociones lo hacen en alrededor de un 33% (Van Heerde et al. 2003; Ataman et al. 2010). Por tanto, pueden llegar a ser bastante más efectivas que las promociones. Por otro lado, pueden ser no sólo más efectivas, sino también más rentables ya que no tienen por qué suponer una disminución del margen obtenido por el distribuidor como las promociones en precio (Ailawadi et al. 2006; Ailawadi et al. 2007), sino todo lo

contrario, si se tiene en cuenta las aportaciones que hace el fabricante para conseguir que su marca sea estimulada a través de estas técnicas (Ailawadi et al. 2009; Valenzuela et al. 2013). Por ello, el merchandising se considera una herramienta con un elevado ratio beneficio-coste (Buttle 1984) que mejora los márgenes de los distribuidores y que debe ser analizado en mayor profundidad en futuras investigaciones (Ailawadi et al. 2009).

La eficacia de estas técnicas tiene su origen en que hacen más perceptible el producto por el consumidor (Yeung y Wyer 2004; Chandon et al. 2009), de tal manera que influyen en las primeras fases del proceso de elección como son la atención y la percepción (Evan et al. 2006). Esto cobra una especial importancia si tenemos en cuenta que los consumidores suelen tener un patrón de recorrido bastante fijo si conocen el establecimiento (Larson et al. 2005) y si se consigue llamar su atención puede lograrse que el producto pueda entrar a formar parte del conjunto considerado de opciones en la fase de evaluación o elección (Yeung y Wyer 2004; Chandon et al. 2009). El hecho de poder ser percibido y evaluado en el establecimiento cobra aún más importancia al conocer que la compra no planificada y decidida en el interior del establecimiento supone alrededor de un 70% del total de las compras (Bezawada et al. 2009; Bell et al. 2011).

La mayoría de los trabajos empíricos analizan la efectividad del merchandising utilizando una única variable dicotómica *display* que toma valor positivo si el producto está estimulado con alguna de las diferentes técnicas de merchandising (véase Woodside y Waddle 1975; Wilkinson et al. 1982; Little 1998; Van Heerde et al. 2000; Lemon y Nowlis 2002; Van Heerde et al. 2004; Ailawadi et al. 2006; Inman et al. 2009). Otros trabajos analizan una técnica de merchandising en concreto, como puede ser la ampliación de espacio en el lineal (Chandon et al. 2009; Valenzuela et al. 2013), el uso de cabeceras de lineal (Bemmaor y Mouchoux 1991) o el uso de apilamientos o islas en pasillos centrales (Smith y Burns 1996). No obstante ninguno de ellos compara la efectividad de varias de estas técnicas a pesar de que existen diferencias que provoca que éstas puedan influir de forma distinta al consumidor (Buttle 1984; Samson y Little 1988; Varley 2006).

Todas las técnicas de merchandising tienen el mismo objetivo: llamar la atención del consumidor acerca de un producto estimulado para, tras un proceso de elección, aumentar sus ventas (Varley 2006; Bezawada et al. 2009; Chandon et al. 2009). No obstante, las distintas técnicas pueden tener matices diferentes debido a sus características inherentes. Por ejemplo, la isla es definida como un apilamiento de un producto en el medio de un pasillo principal (Smith y Burns 1996; Varley 2006), por el que el tráfico de compradores es mayor (Larson et al. 2005). Esta presentación especial afecta principalmente a consumidores menos analíticos y más impulsivos que no sienten la necesidad de buscar información acerca de las otras opciones de la categoría (Bezawada et al. 2009). Otra de las técnicas de merchandising es la cabecera de lineal, la cual es una ubicación especial al inicio del pasillo donde se encuentran los productos de una determinada categoría de producto (Bemmaor y Mouchoux 1991; Samson y Little, 1988; Varley 2006). Esta presentación especial puede atraer a un consumidor que no tenía planificada la compra de un producto no habitual en su cesta de la compra, hacia el pasillo en el que se éste sitúa (Bezawada et al. 2009; Inman et al. 2009). Otra opción es que un producto esté situado en su ubicación habitual y esté estimulado con un cartel especial. Este producto será únicamente percibido por el consumidor que visite el área o pasillo del establecimiento donde se suele encontrar esa categoría de producto determinada, la cual él tenía pensado comprar. En la Tabla 1 se resumen las diferentes técnicas analizadas.

Tabla 1. Tipos de técnicas de merchandising analizadas

TIPO DE TÉCNICA	DESCRIPCIÓN
ISLA	Presentación especial que consiste en colocar el producto estimulado en el medio de un pasillo principal por donde el tráfico de compradores es mayor.
CABECERA	Presentación especial que consiste en colocar el producto estimulado en la entrada del pasillo donde se encuentra el resto de productos de la categoría de producto.
CARTEL	Presentación especial que consiste en una llamada de atención de un producto a través de un rótulo distinto al habitual. Tiene lugar en el lineal donde se encuentra el producto, por tanto no supone un cambio de ubicación.

Fuente: Elaboración propia

## 2.2. Promociones

Las promociones son los estímulos comerciales más utilizados por los distribuidores y fabricantes. La finalidad de las mismas es atraer a los consumidores a los establecimientos y aumentar las ventas de un producto estimulado e incluso de otros (Mulhern y Padgett 1995; Volle et al. 2001; Ailawadi et al. 2006). Diversos estudios previos tasan el crecimiento a corto plazo de las ventas de los productos estimulados por las promociones en alrededor de un 33% (Van Heerde et al. 2003; Ataman et al. 2010). Ante esta importancia han surgido un gran número de trabajos académicos que tratan de analizar claves para el uso óptimo de este recurso (Hardesty y Bearden 2003; Ailawadi et al. 2007; Ailawadi et al. 2009; Leeflang y Parreño-Selva 2012).

Podemos encontrar trabajos previos que clasifican las promociones de diferentes formas con el fin de analizar qué tipo es más aconsejable en función de otras variables como la categoría de producto, el tipo de establecimiento o el perfil del comprador (Inman et al. 1990; Narashiman et al. 1996; Ailawadi et al. 2006; Palazón y Delgado-Ballester 2009). Una de las clasificaciones más habitual e intuitiva habitual es la que distingue entre promociones monetarias como descuentos y reembolsos posteriores, y promociones no monetarias entre las que se encontrarían regalos o sorteos (Chandon et al. 2000). También se suelen clasificar diferenciando si la promoción conlleva un descuento en precio inmediato o, por el contrario, otra ventaja como puede ser una cantidad extra de producto, un 3x2, un regalo de otro producto, una devolución posterior de dinero, etc. (Hardesty y Bearden 2003). Nosotros trabajaremos con esta última clasificación al parecernos más intuitiva y, por tanto, distinguiremos entre promoción en precio (que supone descuento inmediato en el precio del producto) y promoción en producto (aquella que no representa un beneficio monetario inmediato, como una cantidad extra de producto, un 3x2, un regalo de otro producto, una devolución posterior de dinero o una acumulación de una cantidad de dinero en una cuenta utilizable en futuras compras). Puede observarse en la Tabla 2 un esquema sobre las promociones tenidas en cuenta.

Tabla 2. Tipos de promoción

TIPO DE PROMOCIÓN	DESCRIPCIÓN
PROMOCIÓN EN PRECIO	Se trata de un descuento inmediato del precio habitual del producto. De ella se obtiene un beneficio monetario inmediato, al ahorrar parte del presupuesto planificado de la compra.
PROMOCIÓN EN PRODUCTO	Se trata de opciones que permiten un aumento del beneficio sin modificar el precio del producto. Algunos ejemplos son: una cantidad extra de producto, una promoción del tipo "pague 2 y llévase 3", un regalo de otro producto, una devolución posterior de dinero o una acumulación de una cantidad de dinero para descontar en futuras compras.

Fuente: Elaboración propia

## 2.3. Categorías de producto

Las características propias de una categoría de producto pueden influir de forma determinante en la efectividad de un estímulo comercial (Narashiman et al. 1996; Ailawadi et al. 2006; Inman et al. 2009). En este aspecto son diversos los estudios que han concluido que las características del propio producto estimulado influyen en la efectividad de las promociones. Estas características pueden ser por ejemplo, su marca (Bemmaor y Mouchoux 1991; Lemon y Nowlis 2002; Van Heerde et al. 2004; Macé y Neslin 2004; Ailawadi et al. 2006) o su nivel de precios (Narashiman et al. 1996; Wakefield y Inman 2003; Macé y Neslin 2004).

Además, existen estudios que concluyen que otras características inherentes a la categoría de producto también matizan la efectividad de las promociones. Algunas de estas características son su frecuencia de compra (Macé y Neslin 2004, Inman et al. 2009), su facilidad de almacenaje (Raju 1992; Blattberg et al. 1995; Mela et al. 1998; Van Heerde et al. 2000; Pauwels et al. 2002; Ailawadi et al. 2007), su caducidad (Gupta 1988; Krishna 1994) o su nivel de competencia medido en número de marcas (Fader y Lodish 1990; Narashiman et al. 1996; Wakefield y Inman 2003) o cuota de mercado de las marcas de distribuidor (Fader y Lodish, 1990; Wakefield y Inman 2003; Bezawada et al., 2009).

Existen otras características basadas en la motivación o proceso de compra que también influyen en la efectividad de las promociones. Algunas de ellas son: la motivación hedónica o utilitaria

(Shiv y Fedorikhin 1999; Chandon et al., 2000; Wakefield y Inman 2003; Yeung y Wyer 2004; Sloot et al. 2005; Inman et al. 2009; Suh 2009; Palazón y Delgado-Ballester 2013), la compra planificada o impulsiva (Narashiman et al. 1996; Metcalfe y Mischel 1999; Jones et al. 2003; Inman et al. 2009; Bezawada et al. 2009) o la implicación del consumidor en la compra (Kapferer y Laurent 1985; Volle 2001; Park y Moon 2003).

### 3. HIPÓTESIS

Diversos estudios ponen de manifiesto que las características de una categoría de producto matizan los resultados o la efectividad de los estímulos comerciales utilizados para incrementar sus ventas (Narashiman et al. 1996; Ailawadi et al. 2006; Inman et al. 2009). Por esta razón, a la hora de analizar la efectividad de las técnicas de merchandising es importante tener en cuenta que las características de la categoría de producto pueden moderar la misma.

El merchandising tiene como objetivo aumentar la percepción de un producto estimulado, con el fin de que sea considerado para la compra y, tras un breve proceso de evaluación, sea adquirido por el comprador como resultado de una respuesta afectiva o cognitiva (Yeung y Wyer 2004; Inman et al. 2009). En este sentido, las características de las categorías de producto más relacionadas con el merchandising son la impulsividad y la motivación de compra hedónica o utilitaria. La impulsividad por su parte puede favorecer el rápido proceso de elección sin necesidad de contrastar información (Shiv y Fedorikhin 1999) y la motivación hedónica, la creación en la mente del comprador de la respuesta afectiva positiva (Kempf 1999; Suh 2009). Estas dos clasificaciones están muy ligadas entre sí hasta el punto que autores como Suh (2009) definen los productos hedónicos como los que se adquieren bajo la influencia de un proceso afectivo relacionado con sensaciones o factores emocionales, mientras que los productos utilitarios son aquellos que se adquieren buscando beneficios funcionales a través de un proceso analítico y sistemático que conlleva una mayor inversión de tiempo buscando información. Así, siguiendo a trabajos previos como el de Inman et al. (2009) nos centraremos en analizar cómo la característica hedónica o utilitaria de la categoría puede matizar la efectividad de las diferentes técnicas de merchandising analizadas (el cartel, la cabecera de lineal y la isla).

La efectividad de cada una de estas técnicas dependerá de su capacidad para influir en la fase de percepción del proceso de compra, lo cual facilitará su posterior evaluación y, finalmente, su elección si los beneficios aportados por el producto son acordes con los buscados por el consumidor. En este sentido, tanto las características de las distintas técnicas de merchandising como las de la categoría de producto son claves.

La isla, además de aumentar la percepción del producto estimulado, dificulta la búsqueda de información sobre alternativas al encontrarse más alejada de las mismas. Al limitar la información de alrededor del producto, esta técnica influirá a compradores más impulsivos que valoran el producto estimulado únicamente atendiendo a sensaciones afectivas (Shiv y Fedorikhin 1999), con lo que es más probable que elijan opciones que se adquieran por motivaciones de ocio, diversión o placer (Shiv y Fedorikhin 1999; Okada 2005). Así, la isla funcionará mejor para los productos hedónicos, los cuales son adquiridos buscando beneficios como el disfrute o el placer (Kempf 1999; Inman et al. 2009; Suh 2009).

La cabecera de lineal puede recordar la necesidad de compra de un producto no planificado y atraer al comprador hacia una zona del establecimiento. En este lugar, el comprador tiene fácil acceso a la información del resto de alternativas de compra de la misma categoría, pues se encuentra en el inicio del pasillo donde se localizan dichas alternativas (Samson y Little 1988; Varley 2006). Al facilitar el acceso a la información, los consumidores pueden optar por valorar el producto atendiendo no sólo a sensaciones afectivas, sino a aspectos cognitivos (Shiv y Fedorikhin 1999). Es decir, aumentan las posibilidades de valorar productos utilitarios en función de aspectos cognitivos, cuando el comprador busca un beneficio funcional (Suh 2009). Esto supondrá una mayor influencia sobre las categorías utilitarias que la ejercida por la isla. Respecto a las categorías hedónicas, al aumentar la disponibilidad de información, habrá consumidores que sientan la necesidad de justificar la adquisición de un producto cuya motivación de compra es la diversión o el placer (Okada 2005) y

opten por valorar otras opciones próximas. Así, la cabecera de lineal tendrá un menor impacto sobre los productos hedónicos y un impacto mayor sobre los utilitarios que la isla.

El cartel sólo aumenta la percepción del producto para el comprador que visite el área o pasillo del establecimiento donde se encuentra la categoría que él tenía pensado comprar (Samson y Little, 1988; Varley, 2006). Así, el cartel afecta a consumidores que ya tenían planificada la compra de la categoría de producto, por tanto, consumidores más analíticos y planificadores que suelen acudir con la lista de la compra (Inman et al. 2009). En esta situación, los compradores tienen plena disponibilidad de información, lo que les hará decantarse por opciones más utilitarias que le reporten beneficios funcionales (Shiv y Fedorikhin 1999; Suh 2009). Ante estos consumidores más analíticos, el cartel tiene más difícil crear esa sensación afectiva positiva que derive en el impulso de compra, por lo que esta técnica afectará en mayor medida a las categorías de producto utilitarias, es decir, categorías de compra más planificadas, más frecuentes, que suelen estar apuntadas en la lista del comprador y de la que se esperan beneficios más funcionales (Inman et al. 2009; Suh 2009).

Así, se proponen las siguientes hipótesis:

*H1: Para los productos HEDÓNICOS, la isla tendrá mayor efectividad que la cabecera y, ésta a su vez, mayor que el cartel.*

*H2: Para los productos UTILITARIOS, el cartel tendrá mayor efectividad que la cabecera y, ésta a su vez, mayor que la isla.*

La efectividad de las promociones también se ve matizada por las características de la categoría de producto. Tanto las características físicas como las relacionadas con el proceso de compra pueden hacer más aconsejable o efectiva un tipo de promoción u otra (Narashiman et al. 1996; Wakefield y Inman 2003; Ailawadi et al. 2006; Inman et al. 2009).

Recientemente, estudios como los de Chandon et al (2000) o Inman et al. (2009) han analizado la influencia de la motivación de compra, hedónica o utilitaria, de un producto sobre la efectividad de estímulos comerciales.

En concreto Chandon et al. (2000) propone un marco de congruencia en el que el tipo de promoción más adecuada para los productos considerados hedónicos es una promoción que conlleve los mismos beneficios afectivos por el que se adquiere el producto. La promoción relacionada con la motivación de placer que desencadena la compra de productos hedónicos, sería una promoción no monetaria como un regalo o una cantidad extra del mismo producto, pues una mayor cantidad supone un mayor disfrute. Sucede lo contrario para los productos utilitarios, en los que se priorizan los beneficios funcionales y, por tanto, la promoción adecuada sería aquella que tenga un carácter práctico, como puede ser el descuento en precio, ya que supone un ahorro económico con un matiz altamente funcional.

Por tanto, se proponen las siguientes hipótesis:

*H3: Para los productos HEDÓNICOS, la promoción en producto será más efectiva que la promoción en precio.*

*H4: Para los productos UTILITARIOS, la promoción en precio será más efectiva que la promoción en producto.*

## **4. METODOLOGÍA**

### **4.1. Datos**

Para realizar el estudio propuesto, seleccionamos 22 categorías de producto de entre las más estimuladas con técnicas de merchandising de acuerdo con una de las diez mayores cadenas de hipermercados en Europa (Retail-Index 2014). Estas categorías de producto son clasificadas en hedónicas o utilitarias según literatura previa, ya que la mayoría de ellas han sido utilizadas en estudios previos sobre promociones o motivaciones de compra tales como las tabletas de chocolate, el aceite para cocinar, las galletas, las bolsas de patatas fritas, la cerveza o la pizza (Batra y Ahtola 1990; Bezawada et al. 2009). Las categorías que no aparecen en la literatura específicamente han sido

clasificadas por los directores del establecimiento minorista donde se realiza el estudio. El resultado de esta clasificación puede observarse en la Tabla 3.

Tabla 3. Categorías del estudio

CATEGORÍAS HEDÓNICAS	NÚMERO DE PRODUCTOS	CATEGORÍAS UTILITARIAS	NÚMERO DE PRODUCTOS
ACEITE DE OLIVA VIRGEN EXTRA	89	ACEITE DE GIRASOL	22
ACEITE DE OLIVA	45	AGUA CON GAS	12
CEREALES INFANTIL DE CHOCOLATE	32	AGUA SIN GAS	84
CERVEZA CON ALCOHOL CORRIENTE	65	ARROZ	14
CERVEZA CON ALCOHOL EXTRA	142	CEREALES FAMILIAR DE MAÍZ	10
ESPARRAGOS ENVASADOS	91	CERVEZA SIN ALCOHOL	36
GALLETA MARIA	13	PAN DE MOLDE INTEGRAL	39
PAN DE MOLDE BLANCO	20	PASTA MACARRONES	19
PATATAS FRITAS	31	SAL	35
PIMIENTOS PIQUILLO	45		
PIZZAS REFRIGERADAS	62		
SALSA DE TOMATE FRITO	48		
TABLETA DE CHOCOLATE	29		
TOTAL DE PRODUCTOS ANALIZADOS = 983			

Fuente: Elaboración propia

Para conseguir la información necesaria para el estudio, hemos combinado dos fuentes de información: datos de escáner (para obtener el número de unidades vendidas) y datos de observación (para capturar los días que un producto está estimulado con alguna de las técnicas de merchandising analizadas).

#### Datos de escáner

Uno de los mayores minoristas del sector de la alimentación en Europa según el estudio de Retail-Index (2014), nos facilita datos diarios sobre las ventas de 983 productos pertenecientes a las 22 categorías de producto analizadas. Aunque este minorista está presente en 7 países europeos, estos datos son únicamente sobre los resultados de uno de sus establecimientos en España, concretamente en Salamanca durante el año 2012.

La causa de que sólo contemos con los datos de un único establecimiento es que para recoger la información sobre las diferentes técnicas de merchandising utilizadas en el interior del establecimiento, ya que ha sido necesario realizar visitas diariamente durante el periodo de estudio. No obstante, tenemos información diaria sobre los 983 productos de las 22 categorías seleccionadas que este minorista ha tenido en venta en algún momento del periodo de estudio. Esto supone un total de 282.242 observaciones. La tabla 4 presenta algunos estadísticos descriptivos de las observaciones.

Tabla 4. Estadísticos de las observaciones

REFERENCIAS DE PRODUCTO	CATEGORÍAS DE PRODUCTO	TOTAL DE OBSERVACIONES	OBS* CON CARTEL	OBS CON CABECERAS	OBS CON ISLAS	OBS CON PROMO DE PRODUCTO	OBS CON PROMO DE PRECIO
983	22	282.242	21.942	11.662	4.788	5.376	34.292

\*OBS: Observaciones

#### Datos de observación

Para recoger la información sobre la utilización de las diferentes técnicas de merchandising, hemos realizado visitas diarias al establecimiento analizado con el fin de comprobar si alguno de los

productos de las 22 categorías seleccionadas estaba situado en una isla en medio de un pasillo central, en una cabecera al principio del pasillo donde se encuentra el resto de productos de la categoría o si el producto estaba resaltado a través de un cartel. Además, en la visita también se recoge información sobre si el producto estaba promocionado en precio (con un descuento inmediato) o promocionado con otro tipo de promociones en producto tales como una cantidad extra de producto, un regalo de otro producto, un 3x2, una acumulación de un porcentaje del precio pagado en futuros cupones para clientes fidelizados, etc.

#### 4.2. Variables y modelo

Analizando los datos recogidos, creamos diversas variables dicotómicas, tanto para las técnicas de merchandising como para los tipos de promoción, que toman el valor 1 si el producto estaba estimulado de alguna de las formas anteriormente mencionadas o valor cero si no era así, al igual que trabajos como Van Heerde et al. (2000) o Inman et al. (2009). Estas variables dicotómicas son las variables independientes de nuestro modelo.

En cuanto a la variable dependiente, al utilizar un número tan elevado de referencias de producto para aumentar el potencial de generalización de los resultados obtenidos, debemos plantear esta variable en términos relativos y no absolutos. La intención es comparar ventas de muy diversas referencias, por lo que lo aconsejable es utilizar la variación de ventas que presenta la referencia de producto respecto a sus ventas medias cuando no está estimulado de ninguna manera, es decir, ni con técnicas de merchandising ni con promociones. Las principales variables del modelo se describen en la Tabla 4.

Tabla 4. Variables del estudio

VARIABLE	DESCRIPTION
VARIACIÓN DE VENTAS $VV_{it}$	Recoge la variación de ventas que presenta una referencia de producto $i$ durante el día $t$ respecto al nivel medio de ventas de este mismo producto en los días que no estaba estimulado.
CARTEL $CT_{it}$	Recoge si el producto $i$ estaba señalado con un cartel especial durante el día $t$ . La variable toma valor 1 si el producto estaba estimulado y cero en caso contrario.
CABECERA DE LINEAL $CB_{it}$	Recoge si el producto $i$ estaba localizado en una cabecera de lineal durante el día $t$ . La variable toma valor 1 si el producto estaba estimulado y cero en caso contrario.
ISLA $IS_{it}$	Recoge si el producto $i$ estaba localizado en una isla en medio de un pasillo principal durante el día $t$ . La variable toma valor 1 si el producto estaba estimulado y cero en caso contrario.
PROMOCIÓN EN PRODUCTO $PPRODUCTO_{it}$	Recoge si el producto $i$ presentaba una promoción del tipo 3x2, una cantidad extra, un regalo, etc. durante el día $t$ . La variable toma valor 1 si el producto estaba promocionado y cero en caso contrario.
PROMOCIÓN EN PRECIO $PPRECIO_{it}$	Recoge si el producto $i$ durante el día $t$ tenía un precio al menos un 15% más bajo que su precio regular. La variable toma valor 1 si el producto estaba promocionado y cero en caso contrario. Se escoge el 15% de descuento siguiendo trabajos como los de Narashiman et al. (1996) o Wakefield y Inman (2003).

*Nota:  $i$  es el producto sobre la que se recoge la información;  $t$  es el día en el que se recoge la información*

Utilizando estas variables proponemos un modelo de regresión lineal múltiple en el que analizamos los efectos directos de las diferentes técnicas de merchandising y los diferentes tipos de promociones sobre cada una de las categorías analizadas.

$$^{(1)}VV_{it} = \alpha + \beta_1 CT_{it} + \beta_2 CB_{it} + \beta_3 IS_{it} + \beta_4 PPRODUCTO_{it} + \beta_5 PPRECIO_{it} + \varepsilon_i$$

## 5. DISCUSIÓN DE RESULTADOS

La Tabla 5 muestra los resultados de las estimaciones del modelo propuesto para cada una de las categorías de producto consideradas hedónicas por la literatura previa y la Tabla 6, los de las categorías consideradas utilitarias. Estas estimaciones han sido realizadas con el software Stata 13.

EFFECTIVIDAD DE LAS TÉCNICAS DE MERCHANDISING PARA CATEGORÍAS HEDÓNICAS & UTILITARIAS

En los resultados puede observarse que, tanto para las categorías hedónicas como para las utilitarias, las técnicas de merchandising son efectivas. En la mayoría de las categorías, cualquiera de las técnicas de merchandising sirve para aumentar las ventas de forma significativa. Lo mismo ocurre para las promociones. Esto es consistente con estudios previos sobre promociones, los cuales indican efectos positivos a corto plazo matizados por la categoría de producto (Narashiman et al. 1996; Ailawadi et al. 2006; Inman et al. 2009).

Respecto a las técnicas de merchandising, para la totalidad de las categorías hedónicas, la isla influye en mayor medida que la cabecera y, ésta a su vez, en mayor grado que el cartel. No obstante, las tres técnicas son significativamente positivas en todas las categorías, excepto en el caso del cartel para las tabletas de chocolate, en la que no es significativo su efecto. Estos resultados están línea con la hipótesis H1. En cambio, para las categorías utilitarias el efecto del cartel es mayor que el de la cabecera y, éste a su vez, mayor que el efecto de la isla, excepto para la cerveza sin alcohol. En esta categoría el efecto de la isla es mayor que el de la cabecera. Por lo tanto, la hipótesis H2 se cumple para 8 de las 9 categorías utilitarias analizadas. Así, H2 se confirma de forma parcial.

Respecto al tipo de promoción, se puede observar que las promociones en producto tienen un mayor efecto que las promociones en precio para las categorías hedónicas. Estos resultados que nos permite confirmar la hipótesis H3. En cambio, en las categorías utilitarias sucede lo contrario, la promoción en precio es la más efectiva en todos los casos, excepto para la cerveza sin alcohol. Por lo tanto, nuevamente la hipótesis que hace referencia a las categorías utilitarias se cumple para 8 de las 9 categorías clasificadas como tales, siendo la excepción la cerveza sin alcohol. Con estos resultados, en línea con el trabajo previo de Chandon et al. (2000), se puede confirmar parcialmente la hipótesis H4.

Los resultados nos permiten confirmar las hipótesis propuestas para prácticamente la totalidad de las 22 categorías analizadas (véase Tabla 7), pero hacen que nos preguntemos por qué el patrón no se cumple para la cerveza sin alcohol. Cabe la posibilidad de que la razón sea que no es un producto completamente utilitario. Este producto tiene un alto componente hedónico matizado, ya que está asociado a un consumo emocional aunque responsable, por tanto el consumidor busca el placer de una forma más prudente o saludable. Así, podría reunir características relacionadas con el consumo hedónico, como la compra menos planificada, la elección más impulsiva y emocional dejándose llevar por las sensaciones (Kempf 1999; Suh 2009) o que la promoción en producto, más asociada a prolongar el placer que al ahorro monetario, sea más efectiva que la promoción en precio (Chandon et al. 2000).

## 6. CONCLUSIONES

Este trabajo partía con el objetivo de ampliar conocimiento sobre la efectividad del merchandising en función de las categorías de producto. En concreto, se pretendía contrastar la importancia de analizar las técnicas de merchandising de forma desagregada, distinguiendo entre las tres más habituales ya que los trabajos previos no lo hacen (Bemmaor y Mouchoux 1991; Little 1998; Van Heerde et al. 2000; Lemon y Nowlis 2002; Van Heerde et al. 2004; Ailawadi et al. 2006; Inman et al. 2009), y por sus características pueden influir de forma diferente en el aumento de las ventas de un producto (Buttle 1984; Varley 2006).

Los resultados muestran que las técnicas de merchandising aumentan las ventas de todas las categorías de producto analizadas, llegando a influir más que las propias promociones en muchos casos. Esto no sorprende teniendo en cuenta los resultados de trabajos previos que cuantifican el incremento de ventas provocado por el merchandising (Woodside y Waddle 1975; Wilkinson et al. 1982; Bemmaor y Mouchoux 1991) o por las promociones (Van Heerde et al. 2003; Ataman et al. 2010). No obstante, cada una de las tres técnicas de merchandising analizadas influye de forma diferente a la hora de aumentar las ventas de las categorías de productos. Los resultados confirman las hipótesis de partida planteadas. El éxito de la isla, al restringir la información sobre las alternativas, está más ligado a la decisión de compra impulsiva tomada atendiendo a sensaciones y motivos emocionales o afectivos, por tanto, es más coherente que tenga mayor efectividad sobre productos hedónicos, los cuales son elegidos por las mismas motivaciones (Kempf 1999; Suh 2009). Por el contrario, el cartel, por su ubicación es un estímulo que permite la comparación del producto con otras alternativas situadas al lado, favoreciendo así, las decisiones más racionales o reflexivas (Shiv y Fedorikhin 1999). De esta forma, el cartel es más coherente que tenga mayor efectividad sobre productos utilitarios que no se consumen atendiendo a sensaciones o emociones, sino buscando un beneficio más racional (Kempf 1999; Suh 2009).

Además, los resultados muestran que las promociones más adecuadas para los productos hedónicos son las promociones en producto que no representan un beneficio monetario inmediato (Chandon et al. 2000), tales como una cantidad extra de producto, un 3x2, un regalo de otro producto, una devolución posterior de dinero o una acumulación de una cantidad de dinero en una cuenta utilizable en futuras compras. Mientras que para las categorías utilitarias, las promociones más eficaces son las que conllevan un descuento en precio inmediato.

## 7. IMPLICACIONES PARA GESTORES

Teniendo en cuenta estos resultados, los minoristas deberán analizar por separado la efectividad de cada una de las diferentes técnicas de merchandising para poder sacar mayor provecho al espacio en tienda y, por tanto, optimizar sus beneficios. Deben tratarlas por separado a la hora de realizar la organización del establecimiento. En concreto, deben reservar los espacios en las islas situadas en pasillos principales, donde el tráfico de compradores es mayor, para categorías de naturaleza hedónica. Situando estas categorías en las islas obtendrán un mayor incremento de ventas que si colocan en ellas categorías utilitarias, para las que la técnica más efectiva es el cartel que lo resalta sobre el resto de las alternativas del pasillo.

Por otro lado, los minoristas y los fabricantes deben proponer promociones atendiendo a la motivación hedónica o utilitaria de la categoría de producto considerada, de tal manera que deben tratar de acompañar las categorías hedónicas con promociones en producto puesto que éstas aumentan las sensaciones afectivas que desencadenan la elección de estas categorías. Por el contrario, las promociones en precio que llevan asociadas beneficios racionales a través de un ahorro monetario, son las más efectivas para las categorías de producto utilitarias.

## **8. LIMITACIONES Y LÍNEAS FUTURAS DE INVESTIGACIÓN**

Este trabajo analiza los datos de 22 categorías de producto de alimentación de un establecimiento a través de los datos diarios de un año natural completo. El número de categorías es elevado comparado con otros trabajos sobre merchandising (véase Bezawada et al. 2009; Chandon et al. 2009; Inman et al. 2009; Valenzuela et al. 2013). No obstante, una de las principales limitaciones es que los datos provienen de un único establecimiento, lo que limita su poder de generalización. Una segunda limitación es que se han clasificado las categorías de producto en hedónicas o utilitarias siguiendo estudios previos en los que aparecieran las categorías analizadas, tales como Batra y Ahtola (1990) o Bezawada et al. (2009) y aceptando como correcta su clasificación. Una tercera limitación es que el análisis se ha realizado a nivel categoría y, aunque este tipo de análisis sea propuesto por trabajos como Ailawadi et al. (2009), es posible que para cada marca dentro de la categoría analizada los resultados puedan variar según trabajos como los de Bemmaor y Mouchoux (1991) o Lemon y Nowlis (2002).

Así, los futuros estudios podrían tratar de resolver estas limitaciones recogiendo datos sobre varios minoristas, realizando una encuesta a consumidores para clasificar las categorías e incluso comprobar si otras clasificaciones de categorías pueden ayudar a explicar los efectos del merchandising. Además, estos futuros estudios podrían incluir el análisis de las marcas dentro de las categorías de producto buscando matices a los efectos de las diferentes técnicas de merchandising.

## RESUMEN

*Como consecuencia de la crisis económica por la que está atravesando España en la actualidad, el sector comercial se encuentra en un profundo proceso de reestructuración que ha llevado a un descenso continuado en el volumen de negocio. Esto ha llevado a elevados índices de fracaso empresarial que se reflejan en un aumento de los concursos de acreedores en el sector, si bien no se han producido de forma homogénea a lo largo de todo el territorio nacional. En el presente estudio se analiza la distribución de los concursos de acreedores en el sector comercial a lo largo del territorio español a través de la aplicación del análisis exploratorio de datos espaciales (AEDE) con la aplicación GeoDa. Los resultados obtenidos muestran una incidencia muy desigual entre provincias y la inexistencia de un efecto contagio significativo entre las mismas.*

## Palabras clave:

Fracaso empresarial, concurso de acreedores, sector comercial

## 1. Introducción

El sector comercial representa una de las variables más importantes del marketing y uno de los sectores económicos más dinámicos y de mayor peso en la economía de un país (Sainz de Vicuña, 2001). En España representa en torno al 11% del PIB y el 17,2% del VAB del sector servicios (Conserjería de Turismo y Comercio de la Junta de Andalucía, 2013).

En la actualidad, el sector comercial se encuentra en un proceso de reestructuración debido, entre otros factores, a la situación económica de crisis (Sánchez y otros, 2011), que ha producido un descenso en su número de empresas y su volumen de negocio desde 2008 y, por consiguiente, un incremento de los concursos de acreedores en el sector (www.INE.es, 2013). Sin embargo, dicho descenso no se ha producido de forma homogénea a lo largo de todo el territorio nacional.

Para el análisis de la distribución de los mismos a nivel provincial se ha optado por la aplicación del análisis exploratorio de datos espaciales (AEDE), que es una disciplina de análisis diseñada para el tratamiento específico de los datos espaciales o geográficos, con la aplicación GeoDa. Los resultados obtenidos muestran una incidencia muy desigual a lo largo de todo el territorio así como la inexistencia de un efecto contagio significativo entre las diferentes provincias.

## 2. El Sector Comercial Español

Los datos del INE muestran que el número de empresas dedicadas al comercio, así como la actividad comercial medida en términos de la cifra de negocio, no ha dejado de descender desde 2008 y que este descenso ha sido, en la mayoría de los años, menor que con respecto al total de empresas no comerciales demostrando así una mayor capacidad de supervivencia. En la tabla 1 se muestra la evolución del número de empresas dedicadas al sector comercial así como su volumen de negocios a lo largo del periodo 2005 a 2012.

TABLA 1

**Empresas y Volumen de Negocio (millones de euros) del Sector Comercial Español**

Año	Comercio al por mayor		Comercio al por menor y vehículos		Total sector comercial	
	Nº empresas	Volumen negocio (millones de euros)	Nº empresas	Volumen negocio (millones de euros)	Nº empresas	Volumen negocio (millones de euros)
2012*	201.774	36.0416	53.4110	26.5288	735.884	625.704
2011*	204.507	37.1561	53.3285	28.2972	737.792	654.533
2010*	209.617	36.6570	55.3791	29.1758	763.408	658.328
2009*	211.521	35.5777	56.9205	28.9362	780.726	645.139
2008*	215.887	40.9292	58.3213	32.6034	799.101	735.326
2007**	212.749	42.3096	60.4840	34.9055	817.589	772.151
2006**	212.313	39.4372	60.4073	32.8128	816.386	722.510
2005**	206.612	36.8906	61.2325	30.9540	818.937	678.446

\* El comercio minorista está compuesto por las agrupaciones de actividad CNAE 47 (Comercio al por menor, excepto de vehículos de motor y motocicletas) y CNAE 45 (Venta y reparación de vehículos de motor y motocicletas) y el comercio al por mayor por la agrupación de actividad CNAE 46 (Comercio al por mayor e intermediarios del comercio excepto vehículos de motor y motocicletas)

\*\*El comercio minorista está compuesto por las agrupaciones de actividad CNAE 50 (Venta, mantenimiento y reparación de vehículos de motor y motocicletas y venta al por menor de combustible) y CNAE 52 (Comercio al por menor y reparaciones de efectos personales y enseres) y el comercio al por mayor por la agrupación de actividad CNAE 51 (Comercio al por mayor e intermediarios del comercio excepto vehículos de motor y motocicletas)

En 2011 se acusó el efecto de la caída del consumo de 2009 y 2010 y las continuadas dificultades de acceso a la financiación, teniendo que ajustarse a través de un mayor cierre de empresas (Conserjería de Turismo y Comercio de la Junta de Andalucía, 2013). En este contexto, tal y como se muestra en la tabla 2, el número de concursos de acreedores de las empresas del sector comercial al por mayor ha experimentado una fuerte evolución creciente desde el inicio de la crisis económica en 2008, salvo para el ejercicio 2010. El índice con base

en el ejercicio 2008 muestra que el crecimiento de este fenómeno ha sido muy intenso llegando en 2013 a ser casi 3,5 veces mayor que en el primer año de crisis con dos puntos de inflexión al alza muy claros 2008 y 2011. Para las empresas del sector del comercio al por menor y de vehículos la situación descrita es tanto peor que para el comercio al por mayor, teniendo la misma evolución y los mismos puntos de inflexión pero con más intensidad.

No obstante, este análisis descriptivo del comportamiento del fracaso en estos sectores no deja de ser incompleto si queremos conocer la realidad subyacente. Al obtener el peso de los concursos de acreedores en el sector del comercio al por mayor con respecto al total de concursos de acreedores declarados en España, se observa con claridad cómo ha ido disminuyendo desde el año de inicio del estudio, perdiendo peso en la globalidad del fenómeno pasando del 18,66% en 2005 al 15,88% en 2013, casi tres puntos porcentuales menos. Esto pone de manifiesto que el sector se ha ido adaptando a la situación de crisis mejor que el conjunto de la economía. Y que a pesar de experimentar el número de concursos de acreedores, en términos absolutos, un crecimiento explosivo, en términos relativos ha ido decreciendo, síntoma de mayor flexibilidad y adaptación al entorno.

Con respecto al comercio al por menor y de vehículos ocurre lo contrario, aunque en términos relativos ha ido experimentado mayor importancia en el peso del total de concursos en España, resulta claro que en términos absolutos se trata de un peso irrelevante, apenas un 2.60% del total en 2013, lo que pone de manifiesto que a pesar de su importancia en el PIB respecto al fracaso empresarial no lo es.

TABLA 2

**Empresas Concursadas en España**

Año	Total Empresas Concursadas	Comercio al por mayor				Comercio al por menor y vehículos			
		Nº empresas concursadas	% sobre el total de empresas concursadas	Tasa de variación interanual	Índice Base 2008	Nº empresas concursadas	% sobre el total de empresas concursadas	Tasa de variación interanual	Índice Base 2008
2013*	8.934	1.419	15,88%	6,69%	347,79%	232	2,60%	32,57%	644,44%
2012	8.095	1.330	16,43%	44,41%	325,98%	175	2,16%	36,72%	486,11%
2011	5910	921	15,58%	22,47%	225,74%	128	2,17%	100,00%	355,56%
2010	4990	752	15,07%	-6,70%	184,31%	64	1,28%	-24,71%	177,78%
2009	5175	806	15,57%	97,55%	197,55%	85	1,64%	136,11%	236,11%

Elaboración propia. Fuente: [www.ine.es](http://www.ine.es)

\* Los datos de 2013 son provisionales

### 3. Metodología del estudio

Para el análisis de la distribución del número de concursos de acreedores en el sector comercial en España se van a aplicar las técnicas de análisis exploratorio de datos espaciales (AEDE). Se trata de una disciplina del análisis exploratorio de datos, también denominado data mining, diseñada para el tratamiento específico de los datos espaciales o geográficos que relaciona el análisis estadístico con el gráfico, haciendo posible el estudio de las distribuciones espaciales y sus valores atípicos, esquemas de asociación espacial,

agrupamientos espaciales y puntos calientes/fríos de negocio (hot spot). Para la aplicación de dichas técnicas se va a utilizar el programa estadístico GeoDa.

### **3.1. Muestra**

Dada la naturaleza del análisis estadístico a desarrollar la muestra que se utiliza está formada por toda la población de empresas concursadas en el sector comercial en España durante el periodo 2005-2013, dado que la Ley 22/2003, de 9 de julio, Concursal entró en vigor el 1 de septiembre de 2004, no disponiendo de datos anuales comparables para 2004. Los datos se han obtenido del INE.

Otro aspecto importante a tener en cuenta antes de analizar los datos es que para una mayor potencia estadística en la aplicación del GeoDa se recomienda que los datos sean, al menos, provinciales. En nuestro caso, se comprueba que el INE suministra los datos anteriores por provincias para todo el periodo objeto de estudio.

### **3.2. Variable objeto de estudio**

Para un correcto análisis de la importancia de la incidencia de los concursos de acreedores en las diferentes provincias, resulta más apropiado analizar el impacto de los mismos en términos relativos sobre el total de empresas. Dado que para el sector comercial el INE ofrece los datos agrupados en “Comercio al por menor” y “Comercio al por mayor”, en nuestro estudio relacionaremos el número de concursos en cada caso para cada provincia dividido por el total de locales agrupados de la misma forma. Con esta otra ponderación seguimos manteniendo el objetivo de salvar el sesgo producido por la asimetría en la distribución de las empresas a lo largo del territorio nacional. Esta variable alternativa resulta igualmente útil para el análisis por el impacto que supone el cierre de dichos locales sobre la economía de cada provincia.

Para el cálculo del número de locales por subsectores, y teniendo en cuenta el cambio en la clasificación CNAE y que repercute en los datos aportados por el INE, el número total de locales por subsector se ha hallado de la siguiente forma:

Comercio al por menor:

- Años 2005-2009, CNAE93: Epígrafes 50 y 52
- Años 2010-2013, CNAE 2009: Epígrafes 45 y 47

Comercio al por mayor:

- Años 2005-2009, CNAE93: Epígrafe 51
- Años 2010-2013, CNAE 2009: Epígrafe 46

## **4. Técnicas de Análisis Exploratorio de Datos Espaciales (AEDE) con GeoDa**

El AEDE es capaz de analizar y representar dos características fundamentales en toda distribución espacial: tendencia y puntos atípicos. En nuestro estudio, al tratarse de un análisis longitudinal de nueve años, no resulta de interés el análisis de los datos atípicos, más propio de estudios ad-hoc. Así, nos centraremos en tres análisis: 1) Análisis Exploratorio, 2) Análisis de Dependencia o Autocorrelación Espacial y 3) Análisis de la Correlación Espacio-Temporal.

### **4.1. Análisis exploratorio**

Dada la naturaleza de la variable de estudio el análisis exploratorio se centra en dos de los métodos anteriores: el mapa temático y el histograma de frecuencias.

Los mapas temáticos consisten en la representación cartográfica de una variable geográfica. Esta representación puede realizarse mediante símbolos y colores que pongan de manifiesto el

valor de una variable en cada una de las unidades geográficas consideradas. Los mapas temáticos más importantes para la representación de la tendencia espacial de una variable son el mapa de cuartiles y el mapa de la desviación típica, si bien en nuestro caso y dado que el objetivo es en un primer momento realizar un análisis descriptivo del reparto del número de concursos de acreedores a lo largo del territorio nacional, nos centraremos en el mapa de cuartiles. Para el mapa de cuartiles las provincias con el color más oscuro representan a las que se encuentran en el primer cuartil y la más clara en el cuarto. Para una presentación más resumida se presentarán los gráficos del año 2005 (previo a la crisis), 2009 (en plena crisis) y 2013 (en la actualidad).

El análisis del comportamiento de los concursos de acreedores durante el periodo de estudio (2005-2013) muestra, para el comercio mayorista, que existe una mayor concentración de concursos en la parte superior de la diagonal marcada por el eje noroeste-sureste, con especial incidencia en provincias del este, noreste y norte del país. (ver figuras 1, 3 y 5). Así mismo, destaca el hecho de que provincias como Navarra o Barcelona permanecen en el cuarto cuartil (el de mayor número de concursos) durante todo el periodo. En el otro extremo se encuentran, entre otras, muchas de las provincias de Andalucía. Para el comercio al por menor y vehículos, se aprecia un cambio de tendencia muy importante con la entrada de la crisis. Mientras que en 2005 sólo unas cuantas provincias tenían un número importante de concursos, como Madrid o Baleares, con la entrada de la crisis se observa la misma tendencia que en el comercio al por mayor, esto es, el eje noroeste-sureste (ver figuras 2, 4 y 6).

El histograma de frecuencias nos permite conocer la distribución no espacial de la variable objeto de estudio. Es una aproximación a la función de densidad de una variable aleatoria que resulta de utilidad para detectar asimetrías y otras peculiaridades de la distribución. En este caso, se observa para todos los años y para ambos sectores que la distribución no tiene un comportamiento semejante a la normal por lo que se puede afirmar que el comportamiento de los concursos de acreedores en el sector comercial se comporta de forma aleatoria (ver figuras 7 a 12).

#### **4.2. Análisis de dependencia o autocorrelación espacial**

La autocorrelación espacial es la concentración o dispersión de los valores de una variable en un mapa. Refleja el grado en que la variable objeto de estudio de una unidad geográfica es similar a la de otras unidades geográficas próximas. Así, se puede afirmar que existe autocorrelación espacial en la medida en que existe una relación entre lo que sucede en un punto determinado del espacio y lo que acontece en otros puntos de ese mismo espacio (Sánchez, 2008). En el presente estudio la autocorrelación espacial determina si la ocurrencia de concursos de acreedores en el sector comercial en una determinada provincia española está relacionada con los concursos de acreedores acontecidos en otras provincias.

La autocorrelación puede ser positiva o negativa. La autocorrelación espacial positiva se produce cuando existe una relación directa entre valores similares de la variable en una provincia y las cercanas entre sí, de forma que las provincias con valores elevados de la variable se encuentran rodeadas de otras provincias en las que la variable arroja también valores elevados, y viceversa. En este caso en el que se produce una concentración del número de concursos en una zona geográfica concreta, se dice que existe “contagio” (Sánchez, 2008).

Por el contrario, existe autocorrelación espacial negativa cuando las provincias cercanas presentan valores muy diferentes de la variable analizada, de forma que aquellas provincias en las que se registra un valor elevado de la variable están rodeadas de otras en las que la variable toma valores reducidos, y viceversa (Sánchez, 2008).

Finalmente, es también posible la ausencia de autocorrelación espacial, la cual se producirá cuando los valores de la variable se distribuyan aleatoriamente en todo el territorio analizado (aleatoriedad espacial) (Sánchez, 2008).

Para verificar la existencia o ausencia de autocorrelación espacial, se pueden utilizar diferentes índices, siendo el I de Moran el más conocido y utilizado en la práctica (Sánchez, 2008). Éste índice (Moran, 1950) mide el grado de concentración de valores altos/bajos de una variable en el entorno geográfico de cada una de las observaciones de la muestra. Para cada valor del estadístico es posible realizar una inferencia para evaluar el nivel de significatividad estadística de rechazo de la hipótesis nula de ausencia de similitud o disimilitud de valores de una localización geográfica. De este modo, se pone de manifiesto la presencia de puntos calientes o atípicos espaciales, cuya mayor o menor intensidad dependerá de la significatividad asociada a dicho índice. Varía entre los valores -1 y +1, cuanto más cercano a 1 sea el indicador, mayor será el nivel de autocorrelación espacial (Sánchez, 2008).

En el cálculo del I de Moran resulta determinante la definición de vecindad de las unidades espaciales consideradas que se utilice, que en el caso del presente estudio se trata de las provincias españolas. Para ello, se utiliza un ponderador espacial que surge de una matriz de contigüidad que toma valores de uno para provincias adyacentes y de cero para los casos contrarios. Los principales criterios de vecindad son (Sánchez, 2004; Anselin, 2005; Sánchez, 2008):

- Contigüidad tipo Rook o Torre: una provincia será vecina de otra si comparte con ésta un lado o borde del cuadrado. Este criterio se conoce también con el nombre de criterio de la torre, en referencia al movimiento de esta pieza en el juego de ajedrez.
- Contigüidad tipo Queen o Reina: es aquella que considera vecinas a las provincias que comparten un borde o un vértice del cuadrado. También se conoce con el nombre de criterio de la reina.

- Contigüidad tipo Bishop o Alfil: es aquella que considera que dos provincias serán vecinas si comparten un vértice del cuadrado. Este criterio se conoce también con el nombre de criterio del alfil.

Los tres tipos de vecindad presentados reflejan vecindad de primer orden, pero es posible considerar también contigüidad de segundo orden (cuando se considera la influencia de los vecinos de los vecinos), de tercer orden, y así sucesivamente.

Tras una revisión de estudios en los que se aplica el I de Moran al estudio de la autocorrelación espacial en España se observa un uso mayoritario de la vecindad de primer orden tipo reina (Sánchez, 2004; Sánchez, 2008; Buendía et al., 2012), por lo que será la que se aplique en el presente estudio.

TABLA 3  
**Autocorrelación Espacial**

Año	ÍNDICE DE MORAN	
	Comercio al por mayor	Comercio al por menor y vehículos
2013	-0,0197	-0,0570
2012	-0,0249	-0,0351
2011	-0,0162	-0,0835**
2010	-0,0259	0,1034**
2009	-0,0214	-0,0485
2008	-0,0313	0,0117
2007	-0,0257	-0,0656
2006	-0,0129	0,0297
2005	-0,0481	0,0010

\*p<0,10; \*\*p<0,05; \*\*\*p<0,01

En la tabla 3 se presentan los valores del Índice de Moran que muestran, para el comercio al por mayor, que no existe autocorrelación espacial al no obtenerse datos significativos, esto es, los concursos de acreedores ocurridos en las diferentes provincias españolas no están en consonancia con lo que ocurre en sus vecinas. Para el comercio al por menor y vehículos sí se obtienen datos significativos para 2010 y 2011, por lo que podemos concluir que las reducciones en el consumo acumuladas durante los primeros años de crisis y los problemas de acceso al crédito mencionados anteriormente tiene un efecto “contagio” entre las provincias, si bien dicho nivel de autocorrelación espacial es muy reducido al estar muy lejos de 1.

El Índice de Moran representa una estadística resumen que indica la intensidad de autocorrelación entre las provincias, sin embargo, no identifica el patrón de estas relaciones espaciales, esto es, si el esquema de autocorrelación espacial detectado en todo el territorio en conjunto se mantiene también a nivel local. Para ello, debemos acudir a los indicadores de autocorrelación local como el índice Índice de Moran Local. En este sentido, para visualizar de forma clara y directa la presencia (o ausencia, según el caso) de autocorrelación espacial local el AEDE dispone de diversas herramientas, las más utilizada es la denominada mapa LISA.

Las letras LISA significan Local Indicator of Spatial Association. El mapa LISA es un mapa en el que se representan las localizaciones con valores significativos en determinados indicadores estadísticos de asociación espacial local. En concreto, los gráficos LISA incluidos en GeoDa se basan en el estadístico Índice de Moran de asociación local. La principal utilidad de este gráfico es que permite detectar la presencia de bolsas significativas de no-estacionalidad (zonas calientes/frías) que se desvían de la tendencia general de una variable. Para ello, localizan geográficamente los agrupamientos espaciales (que se producen cuando una unidad espacial que registra un valor alto (bajo) de la variable se encuentra rodeada de

unidades espaciales que también registran un valor alto (bajo) de dicha variable, esto es, alto-alto o bajo-bajo) y los atípicos espaciales (que son aquellos que surgen cuando una unidad espacial con un elevado valor de la variable se encuentran rodeada de unidades espaciales en las que la variable registra valores pequeños, o viceversa, es decir, alto-bajo o bajo-alto) (Sánchez, 2008; Naciones Unidas, 2012).

Las figuras 13 a 18 muestran los mapas LISA para los concursos de acreedores de las empresas del comercio al por mayor y al por menor y vehículos para los años 2005, 2009 y 2013.

FIGURA 13

Mapa LISA comercio al por mayor 2013

FIGURA 14

Mapa LISA comercio al por menor y vehículos 2013

FIGURA 15

Mapa LISA comercio al por mayor 2009

FIGURA 16

Mapa LISA comercio al por menor y vehículos 2009

FIGURA 17

Mapa LISA comercio al por mayor 2005

FIGURA 18

Mapa LISA comercio al por menor y vehículos 2005

Los resultados del Índice de Moran Local quedan reflejados en los mapas LISA en cinco tipos de conglomerados espaciales:

- Alto-Alto (Rojo oscuro): Una provincia con un valor de análisis por encima del promedio, rodeada significativamente por provincias vecinas que también se encuentran sobre la media con respecto a la variable de interés, en el presente trabajo, el número de concursos de acreedores. Estas provincias corresponden a los denominados conglomerados calientes (hot spots).
- Bajo-Bajo (Azul oscuro). Una provincia con un valor de análisis inferior al promedio, rodeada por provincias vecinas que también se encuentran bajo la media en relación con la variable de interés. Estas provincias corresponden a los denominados conglomerados fríos (cold spots).
- Bajo-Alto (Azul claro). Presencia de una provincia con un valor de análisis bajo, rodeada significativamente por provincias vecinas con valores que se encuentran sobre la media de la variable de interés.
- Alto-Bajo (Rojo claro). Presencia de una provincia con un valor de análisis alto, rodeada significativamente por provincias vecinas con valores que se encuentran bajo la media de la variable de interés.
- Relación no significativa (Gris). Presencia de unidades territoriales donde el valor de análisis de la variable de interés no se relaciona significativamente con los valores que presentan sus vecinos.

#### ***4.3. Análisis de correlación espacial-temporal***

En el análisis de la correlación espacio-temporal se analiza el número de concursos en una provincia determinada en dos momentos del tiempo (Anselin, 2003). La correlación espacio-temporal se considera así un caso especial de correlación espacial bivariante. El análisis espacio-temporal se puede realizar desde dos puntos de vista:

- Inward diffusion (Difusión interna): De los vecinos en el presente al núcleo en el futuro.
- Outward diffusion (Difusión externa): Del núcleo ahora a los vecinos en el futuro.

Cada una es un punto de vista ligeramente diferente de la correlación espacio-temporal. La más utilizada es la difusión interna (Anselin, 2003; Anselin, 2005) que mide cómo afectará en el futuro a una provincia determinada lo que ocurre en sus provincias vecinas hoy.

Los resultados de la correlación espacio-temporal son muy similares a los del análisis de la correlación espacial, no se observan resultados significativos para ningún momento del periodo analizado ni para el comercio al por mayor ni en el comercio al por menor y vehículos, por lo tanto, no se puede afirmar que se dé contagio del fenómeno concurso de acreedores por el hecho ocurrido en un periodo anterior en las provincias vecinas. Con respecto a la correlación entre dos periodos de tiempo, para el caso de los concursos en el comercio al por mayor se observan valores muy elevados desde 2010 con respecto al año anterior, adelantándose un año en el caso del comercio al por menor y vehículos. Estos resultados confirman el hecho de que en el análisis de la evolución de los concursos de acreedores en el sector comercial a lo largo del territorio nacional es determinante el efecto temporal, esto es, la acumulación de los problemas derivados de la crisis, reflejándose un año antes en el comercio al por menor (ver tabla 4).

TABLA 4

**Correlación Espacio-Temporal**

Año	Correlación espacio-temporal (I de Moran)		Correlación espacial entre dos periodos de tiempo (Slope)	
	Comercio al por mayor	Comercio al por menor y vehículos	Comercio al por mayor	Comercio al por menor y vehículos
2012-13	-0,0199	-0,0385	0,9668	0,6054
2011-12	-0,0207	-0,0674*	0,7544	0,7801
2010-11	-0,0194	-0,0065	0,8299	0,3795
2009-10	-0,0227	0,0321	1,0973	0,8515

2007-08	-0,0344	-0,0267	0,4735	0,3266
2006-07	-0,0206	-0,0024	0,6424	0,7883
2005-06	-0,0246	-0,0383	0,8913	0,1373

\*p&lt;0,10; \*\*p&lt;0,05; \*\*\*p&lt;0,01

**5. Conclusiones**

El análisis exploratorio muestra que, si bien la persistencia del fenómeno concursal en el sector comercial a nivel provincial en la parte superior de la diagonal noroeste-sureste del territorio es mayor, el reparto de los mismos no es homogéneo a lo largo del periodo estudiado. Tampoco se observó efecto contagio ni para el comercio al por mayor ni para el comercio al por menor y vehículos. En resumen, podemos decir que en la ocurrencia de los concursos de acreedores en el sector comercial español el efecto determinante es el temporal y, muy especialmente, la llegada de la crisis de 2008.

Con respecto a las limitaciones del estudio, la falta de información respecto al número de empresas del sector comercial por provincia ha condicionado el estudio al no poder ponderarse el número de concursos de las empresas de comercio al por mayor y al por menor y vehículos objeto de análisis por dicha cifra, sino por el número de locales de cada provincia, con el objeto de quitar el efecto del asimétrico reparto de empresas en el territorio nacional. Este hecho no ha impedido analizar la incidencia concursal en porcentaje con respecto al total de empresas en el análisis a nivel global.

Dentro de las futuras líneas de investigación se analizarán cómo la crisis y, como consecuencia de ella, la entrada en concurso de acreedores de las empresas del sector comercial ha influido en la adaptación de las acciones comerciales en dichas empresas.

## RESUMEN

*La gestión del conocimiento y el aprendizaje derivado resultan críticos para el éxito de las innovaciones y la competitividad de los fabricantes en el canal de distribución. Considerando el nivel de importancia y poder alcanzado por la distribución en la estructura y organización del canal, este trabajo explora cómo las decisiones de innovación, tanto de explotación como de exploración, configuran la capacidad de gestión del conocimiento entre fabricantes y distribuidores, con el fin de mejorar los resultados de las decisiones de innovaciones de los fabricantes. Se contrata un modelo de estrategia-capacidades-resultados sobre una muestra de 201 fabricantes utilizando la metodología de los modelos de ecuaciones estructurales. Los resultados avalan el papel de la gestión del conocimiento con los distribuidores para el éxito de las innovaciones de los fabricantes.*

## 1. Introducción

Este trabajo tiene como objetivo analizar el papel que el conocimiento poseído por los distribuidores tiene en las decisiones de innovación de los fabricantes y en sus consecuentes resultados.

Sin duda, la innovación se ha convertido en una cuestión central de la dirección estratégica (Nag et al., 2007), y todo un principio de la creación de una ventaja competitiva (Adner y Kapoor, 2010). En el contexto de las cadenas de aprovisionamiento, fabricantes y distribuidores interactúan dentro de un sistema de interdependencias mutuas (Adner y Kapoor, 2010). De hecho, se constata que la influencia de los distribuidores en la innovación en productos y procesos se ha visto acrecentada en los últimos años, incorporándose incluso las marcas de distribuidor a esta tendencia, ya que han supuesto un 33% de toda la innovación en las distintas marcas de consumo lanzadas durante 2012 (Kantar Worldpanel, 2013). En concreto, del conjunto de lanzamientos de productos habidos en la distribución comercial durante 2012, el 75% son de imitación ('Me too's') y sólo el 25% son realmente innovaciones, estando lideradas por Mercadona, Lidl y Carrefour.

Las innovaciones pueden tener una naturaleza exploratoria, de variación y novedad en relación a lo existentes, o de explotación, de refinamiento, eficiencia y selección de lo ya existente (March, 1991). El dinamismo del mercado y la propia evolución de las cadenas de aprovisionamiento, hacen necesario reconfigurar las capacidades a través de la obtención de nuevo conocimiento, y así evitar caer en la rigidez de las capacidades (Leonard-Barton, 1992). Así, la habilidad de la empresa para aplicar el conocimiento obtenido al proceso de innovación puede ser una fuente decisiva de ventaja competitiva (Bierly et al., 2009), la Organizational learning theory (Hubert, 1991) and Knowledge-Based-View (Grant, 1996) constituyen marcos teóricos de interés para estudiar la contribución de la distribución a las innovaciones de los fabricantes.

La innovación puede ser una fuente relevante de ventaja competitiva, pero su éxito depende del entorno de la empresa, conocido como 'ecosistema de innovación' y de la capacidad de aprendizaje organizativo (Jiménez-Jiménez & San-Valle, 2011). El conocimiento es considerado como un antecedente clave del éxito en la innovación y el aprendizaje desde fuentes de conocimiento externo es considerado como un antecedente del desempeño de la empresa que proporcionar resultados de conocimiento y comerciales. Para ello, la empresa desarrolla y configura sus capacidades (Hart, 1995).

The relational view of the RBV calls attention to external knowledge as source of competitive advantage (Dwyer y Sing, 1998). Además, la literatura acknowledges the importance of relations between heterogeneous firms for the innovation novelty (Nieto and Santamaría, 2007). En general, en los contextos interorganizativos, el acceso al conocimiento proporcionado por distintos canales externos aumenta la intensidad de las innovaciones (Chiang y Hung, 2010). En particular, en la colaboración entre fabricantes y distribuidores permite mejorar las innovaciones radicales e incrementales (Ganesan et al., 2009). Más aún, considerando el reducido éxito de las innovaciones, el conocimiento en las relaciones interorganizativas es especialmente relevante al aumentar su viabilidad comercial (Hernández et al., 2012). De hecho, las relaciones verticales en el canal de distribución tienen. Por tanto, en las relaciones verticales entre fabricantes y distribuidores se extienden los límites convencionales de la actividad innovadora de la empresa al ecosistema empresarial de interdependencias entre fabricantes y distribuidores (Adner y Kapoor, 2010).

Si bien se han estudiado diversos problemas vinculados al fracaso de las decisiones de innovación, tanto desde la perspectiva de la oferta (p.e., Henderson, 2006), como de la demanda (Abernathy y Clark, 1985), un problema escasamente considerado es la incidencia que las relaciones fabricante-distribuidor tienen sobre las decisiones de innovación (Hernández et al. 2011).

El sector agroalimentario posee una elevada importancia socioeconómica, con más de 2 millones de empleos, supone casi un 9% del PIB. Se trata de un sector maduro, donde las

estrategias de innovación y la diferenciación juegan un papel esencial para El presente trabajo evaluamos la estrategia de innovación de exploración y explotación de los fabricantes de productos agroalimentarios a través de la configuración de las capacidades de conocimiento de los distribuidores.

## **2. Revisión de la literatura e hipótesis**

El marco de exploración-explotación fue introducido por March (1991) y ha sido adoptado en diversos campos de la investigación en dirección de empresas y del marketing (p.e., Kyriakopoulos y Moorman, 2004), y en particular, en el estudio de las relaciones interorganizativas en el canal de distribución (Hernández et al., 2011).

March (1991) define la explotación como “el refinamiento, elección, producción, eficiencia, selección, implementación y ejecución” y el segundo como “búsqueda, variación, toma de riesgos, experimentación, juego, flexibilidad, descubrimiento, e innovación” (p. 71), implicando “el uso y desarrollo de cosas ya conocidas” (p. 105). En esencia, la explotación es “el refinamiento y extensión de las competencias existentes, tecnologías, y paradigmas” y “sus resultados son positivos, próximos, y predecibles” (p. 85). En una definición más refinada del concepto, Levinthal y March (1993, p. 105) definen la explotación como “el uso y desarrollo de cosas ya conocidas”, de forma que las empresas que usan la explotación están actuando y buscando oportunidades en su entorno circundante (Armagan y Ferreira, 2005). La explotación está relacionada con sistemas rígidos, dependencias, rutinas, burocracias, control, y mercados y tecnologías estables (Lewin et al., 1999).

Por otro lado, la exploración está asociada a la experimentación con nuevas alternativas y, en consecuencia, “sus resultados son inciertos, distantes, y frecuentemente negativos” (March, 1991, p. 85). Implica “la búsqueda de conocimiento, de cosas que podrían llegar a ser conocidas” (Levinthal y March, 1993, p. 105). Por tanto, se vincula con estructuras orgánicas, sistemas flexibles, ruptura de los paradigmas existentes, improvisación, autonomía, caos, mercados y tecnologías emergentes (Lewin et al., 1999).

Frecuentemente las empresas se centran en explotar sus capacidades actuales dejando de desarrollar nuevas capacidades. La proactividad derivada del comportamiento estratégico conduce a que las capacidades necesarias para la implementación estratégica varíen (Hart, 1995). Así, la viabilidad a largo plazo se puede ver comprometida al no poseer capacidades para comercializar en nuevos mercados o innovaciones radicales que proporcionen una ventaja competitiva sostenible (Levinthal y March, 1993; Atuahene-Gima, 2005). A este fenómeno se la he denominado como paradoja de la rigidez de las capacidades (Leonard-Barton, 1992).

Las empresas pueden optar por explotar sus ámbitos de producto y mercado existentes, centrando sus esfuerzos en la eficiencia, o bien decidirse por explorar el desarrollo de nuevos productos y mercados al margen de los ya existentes (Anand y Singh, 1997; Kalafsky y MacPherson, 2002). Esta elección determina la búsqueda por equilibrar “las ganancias de hoy y la flexibilidad para adaptarse al mañana” (Volberda et al., 2001, p. 159).

Pero el desarrollo de las competencias correspondientes supone confrontar perspectivas que cabe considerar contradictorias. Así, en el ámbito de las relaciones interorganizativas, Hakansson y Ford (2002), las motivaciones, recursos y conocimientos de cada (fabricante/distribuidor) pueden ser muy diferentes, por lo que es necesario contar con la perspectiva de la otra parte (distribuidor/fabricante). De hecho, la naturaleza opuesta de las actividades de exploración y explotación deriva de varios hechos relacionados con las limitaciones en la asignación de recursos, la inercia organizacional y el desempeño organizacional deseable. En primer lugar, las organizaciones toman decisiones para apoyar las actividades de exploración o explotación cuando asignan recursos. Cuando deciden innovar buscando nuevo conocimiento y potenciales oportunidades a largo plazo en lugar de aprovechar los conocimientos disponibles para atender las necesidades inmediatas (March, 1991). Del mismo modo, cuando las organizaciones asignan recursos para el perfeccionamiento de las

tecnologías existentes y el aprovechamiento de las competencias existentes en lugar de desarrollar nuevas habilidades y capacidades, logran confiabilidad inmediata pero el riesgo de convertirse en obsoleta en el futuro (Holmqvist, 2004; Leonard-Barton, 1992).

También existe una relatividad en la exploración-explotación, ya que debe ser definida desde el punto de vista de una determinada organización o unidad. Determinado conocimiento, tecnología o mercados pueden ser nuevos para una organización, pero conocidos para otra. En consecuencia, lo que para una organización puede considerarse exploración, para otra es exploración (Lavie et al., 2010).

Según Koza y Lewin (1998), las empresas toman sus decisiones de colaboración con otras empresas en función de si su motivación es de explotar una capacidad existente o explotar nuevas oportunidades. A su vez, la colaboración entre empresas está relacionada por su dotación de recursos (Park et al., 2002). La insuficiencia de recursos y capacidades lleva a las empresas a colaborar con otras para acceder a los mercados y comercializar los productos (Hill y Rothaermel, 2003). Así, como los canales de distribución son necesarios para el éxito de las innovaciones de los productores, pero son difíciles de conocer, los fabricantes valoran incluso más la información procedente de los distribuidores que la propia (Menon y Pfeffer, 2003).

En las relaciones verticales entre fabricantes y distribuidores y, concretamente, desde la perspectiva de cómo los fabricantes obtienen e incorporan el conocimiento obtenido de los distribuidores, considerando el ámbito interorganizativo como una entidad de aprendizaje única (Holmqvist, 2009), en la literatura se identifican tres conceptos de conocimiento vinculados entre sí: (i) la adquisición de conocimiento de los distribuidores, (ii) el aprendizaje a colaborar con distribuidores y (iii) el conocimiento sobre la gestión de los distribuidores (Hernández et al., 2011).

La adquisición de conocimiento de los distribuidores hace referencia a la obtención del mismo desde los distribuidores por el fabricante, internalizándolo, diseminándolo y aplicándolo (Hubert, 1991). El desarrollo de actividades de I+D, en particular, con los distribuidores aumenta el aprendizaje de los fabricantes (Anad y Khanna, 2002). El aprendizaje sea el conocimiento de El aprendizaje será mayor a medida que se trata del conocimiento obtenido con objeto de comprender los cambios en el entorno, poder adaptarse a los mismos, así como desarrollar una base de conocimientos sobre las actividades de comercialización, complementando el poseído por el fabricante (Grant y Baden-Fuller, 2004). En consecuencia, proponemos las siguientes hipótesis:

H<sub>1</sub>: La innovación de explotación está positivamente relacionada con la adquisición de conocimiento de los distribuidores

H<sub>2</sub>: La innovación de explotación está positivamente relacionada con la adquisición de conocimiento de los distribuidores

La adquisición, interpretación y almacenamiento de información del mercado dependen de las necesidades de información (Sinkula, 1994). En la medida en que un fabricante colabora con un distribuidor, la proactividad en su estrategia innovadora conducirá a considerar prioritaria la obtención de conocimiento del distribuidor. El valor del conocimiento proporcionado por el distribuidor será mayor cuanto más complemente el poseído por el fabricante (Grant y Baden-Fuller, 2004). Por ello, establecemos la siguiente hipótesis:

H<sub>3</sub>: La adquisición de conocimiento de los distribuidores influye positivamente en el aprendizaje a colaborar con los distribuidores

Asimismo, la acumulación de experiencias favorece el desempeño de rutinas de relación interorganizativa entre fabricantes y distribuidores (Zollo et al., 2002). La adquisición de conocimiento permite desarrollar un aprendizaje a lo largo del tiempo sobre cómo llevar a cabo la relación interorganizativa fabricante-distribuidor (Kale et al., 2000). El establecimiento de procedimientos explícitos de acumulación y aumento del conocimiento de gestión interfirma

asociado con la experiencia relacional previa (Kale y Sing, 1999). Por tanto, proponemos la siguiente hipótesis:

H<sub>3</sub>: La adquisición de conocimiento de los distribuidores influye positivamente sobre el conocimiento sobre el aprendizaje de colaboración con los distribuidores

H<sub>4</sub>: La adquisición de conocimiento de los distribuidores influye positivamente sobre el conocimiento sobre la gestión de los distribuidores

Lukas et al. (1996) proponen un modelo de aprendizaje en el canal de distribución, en el que el aprendizaje a colaboración y el conocimiento generado en la colaboración determinan el desempeño. Asimismo, las organizaciones con más experiencia de interacción con distribuidores tienen mayor facilidad para responder a imprevistos (Anand y Khanna, 2000), aumentando así el desempeño de las decisiones de innovación. Zollo et al. (2002) establecen que aquellas empresas con mayor aprendizaje de colaboración obtienen mejor desempeño. Con objeto de explicar mejor cómo el conocimiento interorganizativo explica los resultados, distinguiremos entre resultados de eficacia y resultados de eficiencia. Por tanto, se proponen las siguientes hipótesis sobre el efecto del aprendizaje sobre el desempeño:

H<sub>5a</sub>: El aprendizaje a colaborar entre fabricante y distribuidor influye positivamente sobre los resultados organizativos de eficacia

H<sub>5b</sub>: El aprendizaje a colaborar entre fabricante y distribuidor influye positivamente sobre los resultados organizativos de eficiencia

H<sub>6a</sub>: El conocimiento de la gestión de los distribuidores influye positivamente sobre los resultados organizativos de eficacia

H<sub>6b</sub>: El conocimiento de la gestión de los distribuidores influye positivamente sobre los resultados organizativos de eficiencia

### **3. Metodología y análisis de datos**

#### ***3.1. Recogida de los datos, muestra y medición de las variables***

Para analizar las relaciones propuestas en el modelo teórico y contrastar las hipótesis de la investigación, se ha seleccionado como escenario empírico la industria productora española de alimentación y bebidas.

En particular, la muestra se compone de 201 empresas productoras españolas, distribuidas a lo largo de la geografía nacional, pertenecientes al sector de alimentación y bebidas. El método de recogida de la información ha sido la entrevista personal con un cuestionario estructurado, dirigido a informadores clave de cada empresa (directivos de marketing).

La Tabla 1 presenta el conjunto de ítems empleados para la medición de los distintos conceptos teóricos, así como las fuentes bibliográficas de las que han sido extraídos.

Para comprobar la unidimensionalidad de cada concepto se realizó un análisis factorial confirmatorio (Anderson y Gerbing, 1988), el cual muestra un ajuste razonable a los datos (Tabla 1). Los índices de ajuste tradicionalmente considerados se encuentran dentro de un rango aceptable. Además, todos los ítems cargan sobre sus respectivos factores (véase Tabla 1), y los parámetros estimados resultan positivos y significativos, lo que evidencia la presencia de validez convergente (Bagozzi y Yi, 1998). Para el análisis de la validez discriminante se calculó el intervalo de confianza al 99% para las correlaciones de cada par de constructos. Ninguno de ellos incluía el uno.

La fiabilidad de las escalas de medida se calculó a través del índice de fiabilidad compuesta de Bagozzi y Yi (1998) y la varianza media extraída de Fornell y Lacker (1981). En todos los casos fueron superiores a los valores mínimos recomendados (0,6 para la fiabilidad compuesta y 0,5 para la varianza media extraída) (Bagozzi y Yi, 1998).

#### 4. Resultados

Para la estimación del modelo propuesto, utilizando la metodología de modelización a través de ecuaciones estructurales, se ha empleado el paquete estadístico LISREL en su versión 8.54, aplicando el método de máxima verosimilitud (Jöreskog y Sörbom, 1996) y utilizando como matriz de entrada la de varianzas-covarianzas. El ajuste del modelo es razonablemente aceptable.

TABLA 2  
Resultados del modelo estructural

Relaciones propuestas en el modelo	Parámetros estimados (estandarizados)	
	Parámetro	t-valor
H <sub>1</sub> . Explotación → Adquisición conocimiento	0,47	6,35***
H <sub>2</sub> . Exploration → Adquisición conocimiento	0,31	4,55***
H <sub>3</sub> . Adquisición conocimiento → Aprendizaje colaboración	0,82	12,38***

Indicadores de ajuste: $\chi^2_{(290)}=885,28$ ; GFI=0,73 SRMR=0,12 RMSEA=0,11; CFI=0,94; NNFI=0,94		

\*p<0,01; \*\*p<0,05; \*\*\*p<0,01

Tanto las estrategias de explotación como las de exploración ejercen su influencia sobre la adquisición de conocimiento de los distribuidores por parte de las empresas fabricantes, confirmándose así H<sub>1</sub> y H<sub>2</sub>. El efecto de estas estrategias es en ambos casos positivo y significativo.

Se confirman también las hipótesis H<sub>3</sub> y H<sub>4</sub>, puesto que la adquisición de conocimiento procedente de los distribuidores ejerce una influencia positiva y significativa sobre el aprendizaje que las empresas productoras obtienen de la colaboración con sus distribuidores, y también sobre la gestión de dichas relaciones con la distribución.

En cuanto a las contribuciones realizadas al desempeño organizativo, se obtiene que, tanto el aprendizaje derivado de las relaciones entre fabricantes y distribuidores, como la adecuada gestión de esta colaboración, ejercen su influencia, de forma positiva y significativa, sobre los niveles de eficiencia de las empresas productoras (lo que confirma H<sub>5b</sub> y H<sub>6b</sub>). Sin embargo, la eficacia se ve influida tan sólo por el aprendizaje de colaboración (confirmando H<sub>5</sub>), no resultando significativa la aportación en este sentido realizada desde la gestión relacional (se rechaza H<sub>6a</sub>).

#### 5. Conclusiones

El presente estudio centra su atención en dos cuestiones claves en la gestión estratégica de los canales de distribución, como son la gestión del conocimiento externo como actividad esencial para las decisiones de innovación y la influencia de la distribución para el éxito de las decisiones de innovación de los distribuidores. Adoptando una perspectiva de proactividad (Hart, 1995), se plantea cómo la adopción por el fabricante de una estrategia de innovación, de

explotación o de exploración, configura el desarrollo de las capacidades de conocimiento interorganizativo y explica el desempeño organizativo. Previos estudios han considerado el papel de los competidores y los clientes en las decisiones de innovación (p.e., Atuahene-Gima, 2005), pero son escasos los trabajos en los que se identifica al distribuidor como grupo de interés influyente en las decisiones de innovación (excepto el trabajo de Hernández et al., 2011 y Song y Zhao, 2004, hasta lo que hemos encontrado). Los niveles de concentración, interdependencias y poder que los distribuidores han alcanzado en la mayoría de los canales de distribución le otorgan un papel clave con el ejercicio de poder coercitivo y experto por su conocimiento del mercado. Así, en sectores como el agroalimentario, resulta determinante la influencia de los distribuidores para el éxito de las innovaciones realizadas, siendo incluso muchas de ellas realizadas por los propios distribuidores.

A diferencia de la investigación realizada en Hernández *et al.* (2011), se adopta un enfoque proactivo de la estrategia de innovación que permite considerar la configuración de la capacidad relacional con los distribuidores y sus efectos sobre el desempeño. En este sentido, el trabajo presentado constituye una innovación teórica en la secuencia capacidades-estrategia-desempeño.

Los resultados obtenidos en el análisis avalan la influencia que la estrategia de innovación posee sobre la configuración de las capacidades de gestión del conocimiento interrelacional. En cuanto a las limitaciones, señalar la conveniencia de estudiar las relaciones propuestas en otros sectores y profundizar en su validación.

## RESUMEN

*El surtido es una de las herramientas competitivas más importantes con las que cuenta el minorista para diferenciarse de sus competidores. La oferta de un mayor número de referencias puede ayudar al minorista a atraer a un mayor número de individuos al establecimiento y, por tanto, a incrementar las ventas de la categoría. Pero, ¿cuál es la relación entre el tamaño del surtido y el nivel de ventas de la categoría? En este trabajo se realiza una estimación empírica de las elasticidades tamaño de surtido-ventas para doce categorías de producto dentro del sector de los bienes de consumo masivo en el formato hipermercado. Los resultados obtenidos sugieren que la sensibilidad de las ventas a cambios en el número de referencias ofrecido es mayor para aquellas categorías adquiridas de forma menos frecuente y por un menor porcentaje de hogares/individuos.*

## Palabras clave

Surtido, Elasticidad tamaño de surtido-ventas, minorista, hipermercado

## 1. Introducción

El surtido es, sin lugar a dudas, una de las herramientas competitivas más poderosas con las que cuenta el minorista para lograr diferenciarse de sus competidores (Simonson, 1999; Stassen et al., 1999). De hecho, el surtido junto con la localización y el nivel de precios del establecimiento se configura como uno de los aspectos determinantes, no solo para atraer clientes al establecimiento (Kahn, 1999), sino también para lograr retenerlos (Grewal et al., 1999).

La noción de variedad del surtido a nivel minorista puede ser analizada desde una perspectiva técnica y una perspectiva operativa o de medida. En base a la primera, la variedad de surtido se refiere al número de opciones disponibles dentro de una categoría específica de producto. A nivel operativo, la variedad de surtido puede ser analizada, a su vez, desde una perspectiva objetiva o perceptual en función de la medida utilizada (Peng, 2008). Desde el punto de vista objetivo, dos medidas son las tradicionalmente utilizadas: (1) tamaño del surtido – representado por el número total de *SKU*<sup>2</sup>'s – (Chiang y Wilcox, 1997), y (2) composición del surtido – representado, e.g., por diferentes atributos de la categoría como la marca o el sabor (Boatwright y Nunes, 2001). Las medidas perceptuales relacionadas con la variedad de surtido incluyen aspectos como la facilidad de compra (Broniarczyk y Hoyer, 2006), la disponibilidad de la marca preferida por el consumidor (Broniarczyk et al., 1998) o la congruencia entre la organización del surtido que tiene el consumidor en su mente y la que desarrolla el propio minorista (Morales et al., 2005). En este trabajo adoptaremos una perspectiva objetiva de variedad de surtido basada en el número total de referencias ofertadas dentro de una categoría de producto.

El tamaño del surtido parece tener una relación directa sobre la variedad percibida por parte del individuo (Chernev, 2011). Por ejemplo, Amine y Cadenat (2003) hallan como, más allá de la disponibilidad de las principales marcas nacionales y de las marcas preferidas, los individuos utilizan principalmente el número de *SKU*'s cuando evalúan un surtido determinado. En este contexto, la mayor o menor variedad de referencias ofertadas en un surtido parece influir en el tráfico del establecimiento y, por tanto, en el nivel de ventas. Así, múltiples autores (e.g., Arnold et al., 1978; Brown, 1978) hallan un efecto positivo de la variedad de surtido sobre la elección de establecimiento. Los surtidos más grandes tienden a ser percibidos como de mayor variedad, lo que se considera, tradicionalmente, que beneficia al consumidor (Chernev, 2006). Sin embargo, una corriente investigadora alternativa sugiere que los surtidos más grandes no siempre benefician la elección del consumidor (Chernev, 2003a), ya que crean confusión y pueden conducir, potencialmente, a una “saturación cognoscitiva” del individuo (Hauser y Wenerfelt, 1990), incrementando la probabilidad de retrasar la decisión de elección o de, incluso, no elegir nada (Chernev, 2003b). Teniendo en cuenta todos estos aspectos, los resultados de estos trabajos sugieren que en presencia de un nivel de incertidumbre acerca de la preferencia del individuo, las elecciones a realizar en un surtido de mayor tamaño pueden potencialmente provocar un descenso de la probabilidad de elección de cualquiera de las alternativas presentes, así como una menor preferencia por la opción finalmente seleccionada (Chernev, 2006:51).

Sin embargo, una corriente investigadora alternativa sugiere que los surtidos más grandes no siempre benefician la elección del consumidor (Chernev, 2003a), ya que crean confusión, incrementando la probabilidad de retrasar la decisión de elección o de, incluso, no elegir nada (Chernev, 2003a, 2003b; Dhar, 1997; Greenleaf and Lehmann, 1995; Schwartz et al., 2002). Además, los surtidos más grandes pueden conducir, igualmente, a una menor preferencia debido a la demanda creciente de recursos cognitivos del individuo que genera el hecho de tener que evaluar el atractivo de las distintas (muchas) opciones disponibles (Huffman y Kahn, 1998; Jacoby et al., 1974; Shugan, 1980). Este esfuerzo extra puede conducir potencialmente a una “saturación cognoscitiva” del individuo (Hauser y Wenerfelt, 1990; Malhotra, 1982). Teniendo en cuenta todos estos aspectos, los resultados de estos trabajos sugieren que en presencia de un nivel de incertidumbre acerca de la preferencia del individuo, las elecciones a realizar en un surtido de mayor tamaño pueden potencialmente provocar un descenso de la probabilidad de elección de cualquiera de las alternativas presentes, así como una menor preferencia por la opción finalmente seleccionada (Chernev, 2006:51). De hecho, varios autores (e.g., Boatwright

---

<sup>2</sup> *Stock Keeping Unit*

y Nunes, 2001; Broniarczyk et al., 1998; Dreze et al., 1994) muestran como la reducción del tamaño de un surtido puede incrementar la probabilidad de compra de dicho surtido, conduciendo a un incremento en las ventas. Así, Iyengar y Lepper (2000), utilizando el jamón cocido como categoría, muestran que los consumidores mostraban mayor probabilidad de realizar una compra cuando se enfrentaban a un surtido compuesto por seis referencias que cuando el surtido estaba compuesto por 24 referencias (30% vs. 3%, respectivamente). Resultados similares han sido recogidos por múltiples autores en una variedad de categorías de producto, e.g., productos de electrónica (Chernev, 2003a), chocolate (Berger et al., 2007; Chernev, 2003b) o fondos de inversión (Iyengar et al., 2004; Huberman et al., 2007; Morrin et al., 2008, 2011).

Comprender la relación entre el tamaño del surtido y las ventas de la categoría es particularmente interesante para la gestión minorista. En este sentido, un conocimiento acerca de cómo las ventas reaccionan ante modificaciones en el número de referencias ofrecidas puede ser de ayuda para que el minorista organice sus surtidos. En este trabajo se desarrolla una estimación empírica de las elasticidades del tamaño del surtido para doce categorías de producto dentro del formato hipermercado (grande y pequeño). Si bien, y tal y como se ha señalado anteriormente, existen trabajos que han analizado la relación entre el tamaño del surtido y el nivel de ventas de la categoría, ninguno de ellos lo han hecho a través de la estimación de las elasticidades tamaño del surtido-nivel de ventas. Las categorías de producto utilizadas han sido caracterizadas a partir de la tipología desarrollada por Dhar et al. (2001) que utiliza la penetración y la frecuencia de compra como aspectos que permiten clasificar las categorías de producto ofrecidas en los lineales de los establecimientos.

## 2. Revisión de la literatura

Wroe Alderson acuñó el concepto de surtido en marketing a comienzos de los años 50 (Wind, 1977). Alderson (1957:195) definió el surtido como “una colección heterogénea de productos diseñados para servir las necesidades de algún sistema de comportamiento”. Hoy en día, y con la intensa competencia existente en el sector de la gran distribución (especialmente en el contexto de la distribución alimentaria), el surtido se ha convertido en uno de los elementos fundamentales para atraer nuevos consumidores al establecimiento (Kahn, 1999) y retener a los consumidores habituales (Grewal et al., 1999).

En general, y hasta hace relativamente poco, la literatura asumía la mayor preferencia del consumidor por aquellos surtidos con una mayor variedad. De hecho, en numerosas disciplinas (véase Chernev, 2003), como la psicología social, la economía o el comportamiento del consumidor, se asume que una mayor variedad beneficia al consumidor (Chernev, 2006). Así, desde el punto de vista de la economía, los surtidos de mayor tamaño ofrecen una mayor oportunidad para que el consumidor satisfaga sus preferencias (Kahneman et al., 1997). En este sentido, los consumidores tienen mayor confianza en la elección entre minoristas con surtidos de mayor tamaño, ya que es poco probable que no exista su “referencia preferida” (Chernev, 2011). Pero, además de la mayor probabilidad de que el consumidor encuentre su marca/alternativa preferida en aquellos surtidos de mayor tamaño, el hecho de contar con múltiples referencias en su conjunto de elección puede generar una utilidad adicional al individuo (Broniarczyk et al., 1998; Oppewal y Koelemeijer, 2005). En este sentido, cuanto menor es el número de limitaciones que puedan existir en el proceso de toma de decisiones, mayor es la libertad de decisión del individuo (Brehm, 1972) y el control que éste percibe sobre dicho proceso (Inesi et al., 2011). Además, los surtidos de mayor tamaño permiten mantener un mayor nivel de flexibilidad al individuo en sus procesos de elección (véase Kahn y Lehmann [1991] para una revisión en esta línea). Esta flexibilidad es muy importante, ya que permite al individuo mantener sus “opciones de elección abiertas” a la vista de la incertidumbre o la ambigüedad en relación a futuros gustos o situaciones particulares de compra (Kreps, 1979).

No obstante, una corriente investigadora alternativa parece sugerir que los surtidos más grandes no siempre benefician la elección del consumidor (Chernev, 2003), ya que crean confusión, incrementando la probabilidad de retrasar la decisión de elección o de, incluso, no elegir nada (Dhar, 1997; Schwartz et al., 2002). Además, los surtidos más grandes pueden conducir, igualmente, a una menor preferencia debido a la demanda creciente de recursos cognitivos del individuo que genera el hecho de tener que evaluar el atractivo de las distintas (muchas) opciones disponibles (Huffman y

Kahn, 1998; Shugan, 1980). Este esfuerzo extra puede conducir potencialmente a una “saturación cognoscitiva” del individuo (Hauser y Wernerfelt, 1990; Malhotra, 1982).

Desde la perspectiva del minorista, los surtidos de mayor tamaño son considerados menos deseables desde el punto de vista de los costes (Bayus and Putsis, Jr., 1999; Moorthy, 1984). Parece, por tanto, que desde la perspectiva de costes, para el distribuidor es mucho más beneficioso trabajar con surtidos reducidos, ya que se minimizan los costes de inventario, almacenamiento, logísticos, financieros, etc., lo que a su vez se puede traducir en un mayor poder de negociación frente a los proveedores.

Dados los resultados contradictorios anteriormente expuestos, el sentido de la relación causal entre tamaño del surtido y nivel de ventas no parece estar del todo clara. Aunque los trabajos anteriormente mencionados han examinado la relación entre ambos aspectos, la mayoría de ellos lo han hecho a través de la metodología experimental. Sin embargo, esta es una técnica que hace difícil el llegar a conclusiones definitivas dadas las propias características del diseño experimental (Corstjens y Doyle, 1981); además, aunque puede ser utilizada para detectar la existencia de correlación entre las diferencias entre el tamaño del surtido y las variaciones de la demanda, no permite conocer la existencia de causalidad entre ambas variables.

### 3. Metodología

Los datos utilizados en este trabajo han sido proporcionados por la empresa *IRI Worldwide*, a partir de su panel de detallistas *Infoscan*, el cual incluye información sobre los establecimientos de libre servicio de más de 100m<sup>2</sup> con tecnología escáner y ubicados en todo el territorio español. A enero de 2013 existían en España 17.496 establecimientos detallistas de alimentación con estas características. Estos establecimientos son los que conforman el universo de tiendas que el panel de detallistas de IRI utiliza. Según los responsables de *IRI*, aún cuando los establecimientos que conforman el panel suponen el 86,9% de la cuota de mercado a nivel nacional, las características del proceso de recogida de información<sup>3</sup> y los factores de proyección utilizados por la consultora, permiten afirmar que las cifras de surtido y ventas de este panel y, por tanto, de este trabajo, son totalmente representativos del 100% del universo de establecimientos existente en España. Es por ello que la consultora utiliza como dato de referencia de su panel el número total de establecimientos existentes en nuestro país. Estos establecimientos son agrupados por área geográfica y por formato. No obstante, y como hemos indicado con anterioridad, en este trabajo nos vamos a centrar en el formato hipermercado; la consultora *IRI* diferencia entre hipermercado grande (superficie de venta > 5.000m<sup>2</sup>) y pequeño (superficie de venta entre 2.501m<sup>2</sup> y 5.000m<sup>2</sup>). En España a 1 de enero de 2013 existían 424 hipermercados, de los que 131 eran considerados pequeños y 293 grandes.

La base de datos utilizada incluye información semanal de las ventas y el tamaño del surtido por categoría para un conjunto de cinco años (2008-2012). En particular, hemos utilizado doce categorías de producto, agrupándolas a partir de la clasificación desarrollada por Dhar et al. (2001), la cual es utilizada habitualmente en los trabajos que analizan el papel de la categoría de producto en los diversos aspectos relacionados con el establecimiento de venta y el comportamiento del consumidor<sup>4</sup>. Estos autores distinguen cuatro tipos de categorías de producto, en función de la frecuencia de compra (número medio de veces que la categoría es comprada en un período determinado de tiempo) y de la penetración (porcentaje de individuos que compran la categoría): (1) productos habituales (*staple*) (elevada frecuencia y penetración); (2) productos nicho (*niche*) (elevada frecuencia y baja penetración); (3) productos potenciadores de variedad (*variety enhancers*) (baja frecuencia y elevada penetración), y (4) productos de relleno (*fill-in*) (baja frecuencia y baja penetración). Para la selección de las categorías y la inclusión en cada una de los cuatro tipos definidos en la tipología de Dhar et al. (2001) se ha utilizado una muestra de 53 categorías que representan más del 60% de las ventas de

---

<sup>3</sup> Según información de la propia consultora, el 100% de los establecimientos de las cadenas principales (que suponen casi el 77% de la cuota de mercado nacional) forman parte de manera “permanente” del panel. Además, en cada período se seleccionan aleatoriamente otros establecimientos (e.g., de grupos de distribución locales y de Euromadi) que suponen un 10% adicional de la cuota de mercado nacional recogida anualmente por el panel. Igualmente, hay que tener en cuenta que el 100% de los establecimientos existentes en Canarias forma parte del panel. Finalmente, cabe destacar que algunas cadenas de establecimientos aportan datos por provincia, de manera que la información incluye a todos los establecimientos situados en la misma

<sup>4</sup> Otra de las clasificaciones habitualmente utilizadas es la que diferencia entre categorías utilitarias y categorías hedónicas

bienes de consumo envasados en España, de modo que utilizando la información sobre la rotación y el volumen de ventas de cada categoría, hemos obtenido un ranking que nos ha permitido clasificar cada categoría en función de su frecuencia de compra y su nivel de penetración. A partir de dicho ranking hemos seleccionado doce categorías (3 por tipo) de modo que estuvieran incluidos productos de alimentación, higiene y cuidado personal, así como productos de limpieza. En particular, las ocho categorías utilizadas han sido las siguientes: *leche de larga duración*, *yogur* y *cerveza* (productos habituales), *pan de molde*, *bollería industrial* y *frutos secos* (productos nicho), *atún*, *café* y *papel higiénico* (productos potenciadores de variedad), y, finalmente, *desodorante*, *ambientador* y *detergente de máquina en polvo* (productos de relleno).

Las elasticidades tamaño del surtido-ventas han sido estimadas a partir de una función de demanda que relaciona ambas variables. Así, las ventas (en unidades físicas) han sido utilizadas como variable dependiente, mientras que el tamaño del surtido, así como una variable de retardo se han utilizado como variables explicativas. Cabe señalar que las ventas en unidades son la variable más utilizada en los modelos de respuesta de ventas que utilizan datos a nivel de establecimiento/categoría (Blattberg y George, 1991). El tamaño del surtido es medido como el número de SKUs por categoría. El uso de esta variable está en consonancia con lo que múltiples estudios previos de la literatura emplean (véase, e.g., Chiang y Wilcox, 1997). La variable de retardo se incluye con objeto de capturar el efecto dinámico de la respuesta de las ventas al tamaño del surtido y, adicionalmente, para eliminar la correlación residual de la serie de datos (véase Blattberg y George, 1991).

Para modelizar la relación entre tamaño del surtido y nivel de ventas hemos utilizado un modelo logarítmico por varias razones: (1) porque la elasticidad es obtenida directamente de los parámetros estimados; (2) porque proporciona mejores ajustes en términos de la suma de los errores cuadráticos para un mayor tamaño muestral, y (3) porque la ‘sobre-estimación’ de los valores de las elasticidades –en caso de que se produzcan– es menor que la obtenida en otras formas como la lineal (Bolton, 1989). Por tanto, el modelo utilizado para la función de respuesta de las ventas para cada uno de los dos formatos de hipermercado (grande vs. pequeño) y para cada una de las doce categorías de producto es el siguiente:

$$LS_{ijt} = \beta_{0ij} + \beta_{1ij}LAS_{ijt} + \beta_{2ij}LS_{ijt(t-1)} + \varepsilon_{ijt} \quad (1)$$

donde  $i = 1, 2, \dots, 12$  se refiere a la categoría de producto,  $j = 1, 2$  al formato de hipermercado,  $t$  (1, ... 260) a la semana de referencia, y

$LS_{ijt}$  = Logaritmo de las ventas (unidades físicas)

$LAS_{ijt}$  = Logaritmo del tamaño del surtido (nº de SKUs)

$\beta_{0ij}$  = Término constante

$\beta_{1ij}$  = Elasticidad tamaño del surtido-ventas para la categoría de producto  $i$ , y el formato  $j$

$\varepsilon_{ijt}$  = Término de perturbación estocástica (se asume independiente e idénticamente distribuido a partir de una normal de media 0 y varianza  $\sigma^2_{\varepsilon_{ijt}}$ )

#### 4. Resultados

La estimación de las elasticidades del tamaño del surtido son satisfactorias, tal y como pone de manifiesto la significatividad de los *tests-F* (todos significativos al 99%). El valor del coeficiente de ajuste  $R^2$  es elevado para todos los modelos estimados, oscilando entre 0,024 y 0,849 (el valor medio del coeficiente  $R^2$  para el conjunto de modelos estimados es 0,4683). La distribución de la elasticidad por formato y categoría se muestra en la tabla 1.

\*\*\*  $p < 0,0001$  \*\*  $p < 0,01$  \*  $p < 0,05$

Gráficamente, la figura 1 nos muestra la representación gráfica de los valores de las elasticidades del tamaño de surtido para cada una de las categorías y los dos tipos de hipermercado considerados (las elasticidades no significativas han sido consideradas como cero).

**FIGURA 1**  
**Elasticidades tamaño del surtido – ventas**

Las elasticidades tamaño de surtido-ventas varían de forma considerable entre categorías de producto y entre ambos formatos. Como podemos observar en la tabla 1, existen algunas categorías de producto cuyas elasticidades no difieren significativamente de cero al 95%. Es el caso de dos productos habituales (cerveza y leche), un producto nicho (pan de molde), y un producto potenciador de variedad (café). El valor no significativo de estas elasticidades supone que un incremento (o decremento) del número de referencias ofrecido no produce ningún cambio significativo en el nivel de ventas de la categoría. Las categorías no sensibles al tamaño del surtido abarcan todas las tipologías de producto excepto los productos de relleno (i.e., desodorante, ambientador y detergente de máquina en polvo), cuyas elasticidades son todas significativas. Cabe destacar que de las cuatro categorías con elasticidades no significativas, dos de ellas son consideradas como habituales, lo que parece señalar que en productos adquiridos de manera muy frecuente por una mayoría de hogares, son aspectos diferentes al tamaño del surtido los que pueden incrementar las ventas de la categoría.

La figura 1 muestra como son las categorías de relleno, i.e., aquellas adquiridas de manera menos frecuente y por un porcentaje menor de hogares (ambientador, desodorante y detergente de máquina en polvo), las que mayor sensibilidad presentan a cambios en el tamaño del surtido. Esta mayor sensibilidad es especialmente destacable en el caso del hipermercado grande. De hecho, la elasticidad tamaño del surtido-ventas media para el conjunto de categorías dentro del formato hipermercado grande es muy superior al formato hipermercado pequeño (0,2535 vs. 0,1199), lo que sugiere una mayor capacidad de los hipermercados de mayor tamaño para modificar el nivel de ventas de sus categorías de producto utilizando el número de referencias.

Por categoría, la tabla 2 muestra el valor medio de las elasticidades tamaño del surtido-ventas para cada una de las doce categorías de producto analizadas, para los dos tipos de hipermercados considerados.

TABLA2  
Distribución de las elasticidades del tamaño de surtido entre categorías

	Habituales			Nicho			Potenciadores variedad			Relleno		
	Cerveza	Leche	Yogur	Bollería industrial	Pan molde	Frutos secos	Café	Atún	Papel higiénico	Desodorante	Ambientador	Detergente
Elasticidad	— <sup>a</sup>	—	0,194	0,318	—	0,180	—	0,189	0,153	0,321	0,348	0,540
	0,064			0,060			0,220			0,402		

<sup>a</sup>No significativamente distinto de cero

Como podemos observar en la tabla 2, el valor de la elasticidad tamaño de surtido-ventas para las categorías habituales y nicho es muy similar, y mucho más reducido que para las categorías potenciadoras de variedad y, sobre todo, para las categorías de relleno. En este sentido, la sensibilidad de las ventas de las categorías habituales y nicho frente a cambios en el tamaño del surtido es aproximadamente cuatro veces menor a la sensibilidad de categorías potenciadoras de variedad, y casi siete veces menor a la sensibilidad de categorías consideradas de relleno.

## 5. Conclusiones

Los resultados obtenidos apoyan la relación positiva entre tamaño de surtido y ventas encontrada en trabajos previos. Así, las elasticidades tamaño del surtido-ventas son significativamente no diferentes de cero para una mayoría de categorías de producto en los dos formatos de hipermercados analizados. La excepción son dos de las categorías habituales, una categoría nicho y otra potenciadora de variedad. Estos resultados indican que, de alguna manera, las características de la categoría de producto condicionan la sensibilidad de las ventas de la misma ante cambios en el tamaño del surtido. Igualmente, parece que existen diferencias entre el tamaño del hipermercado, dado que el valor medio de las elasticidades para el caso de los hipermercados más grandes duplica al de los hipermercados pequeños. Parece, por tanto, que hay una relación directa entre el tamaño y la sensibilidad (una vez consideradas las diferencias entre las categorías de producto). Por otra parte, en todos los casos en los que la elasticidad es significativa, ésta toma un valor positivo, señalando que cuanto mayor es el

número de referencias ofertadas dentro de una categoría, mayor es el nivel de ventas de la misma, de modo que esa relación no cambia.

En relación a la categoría de producto, nuestros resultados muestran como las categorías de relleno son las que mayor sensibilidad presentan (valor medio de 0,402) ante modificaciones del tamaño del surtido. Este resultado sugiere que el incremento del tamaño del surtido (nº de referencias) en aquellas categorías adquiridas de manera menos habitual y de forma menos frecuente por parte del individuo ofrece los mejores resultados en categorías de este tipo. Por el contrario, aquellas categorías más frecuentemente adquiridas por el consumidor (tanto por una mayoría de hogares (i.e., productos habituales) como por un porcentaje menor (i.e., productos nicho)) presentan la menor sensibilidad frente a cambios en el número de referencias, por lo que parece que el surtido no va a ser uno de los aspectos que mayor efecto vaya a generar en el nivel de ventas de la categoría. Esto probablemente se deba al elevado nivel de “saturación” de referencias que estas categorías presentan (Drèze et al., 1994). Dados estos resultados, recomendamos a los minoristas que para este tipo de categorías prioricen la utilización de otras herramientas de marketing que tal vez sí puedan incrementar el nivel de ventas de la categoría de manera significativa (e.g., promociones de ventas) frente a estrategias de incremento del número de referencias ofertadas. En línea con este resultado, parece, incluso, que un descenso en el tamaño medio de los surtidos de categorías adquiridas de manera muy frecuente puede ser incluso beneficioso para el minorista, dado que es probable que el descenso de los costes de stock y de gestión de los surtidos más pequeños compense el descenso (muy reducido) de las ventas de estas categorías.

El ahorro de costes derivado del menor tamaño del surtido en las categorías de elevada frecuencia de compra podría, adicionalmente, compensar el mayor coste que supondría incrementar el tamaño de los surtidos de las categorías de baja frecuencia. Y es que en estas categorías, el incremento del tamaño del surtido sí que tiene un efecto positivo mucho mayor. Así, para el caso de los productos potenciadores de variedad, un incremento del 10% en el tamaño del surtido supone un aumento del nivel de ventas de la categoría en un 2,2%, mientras que para el caso de los productos de relleno este incremento es superior al 4%. Parece, por tanto, que en este tipo de categorías de producto el surtido es un aspecto de la estrategia del minorista que puede estimular las ventas de un modo más significativo, por lo que es recomendable su utilización junto con otras herramientas del marketing mix.

En definitiva, nuestros resultados aconsejan al minorista que tenga en cuenta las características de las categorías de producto en términos de frecuencia y penetración, a la hora de decidir si puede ser o no interesante la modificación del número de referencias con objeto de incrementar el nivel de ventas de la categoría. En este sentido, parece que el surtido juega un papel mucho más significativo en categorías compradas de manera menos frecuente que en aquellas adquiridas de manera muy habitual por parte del consumidor. La menor influencia del surtido sobre el nivel de ventas en estas categorías más frecuentes puede ser analizada desde una doble perspectiva: desde la perspectiva del incremento del surtido o desde el punto de vista de la reducción del mismo. Desde la primera, la capacidad del surtido para incrementar las ventas se manifiesta escasa; desde la segunda, reducciones importantes del surtido parecen no provocar descensos muy significativos de las ventas, por lo que si el objetivo es reducir costes vía disminución del número de referencias, este tipo de categorías es el contexto idóneo para hacerlo. Por otra parte, en aquellas categorías adquiridas de manera menos habitual, la mayor sensibilidad de las ventas a cambios en el número de referencias ofrecido ofrece una oportunidad para aquellos establecimientos que quieran incrementar el tamaño del surtido, pero, igualmente, supone una llamada de atención para los establecimientos que quieran reducir dicho tamaño, dado que las consecuencias sobre el nivel de ventas de estas categorías va a ser mucho mayor.

## **6. Limitaciones y futuras líneas de investigación**

Como cualquier trabajo de investigación, este estudio no está exento de limitaciones que, por otra parte, abren la posibilidad a futuras investigaciones. En primer lugar, hay que tener en cuenta que la evolución de las ventas y el éxito de un establecimiento/marca no depende, únicamente, del tamaño del surtido, sino que existen otros aspectos de la estrategia de marketing del minorista – tal y como hemos comentado en el apartado anterior de conclusiones – que van a influir en el éxito del mismo. En

este sentido, en este trabajo nos hemos centrado en el surtido como variable “fundamental” de éxito para un minorista, pero aspectos como el precio, la cercanía o las promociones también son muy relevantes en este análisis. Sería, por tanto, muy interesante poder desarrollar un marco de estudio en el que, además del tamaño del surtido, se incluyan otros aspectos relacionados con la gestión del establecimiento. Otra de las limitaciones de este estudio se refiere al formato analizado. En este sentido, en trabajos futuros sería interesante incluir en el análisis otros formatos de distribución (e.g., supermercados y discounters), de modo que nos permitiera conocer si la relación obtenida en este trabajo es extensible a otros formatos de distribución. La no diferenciación entre marcas nacionales y marcas de distribuidor es otra de las limitaciones. En futuros trabajos sería interesante poder estimar elasticidades diferenciadas para cada tipo de marca, dado que aspectos como la preferencia, la lealtad y, en definitiva, el comportamiento de compra del consumidor son diferentes para un tipo de marcas y otro. Finalmente, sería interesante utilizar tipologías de categorías de producto diferentes a la utilizada en este trabajo y desarrollada por Dhar et al. (2001). Si bien es cierto que dicha tipología es ampliamente utilizada en el ámbito de la gestión por categorías, sería interesante utilizar el carácter utilitario o hedónico de la categoría para agruparlas; esto nos permitiría comparar las similitudes y diferencias entre los resultados. Finalmente, cabe señalar que el análisis se ha limitado a doce categorías de producto, por lo que sería interesante ampliar los resultados con un mayor número de categorías de producto.

## RESUMEN

*El estudio de las valoraciones y conductas del consumidor asociadas al proceso de recuperación del servicio es un tema de gran interés académico y empresarial. En este contexto, nuestro objetivo es, por una parte, analizar los efectos directos de esta cadena de relaciones “atribuciones causales y esfuerzos de recuperación → satisfacción con la recuperación del servicio → intenciones de boca-oído y de boca-oído online” y, por otra parte, estudiar el papel moderador que tiene la edad en la relación entre la satisfacción y el boca-oído posterior. Utilizando una muestra de 336 sujetos que han experimentado un fallo en algún establecimiento minorista, los resultados del modelo de ecuaciones estructurales confirman los efectos directos propuestos. Además, el análisis multigrupo revela que la edad modera la relación entre la satisfacción y el boca-oído online. Estos resultados derivan en implicaciones importantes para la gestión y en futuras líneas de investigación.*

## Palabras clave:

Recuperación del servicio, satisfacción, atribuciones, boca-oído, comercio minorista

---

<sup>1</sup> Este estudio se enmarca en un Proyecto de Investigación Precompetitivo realizado con el apoyo financiero prestado por el Vicerrectorado de Investigación y Política Científica de la Universitat de València (Ref.: UV-INV-PRECOMP13-115370).

## 1. Introducción

En el proceso de prestación del servicio es muy difícil que las empresas puedan eliminar todos los fallos, incluso aunque tengan una clara orientación al cliente y ofrezcan altos niveles de excelencia (Del Rio et al., 2009). La variabilidad inherente al servicio hace que sea imposible garantizar el 100% de servicios libres de errores (Lovelock y Wirtz, 2004). Cuando el cliente percibe algún fallo se genera un nivel de insatisfacción que puede favorecer el cambio de proveedor, el boca-oreja negativo o cualquier forma de queja (Crié, 2003). Por tanto, recuperar al cliente es crucial para evitar estas consecuencias negativas. En esta línea, existen muchas aportaciones que destacan la importancia que tiene una recuperación exitosa del servicio en la satisfacción posterior (p.e. Holloway y Beatty, 2003), en la repetición de compra (p.e. Mattila, 2001) y en las comunicaciones boca-oído (p.e. Swanson y Hsu, 2009).

La investigación sobre la recuperación del servicio es extensa y su interés continúa siendo de gran importancia tanto para académicos como gestores (Kunz y Hogreve, 2011). En la literatura se han propuesto diversos antecedentes de la satisfacción con la recuperación del servicio y entre ellos destacan las atribuciones que realiza el consumidor sobre las causas del fallo (Maxham y Netemeyer, 2002). También son importantes las estrategias y esfuerzos que realiza la empresa para conseguir la recuperación del servicio. En este sentido, existen evidencias empíricas del efecto que tiene una recuperación exitosa en la satisfacción del cliente (p.e. Smith et al., 1999). En cuanto a las consecuencias de la satisfacción con la recuperación, numerosos trabajos confirman el impacto positivo que tienen dicha satisfacción en las respuestas de lealtad (Cambra et al., 2013) y concretamente en los comentarios boca-oído (Kau y Loh, 2006).

En este contexto, nuestro objetivo se centra en estudiar el proceso de satisfacción con la recuperación del servicio en el ámbito del comercio minorista a partir de dos tipos de relaciones. Por una parte, pretendemos investigar los efectos directos que se producen en la siguiente cadena de relaciones: atribuciones causales y esfuerzos de recuperación → satisfacción con la recuperación del servicio → intenciones de boca-oído y de boca-oído online. Y por otra parte, abordamos el estudio del efecto moderador que tiene la edad del cliente en la relación entre la satisfacción con la recuperación y las intenciones de boca-oído y de boca-oído online.

## 2. Revisión teórica

Un fallo en un servicio se refiere a cualquier problema que ocurra en la interacción entre el comprador y el proveedor (Michel y Meuter, 2008). Cuando se produce un fallo, las empresas pueden desarrollar un conjunto de acciones para tratar de resolver el problema con el cliente (Grönroos, 1998). Autores como Smith et al. (1999) y Chang y Hsiao (2008) destacan que, a diferencia de la gestión de quejas que tiene carácter reactivo, la recuperación del servicio es un proceso proactivo que persigue una solución satisfactoria, orientación al cliente y lo más rápida posible. Así pues, se puede definir la recuperación del servicio como el *“proceso que identifica el fallo, resuelve de forma efectiva el problema con el cliente, clasifica la causa que lo ha originado y genera información sobre cómo mejorar el proceso de prestación del servicio”* (Tax y Brown, 2000: p. 272). Más recientemente, Michel et al. (2009: p. 267) definen este proceso como *“las acciones que desarrolla una empresa para reestablecer la satisfacción y la lealtad del cliente después del fallo, para asegurar que el incidente consiga mejorar el proceso y para capacitar y recompensar a los empleados para esta tarea”*. Según este enfoque, se reconocen tres partes en el proceso de recuperación: el cliente, el proceso y los empleados. Por tanto, los clientes y los empleados de primera línea adquieren un papel fundamental en el proceso de recuperación del servicio (Edvardsson et al., 2011).

La satisfacción con la recuperación del servicio se refiere a la evaluación favorable que realiza el consumidor cuando compara los beneficios y sacrificios del fallo experimentado con las consecuencias de la solución del problema (Huang, 2011). Considerando este tipo de satisfacción, analizamos en primer lugar los dos antecedentes propuestos (las atribuciones causales y la percepción sobre los esfuerzos de recuperación del servicio), posteriormente las

consecuencias en forma de intenciones de boca-oído (tanto convencional como online) y, por último, el efecto moderador de la edad del cliente.

### ***2.1. Las atribuciones causales***

Según la teoría de las atribuciones, los consumidores buscan las causas del resultado de una experiencia de compra, sobre todo cuando se trata de algo inesperado (Weiner, 2000). En este proceso, los individuos pueden identificar las causas del éxito o fracaso de su experiencia utilizando tres criterios: el origen, la estabilidad y el control (Folkes, 1984; Folkes et al., 1987; Bitner et al. 1990). Así pues, considerando situaciones de fallo en el servicio, los consumidores pueden realizar los tres siguientes tipos de atribuciones.

Las atribuciones de origen o *locus* se refieren a la búsqueda del origen. El consumidor puede percibir que las causas pueden ser internas si asume que es él mismo el causante del problema, externas si atribuye el problema al proveedor del servicio, y situacionales cuando asigna las causas a factores del entorno o a terceras partes (p.e. el azar, otros consumidores, etc.). En general, los trabajos abordan esta variable considerando las atribuciones de origen externo ya que los consumidores suelen percibir en la mayoría de ocasiones que los fallos son responsabilidad de la empresa (Smith et al., 1999; Hess et al., 2003). Este tipo de atribuciones tienen un gran impacto en la satisfacción del cliente (Maxham y Netemeyer, 2002).

Respecto a las atribuciones de estabilidad, el individuo valora la estabilidad de las causas cuestionando la probabilidad de que vuelva a repetirse la causa que originó el problema. Será una causa estable o permanente cuando éste percibe que se va a repetir en el futuro, mientras que será una causa inestable o temporal si percibe que tiene carácter puntual. Diversos trabajos relacionan las atribuciones de estabilidad con la satisfacción. Por ejemplo, en el trabajo de Smith y Bolton (1998) se concluye que la percepción de estabilidad de las causas tiene un efecto negativo en la satisfacción del cliente. También Casado y Mas (2002) encuentran que la satisfacción es más baja cuando los consumidores perciben que el problema se repite.

Y en cuanto a las atribuciones de control, el individuo analiza si la parte responsable del fallo en el servicio puede tener cierto control sobre las causas, es decir, si puede prevenirlo. Será una situación controlable o evitable si el consumidor piensa que el causante del problema puede intervenir para evitarlo, y será una situación incontrolable o inevitable cuando considera que el responsable no puede actuar para evitar el fallo. Existen evidencias empíricas del efecto que tienen las atribuciones de control sobre la satisfacción. Por ejemplo, Choi y Mattila (2008) revelan que si los consumidores perciben que la empresa no hace nada para solucionar el problema teniendo la capacidad para evitarlo están menos satisfechos que aquellos que desconocen el grado de control que puede tener el proveedor. Magnini et al. (2007) también confirman que la satisfacción es mayor cuando el cliente percibe que la empresa tiene poco control sobre la causa.

En resumen, de acuerdo con estas atribuciones, cuando el consumidor percibe que el culpable del fallo es el proveedor del servicio, que es probable que el problema se repita y que la empresa podría haberlo evitado, se sentirá más insatisfecho y desarrollará conductas desfavorables para la empresa (Folkes, 1984; Gooding y Kinicki, 1995). A la vista de estos resultados, suponemos que en los comercio minoristas cuanto más atribuya el cliente la responsabilidad del fallo a la tienda servicio (atribuciones de origen externo), menor nivel de satisfacción va a experimentar. Asimismo, cuanto más perciba que la causa es inestable o puntual (atribuciones de causa inestable) y poco controlable por la tienda (atribuciones de causa incontrolable), mayor será su nivel de satisfacción. En esta línea, formulamos las siguientes hipótesis relacionadas con las atribuciones (Figura 1):

*H<sub>1</sub>: Las atribuciones de origen externo influyen negativamente en la satisfacción del cliente con la recuperación del servicio.*

*H<sub>2</sub>: Las atribuciones de causa inestable influyen positivamente en la satisfacción del cliente con la recuperación del servicio.*

*H<sub>3</sub>: Las atribuciones de causa incontrolable influyen positivamente en la satisfacción del cliente con la recuperación del servicio.*

## **2.2. Los esfuerzos de recuperación del servicio**

Es compartido que una recuperación exitosa tiene un gran efecto sobre la satisfacción y la lealtad del cliente (Zeithaml et al., 1996; Maxham y Netemeyer, 2002). Por tanto, estudiar el efecto que tiene una adecuada recuperación del servicio en los juicios de satisfacción es clave para comprender las respuestas posteriores en forma de lealtad (Chang y Hsiao, 2008; Varela et al., 2009). En una situación insatisfactoria, cuando la empresa desarrolla acciones para recuperar el servicio el consumidor no sólo evalúa la solución o el resultado (lo que recibe) sino también el proceso de recuperación (cómo lo recibe) (Tax et al., 1998). Por tanto, la recuperación del servicio tiene una doble dimensión: resultado y proceso (Duffy et al., 2006).

Aunque las compensaciones se han reconocido como herramientas adecuadas para una recuperación efectiva (Hoffman et al., 2003), en algunas situaciones deben de ir acompañadas de ciertas explicaciones por parte de los empleados para que tengan un efecto importante en las valoraciones del consumidor (Grewal et al., 2008). En este contexto, el esfuerzo percibido por el cliente se puede definir como la percepción de energía y recursos que una empresa dedica para solucionar el problema (De Matos et al., 2007; Huang, 2008). Dicho esfuerzo se ha reconocido en la literatura como un antecedente clave de la satisfacción con la recuperación (Huang 2008; Ha y Jang, 2009; Cambra et al., 2011).

Las evidencias empíricas muestran que cuando el cliente percibe que la empresa realiza esfuerzos para reparar el fallo en el servicio su nivel de satisfacción aumenta (p.e. Gruber et al., 2009; Cambra et al., 2013; Balaji y Sarkar, 2013), e incluso si la solución o el resultado final no es satisfactorio (p.e. Bandhari et al., 2007; Specht et al., 2007). Específicamente, diversos trabajos también confirman el efecto positivo que tienen los esfuerzos percibidos por los clientes para recuperar el servicio en la satisfacción con este proceso de recuperación (p.e. Kau y Loh, 2006), en la lealtad (p.e. Lin, 2009) y de forma específica en las intenciones de boca-oído (p.e. McQuilken, 2010). Por ejemplo, Bradley y Sparks (2012) concluyen que la satisfacción con la recuperación y las actitudes hacia la empresa son más positivas cuando la compensación y la explicación ofrecidas al cliente son mejores. Por tanto, entendemos que a mayor percepción de esfuerzo por parte de la tienda para solucionar el problema, mayor va a ser la satisfacción con la recuperación del servicio, formulando así la siguiente hipótesis (Figura 1):

*H<sub>4</sub>: La percepción del cliente sobre los esfuerzos de recuperación del servicio de la tienda influye positivamente en la satisfacción del cliente con dicha recuperación.*

## **2.3. La conducta de boca-oído**

La relación entre la satisfacción con la recuperación del servicio y la lealtad ha sido ampliamente estudiada en la literatura (p.e. Homburg y Fürst, 2005; Kikbin et al., 2013; Cambra et al., 2013). Dicha lealtad se puede manifestar en diferentes formas de conducta y actitudes (Oliver, 1999; Zeithaml et al., 1996) que aportan beneficios importantes para las empresas. En este sentido, los clientes fieles tienen más intención de repetir la compra, desarrollan más ventas cruzadas, tienen menor sensibilidad al precio, les influyen menos las acciones de la competencia, realizan comunicaciones boca-oído positivo y se sienten menos insatisfechos si se repiten los fallos en el servicio (Oliva et al., 1992). Además, el tratamiento adecuado de los problemas e insatisfacciones de los clientes generan mayor lealtad que en situaciones de ausencia de problemas (Oliver, 1997).

Una de las dimensiones más relevantes y reconocidas de la lealtad son los comentarios boca-oído (Carl, 2006). En general, las definiciones coinciden en señalar que se trata de una comunicación entre consumidores acerca de un producto, servicio o empresa y que el emisor de la información es un individuo independiente (Harrison-Walker, 2001; Litvin et al., 2008). Por tanto, esta conducta excluye la comunicación formal de los clientes a las empresas (en forma de quejas o sugerencias) y de las empresas a los clientes (mediante las acciones de promoción) (Mazzarol et al., 2007). También se ha destacado que se trata de un tipo de conducta directo y

personal que hace que la información transmitida sea más real y creíble y, por tanto, con un efecto en las decisiones de otros consumidores mucho mayor que el de la publicidad o promoción (Sen, 2008).

Con el crecimiento de las tecnologías, surge la dimensión virtual de la conducta de boca-oído. Aunque algunos trabajos demuestran que esta forma de comunicación tiene menor impacto que la experiencia cara a cara del boca-oreja convencional (p.e. Sen y Lerman, 2007), su importancia académica y empresarial va en aumento (Lee y Koo, 2012; WOMMA). Al ser internet el canal de comunicación del boca-oreja online, los individuos pueden compartir información por tres vías: *one-to-one* (mail o mensajería instantánea), *one-to-many* (p.e. sitios web) y *many-to-many* (p.e. blogs, comunidades virtuales o foros) (Chan y Ngai, 2011).

Existen numerosas evidencias empíricas del efecto que tiene la satisfacción con la recuperación del servicio y la conducta de boca-oído. Por ejemplo, Maxham y Netemeyer (2002) encuentran una relación positiva entre la satisfacción con la recuperación y las intenciones de boca-oído. Los resultados de Kau y Loh (2006) indican que la confianza y el boca-oído se pueden aumentar mejorando la satisfacción con la recuperación del servicio. También Farquhar y Panther (2007) obtienen que la satisfacción con la solución de un problema aumenta las intenciones de continuar comprando y de recomendación. Los resultados de Komunda y Osarenkhoe (2012) indican que la satisfacción con el tratamiento de la queja provoca boca-oído positivo. Haciendo referencia al boca-oído negativo, Voorhees et al. (2006) demuestran que es menos probable que los consumidores satisfechos con la recuperación realicen comentarios boca-oído negativos. Y el trabajo de Balaji y Sarkar (2013) revela que la satisfacción después de la recuperación afecta negativamente al boca-oído negativo. Considerando estas aportaciones, suponemos que en nuestro contexto la satisfacción con la recuperación del servicio va a tener un efecto positivo en la intención de boca-oído convencional y en la intención de boca-oído online en particular, formulando así las siguientes hipótesis (Figura 1):

*H<sub>5</sub>: La satisfacción del cliente con la recuperación del servicio influye positivamente en su intención de boca-oído.*

*H<sub>6</sub>: La satisfacción del cliente con la recuperación del servicio influye positivamente en su intención de boca-oído online.*

#### **2.4. El efecto moderador de la edad del cliente**

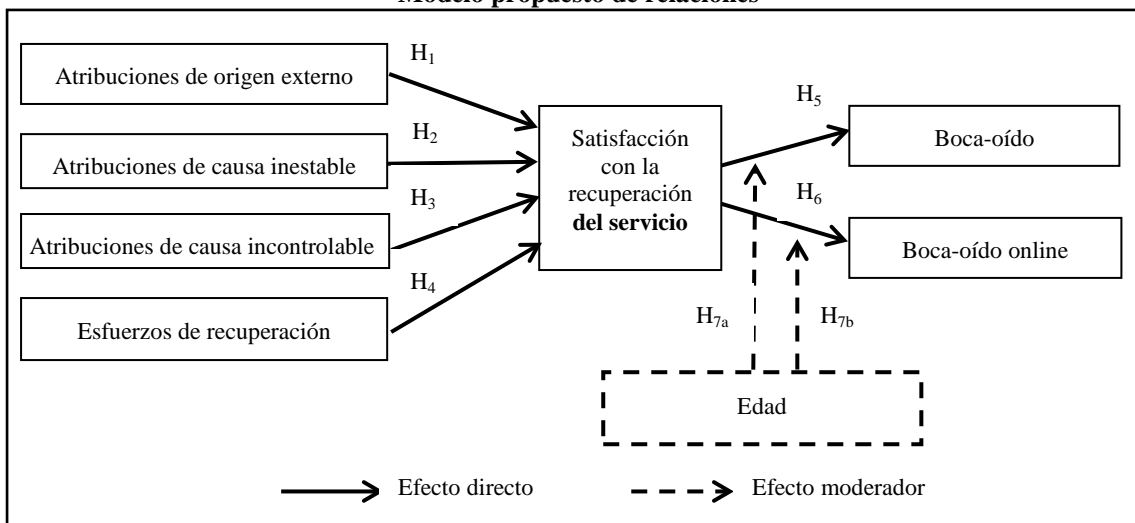

En la literatura se ha abordado el estudio de diferentes variables moderadoras que intervienen en el proceso de recuperación del servicio. Respecto al efecto moderador en la formación de la satisfacción se han investigado variables como el tipo de servicio (online vs offline) (p.e. Lii et al., 2013), la edad (p.e. Roschk et al., 2013), las atribuciones de estabilidad y control (p.e. Nikbin et al., 2013), la gravedad del fallo (p.e. McQuilken et al., 2013; Balaji y Sarkar, 2013), el género (p.e. Cambra et al., 2013), el tipo de compensación (p.e. Bradley y Sparks, 2012), la equidad de la marca (p.e. Huang, 2011) o el grado de implicación del consumidor (p.e. Cambra et al., 2014). En cuanto al efecto moderador en la relación entre la satisfacción con la recuperación y la lealtad, las variables más estudiadas son el tipo de relación que tiene el cliente con la empresa (cliente relacional vs cliente transaccional) (p.e. Pizzutti y Basso, 2012), el género (p.e. Cambra et al., 2013), la gravedad del fallo (p.e. Balaji y Sarkar, 2013), equidad de la marca (p.e. Huang, 2011) o la justicia (p.e. Wang et al., 2011).

Diversos trabajos que han estudiado la relación entre la satisfacción y la retención de clientes sugieren que algunas características culturales y socio-demográficas como la edad, el género, los ingresos o el nivel de formación (p.e. Verhoef, 2003; Shahin y Chan, 2006; Karande et al., 2007; Cambra et al., 2013) pueden influir en las conductas del consumidor. En particular, el efecto que tiene la edad en contextos de recuperación del servicio ha sido una variable escasamente investigada (Roschk et al., 2013). Sin embargo, el interés por la investigación de la edad del consumidor va en aumento, sobre todo en sociedades que están envejeciendo, como es la española, ya que la población adulta representa un segmento cada vez mayor y con gran capacidad de compra (Simcock et al., 2006).

Existen evidencias empíricas sobre el papel moderador de la edad en las valoraciones y respuestas de los consumidores ante fallos en el servicio. Por ejemplo, en el trabajo de Varela et al. (2010) se confirma que la edad modera el efecto que tiene el tipo de fallo en las emociones negativas del consumidor. Roschk et al. (2013) concluyen que la edad modera la relación entre la justicia y la satisfacción después de la queja. Y los resultados de Cambra et al. (2011) indican que los clientes adultos se muestran más leales que los jóvenes después de la recuperación del servicio. A la vista de estas investigaciones, consideramos que en nuestro contexto de estudio la edad del cliente va a ejercer un efecto moderar en la relación entre la satisfacción y las intenciones posteriores de boca-oído, tanto convencional como online. Por tanto, formulamos de esta forma la última hipótesis de nuestro trabajo (Figura 1):

*H<sub>7</sub>: La edad del cliente modera el efecto de la satisfacción con la recuperación del servicio en H<sub>7a</sub> la intención de boca-oído y en H<sub>7b</sub> la intención de boca-oído online.*

FIGURA 1  
Modelo propuesto de relaciones

### 3. Metodología

Con la finalidad de contrastar el modelo propuesto, se llevó a cabo una investigación cuantitativa en el contexto de experiencias de compras y/o consumo que incluyen esfuerzos de recuperación del servicio por parte de establecimientos comerciales minoristas. El método aplicado para la recoger este tipo de información ha sido la técnica retrospectiva del recuerdo, de tal forma que el individuo ha tenido que recordar una situación insatisfactoria en cualquier tienda donde haya habido actuación por parte del empleado para solucionar el problema. Para ello, se desarrolló una encuesta personal a 336 individuos basada en un cuestionario estructurado (Tabla 1).

-----------------------------	------------------------------------

Con la finalidad de obtener una muestra representativa de la población, el trabajo de campo se ha desarrollado en diferentes ubicaciones comerciales de una provincia española que han facilitado la localización y disponibilidad de consumidores. Las encuestas fueron realizadas a la salida de diversos establecimientos comerciales preguntando a los encuestados acerca de su relación con la tienda visitada. Para seleccionar a los encuestados se ha seguido un procedimiento de muestreo aleatorio simple. Las características socio-demográficas y relacionadas con la experiencia de compra se muestran en las tablas 2 y 3, respectivamente.

**TABLA 2**  
**Perfil socio-demográfico de la muestra**

Género		Edad		Ocupación		Estudios		Ingresos (€)	
Hombres	31,6%	≤ 20	6,6%	Trabajando	44,1%	Primarios	22%	≤ 1000	35,7%
Mujeres	68,4%	21-30	15,5%	Estudiando	7,9%	Bachiller	20,4%	1000-2000	43,5%
		31-40	19,1%	Trabajando y estudiando	4,9%	Formación profesional	19,4%	2000-3000	18%

--	--	--

Una vez recogidos los datos, se realiza un análisis de componentes principales (ACP) con el fin de agrupar los ítems utilizados en factores. A continuación, con el fin de confirmar la validez del modelo propuesto, se realiza un análisis de covarianzas o estimación de un modelo de ecuaciones estructurales siguiendo el procedimiento en dos etapas recomendado por Anderson y Gerbing (1988). Este procedimiento implica, en primer lugar, analizar la calidad de la medida de los constructos a través de un análisis factorial confirmatorio y, en segundo lugar, la estimación de un modelo estructural, teórico o causal, que permite obtener información acerca de las relaciones entre los constructos a los que se refieren las hipótesis de este estudio. De esta forma, se pueden contrastar simultáneamente las hipótesis acerca de las relaciones de causalidad entre las variables latentes y/o observadas (Figura 1).

Por último, con el fin de contrastar la influencia de la edad del consumidor en la relación entre la satisfacción con la recuperación del servicio y las intenciones de comunicación boca-oído a través de los medios tradicionales y por vía electrónica, se estima un modelo de ecuaciones estructurales multigrupo o multimuestra. A través de esta técnica tratamos de contrastar la existencia de diferencias significativas en estas relaciones en función de la edad del consumidor (Figura 1).

#### 4. Resultados

En primer lugar, a modo de análisis preliminar, se realiza un análisis de componentes principales (ACP) con rotación VARIMAX con el fin de obtener la estructura de relaciones entre las variables que componen las diferentes escalas. Tras esta primera fase exploratoria, los resultados del ACP fueron sometidos a un análisis factorial confirmatorio. Como resultado, se observa que los índices de ajuste oscilan alrededor de 0,9, lo que indica un ajuste aceptable del modelo (Tabla 5). Adicionalmente, el error cuadrático medio es bajo (RMSEA = 0.053).

TABLA 5  
Resultados del análisis factorial confirmatorio

Constructo	Ítem	Carga fact. est. (error est.)	t	$\alpha$ Cronbach	Fiabilidad compuesta	Varianza extraída
F1. Atribuciones de origen externo	AO1	0.886	-	0.940	0.943	0.892
	AO2	1.000 (0.084)	13.761*			
F2. Atribuciones de causa inestable	AE1	1.000	-	-	-	-
F3. Atribuciones de causa incontrolable	AC1	1.000	-	-	-	-
F4. Esfuerzos de recuperación	ER1	0.809	-	0.812	0.824	0.544
	ER2	0.864 (0.057)	16.514*			
	ER3	0.614 (0.070)	9.136*			
	ER4	0.632 (0.067)	9.763*			
F5. Satisfacción con la recuperación	S1	0.947	-	0.967	0.970	0.914
	S2	0.964 (0.020)	50.438*			
	S3	0.957 (0.022)	40.505*

	BO2	0.984 (0.016)	63.996*			
	BO3	0.974 (0.017)	59.312*			
F7. Boca-oído online	BOO1	0.700	-	0.949	0.877	0.708
	BOO3	0.982 (0.117)	9.810*			
	BOO3	0.818 (0.113)	9.924*			

Chi-cuadrado Satorra-Bentler: 188.49; grados de libertad: 98; CFI: 0.979; IFI: 0.979; Bentler-Bonett NNFI: 0.941; RMSEA: 0.053.

A partir de los resultados expuestos en la Tabla 5, se puede confirmar la fiabilidad de las escalas, ya que tanto la fiabilidad compuesta como el coeficiente alfa de Cronbach están por encima del valor recomendado de 0,8 para todos los constructos, las varianzas extraídas son superiores al 50% y las cargas factoriales estandarizadas son estadísticamente significativas para todos los ítems. Todo ello nos permite confirmar la validez convergente del modelo.

TABLA 6  
Medias, desviaciones típicas y correlaciones entre constructos

Constructo	Media	Desv. típ.	Correlaciones						
			F1	F2	F3	F4	F5	F6	F7
F1. Atribuciones de origen externo	3.290	1.430		0.000 (-0.18, 0.18)	-0.196 (-0.37, -0.02)	-0.131 (-0.29, 0.02)	-0.350 (-0.56, -0.14)	-0.414 (-0.61, -0.21)	-0.175 (-0.29, -0.06)
F2. Atribuciones de causa inestable	3.036	1.238			0.232 (0.05, 0.42)	0.369 (0.19, 0.55)	0.482 (0.28, 0.69)	0.346 (0.16, 0.53)	-0.069 (-0.17, 0.04)
F3. Atribuciones de causa incontrolable	2.613	1.153				0.125 (-0.04, 0.29)	0.348 (0.16, 0.54)	0.218 (0.05, 0.39)	-0.054 (-0.14, 0.04)
F4. Esfuerzos de recuperación	2.490	1.142					0.588 (0.41, 0.77)	0.529 (0.37, 0.69)	0.221 (0.12, 0.32)
F5. Satisfacción con la recuperación	3.242	1.358						0.735 (0.55, 0.92)	0.188 (0.09, 0.28)
F6. Boca-oído	2.736	1.284							0.324 (0.22, 0.43)
F7. Boca-oído online	2.909	1.322							

Por otra parte, se calculan las correlaciones entre constructos con el fin de comprobar la validez discriminante (Tabla 6). Para ello, calculamos el intervalo de confianza descrito por Anderson y Gerbing (1988) para las correlaciones entre todos los pares de constructos. Esta prueba requiere el cálculo de un intervalo de confianza de  $\pm$  dos errores estándar para la correlación entre dos constructos y determinar si este intervalo incluye el valor 1. En caso de que este intervalo no incluya el valor 1, la validez discriminante queda confirmada. En este caso, como se puede comprobar en la Tabla 6, ninguno de los intervalos incluye la unidad, quedando así confirmada la validez discriminante.

Una vez confirmada la validez, estimamos el modelo de ecuaciones estructurales que aparece en la Figura 1, obteniendo los resultados que se muestran en la Tabla 7.

TABLA 7  
Resultados del modelo de ecuaciones estructurales

Relación	Parámetro estandarizado	Error estándar	t	Hipótesis
Atribuciones de origen externo → Satisfacción con recuperación	-0.304	0.047	-6.404*	H <sub>1</sub> aceptada
Atribuciones de causa inestable → Satisfacción con recuperación	0.736	0.293	5.474*	H <sub>2</sub> aceptada
Atribuciones de causa incontrolable → Satisfacción con recuperación	0.382	0.206	3.938*	H <sub>3</sub> aceptada
Esfuerzos de recuperación → Satisfacción con recuperación	0.458	0.067	8.084*	H <sub>4</sub> aceptada
Satisfacción con recuperación → Boca-oído	0.709	0.039	17.689*	H <sub>5</sub> aceptada
Satisfacción con recuperación → Boca-oído online	0.180	0.031	3.078*	H <sub>6</sub> aceptada

Chi-cuadrado Satorra-Bentler: 291.40; grados de libertad: 113; CFI: 0.959; IFI: 0.959; Bentler-Bonett NNFI: 0.950; RMSEA: 0.07; \* Significativo  $p < 0.05$

Como resultado, cabe destacar, en primer lugar, que todas las relaciones presentan los signos que se habían hipotetizado a partir de la revisión de la literatura. Así, las atribuciones de causa inestable y de causa incontrolable y los esfuerzos de recuperación influyen positiva y significativamente sobre la satisfacción del cliente con la recuperación, y esta última, a su vez, influye positivamente sobre la intención de emitir comunicaciones boca-oído por medios convencionales y, en menor medida, a través de Internet. En cambio, las atribuciones de origen externo ejercen una influencia negativa sobre la satisfacción con la recuperación del servicio. El ajuste global del modelo es aceptable, ya que los índices de ajuste se encuentran alrededor del valor recomendado de 0,9 y el RMSEA es inferior al valor de referencia de 0,08.

Adicionalmente, para contrastar la H<sub>7</sub> esperamos encontrar diferencias significativas entre los clientes más jóvenes y los de mayor edad en la evaluación de la satisfacción del cliente con la recuperación y las intenciones de boca-oído (tanto convencional como online). Con el fin de contrastar esta hipótesis, en primer lugar, se realiza un análisis de varianza entre dos grupos de clientes, a saber, los menores de 40 años y los que superan esta edad (Tabla 8).

TABLA 8  
Valores medios y diferencias significativas de las variables propuestas en función de la edad

	Edad < 40 (N=134)	Edad ≥ 40 (N=202)	F	p valor
F1. Atribuciones de origen externo	3.36	3.24	0.74	0.391
F2. Atribuciones de causa inestable	2.89	3.13	3.19	0.075
F3. Atribuciones de causa incontrolable	2.53	2.67	1.16	0.283
F4. Esfuerzos de recuperación	2.39	2.56	2.63	0.106
F5. Satisfacción con recuperación	3.11	3.33	2.19	0.140
F6. Boca-oído	2.54	2.86	5.23	0.023
F7. Boca-oído online	1.52	1.33	4.84	0.028

Los clientes de mayor edad muestran puntuaciones más altas para todos los constructos analizados, a excepción de las atribuciones de origen externo y las intenciones de boca-oído online. Sin embargo, las diferencias son estadísticamente significativas únicamente para las intenciones de boca-oído convencional y online, de manera que los clientes que superan la cuarentena tienden a compartir sus experiencias con el establecimiento con familiares, amigos y conocidos en mayor medida que los clientes más jóvenes, si bien éstos presentan una tendencia significativamente mayor a realizar más boca-oído por Internet ( $p < 0.05$ ). Este hecho puede venir explicado por el uso de las redes sociales por parte de los más jóvenes para comunicarse con sus contactos, reemplazando así las comunicaciones cara a cara o por vía telefónica para este grupo de edad.

Con el fin de profundizar en esta cuestión, se lleva a cabo un análisis multigrupo. De esta manera, se trata de contrastar la existencia de diferencias significativas en las relaciones entre la satisfacción del cliente con la recuperación y las intenciones de boca-oído por medios convencionales y online en función de la edad del consumidor. Los resultados obtenidos se muestran en la Tabla 9.

TABLA 9  
Resultados del análisis multigrupo

	Edad < 40 (N=134)	Edad ≥ 40 (N=202)	Chi <sup>2</sup>	p valor
Atribuciones de origen externo → Satisfacción con recuperación	-0.401	-0.230	-	-
Atribuciones de causa inestable → Satisfacción con recuperación	0.659	0.579	-	-
Atribuciones de causa incontrolable → Satisfacción con recuperación	0.145	0.609	-	-
Esfuerzos de recuperación → Satisfacción con recuperación	0.459	0.455	-	-
Satisfacción con recuperación → Boca-oído	0.719	0.694	0.000	0.995
Satisfacción con recuperación → Boca-oído online	0.113	0.176	9.134	0.003

Chi-cuadrado Satorra-Bentler: 445.83; grados de libertad: 228; CFI: 0.951; IFI: 0.951; Bentler-Bonett NNFI: 0.941; RMSEA: 0.054

A partir de los resultados obtenidos, cabe resaltar la existencia de diferencias significativas entre los dos grupos de edad considerados únicamente en la relación entre la satisfacción con la recuperación del servicio y las intenciones de boca-oído online. Así, la intensidad de esta relación es más fuerte para los consumidores de mayor edad frente a los más jóvenes ( $p < 0.01$ ), confirmándose la hipótesis  $H_{7b}$ . En cambio, si bien anteriormente se constató a través del análisis de la varianza que los clientes de mayor edad presentan valores significativamente mayores para las intenciones de boca-oído por medios convencionales frente a los más jóvenes, a partir del análisis multigrupo no se observa un efecto moderador de la edad sobre esta relación.

## 5. Conclusiones

La investigación de las valoraciones y respuestas que tienen los clientes en situaciones de fallo en el servicio es un área que está recibiendo una atención especial tanto a nivel académico como a nivel práctico (Kunz y Hogreve, 2011). Este trabajo ha abordado el estudio del proceso de recuperación del servicio en experiencias insatisfactorias de compra en comercios minoristas. Para ello, en primer lugar, hemos analizado el efecto directo que tienen las tres dimensiones de las atribuciones causales y la percepción sobre los esfuerzos de recuperación en la satisfacción, así como de dicha satisfacción sobre las intenciones de boca-oído convencional y online. Y en

segundo lugar, se ha estudiado el efecto moderador que ejerce la edad en la relación entre la satisfacción y las intenciones de boca-oído.

Los resultados muestran que las atribuciones que realizan los consumidores sobre las causas del fallo influyen en el grado de satisfacción con la recuperación del servicio. Concretamente, las atribuciones de origen externo afectan negativamente a la satisfacción, mientras que las atribuciones de causa inestable y de causa incontrolable lo hacen positivamente, siendo las de causa inestable las que más influencia ejercen. Cuando los consumidores asignan la responsabilidad del problema a la tienda, se sienten menos satisfechos con la solución, sin embargo, si perciben que la causa es puntual y que la tienda no ha podido evitar el problema, se sienten más satisfechos con la recuperación. Estos resultados se encuentran en la línea de investigaciones previas sobre el papel de las atribuciones en la satisfacción del consumidor (p.e. Maxham y Netemeyer, 2002; Choi y Mattila, 2008).

Respecto a la percepción de los esfuerzos de recuperación por parte de la tienda, también se ha revelado como un antecedente importante de la satisfacción del cliente con la solución del fallo, tal y como lo confirman evidencias empíricas anteriores (p.e. Kau y Loh, 2006; Bradley y Sparks, 2012). Del mismo modo, la satisfacción con la recuperación estimula las intenciones de realizar comentarios boca-oído (p.e. Farquhar y Panther, 2007; Komunda y Osarenkhoe, 2012). En nuestro caso, podemos comprobar que el efecto que tiene la satisfacción sobre el boca-oído convencional es mayor que el efecto sobre el boca-oído online. Consideramos que esta diferencia puede deberse al mayor esfuerzo que requiere hacer comentarios y recomendaciones por el medio virtual.

Adicionalmente, los resultados indican que las conductas de boca-oído son diferentes en función de la edad. Los clientes de más de 40 años realizan más comentarios de este tipo que los de menos de 40 años pero menos a través de internet. Este hecho puede venir explicado por el elevado uso de las redes sociales por parte de los más jóvenes para comunicarse con sus contactos, reemplazando así las comunicaciones cara a cara o por vía telefónica para este grupo de edad. También la edad del cliente modera la relación entre la satisfacción con la recuperación y el boca-oído online. De forma específica, la satisfacción de los clientes de más de 40 años influye más en la conducta de boca-oído online que en clientes de menor edad. Este hallazgo puede implicar que los consumidores más adultos que escriben sus comentarios sobre la tienda a través de internet necesitan estar muy satisfechos para realizar este tipo de boca-oreja, mientras que los menos adultos están menos condicionados por su nivel de satisfacción a la hora de emitir sus valoraciones de forma virtual, ya que emplean este medio más habitualmente.

Desde el punto de vista de la gestión empresarial, los responsables de tiendas deben ser conscientes de la importancia que tiene la percepción del cliente sobre las causas del fallo y sobre los esfuerzos de recuperación, tanto los orientados a la solución como los orientados al proceso. Para ello, los establecimientos deberían diseñar actuaciones orientadas a tratar los fallos prestando especial atención a las compensaciones de tipo material o económico y a las explicaciones sobre las causas del problema. En este sentido, en la medida en que los consumidores perciban que el fallo es puntual e inevitable, realizarán valoraciones más positivas y será más probable que cuenten a otros su satisfacción.

Para avanzar en el estudio de la satisfacción con la recuperación del servicio, proponemos incorporar otros antecedentes importantes que destaca la literatura, como son la justicia o equidad (p.e. Bradley y Sparks, 2012) o la gravedad del problema (p.e. Betts et al., 2011). Así mismo, se puede analizar el efecto moderador de otras características personales del consumidor (p.e. Cambra et al., 2013) y relacionadas con el contexto de compra, como el tipo de compra online y en tienda (p.e. Lii et al., 2013). Estos análisis permitirán mejorar nuestra comprensión sobre las variables que influyen en la relación entre la satisfacción con la recuperación y la conducta de boca-oído posterior.

## RESUMEN

*El concepto del capital de marca ha despertado un interés creciente en el contexto de la distribución comercial minorista. Sin embargo, las contribuciones dirigidas a determinar su contenido todavía son limitadas. Además, no existe consenso en cuanto a la relación entre este constructo y la lealtad del cliente. Por ello, este trabajo pretende profundizar en la dimensionalidad del capital de marca de la tienda y su relación con la lealtad a través de dos modelos alternativos, uno que propone la lealtad como una dimensión del capital de marca y otro que considera este constructo como el efecto del capital de marca. Los resultados afirman dos dimensiones clave del capital de marca de la tienda – la imagen y la calidad de servicio y corroboran la validez de ambos modelos propuestos, si bien se constata una cierta superioridad del modelo que presenta la lealtad como dimensión del capital de marca de la tienda, frente al que supone la lealtad como consecuente.*

## PALABRAS CLAVE

*Capital de marca de la tienda, lealtad, notoriedad, imagen, calidad, valor percibido.*

---

<sup>1</sup> Este estudio ha sido realizado con el apoyo financiero prestado por el proyecto I+D del Plan Nacional del Ministerio de Educación y Ciencia - ECO2010-17475.

## 1. Introducción

Desde la literatura se evidencia la necesidad de investigar el concepto “capital de marca”, entendido como un valor añadido que los consumidores atribuyen a los productos a través de su marca (Lassar et al., 1995; Yoo et al., 2000; Pappu y Quester, 2006a). En este contexto, algunos trabajos muestran los efectos del capital de marca en productos (e.g. Lassar et al., 1995; Yoo et al., 2000; Villarejo, 2003; Taylor et al., 2004). Así, se ha señalado que los consumidores otorgan un mayor valor de marca a aquellas que consideran fuertes, únicas y deseables (Yoo et al., 2000; Verhoef et al., 2007), lo que permite crear una serie de ventajas competitivas capaces de ofrecer una propuesta de valor sobre la base de las asociaciones existentes (Aaker, 1996) y unos resultados financieros superiores (Roberts y Dowling, 2002).

En el contexto de la distribución comercial minorista, se empieza a referir la importancia de construir un capital de marca vinculado al establecimiento comercial (Ailawadi y Keller, 2004; Jinfeng y Zhilong, 2009), lo que supone la aparición del concepto de capital de marca de la tienda (Pappu y Quester, 2006). Desde la literatura de marketing se advierte que este constructo representa uno de los elementos clave sobre el que es posible apoyar una estrategia de diferenciación frente a la competencia (Lassar et al., 1995; Yoo et al., 2000).

No obstante, aunque existen estudios recientes que reflejan el interés progresivo suscitado en torno a la conceptualización del capital de marca del establecimiento (p.e. Pappu y Quester, 2006a; Jinfeng y Zhilong, 2009; Swoboda et al., 2009), a partir de la revisión de la literatura se observa que su desarrollo y análisis ha sido, hasta el momento, escaso. Además, existe un cierto desacuerdo en cuanto a la dimensionalidad del capital de marca de la tienda y sus relaciones con otras variables. En este sentido, la lealtad ha sido considerada por algunos investigadores como una dimensión del capital de marca de la tienda (Arnett et al., 2003; Hartman y Spiro, 2005; Pappu y Quester, 2006a; Jinfeng y Zhilong, 2009), mientras que otros sugieren que es su consecuencia (p.e. DeCarlo et al., 2007; Martenson, 2007; Chebat et al., 2009; Fleck y Nabec 2010).

Por todo lo anteriormente expuesto, el presente trabajo se enmarca en la línea de investigación que persigue profundizar en el estudio del capital de marca de la tienda, delimitando las variables que contribuyen a su formación, al igual que la influencia que esta variable puede ejercer en la lealtad del cliente hacia el establecimiento comercial. De este modo, este estudio busca ser una aproximación que pretende entender el proceso de formación del capital de marca de la tienda y sus dimensiones, con una orientación metodológica intervariable por recoger las relaciones del capital de marca con otras variables resultado (Gallarza y Gil, 2006). En particular, se trata de definir el tipo de relación que presentan el capital de marca de la tienda y la lealtad, posicionándonos en la discusión entre los académicos que consideran la lealtad como dimensión del capital de marca de la tienda y los que proponen una relación causa-efecto entre ambos constructos.

## 2. Marco teórico e hipótesis de investigación

### 2.1. Capital de marca: conceptualización y evaluación

A lo largo de los años han surgido diversas aproximaciones que tratan de definir el capital de marca, delimitándolo como el valor añadido al producto consecuencia de la existencia de una marca (Yoo et al., 2000). La marca es definida como aquel valioso activo intangible y difícil de imitar (Roberts y Dowling, 2002) capaz de ofrecer una propuesta de valor sobre la base de las asociaciones existentes y transmitir la cultura y valores de la organización (Aaker, 1996), además de ayudar al logro de unos resultados financieros superiores (Roberts y Dowling, 2002).

Las aportaciones realizadas respecto al concepto de capital de marca desde la perspectiva de marketing, confieren al mercado y a los consumidores el mayor protagonismo, analizándolo en términos de actitudes acumuladas en la mente del consumidor (Ambler y Styles, 1995), preferencias (Park y Srinivasan, 1994), percepciones (Lassar et al., 1995; Yoo et al., 2000), asociaciones y comportamientos (Aaker, 1991) del consumidor hacia la marca. En este sentido, Keller (1993: 8) concibe el capital de marca como “*el efecto diferencial del conocimiento de la marca en la respuesta del consumidor al marketing de la marca*”. Y, por su parte, Yoo et al. (2000: 196) introducen

explícitamente la comparación con otras marcas como un elemento conceptual relevante, definiendo de este modo el capital de marca como *“el valor añadido percibido por el consumidor que le lleva a la elección entre varias alternativas con idénticas características”*.

Si bien la investigación en torno al capital de marca en el ámbito del producto goza de una larga tradición, el número de aportaciones dirigidas a delimitar su contenido en el contexto de la distribución comercial minorista es limitado (Arnett et al., 2003; Hartman y Spiro, 2005; Pappu y Quester, 2006a y b; Christodoulides et al., 2006; Baldauf et al., 2009; Chebat et al., 2009; El Hedhli y Chebat, 2009; Jinfeng y Zhilong, 2009; Swoboda et al., 2009; Hernández y Navarro, 2009; Fleck y Nabec, 2010; Shen, 2010; Arnett et al., 2010; Ha et al., 2010). Estas contribuciones se pueden clasificar en cuatro grupos, según el objetivo que pretendían alcanzar: a) elaborar índices de capital de marca de la tienda, entendiendo éste como un constructo multidimensional (Arnett et al., 2003); b) extender las medidas multidimensionales de capital de marca desarrolladas en contextos de producto al contexto minorista (Pappu y Quester, 2006a; Jinfeng y Zhilong, 2009; Shen, 2010); c) desarrollar medidas multidimensionales de este constructo según formato comercial, como las aportadas para centros comerciales bajo la denominación de *shopper-based mall equity* (SBME) de Chebat et al. (2009) y El Hedhli y Chebat (2009) y d) utilizar medidas globales unidimensionales (Arnett et al., 2003; Hernández y Navarro, 2009; Shen, 2010; Ha et al., 2010). Muchas de estas aportaciones acotan el dominio del constructo “capital de marca”, a partir de dimensiones con denominaciones similares, pero que difieren en cuanto a su conceptualización y evaluación.

Así, dentro del primer grupo de trabajos se enmarca la investigación desarrollada por Arnett et al. (2003) quienes desarrollan un índice parsimonioso de medición del capital de marca de la tienda, demostrando al mismo tiempo su utilidad. Basándose en los trabajos de Aaker (1991) y Yoo et al. (2000), estos autores identifican las siguientes dimensiones del capital de marca de la tienda: a) la lealtad hacia la tienda; b) la conciencia del nombre marca; c) la calidad de servicio y d) las asociaciones del minorista (medidas a partir de la calidad de producto y del valor). Para los autores, las tres primeras dimensiones son consistentes de minorista a minorista y por lo tanto, su medición debe ser similar para todos ellos, mientras que es necesario ajustar y seleccionar el tipo de asociaciones de marca más relevantes para cada minorista, pues pueden no ser las mismas.

Desde la segunda perspectiva, Hartman y Spiro (2005: 1114) definen el capital de marca de la tienda como: *“el efecto diferencial existente del conocimiento de la tienda en la respuesta del consumidor al marketing del establecimiento”*, tomando como punto de partida la aproximación de Keller (1993). En esta línea, Pappu y Quester (2006a) extienden las medidas de capital de marca desarrolladas por Yoo y Donthu (2001) al ámbito minorista y delimitan el constructo a partir de cuatro dimensiones: a) conciencia de la enseña del distribuidor; b) asociaciones del distribuidor (definidas éstas como la imagen de tienda); c) calidad percibida del distribuidor, y d) lealtad conceptualizada desde un planteamiento actitudinal y no conductual como *“la tendencia de ser leales a un determinado minorista demostrado por la intención de comprar en él como primera elección”*.

Los trabajos de Chebat et al. (2009) y El Hedhli y Chebat (2009) pertenecen al tercer planteamiento del constructo, pues desarrollan medidas del capital de marca de la tienda aplicadas al formato centro comercial, entendiéndose como un constructo formado por dos dimensiones: la conciencia del centro comercial y su imagen. A su vez esta última se constituye a partir de cuatro dimensiones en la propuesta de Chebat et al. (2009) (conveniencia, ambiente global, calidad de los servicios y calidad de los productos), mientras que El Hedhli y Chebat (2009) concluyeron que la imagen del centro comercial puede ser explicada a partir de la apariencia general, el ambiente global y el comportamiento de los empleados.

Por último, en el contexto minorista se han utilizado medidas globales del capital de marca adaptadas del contexto de producto. Así Arnett et al. (2003) utilizan como criterio externo para valorar la validez del índice de capital de marca, una escala de medida global reflectiva desarrollada por Yoo et al. (2000), mientras que Shen (2010) adapta en su investigación la propuesta de medida global del capital de marca planteada por Yoo y Donthu (2001). Adicionalmente, desde la perspectiva del propio distribuidor y dentro del contexto de la construcción de la cadena de valor en el canal de distribución, se ha abordado el análisis del capital de marca desde la valoración del propio minorista. Hernández y

Navarro (2009) proponen el concepto *Buying group's retailer equity* (BGRE) para referirse al capital de marca del minorista al que accede como consecuencia de usar una marca perteneciente a la agrupación de compra de la que forma parte. En este caso, la estimación del capital de marca se realiza a partir de las percepciones de distribuidores a través de una medida global ad hoc.

A partir de todas estas contribuciones, podríamos concluir que existe evidencia en la literatura para considerar que el capital de marca de la tienda podría ser entendido como un constructo multidimensional compuesto por seis dimensiones: a) la notoriedad; b) la imagen; c) la calidad de servicio; d) la calidad de producto; e) el valor percibido y d) la lealtad. Si bien, también podría ser igualmente cierto, a la luz de algunas de las aportaciones referidas, que todas las dimensiones anteriores contribuyeran a la formación del capital de marca de la tienda y que este tuviera a su vez una influencia positiva sobre la lealtad del consumidor hacia el establecimiento comercial minorista. A continuación abordamos más detenidamente todas las dimensiones identificadas y su relación con el capital de marca y proponemos distintas hipótesis a investigar.

## **2.2. Capital de marca de la tienda y sus dimensiones**

La notoriedad de marca se ha definido como el grado de familiaridad del nombre del minorista para los consumidores (Aaker, 1991), relacionándose con la facilidad con la que el nombre del minorista es evocado en la mente del consumidor. El lugar que ocupa la marca en la mente del consumidor resulta crucial en el proceso de elección, en la medida en que contribuye a determinar su conjunto de consideración (Keller, 1993), ya que si esa marca no está en su memoria cuando este se plantea el lugar donde realizar su compra, rara vez la elegirá entre sus alternativas (Villarejo et al., 2007). La notoriedad ha sido positivamente relacionada en diversas ocasiones con el capital de marca de la tienda (Keller, 1993; Yoo et al., 2000; Hartman y Spiro, 2005; Pappu y Quester, 2006a; Jinfeng y Zhilong, 2009). Por ello, se constituye como un elemento del capital de marca que influye en las decisiones del consumidor tanto a nivel afectivo como a nivel conductual (Villarejo et al., 2007) creando sentimientos de agrado y familiaridad (Aaker, 1991). A partir de ahí, proponemos la primera hipótesis a investigar:

*H1: La notoriedad de la tienda influye positiva y significativamente sobre el capital de marca de la tienda.*

De otro lado, la imagen del establecimiento, resultado de la gestión de la distribución por parte de las empresas (Villarejo et al., 2007), es utilizada como herramienta de marketing para lograr, incrementar y mejorar el capital de marca (Srivastava y Shocker, 1991). Cada establecimiento tiene una imagen única, definida a partir de asociaciones automáticas al establecimiento por parte de sus principales clientes, incluso aunque existan dos o más tiendas con los mismos precios y políticas operativas en la misma área de mercado (Thelen y Woodside 1997). Diversos estudios han concluido que cuanto más favorable sea la imagen del establecimiento para el consumidor, mayor será el valor de ese establecimiento, ejerciendo así una influencia positiva sobre el capital de marca global de la tienda (Villarejo, 2003). Más recientemente, Beristain y Zorrilla (2011) encuentran apoyo empírico a la idea de que la imagen de la tienda puede ser utilizada por los minoristas para influir en todos los componentes del capital de marca de la tienda. Estas ideas dan lugar a la segunda hipótesis de investigación:

*H2: La imagen de la tienda influye de forma positiva y significativa sobre el capital de marca de la tienda.*

En cuanto a la calidad de servicio, ha sido identificada como una característica importante de las marcas fuertes (Arnett et al., 2003), que influye significativamente en el comportamiento del consumidor (Bolton, 1998). En este sentido Arnett et al. (2003) han concluido que la calidad servicio contribuye a la creación del capital de marca de la tienda en mayor medida que cualquier otra dimensión. A partir de ahí proponemos la tercera hipótesis a investigar:

*H3: La calidad de servicio influye de forma positiva y significativa sobre el capital de marca de la tienda.*

Adicionalmente, se ha argumentado que el capital de la marca de la tienda se asienta, en gran parte, en las asociaciones específicas vinculadas a la misma (Aaker, 1991). Dichas asociaciones vinculadas al

nombre del minorista, con frecuencia dependen de las estrategias de marketing implementadas por la tienda. Entre dichas asociaciones, Arnett et al. (2003) destacan la calidad del producto y el valor percibido. Con respecto al valor percibido, en el ámbito del comercio minorista, Sweeney y Soutar (2001) desarrollan una escala de su medición, nombrada PERVAL. Las dos dimensiones funcionales de esta escala se refieren a la utilidad derivada del producto debida a la reducción de sus costes percibidos a corto y largo plazo, y la utilidad derivada de la calidad percibida y el rendimiento esperado del producto, que se corresponden con el valor percibido por el consumidor y la calidad del producto, respectivamente. A partir de estas consideraciones, enunciarnos las siguientes hipótesis de investigación:

*H4: La calidad de producto influye de forma positiva y significativa sobre el capital de marca de la tienda.*

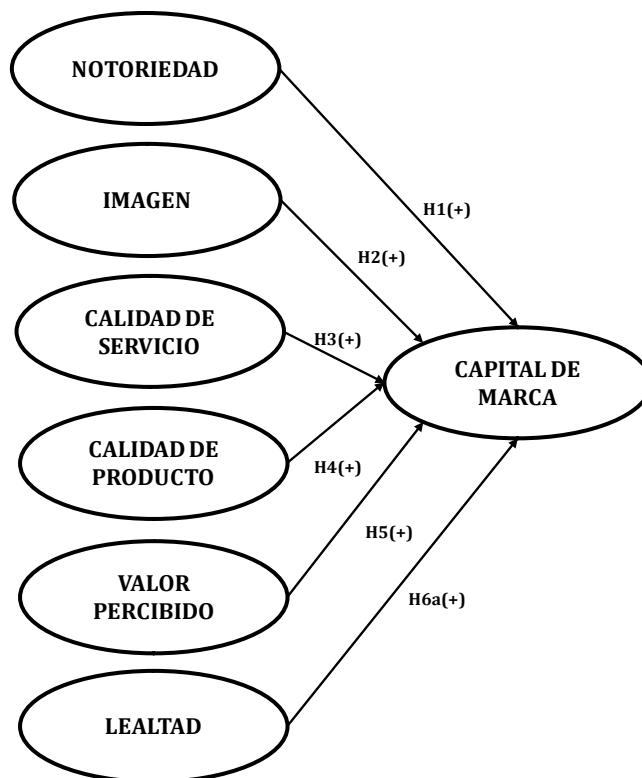

*H5: El valor percibido influye de forma positiva y significativa sobre el capital de marca de la tienda.*

Por último, a partir de la evidencia existente en el ámbito del capital de marca del producto (Aaker 1991, Yoo et al., 2000) numerosos autores sugieren que la lealtad es una de las dimensiones que constituyen el capital de marca de la tienda (p.e. Arnett et al., 2003; Hartman y Spiro, 2005; Pappu y Quester, 2006a; Jinfeng y Zhilong, 2009), señalando que la lealtad hacia la tienda correlaciona positivamente con el resto de dimensiones del capital de marca, contribuyendo así a su formación (Jinfeng y Zhilong, 2009). En este sentido, la lealtad hacia la marca se conforma como la medida del vínculo entre el consumidor y la marca que a menudo constituye el núcleo del capital de marca. Por tanto, planteamos la sexta hipótesis de investigación:

*H6a: La lealtad hacia la tienda influye de forma positiva y significativa sobre el capital de marca de la tienda.*

Todas las hipótesis de investigación enunciadas se recogen en el primer modelo causal propuesto, ilustrado en la Figura 1.

FIGURA 1  
Modelo causal 1

### 2.3. Lealtad como efecto del capital de la marca de la tienda

Con respecto a la relación entre la lealtad y el capital de marca, mientras que algunos investigadores señalan que la lealtad puede ser entendida como una de las dimensiones que constituyen el capital de marca de la tienda (p.e. Arnett et al., 2003; Hartman y Spiro, 2005; Pappu y Quester, 2006a; Jinfeng y Zhilong, 2009), otros consideran que es un efecto del mismo (p.e. DeCarlo et al., 2007; Martenson, 2007, Chebat et al., 2009; Fleck y Nabec, 2010; Allaway et al., 2011). A partir de este desacuerdo acerca del entendimiento de la lealtad y capital de marca de la tienda, se precisa clarificar la naturaleza de la relación entre los dos constructos.

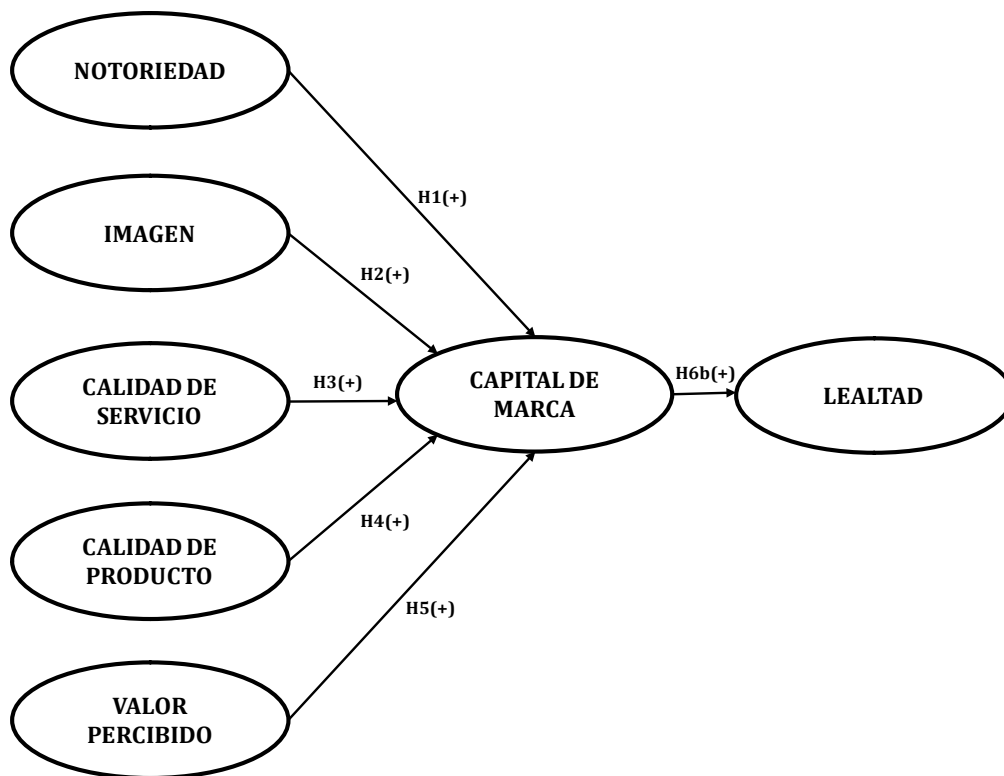

Respecto a los efectos producidos por el capital de marca, existen diversas aportaciones desde la perspectiva de producto (e.g. Taylor et al., 2004; Broyles et al., 2009) que analizan la existencia de un conjunto de variables resultado del efecto diferencial proporcionado por el capital de marca. En particular, se ha señalado la lealtad, identificándola como el resultado de una serie de actitudes y pensamientos generados en el consumidor (Keller, 1993) como consecuencia de un proceso de decisión y evaluación (Bloemer y Ruyter, 1998).

En esta línea, entre los autores que sugieren que la lealtad es una consecuencia del capital de marca, Chebat et al. (2009) han evidenciado que *shopper-based mall equity* genera la lealtad entre todos los compradores, tanto entre las mujeres como entre los hombres. Del mismo modo, Allaway et al. (2011) han concluido que la lealtad del consumidor es un efecto del capital de marca en la industria de supermercados estadounidenses. A partir de estos hallazgos, se propone la siguiente hipótesis de investigación alternativa:

*H6b: El capital de marca de la tienda influye de forma positiva y significativa sobre la lealtad hacia la tienda.*

Esta hipótesis está reflejada en el segundo modelo causal propuesto, tal y como se puede observar en la Figura 2.

FIGURA 2  
Modelo causal 2

### 3. Metodología

Con el objetivo de contrastar los modelos propuestos, se desarrolló una encuesta personal estructurada a 820 individuos. En concreto, la encuesta se realizó en una provincia española, seleccionando trece enseñas de los sectores de alimentación, textil, electrónica y hogar. Los establecimientos que han sido retenidos en base a los productos ofertados y su posicionamiento en el mercado español, forman parte de los principales grupos de distribución en España y son considerados como algunas de las marcas minoristas europeas más sobresalientes y de mayor rendimiento. Adicionalmente, la mayoría de estos establecimientos fueron citados como referentes en sus respectivos sectores, según se desprende de un estudio anterior realizado por los autores. Con la finalidad de obtener una muestra más representativa de la población, las encuestas fueron realizadas a la salida de estos establecimientos, siguiendo un muestreo dirigido, interceptando a los compradores de lunes a sábado y en horarios de mañana y tarde, preguntándoles acerca de su relación con la tienda visitada.

La Tabla 1 refleja la distribución de la muestra según las variables de clasificación (género, edad, niveles de estudios y ocupación).

TABLA 1  
Distribución de la muestra

CARACTERÍSTICAS DE LOS CONSUMIDORES	FRECUENCIA	%
<b>Género</b>		
Hombres	293	35,7
Mujeres	527	64,3
<b>Edad</b>		
18-25 años	151	18,4
26-35 años	163	19,9
36-45 años	184	22,4
46-55 años	164	20,0
56-65 años	114	13,9
Más de 65 años	44	5,4
<b>Nivel de estudios</b>		
Sin estudios	14	1,7
Educación Primaria	125	15,2
Educación Secundaria y Ciclos formativos	286	34,9
Estudios Universitarios	386	47,1
No contesta	9	1,1
<b>Ocupación</b>		
Estudiante	123	15,0
Ama de casa	67	8,2
Desempleado	102	12,4
Pensionista	76	9,3
Trabajador por cuenta propia	72	8,8
Trabajador por cuenta ajena	380	46,3

Para la recogida de la información se procedió a la administración de un cuestionario estructurado con preguntas cerradas, en el que el consumidor debía indicar su grado de acuerdo o desacuerdo con una serie de afirmaciones utilizando una escala Likert de 7 puntos, así como una serie de cuestiones de clasificación.

Los ítems incluidos en el cuestionario para el análisis de los constructos han sido propuestos en base a la revisión de diferentes estudios previos. Así, se ha adaptado la escala global de capital de marca de la tienda de Shen (2010), y se han tomado ítems de las escalas de lealtad, notoriedad y calidad de servicio utilizadas por Arnett et al. (2003). Por su parte, la calidad de producto y el valor percibido han sido medidos a través de ítems de las escalas propuestas para sendos constructos por Sweeney y Soutar

(2001), mientras que la imagen ha sido evaluada a partir de las escalas propuestas por Chowdhury et al. (1998) y Jinfeng y Zhilong (2009). Los detalles de la investigación se resumen en la Tabla 2.

TABLA 2

## 4. Análisis y resultados

### 4.1. Validación de las escalas de medida

Con el fin de validar las escalas de medida empleadas, se ha usado la técnica de regresión por mínimos cuadrados parciales (PLS) con ayuda del software Smart PLS (versión 2.0). Se trata de una técnica a la que cada vez se le presta mayor atención en la investigación en marketing y dirección de empresas tanto a nivel internacional como nacional (p.e. Barclay et al., 1995; Arnett et al., 2003; Cepeda y Roldán, 2004; Henseler et al., 2009; Arteaga et al., 2010; Hair et al., 2012a y b).

Para la valoración de la validez convergente analizamos las cargas de cada indicador sobre su variable latente, la varianza extraída promedio (AVE) y las cargas cruzadas (cross-loadings) (Hair et al., 2014) (véase Tabla 3). Al analizar las cargas se comprueba que todos los indicadores tienen cargas superiores a 0,6, criterio establecido por Bagozzi y Yi (1988). Además, a través de las cargas cruzadas comprobamos que ningún indicador tiene cargas superiores sobre un constructo distinto de aquel para el que se concibió. A continuación evaluamos la varianza extraída promedio, observando valores superiores a 0,5 en todos los casos, con lo que se establece que más del 50% de la varianza del constructo es debida a sus indicadores (Cepeda y Roldán, 2004).

De otro lado, la fiabilidad fue medida a través de los criterios de  $\alpha$  de Cronbach e índice de fiabilidad compuesta (IFC), observando valores superiores a 0,7 en ambos casos (Nunnally y Bernstein, 1994), lo que confirma la fiabilidad del instrumento de medida (véase Tabla 3).

TABLA 3

Una vez verificado que el modelo de medida es satisfactorio en relación a los criterios precedentes, es decir, las medidas de los constructos son fiables y válidas, damos paso a la evaluación de los dos modelos causales (Barclay et al., 1995; Cepeda y Roldán, 2004; Hair et al., 2014).

#### 4.2. La evaluación de los modelos causales

Tras la evaluación y análisis del instrumento de medida, procedemos al análisis de los dos modelos alternativos propuestos, expuestos en las Figuras 1 y 2, que reflejan las hipótesis planteadas en el presente trabajo. Para la estimación de cada uno de los modelos propuestos, igual que para la validación del instrumento de medida, se utiliza la técnica PLS y el *bootstrapping* de 500 submuestras de tamaño igual a la muestra original para la determinación de la significatividad de las cargas. Los resultados obtenidos se pueden observar en las Tablas 5 y 6.

En primer lugar comprobamos el poder predictivo del modelo estructural a través de los  $R^2$ . Según esta medida, la proporción de varianza de las variables endógenas que es explicada por los constructos que las predicen debería ser superior a 0,1. Como podemos ver en las Tablas 5 y 6, todos los valores de las variables dependientes superan este límite establecido por Falk y Miller (1992). A la vez que se ha analizado el tamaño del valor  $R^2$  como criterio de relevancia predictiva, también se ha aplicado la técnica de reutilización de muestra - *blindfolding*, proporcionando una distancia de omisión de siete (Geiser, 1974; Stone, 1974). Según esta reflejado en las Tablas 5 y 6, el estadístico  $Q^2$  de todas las variables resulta positivo. Este estadístico representa una medida de lo bien que los valores observados son reconstruidos a partir de los parámetros estimados (Hair et al., 2014). Por tanto, las hipótesis formuladas respecto a las variables latentes tendrán un nivel predictivo adecuado y permitirán evaluar la significatividad de las relaciones causales establecidas en ambos modelos.

Por lo que respecta al primer modelo, que propone la lealtad hacia la tienda como dimensión del capital de marca del establecimiento (Tabla 5), no todas las dimensiones propuestas resultan ser estadísticamente significativas. Así, mientras se confirma la influencia positiva y significativa de la imagen de la tienda ( $\beta=0,1898$ ;  $p<0,01$ ; H2), la calidad de servicio ( $\beta=0,0838$ ;  $p<0,05$ ; H3) y la lealtad hacia la tienda ( $\beta=0,5573$ ;  $p<0,01$ ; H6a) en la creación del capital de marca, no se encuentra apoyo a la inclusión de la notoriedad ( $\beta=-0,0120$ ; H1), la calidad de producto ( $\beta=-0,0001$ ; H4) y el valor percibido ( $\beta=0,0534$ ; H5) entre las dimensiones del capital de marca de la tienda.

TABLA 5  
Contraste de hipótesis de investigación: Modelo 1

RELACIÓN CAUSAL	HIPÓTESIS	$\beta$	T
H1: Notoriedad → Capital de marca	NO ACEPTADA	-0,0120ns	0,3855
H2: Imagen → Capital de marca	ACEPTADA	0,1898**	5,1718
H3: Calidad de servicio → Capital de marca	ACEPTADA	0,0838*	2,1088
H4: Calidad de producto → Capital de marca	NO ACEPTADA	-0,0001ns	0,0025
H5: Valor percibido → Capital de marca	NO ACEPTADA	0,0534ns	1,6501
H6a: Lealtad → Capital de marca	ACEPTADA	0,5573**	17,3801

$R^2$  (Capital de marca) = 0,5500;  $Q^2$  (Capital de marca) = 0,4910.  
\* $p<0,05$ ; \*\* $p<0,01$ ; ns=no significativo.

En relación al modelo que sugiere una relación causa-efecto entre el capital de marca de la tienda y la lealtad (Tabla 6), los resultados confirman la dimensionalidad de todas las variables, excepto una -la calidad de producto- ( $\beta=-0,0235$ ; H4). Así, se puede observar que las siguientes dimensiones afectan positiva y significativamente al capital de marca de la tienda: a) la notoriedad ( $\beta=0,1398$ ;  $p<0,01$ ; H1); b) la imagen ( $\beta=0,2661$ ;  $p<0,01$ ; H2); c) la calidad de servicio ( $\beta=0,2039$ ;  $p<0,01$ ; H3) y d) el valor percibido ( $\beta=0,1406$ ;  $p<0,01$ ; H5).

Por lo que respecta al impacto del capital de marca sobre la lealtad (véase Tabla 6), los resultados demuestran que el capital de marca de la tienda ejerce un efecto positivo y significativo sobre la

lealtad del consumidor, siendo esta relación la más fuerte entre las propuestas en el segundo modelo causal ( $\beta=0,7056$ ;  $p<0,01$ ; H6b).

TABLA 6  
**Contraste de hipótesis de investigación: Modelo 2**

RELACIÓN CAUSAL	HIPÓTESIS	$\beta$	t
H1: Notoriedad → Capital de marca	ACEPTADA	0,1398**	3,8286
H2: Imagen → Capital de marca	ACEPTADA	0,2661**	6,5105
H3: Calidad de servicio → Capital de marca	ACEPTADA	0,2039**	4,5064
H4: Calidad de producto → Capital de marca	NO ACEPTADA	0,0235ns	0,6219
H5: Valor percibido → Capital de marca	ACEPTADA	0,1406**	3,9770
H6b: Capital de marca → Lealtad	ACEPTADA	0,7056**	33,2272

$R^2$  (Capital de marca) = 0,3614;  $R^2$  (Lealtad) = 0,4978;  $Q^2$  (Capital de marca) = 0,3126,  $Q^2$  (Lealtad) = 0,4018.  
 \*\* $p<0,01$ ; ns=no significativo.

Con todo, del análisis de los resultados obtenidos para los dos modelos alternativos, se puede concluir la validez de ambas propuestas. Ambas señalan la imagen del establecimiento y la calidad de servicio como dimensiones que contribuyen positivamente a la formación del capital de marca de la tienda; mientras que para la calidad de producto hacia la tienda, los resultados obtenidos a partir de ambos modelos discrepan de los hallazgos en estudios previos (Arnett et al., 2003). Con respecto a la relación entre lealtad y capital de marca de la tienda, la inclusión de la lealtad como dimensión del capital de marca de la tienda contribuye a explicar en mayor medida este constructo ( $R^2$  del Capital de marca de la tienda = 0,5500 en el modelo que presenta la lealtad como dimensión, frente a valor promedio de  $R^2 = 0,4296$  en el modelo que propone la lealtad como efecto). Además, según la propuesta de Tenenhaus et al. (2005) al calcular la medida global de bondad del ajuste (GoF) (Guenzi y Georges, 2010), se obtiene un valor superior en el modelo que plantea la lealtad como dimensión del capital de marca de la tienda. En concreto, este modelo consigue alcanzar un 65,83% del ajuste total, frente a un 58,18% para el modelo que propone la lealtad como consecuencia última del capital de marca de la tienda. Por ello, concluimos la superioridad del modelo que presenta la lealtad como dimensión del capital de marca de la tienda, frente al que supone la lealtad como efecto.

TABLA 7  
**Bondad de ajuste de los modelos propuestos**

	Comunalidad	MODELO 1		MODELO 2	
		$R^2$	GoF	$R^2$	GoF
NOT	0,7606	-	0,6583	-	0,5818
IMG	0,5339	-		-	
CS	0,8854	-		-	
CP	0,8570	-		-	
VP	0,7527	-		-

CM	0,9080	0,5500		0,4978	
<b>Promedio</b>	<b>0,7879</b>	<b>0,5500</b>	<b>0,4296</b>		

Notas. Se obtienen valores  $R^2$  solo para las variables dependientes.  $GoF = \sqrt{\text{valor promedio de la comunalidad} \times \text{valor promedio de } R^2}$

## 5. Conclusiones

A través del presente trabajo se ha pretendido contribuir a la investigación en torno al capital de marca en el ámbito de la distribución comercial minorista. El estudio realizado ha permitido profundizar en la naturaleza del constructo y la delimitación de las variables que contribuyen a su formación a través de una muestra de consumidores españoles, proponiendo un modelo integrador para el análisis de las dimensiones y efectos del capital de marca de la tienda.

A la vista de los resultados obtenidos mediante la estimación de dos modelos estructurales podemos identificar como dimensiones del capital de marca de la tienda dos variables: a) la imagen del establecimiento (H2) y b) la calidad de servicio (H3). En este sentido, teniendo en cuenta la significatividad de las relaciones previamente establecidas estamos en disposición de afirmar que la imagen y la calidad de servicio que el consumidor percibe están relacionadas positiva y significativamente con el capital de marca de la tienda. Consecuentemente, cuanto más positiva sea la imagen del establecimiento en la mente del consumidor, mayor será su capital de marca. Asimismo, al confirmar la existencia de una relación positiva entre la calidad de servicio y el capital de marca, podemos concluir que un nivel superior de la calidad de servicio ofrecido incrementará el capital de marca de la tienda. Entre estas dos dimensiones, la imagen de la tienda ejerce el papel más importante en la creación del constructo en ambos modelos.

De otro lado, el efecto de la calidad de producto no resulta ser significativo (H4) en ninguno de los dos modelos planteados. Por ello, concluimos que la calidad de producto no influye de forma significativa sobre el capital de marca de la tienda y, por tanto, no podemos aceptar la hipótesis que establecía la relación positiva y significativa entre estas dos variables, lo que coincide con algunos estudios previos (p.e. Atilgan et al., 2005; Bravo et al., 2006; Buil et al., 2010). En esta línea, la razón de esta falta de influencia significativa de la calidad percibida de producto sobre el capital de marca en ambos modelos puede deberse a que esta variable tiene un fuerte carácter cognitivo. Así, la compra del producto parece ser la consecuencia de la mayor valoración del consumidor de una marca frente a otras marcas alternativas, y en muchos casos esta elección es realizada entre marcas percibidas como similares.

Adicionalmente, atendiendo a los resultados obtenidos en el primer modelo causal, no se puede afirmar la influencia positiva y significativa de otras dos dimensiones propuestas: notoriedad (H1) y valor percibido (H5). Mientras que la falta del impacto positivo del valor percibido en la formación del capital de marca se podría explicar por la naturaleza cognitiva de esta variable, al igual que en el caso de la calidad percibida, es probable que la notoriedad no muestre un valor significativo por el hecho de que todos los establecimientos minoristas analizados pueden ser considerados como referentes en sus respectivos sectores. Otra posible explicación puede radicar en la menor importancia, en términos relativos, de la notoriedad, frente a otros aspectos relativos al surtido o al servicio del minorista y, especialmente a la lealtad hacia la tienda. En este sentido, el impacto de la lealtad se muestra como la dimensión que incide en mayor medida en la creación del capital de marca (H6a), entre seis dimensiones propuestas.

En cambio, a la luz de los resultados obtenidos en el segundo modelo causal podemos confirmar la contribución positiva sobre la formación del capital de marca de la tienda de cuatro de las cinco variables identificadas como posibles dimensiones del constructo, es decir: a) la notoriedad de la tienda; b) la imagen del establecimiento; c) la calidad de servicio y d) el valor percibido de la tienda. En consecuencia, resulta evidente que la forma en que la tienda es definida en la mente de los consumidores a través de sus percepciones e impresiones, el valor global percibido, el nivel de reconocimiento o recuerdo de la identidad de la tienda y la calidad de servicio ofrecido resultan herramientas claves sobre las que el establecimiento debe profundizar, ya que a través de ellas podrá incrementar su capital de marca y conseguir un elemento de diferenciación frente a la competencia. Adicionalmente, cabe señalar que, según este modelo, la lealtad se afirma como un efecto del capital de la marca (H6b), pudiéndose concluir que el capital de marca de la tienda ejerce una influencia positiva y significativa sobre la lealtad del consumidor. También se observa que esta relación es la más fuerte que cualquier otra relación del modelo. Sin embargo, la medida global de bondad del ajuste (GoF) demuestra la inferioridad de este modelo frente al que considera la lealtad como una dimensión del capital de marca. Por ello, podemos concluir que la lealtad es mejor entendida como una dimensión del capital de marca que su efecto.

Con todo, de nuestro trabajo pueden derivarse diversas implicaciones para la gestión. Ante la creciente competencia en la distribución comercial minorista (Sales y Gil, 2007), los establecimientos deberán iniciar estrategias de diferenciación para mantener su competitividad. En este sentido, y dado que el capital de marca de la tienda se muestra como una variable clave sobre la que actuar, un mejor conocimiento de las variables que influyen en su formación permitirá al detallista articular estrategias

y acciones con el fin de lograr un mejor posicionamiento y realizar una entrega de valor superior para el consumidor. Para ello, deberá cuidar todos los aspectos, tanto funcionales como emocionales, vinculados al establecimiento que puedan generar imagen, calidad de servicio, valor percibido o notoriedad en el consumidor, ya que a través de ellos podrá influir en las percepciones e impresiones de los consumidores (Yoo et al., 2000) y lograr un incremento en la lealtad del consumidor hacia el punto de venta.

Para finalizar, cabe apuntar algunas limitaciones que en sí mismas consideraríamos futuras líneas de investigación. La primera se refiere al ámbito geográfico restringido de aplicación del estudio. Así, sería interesante poder comparar los resultados derivados de este trabajo con las percepciones de los consumidores de otras zonas, ya que cabe esperar que la estructura comercial, la cultura y costumbres de los consumidores de cada región influyan en la percepción del consumidor. Además, también se podría comparar los resultados del modelo establecido entre las tres enseñas comerciales retenidas detectando posibles diferencias en las percepciones de los consumidores y en la formación de los distintos capitales de marca. En esta línea, sería interesante la comparación entre formatos comerciales distintos.

## ABSTRACT

**Introduction:** *With the prompting trend today toward higher retail concentration, the global recession and the changing consumer habits, building successful private labels has become a priority for many retailing companies.*

**Purpose:** *This study aims to analyze the dimensions influencing private labels' purchase intention, as well as the roles of manufacturer identification and brand loyalty.*

**Methodology:** *For this purpose we develop structural equation model analysis, gathering a sample of 362 individuals.*

**Findings:** *Our findings suggest that private labels' image and their quality perception are partially mediated by loyalty, whereas the manufacturer identification plays a moderating role. In addition, our results reveal that store image and retailer reputation enhance private labels' image and perceived quality.*

**Implications:** *This research provides useful insights for retailing managers, who should deeply consider the store image and their reputation when designing their branding strategies, and develop marketing activities in order to enhance customers' private label loyalty.*

**KEYWORDS:** *Private label, purchase intention, manufacturer identification, loyalty, retailing*

## 1. INTRODUCTION

Since the introduction of private labels into the market, consumers have witnessed a substantial increase in their availability, due to the higher retailing concentration and the changing consumer habits (Ailawadi and Keller, 2004; Anselmsson et al., 2007). The private labels' continuous growth was also caused by the constant evolution they have undergone since their appearance in the marketplace. In fact, the annual sales revenue of private label brands worldwide approaches one trillion US dollars (Kumar and Steenkamp, 2007; Wu et al., 2011), and especially in Europe private label penetration is extremely large (Hoch, 1996; De Wulf et al., 2005). Private labels, also known as store brands, retailer brands and distributor's brands are brands owned, developed and managed by one retailer (Kotler and Armstrong, 1996). As the economic downturn causes a decline in consumer income, retailers build and develop private labels in order to increase profit and differentiation (Richardson et al., 1996; Wu et al., 2011), retain customers and increase market share (Hoch, 1996, Wu et al., 2011). Thus, developing private label brands becomes a relevant strategy for retailers. In fact, in the recent decades, retailers have tried to convert their brands into just one more alternative brand choice within the range available to consumers, offering a great variety of private label products (Choi and Huddleston, 2013) and boosting their image so that private labels are not perceived as low quality alternative, since their competitiveness was mainly rooted in lower prices and less promotional expenses compared to manufacturer brands (Bao et al., 2011).

In spite of the emergence and growing importance of private labels, most previous conceptual and empirical research has been focused on manufacturer brands, and only recently they have been deeply investigated (Ailawadi, 2001; Karry and Zaccour, 2006). Previous studies on private labels could be split into two main categories. First one addresses the private labels' purchasing proneness in comparison with manufacturer brands (Hoch, 1996; Ailawadi et al., 2001). Second ones are related to the variables influencing consumers' attitude and preferences towards the consumption of private labels, considering the product category, price consciousness or perceived risk (Batra and Sinha, 2000; Baltas, 2003; Semeijn et al., 2004). However, previous research rarely incorporates store or retailer image variables; although they are increasingly important, since consumers use the store image and retailer reputation as cues for reducing the purchasing risk of private labels (Semeijn et al., 2004), as well as a means of reducing poor quality associations and extending private labels' purchase intention beyond price sensitive consumer segments (Vahie and Paswan, 2006; Wu et al., 2011). Moreover, previous empirical studies primarily focus on the mediating role of price consciousness (Tseng and Hwang, 2003), despite consumers choose private label brands to which they are loyal. Thus, loyalty may be considered a mediator for private label purchase intention. Additionally, our research analyzes the role of manufacturer identification on the product package as a moderating variable, since consumers may choose private labels which provide information on the product manufacturer, in order to reduce the purchase perceived risk (Purohit and Srivastava, 2001). Thus, the manufacturer identification on private label products may be playing a moderating role on consumers' purchase intention.

Our research seeks to provide a more in-depth understanding of the dimensions generating private labels' purchasing proneness, in order to examine the main components through which private labels increase their purchase intention. For this purpose, this research proposes a causal model covering both the direct and indirect effects caused by one consumer-level variable -private label loyalty-, along with a product-level factor -manufacturer identification on the package-, developing a multiple group analysis through structural equation modeling. Finally, our results suggest that private labels' image and their quality perception influence -through consumers' loyalty- on their purchasing proneness, as well as highlight the role of the manufacturer identification on the product package as a

moderating variable on private labels' purchase intention. This paper is structured as follows. First, a conceptual framework presentation of the variables to be studied is provided. This is followed by the description of the methodology adopted and fieldwork. Finally, the results and implications of the study are discussed together with limitations and possible future lines of research.

## 2. CONCEPTUAL FRAMEWORK

### 2.1 *Private labels' purchase intention*

#### 2.1.1. *Store image*

Martineau (1958) first introduced the concept of store image as the way the consumers' mind picture the store, influenced by functional qualities and by psychological attributes. In fact, the store image has generally been conceptualized as the way in which the store is defined in consumers' minds by attributes such as the quality of products offered, the product assortment, the services provided, the physical facilities and layout, the internal environment or the good relation of *value for money* (Grewal et al., 1998; Chowdhury et al. 1998; Anselmsson et al., 2007). Consequently, the store image is expressed in terms of the store's attributes assessed by consumers (Devlin et al., 2003), and could be conceptualized as the overall attitude or impression consumers derive from the intrinsic and extrinsic characteristics of the store (Wu et al., 2011).

From a managerial point of view, private label brands are brands like any other, despite they are subject to one important difference, which is their image positioning based on that of the store (Kapferer, 2008). Consequently, consumers use store image as one variable to evaluate private label brands (Ailawadi and Keller, 2004). When consumers have a positive perception of the store image, it exerts a positive influence on private labels carried by the store (Dhar and Hock, 1997; Wu et al., 2011) and on their purchase intention (Grewal et al., 1998). Thus, store image is predominantly important as a source of value for private labels (De Wulf et al., 2005), influencing their purchasing proneness (Semeijn et al. 2004, Vahie and Paswan 2006). More specifically, Richardson et al. (1996) found that consumers' evaluations of the overall quality of private labels were higher when the store image was more favorable. According to Semeijn et al. (2004) the store image directly influences the perceived quality of private labels; and a better store image leads to a greater perception of private label brand image (Beristain and Zorrilla, 2011). Thus, a better store image leads to a greater perception of private label's quality (Beristain and Zorrilla, 2011). Additionally, Vahie and Paswan (2006) found a positive relationship between store image and private labels' image. Therefore, we can hypothesize that stores with a better image make consumers perceive them as offering private label brands with better image and offering higher quality; so, the more positive a store image, the higher private labels' quality perception and the better image. Hence, the following research hypotheses are posed:

*H<sub>0</sub>: The store image is positively related to private label image*

*H<sub>1</sub>: The store image is positively related to private label perceived quality*

#### 2.1.2. *Corporate reputation*

Retailers can be perceived as firms or companies, linking the retailer to aspects such as the company interest in and commitment to society (Brown and Dancing, 1997; Beristain and Zorrilla, 2011). The corporate reputation could be conceptualized as the degree to which firms assume economic, legal,

ethical and social responsibilities towards their stakeholders (Maignan et al., 1999). According to Purohit and Srivastava (2001) retailers provide the interface between consumers and manufacturers, given that retailer reputation is directly and indirectly linked to private labels. The corporate reputation or retailer reputation not only impacts perceptions of private labels' quality directly, but also indirectly impacts quality perception by increasing the likelihood of warranty in assessing private labels' quality. In this way, retailing corporations with a high-quality reputation have great incentives to preserve their reputation by screening out poor-quality manufacturers and offering high-quality private labels. So, private label products distributed through reputable retailers provides assurance to consumers (Dodds et al., 1991; Purohit and Srivastava, 2001).

The corporate reputation allows consumers to infer the quality of the merchandise (Bao et al., 2011), in terms that perceptions of product quality are higher when private label products are sold through a retailer with a good reputation (Purohit and Srivastava, 2001). As a result, consumers perceive private labels owned by a favorable reputed retailer to carry higher quality than a poor reputed retailer (Bao et al., 2011). So the quality of a given private label is perceived differently depending on the reputation of the retailer who offers it. Moreover, Ånselmsson and Johansson (2007) showed that reputed and socially responsible image of the retailer has a positive influence on private labels' purchase intention. The present research considers corporate reputation in broad perspective, including the corporate image deriving from its social and strategic behavior. Thus, we would hypothesize that consumers who perceive the retailing corporation as a competent firm, with experience and that behaves in an ethical honest way, may also perceive that has capacity to offer private label brands that satisfy their needs and expectations. Thus, we posit the following hypotheses:

*H<sub>2</sub>: The corporate reputation is positively related to private label image*

*H<sub>3</sub>: The corporate reputation is positively related to private label perceived quality*

#### *2.1.3. Private label image*

Aaker (1991) conceptualizes brand image or associations as the information in consumers' minds linked to a brand or product, which create favorable attitudes towards the brand. According to Yoo et al. (2000) brand image consist in multiple associations, ideas or facts that establish solid brand knowledge, resulting in a higher purchase intention. More specifically, private labels' image is the association consumers add to private label products, leading to perceptions of private label brands (Wu et al., 2011). On one hand, private labels' positive image can be used by retailers as a tool to differentiate and enhance consumers' loyalty (Levy and Weitz, 2004). And on the other hand, consumers use private label image as one extrinsic cue for evaluating their quality and reduce the purchasing perceived risk (Wu et al., 2011). In this way, private labels with good image, create more positive attitudes from consumers and a higher purchase intention (Wu et al., 2011). Therefore, increasing private labels' image enhances purchasing intention. So, we propose that the positive and favorable private label image or associations can positively influence consumer loyalty to private label brands, leading also to a greater purchase intent. Thus, the following research hypotheses are posed:

*H<sub>4</sub>: Private label image is positively related to private label loyalty*

*H<sub>7</sub>: Private label image is positively related to private label purchase intention*

#### *2.1.4. Private label perceived quality*

According to Zeithaml (1988), perceived quality could be conceptualized as the consumers' global judgment of the brand or product overall excellence or superiority. According to Aaker (1991) perceived quality is related to consumers' subjective perception of a product or brand attributes involved in the brand choice and purchase. Previous studies indicate that consumers generally perceive private label brands to be of lower quality than manufacturer brands (Dick et al., 1995). Nevertheless, retailers have been introducing private label brands whose quality matches or even exceeds that of manufacturer brands, while still selling for a slightly lower price (De Wulf et al., 2005). More

specifically, perceived quality predominantly determines the consumer private labels' purchasing proneness (Richardson et al., 1996; Bao et al., 2011). Furthermore, the most important driver of private label share is their perceived quality (Hoch and Banerji, 1993; Sethuraman, 2000; Ailawadi and Keller, 2004); being a key factor of their purchase intention. So, the better the private label positions in terms of quality, the more likely it is to be purchased (Ailawadi and Keller, 2004; Sprott and Shimp, 2004), and exerts substantial influence on the purchase intention (Bao et al., 2011). So, we propose that consumers will have higher loyalty, when they perceive that private label brands offer quality; and that consumers are more prone to purchase private label brands with higher perceived quality. This set of considerations leads us to the following hypotheses:

*H<sub>5</sub>: Private label perceived quality is positively related to private label loyalty*

*H<sub>8</sub>: Private label perceived quality is positively related to private label purchase intention*

## ***2.2. The mediating role of private labels' loyalty***

Oliver (1997) conceptualizes brand loyalty as a deeply held commitment to rebuy or repatronize a preferred brand consistently in the future despite situational influences. According to Aaker (1991), brand loyalty is defined as the attachment a customer has to a brand, reflecting how likely a customer will switch to another brand. Then, in branding literature, a consumer is said to be brand loyal when this consumer consistently purchases a single brand (De Wulf et al., 2005).

Loyalty is one variable which many studies have demonstrated to have strong influence on purchase decision (Rondan et al., 2006). In fact, there is empirical evidence suggesting that once the consumer has tried private labels, increases their purchasing proneness and engenders loyalty (Steenkamp and Dekimpe 1997); and that private label brands encompass private labels' loyalty (Huang and Huddleston, 2009). More specifically, previous research links private labels' loyalty to their image and perceived quality. The outcome of consumer's associations and perceived quality may result in loyalty toward a specific private label (Choi and Huddleston, 2013). Moreover, loyalty to private labels is only possible if they possess a positive favorable image (Steenkamp and Dekimpe, 1997); and high perceived quality (Binninger, 2008). So, consumers' satisfaction with private label brands is a significant driver of private label brand loyalty (Huang and Huddleston, 2009); while private label loyalty is the main variable influencing the purchasing process (Rondan et al., 2006).

In our research we will examine the conceptual base for the relationships between consumers' image of private labels, their quality perception and their influence on private labels' purchase intention. Specifically, we argue that consumers' loyalty to private label brands mediate these relationships. Therefore, we propose that private label loyalty not only leads to purchase intention, but also mediates the positive relationship between private label image and private label quality perception and purchase intention. That is, we consider that consumers' loyalty to private label brands will mediate the relationships between image, perceived quality and their purchase intention. Thus, this set of considerations leads us to the following research hypotheses:

*H<sub>6</sub>: Consumers are more prone to purchase a private label with higher loyalty*

*H<sub>7</sub>: Besides the indirect influence through private label loyalty, private label image has a positive direct influence on purchase intention*

*H<sub>8</sub>: Besides the indirect influence through private label loyalty, private label perceived quality has a positive direct influence on purchase intention*

## ***2.3. Moderating role of manufacturer identification***

The information related to private labels brands that consumers have is not as complete as for manufacturer brands (Wu et al., 2011); in fact, private labels are characterized as basic and functional products, which may identify or not a specific product manufacturer (Huang and Huddleston, 2009). Private label brands often lack a distinct identification with a specific manufacturer (Dick et al., 1995; De Wulf et al., 2005). However, when consumers hold a favorable and strong quality perception toward a private label brand they are likely to purchase it; and these favorable perceptions are more effectively internalized when manufacturer name is present (Choi and Huddleston, 2013). The reason may be that consumers prefer the guarantee that a familiar manufacturer brings, rather than the risk linked with purchasing an unknown manufacturer private label product (Baltas, 1997). Additionally, different types of private label brands are available in the market, since some retailers provide the manufacturer identification from the product package, allowing the manufacturer recognition to consumers.

In this way, private labels with manufacturer identification on the package allow consumers associate and connect one specific private label product with an identified manufacturer, and consequently, reduce the purchase risk. So, the purchase risk is the operating mechanism underlying the effect of manufacturer identification on purchase intention, since the manufacturer identification would carry less purchasing risk for consumers than non-identified manufacturer products (Batra and Sinha, 2000; Bao et al., 2011). Thus, the manufacturer identification sends a strong signal to consumers about the product image and quality, providing assurance and reducing purchase risk. So, to the extent that the manufacturer identification on the product package provides assurance to consumers about product quality (Purohit and Srivastava, 2001), we expect a more favorable private label purchase intention for these private label brands providing manufacturer identification or recognition, rather than for private label brands with no manufacturer information. That is, we propose that is likely that providing consumers' information about the product manufacturer, will influence consumers' private label purchase intention, since the presence of the manufacturer identification may be particularly useful for reducing the purchasing risk, as well as for obtaining greater confidence in the private label product quality.

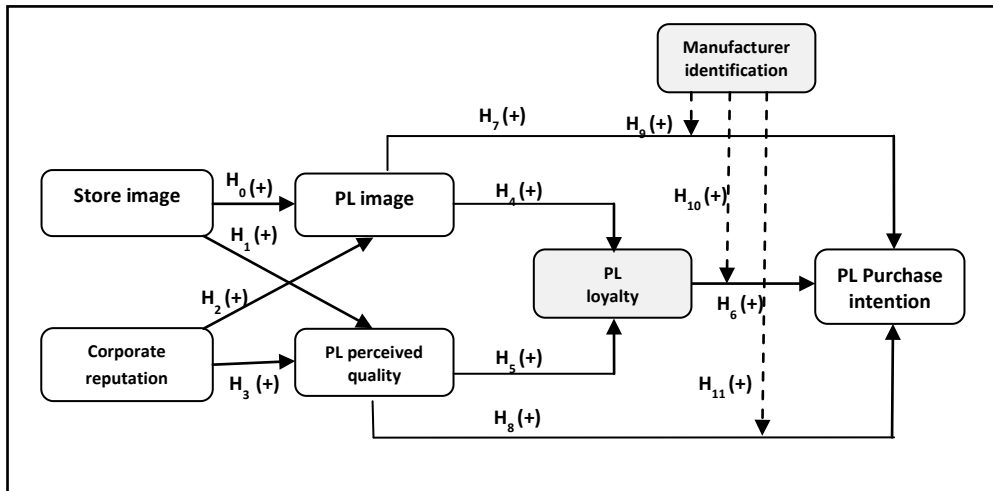

Our research contends that any attributes serving to mitigate and diminish private labels' purchasing risk would increase consumer purchase intention, such as manufacturer identification. This specific extrinsic cue can fulfill the purchase risk and influence consumers' purchase intention, by moderating the relationship among private labels' image, perceived quality and loyalty with their purchase intent. Hence, we propose that providing the manufacturer identification on private label products' packages may be an effective way to improve their purchase intention. In other words, when a private label identifies its manufacturer, this information may influence the consumer attitude and perceptions. So, we propose that the manufacturer identification on private label brands will positively moderate the effect of private label image, quality perception and loyalty on their purchasing intention:

*H<sub>9</sub>: The manufacturer identification moderates the influence of private label image on purchase intention*

*H<sub>10</sub>: The manufacturer identification moderates the influence of private label loyalty on purchase intention*

*H<sub>11</sub>: The manufacturer identification moderates the influence of private label quality perception on purchase intention*

**FIGURE 1.** Conceptual Proposed model

### 3. METHODOLOGY

#### 3.1. Data collection

To test the research hypotheses, the information was collected by means of a structured on-line questionnaire among consumers residing in Spain. Spain has become one of the European markets with higher private labels' market share (Bigné et al. 2013), thus representing an excellent basis for our study, and providing a large mature market. We proceeded with a random sampling among consumers so that each participant evaluated one single private label brand. In fact, the respondents were deliberately not asked to select the one private label brand for which they have knowledge or consumer experience. The sampling error was 5.53%, with a confidence level of 95% under the hypothesis  $p=q=0.5$ , and fieldwork was carried out in June 2012. A sample of 394 consumers was gathered, obtaining a total amount of 362 valid responses on the five major Spanish retailers' private label brands. The last part of the questionnaire contained several socio-demographic questions.

#### 3.2. Variables and measurement scales

Two criteria were followed in order to select the private label brands for our study. In first place, we considered the Spanish major retailers, according to their total revenue in year 2012 (Worldpanel Distribucion, 2012). Secondly, we took into consideration retailers who give their own name to their private label brands, including either the store name or logo on the packaging. This way, we selected five major retailers, namely Carrefour, Mercadona, Dia, Eroski and El Corte Ingles. Additionally, we chose private label brands with different manufacturer information. More specifically, the private label brands of Mercadona, Eroski and El Corte Ingles ( $n= 219$ ) provide the manufacturer identification on their products' packages; and these retailers are popular for providing such information for all their private label products. On the other hand private label brands of Carrefour and Dia ( $n= 143$ ) exhibit no manufacturer identification, deleting information about the product manufacturer, except for a code number which relates to the industrial registration number. Moreover, it should be remarked that the 61% of the Spanish consumers read the package information on agrifood products, then showing their interest on the origin and manufacturers of products (Nielsen, 2010).

All measures are adapted from or developed based on prior research, and were measured using the classic Likert-type 1-5 scale. The *store image* is measured by three items adopted from Chowdhury et al. (1998) and Beristain and Zorrilla (2011), in order to assess consumers' perception of the store from multiple perspectives, such as product offer, service and quality. Secondly, we used three items to measure *corporate reputation*, adopted from previous studies (Handelman and Arnold, 1999), based

on the research line about the influence of the company experience or their honest behavior. *Private label image* is measured on a 4-item scale, comprising items proposed by Aaker (1991) and Netemeyer et al. (2004). Private labels' *quality perception* is measured on the scale proposed by Dodds et al. (1991), which evaluates the consumer's overall assessment of the quality of a product or brand. For measuring private label *loyalty*, we used two items proposed by Yoo et al., (2000), regarding whether the consumer is considered loyal to a particular brand. Finally, *purchase intention* is measured on a 3-item scale, including items adopted from Netemeyer et al. (2004).

## 4. RESULTS

### 4.1. Analysis of the measurement model

Structural equation modeling was carried out in order to analyze the proposed model with Amos. Confirmatory factor analyses were employed to address the issues of dimensionality, convergent and discriminant validity (Anderson and Gerbing, 1988). Our confirmatory factorial analysis shows that all standardized factor loadings are significant, exceeding the recommended minimum of 0.50, with a reliability level of 95%. These results reveal the strong convergent validity (Fornell and Larcker, 1981; Steenkamp and Trijp, 1991; Diamantopoulos and Siguaw, 2006). In relation with the internal consistency and reliability, Cronbach Alpha, composite reliability coefficients and analysis of the extracted variance exceeded were calculated. We obtained cronbach alpha values from 0.716 to 0.903, thus being acceptable as suggested Anderson and Gerbing (1988) and Hair et al. (1998). The composite reliability exceeded the value of 0.70, satisfying the criteria (Fornell and Larcker, 1981; Hair et al., 1998), and providing evidence of convergent validity. The average variance extracted for these measures ranged from 0.504 to 0.779 and exceeded the recommended minimum of 0.50 (Fornell and Larcker, 1981; Hair et al., 1999), demonstrating discriminant validity.

TABLE 1

Factor loadings of latent variables and Indicators of Internal Consistency and Reliability

Construct	Indicators	Cronbach Alpha	Lambda	CR	AVE
<b>Store image</b> Chowdhury et al. (1998), Beristain and Zorrilla (2011)	Stim1 Store X offers a wide range of products Stim2 Store X offers products with high quality Stim3 The store X offers the services that I'm looking for (ex. <b>Purchase intention</b> Netemeyer et al. (2004)	Pint1 I would buy private label X. Pint2 I am likely to buy private label X. Pint3 It makes sense to purchase private label X instead of other competing brands	0.903	0.754 0.915 0.948	0.908	0.768

**4.2. Analysis of the structural model**

Structural equation modeling was developed to assess the statistical significance of the research proposed relationships (Figure 1). Model fit criteria suggested by Hu and Bentler (1996) were used for both the measurement and the structural model:  $\chi^2 / df$ , goodness of fit (GFI), adjusted goodness of fit (AGFI), comparative fit index (CFI), root mean square residual (RMR) and root mean square error of approximation (RMSEA). Acceptable models should have  $\chi^2 / df \leq 3$ , AGFI  $\geq 0.80$ , RMR  $\leq .1$ , RMSEA  $\leq 1.0$  and GFI and CFI higher than 0.90. All of the obtained fit measures indicated that the structural model was acceptable ( $\chi^2/df=2.361$ ;  $p<.000$ ): RMSEA=0.061; RMR= 0.054; GFI=0.918; AGFI=0.888; CFI=0.958). Since the goodness of fit index surpass the recommended value of 0.9, the proposed causal model can be considered satisfactory. Moreover, the conceptual model shows structural parameter estimates with an acceptable fit to the data (Table 2).

**TABLE 2.**

Structural modeling adjustment indexes.

<i>Structural model</i>	ABSOLUTE FIT MEASURES						INCREMENTAL FIT MEASURES					PARSIMONY MEASURES
	<i>Chi-square</i>	<i>df</i>	<i>p</i>	<i>GFI</i>	<i>RMR</i>	<i>RMSEA</i>	<i>AGFI</i>	<i>NFI</i>	<i>IFI</i>	<i>TLI</i>	<i>CFI</i>	<i>Normed Chi-square</i>
<b>Direct</b>	247.496	97	0.001	0.922	0.056	0.066	0.891	0.928	0.955	0.944	0.955	2.552
<b>Partial mediation</b>	295.180	125	0.001	0.918	0.054	0.061	0.888	0.929	0.958	0.948	0.958	2.361
<b>Full mediation</b>	336.325	127	0.001	0.907	0.065	0.068	0.875	0.919	0.948	0.937	0.949	2.648

**4.3. Direct effects**

The conceptual proposed model showed an adequate general fit to the provided data; and the parameters were tested to decide whether to accept the proposed relationships and the research hypotheses. Our results report the antecedents of private label purchasing proneness, namely, store image and corporate reputation, that are positively related with private label image and perceived quality; thus supporting H<sub>0</sub>, H<sub>1</sub>, H<sub>2</sub> and H<sub>3</sub>.

In terms of effect size, the corporate reputation seems to contribute the most to private label image ( $\beta_{23}=0.741^{**}$ ), followed by store image ( $\beta_{13}=0.240^{**}$ ). On the other hand, regarding the private labels' quality perception, it should be highlighted that all the proposed relationships of store image ( $\beta_{14}=0.643^{**}$ ) and corporate reputation ( $\beta_{24}=0.362^{**}$ ) are significantly positive on private labels' perceived quality. So, it can be stated that the better and more favorable store image and corporate reputation, the better private label image and quality perception. Thus, regarding the casual hypothesized relationships, seven of them were statistically significant in the suggested direction, with the exception of the relationship of perceived quality on purchase intention. Finally, it should stressed the significant relationship among the dimensions of private labels' purchase intention and two antecedents –store image and corporate reputation-.

**TABLE 4.**

Results of the structural model (standarized coefficients)

<i>ns=no significant</i> <i>** significant (p&lt;0.01)</i>							

**4.4. The mediating effect of private label loyalty**

Our conceptual model proposes that private label loyalty mediates the influence of private label image and private label perceived quality on purchase intention. According to Baron and Kenny (1986) a mediating effect takes place when three conditions are satisfied. First, the independent variable has a significant influence on the mediator. Second, the mediating variable has a significant effect on the dependent variable; and third, the previous significant relationship between the independent and the dependent variables is reduced when introducing the mediator. Additionally, whether the effect of the independent variable is not statistically significant a complete mediating role exists; otherwise, a partial mediating effect takes place. For analyzing the mediating role of private label loyalty, our research estimates both a *direct effect* and a *full mediating* models (Table 4). On the other hand, in the *full mediating* model, significant influences exist between private label image and private label loyalty and purchase intention, while we observed a relationship in the expected direction between private label perceived quality and purchase intention, but it failed to reach statistical significance. Finally, in a *partial mediating* model, in addition to the significant relationships among private label image, perceived quality, loyalty and purchase intention, our research shows a direct influence of the independent variables on purchase intention. Therefore, partial mediating effects are supported. Regarding the *direct effect* model, significant effects are observed of private label image and perceived quality on purchase intention. More specifically, private label image shows a significant influence on purchase intention ( $\beta_{36}=0.991^{**}$ ), as well as private label quality perception ( $\beta_{46}=-0.255^{**}$ ). However, and contrary to our expectations this relationship was significant but in the opposite direction. Nevertheless, in the *partial mediating* model this influence is reduced both for private label image ( $\beta_{36}=0.764^{**}$ ) and for perceived quality ( $\beta_{46}=-0.298^{**}$ ), supporting H<sub>7</sub> and H<sub>8</sub>. Finally, a comparison between the full and the partial mediating models shows that the latter fits data better ( $\Delta\chi^2=41.145$ ;  $df=4$ ,  $p<0.001$ ).

**4.5. The moderating role of manufacturer identification**

Data have been analyzed through structural equation modeling and multigroup analysis to test the moderation hypotheses, that is, the moderating role of manufacturer identification on the relationship

between private label image, perceived quality and loyalty on their purchase intention. The sample was divided into two groups, according to the manufacturer identification on the products' package. Thus, sample comparisons were made between private labels with manufacturer identification - Mercadona, Eroski and El Corte Ingles- (n=219) and private labels with no manufacturer identification -Dia and Carrefour- (n=143). The model estimated simultaneously on these two groups shows an adequate fit ( $\chi^2=216.849$ ;  $p<0.001$ ; CFI=0.970). In first place, the proposed model is estimated with all hypothesized parameters being allowed to be estimated freely within each subsample ( $\chi^2=216.849$ ;  $df=134$ ). Next, in a constrained model, the path coefficients corresponding to the relationship between private label image and private labels' purchase intention ( $H_9$ ) is constrained to remain invariant across the two subsamples ( $\chi^2=217.169$ ;  $df=135$ ). The significantly higher  $\chi^2$  value for the constrained model did not improve the model fit, thus supporting  $H_9$  ( $\Delta\chi^2=0.32$ ;  $df=1$ ,  $p<0.001$ ). Additionally, the equality constraint of private label loyalty and their purchase intention did not improve the model fit ( $\chi^2=216.986$ ;  $df=135$ ), as well as the constraint of private label perceived quality and their purchase intention ( $\chi^2=217.733$ ;  $df=135$ ). The significantly higher  $\chi^2$  value for the constrained models supports  $H_{10}$  ( $\Delta\chi^2=0.137$ ;  $df=1$ ,  $p<0.001$ ) and  $H_{11}$  ( $\Delta\chi^2=0.884$ ;  $df=1$ ,  $p<0.001$ ). Our findings show that the manufacturer identification on private label products' packages moderates the effect of private label image, perceived quality and loyalty on their purchase intention.

## 6. CONCLUSION

There are many articles on private labels, retailer or store brands, whilst there are not as abundant researches analyzing the dimensions influencing their purchase intention. The present paper aims to contribute to this lack of research by assessing the variables that influence private labels' purchase intention, along with the mediating effect of private labels' loyalty and the moderating role of manufacturer identification. Our study has tested a model which integrates numerous variables related to private labels' purchasing proneness, but incorporating the original focus on the role of the manufacturer identification.

In first place, our model estimation provides evidence that both store image and the corporate reputation are powerful antecedents to private label purchase intention. In this regard, our findings support a higher influence of corporate reputation on private label image, whereas the store image exerts a higher impact on private label quality perception. So, the obtained results imply that when consumers are making decisions about the purchase of private labels brands, the image of the store, as

well as the corporate reputation play determinant roles; highlighting that private labels' consumer behavior is a complex process, where consumers evaluate and assess two store related variables. The reason may be that consumers would be highly confident in the signaling ability of the store image (Bao et al., 2011), or that consumers rely on the store image and the corporate reputation to reduce the purchase risk for private labels, being in line with some previous research (Purohit and Srivastava, 2001).

Other important finding is that private labels' image appears to be heavily weighted by consumers, exerting the strongest effect on loyalty and on purchase intention. That is, the private label image is the most important driver for private label loyalty and purchasing proneness. So, private label image is critical to private labels' success in today's increasingly competitive marketplace, being the variable exerting higher influence on consumers' behavior. Additionally, it should be stressed that private label purchase intention was found to be significantly affected by perceived quality, but not in the expected direction, while exerting a lower influence on their purchase intent. This may be due to the fact that nowadays private labels are positioning as an equal quality alternative to manufacturer brands (Choi and Huddleston, 2013), competing on a more equal footing with manufacturer brands in terms of product quality (Grunert et al., 2006). These results suggest that retailing managers should focus on creating and communicating a positive favorable private label image. Other major finding is related with one consumer-level factor, that is, private label loyalty. Our major contribution is the examination of the direct and indirect effects, both mediated by private label loyalty; and thus, demonstrating the partially mediating role of private label loyalty. In our study we first considered the relationship between private labels' loyalty and their purchase intention, and subsequently we focused on the indirect relationships between private label image and their quality perception on private labels' purchase intention. The results show that the indirect effect through the mediation of private label loyalty outperforms the direct effect of private label image and their quality perception on purchase intent; while showing the positive influence of private labels' loyalty on consumers' purchase intention.

Finally, one major research question was aimed at providing insights in the moderating role of the manufacturer identification. Our findings indicate that the presence of the manufacturer identification on private label products' package moderates the private labels' purchase intention, upon three drivers, namely private label image, private label quality perception and loyalty. This finding, related to one product-level variable, supports the idea that consumers' private label purchasing proneness is different for private label brands providing the manufacturer identification on the package, from private labels without this information. We assumed the hypothesis that the effect of manufacturer identification on private labels' purchase intention may differ across the two types of private labels - private labels with manufacturer identification and private labels which deleted this information-, thus being a predictor of private labels' purchase intention. This assumption is supported by the results obtained. So, when a private label brand is associated with a specific manufacturer, in general terms consumers perceive it as a guarantee, and this private label is perceived as offering an acceptable quality. The explanation may be that the presence of the name or identification on the private label product package has conferred these brands a degree of security and protection against the purchase perceived risk (Gonzalez-Mieres et al., 2006). According to McNeill and Wyeth (2011), customers tend to choose familiar brands and branded products rather than private labels with unknown and unfamiliar brand names; being the manufacturer recognition and familiarity a key variable in the decision-making process. So, consumers seek for the guarantee and prestige offered by private labels containing manufacturers' identification.

Derived from our findings, we propose some useful insights for retailers, in order to increase private labels' proneness and purchase intent. In first place, our findings provide some highlights on the influence of antecedents such as store image and the corporate reputation. In this sense, the development of commercial policies focused to reinforcing the store image or the corporate reputation, contribute to the improvement of private labels' image and their quality perception, increasing their purchase intention. Secondly, our findings show consumers' reliance on extrinsic variables, such as the private label image, their perceived quality and the manufacturer identification, being key elements for consumers when making the decision to purchase private labels. Regarding the manufacturer

identification on the product package, retailers who introduce and offer private label brands need to consider the positive and favorable impact of the manufacturer identification, in order to influence consumers' purchase intention. So, why not including this information on the private labels' package?.

Moreover, we understand that for enhancing private label image, retailers should increase the exposure of consumers to these brands, inside and outside of the point of sale. So, in terms of actions which may be performed inside the store, there should be considered the merchandising and the good private label brand display in the store lineal. As for the actions which may developed outside the store, retailers should strongly invest on private labels' advertising, along with strengthening promotional campaigns. Regarding their quality perception, it is essential that retailers banish the idea that private label products are of inferior quality, merely based on their affordable and lower prices. So, we would suggest retailers to communicate and make clear to consumers that the private labels' lower prices are not a consequence of an inferior quality, but rather a result from greater cost savings in marketing and advertising. It would be of great interest to promote trials and sampling of private labels among consumers, so they can thereby evaluate their quality, not only based on external variables (Sprott and Shimp, 2004).

This research has several limitations which also provide possible avenues for future research. As for the main limitation of this study, first we should notice that this empirical research was carried out limited to a number of private labels in one specific European developed market and these factors may limit the generalizability of our results. Thus, we encourage future research to pursue in this direction by undertaking cross-cultural studies. Secondly, it would be interesting to incorporate new variables or dimensions into the model, related to private labels' consumer purchasing behavior, such as the price perception, the attitude towards private labels. Finally, as proposed in previous literature on the topic, there are differences among product categories regarding private labels' purchasing proneness (Batra and Sinha, 2000).

## **RESUMEN**

Several previous studies have investigated creativity as an enhancer of innovation, their results showing that there is a positive relationship between the organizational creative climate and innovation. However, no research has been conducted on whether there is a saturation point beyond which an increase in creativity makes innovation performance decrease. In this paper we question the traditional positive relationship between creativity and innovation, and suggest that such a relationship is not linear, but has instead an inverted U-shape due to a saturation effect. We have developed a conceptual model to explain innovation performance considering creativity and network centrality, and it has been tested in the ceramic industrial cluster in Spain. Empirical findings support the inverted U-shaped relationship between creativity and innovation. The implications of these results in relation to creativity and innovation theory and practices are discussed.

## 1. Introduction

This study examines the effect of organizational creativity and centrality on innovation performance, and suggests the existence of an inverted U-shaped relationship between creativity and innovation.

According to previous research, creativity has become a relevant input, if not a prerequisite, for innovation in firms (Amabile 1998) and so for any marketing success, as all of them begin with a creative idea (Levitt, 1986). Some authors have repeatedly argued for the positive implications of creativity on innovation (Amabile et al. 1996; Shalley, Zhou, and Oldham 2004). and firms are moving from the cost-cutting focus to the revenue growth generated by the organizational creativity and innovation (Coy, 2000).

In this context, it seems to be almost axiomatic that creativity is good. Indeed, it cannot be denied that it often leads to beneficial advances for individuals and organizations. However, in spite of these precedents, the creativity literature has yet to come up with sufficient empirical evidence proving its positive effects. Particularly, more precise considerations about a direct causal relation between creativity and innovation are required. For instance, intuitively, since creativity can be associated to the first phases of the innovation process, that is to say, those connected to the pure generation of ideas, it is reasonable to suppose that a firm may have a limited capacity to absorb all this new creative material. In consequence, it can be suggested that there is a potential excess of creativity and a need to find a balance among all the phases of the innovation process.

In this direction, we captured some insights from diverse literature sources, particularly from the field of psychology, which talk about the *dark side of creativity*. This literature is critical about the dominant assumption that considers that the enchantment with creativity typically ignores the fact that a great deal of creative effort is made in service of negative ends (James, Clark, and Cropanzano 1999). The perverse results of innovation occur when creativity is deliberately aimed at hurting others or in the case of the accidental negative side effects of well-intentioned acts (Cropley 2010). However, in this work we focus on a distinct dimension of the issue: the negative effect of an excess of creativity in terms of cost-benefit for the organizations, regardless of whether right or wrong use is made of it.

In our case we argue that creativity has a positive effect on innovation through the development of novel product and service ideas, processes, and procedures by employees or a small group of employees (Woodman, Sawyer, and Griffin 1993; Amabile et al. 1996). Beyond a certain point, however, additional increases in creativity become detrimental for firms. A curvilinear relationship facilitates the understanding of the problem as well as the search for possible solutions.

This line of argument shows some resemblance to other curvilinear relations found in the literature. Similarly to what happens with other positive assets of firms, when they reach a certain level additional increases are not followed by parallel benefits and finally they may become negative. For example, Stock, Greis, and Fischer (2001) proposed this relation in the effects of absorptive capacity on innovation. Berman, Down, and Hill (2002) looked at how shared experience affected performance. Moreover, McFadyen and Cannella (2004) examined the influence of the number of exchange partners on the amount of knowledge that a person creates, and Nooteboom (1992; 1999) considered the relation between cognitive distance and innovation performance. Finally, Molina-Morales and Martínez-Fernández (2009) found support for an inverted U-shaped relation between trust and innovation. In general, all these previous references coincide in

considering that accumulation of an encouraging asset or factor has no linear positive effect on the outcomes of the firm.

In addition, having the appropriate knowledge is a source of competitive advantage so we could differentiate one firm from the rest (Spender, 1996) and so we consider the network position of the firm as an explanatory factor of innovation. Ties in networks are viewed as pipes through which knowledge flows (Ahuja 2000). Firms well connected to others in the network gain a lot of benefits, some of them related to innovation results (Tsai 2001; Reinhold, Pedersen, and Foss 2011).

However, not all the firms have the same opportunities to gather the innovative knowledge within a territory, this is why we have extended this literature by exploring the territorial dimension of these issues. Industrial clusters contain heterogeneous firms (Boschma and Ter Wal 2007), with distinct attributes (Giuliani and Bell 2005). In clusters, firms in the same area are connected in social relations and have access to knowledge that physical proximity makes available (Beschi and Lissoni 2001). Opportunities and constraints are also asymmetrically distributed within regional clusters, and in consequence individual firms show significant differences in innovation performance (Giuliani 2007a).

What our study mainly adds to recent creativity research is evidence that the degree of creativity of a firm in an industrial cluster has a non-linear repercussion on its innovation results. In addition, we confirm the key value of the firm's network position for innovation. We therefore offer a valuable contribution to the understanding of the genesis of innovation by emphasizing the relevance of creativity and network position, and providing explanations.

We now begin by describing the logic of our study, followed by our hypotheses. We then present a description of our methods and analyses based on a study of 155 firms representing the total population of a ceramic tile cluster in Spain. We finish with a discussion of our findings and proposed directions for future research.

## **2. Hypotheses**

### **2.1. Creativity and innovation performance**

According to Amabile (1988), creativity is the production of novel and useful ideas i.e. produce creative products, services, production services and marketing initiatives that are unique to the market place and create value for the customer. Thus, creativity in marketing consists of any novel and valuable marketing idea, product, process, strategy or tactic (Titus, 2007). Innovation, on the contrary, refers to the refining and implementation of these ideas (Gurteen 1998; Ekvall 1997). Hence, creativity can be considered a key input of innovation (Chang and Chiang 2010; Oldham and Cummings 1996; Shalley, Zhou, and Oldham 2004) affecting innovation performance (Koen et al. 2001; Reid and de Brentani 2004; Zhang and Doll 2001). Recently, authors have reported how creativity leads the most relevant improvements in employment and value creation in modern economies (Moultrie and Young 2009; Chang and Chiang 2010).

Creativity is generated by individuals and groups, but it is fostered or hampered by the organizational environment, which is also responsible for implementing the result of this creativity – the ideas – and turning them into innovation, as creativity is an important factor of innovation, but it is not sufficient by itself (Amabile et al. 1996). Many precedents can be found in favor of a positive relationship between creativity and innovation. For instance, the greater density of the creative workforce can aggregate to a richer knowledge structure to provide more knowledge exchanges and learning opportunities within the firm, thus contributing to organizational innovation outcomes (Chen and Huang 2010).

In addition Woodman et al. (1993) suggested that the creativity output of a firm also depends on the context and the environment where the firm operates, not only on the individual, team, and organizational creativity inputs. In this sense the territory becomes a strategic asset for the development of creativity (Power and Scott 2004), as the relational dynamics created by the actors operating in the territory influence the creative processes (Granovetter 1985; Sedita and

Paiola 2009). This idea is consistent with the cluster and industrial districts literature that supports the creation of advantages inside a specific territory (Becattini 1987; Becchetti and Rossi 2000). In short, it can be concluded that within the context of the industrial cluster, the propensity to be creative is likely to enhance the innovation of firms (Isaksen, Lauer, and Ekvall 1999; Shalley, Zhou, and Oldham 2004; Amabile et al. 1996).

Amabile (1988) and Woodman et al. (1993) placed creativity inside the organizational innovation system, showing that the organizational climate is essential to promote creativity and therefore innovation (Amabile et al. 1996; Hosseini, Azar, and Rostamy 2003; Shalley, Zhou, and Oldham 2004). In this vein Çokpekin and Knudsen (2012) stated that firms that motivate their employees to be creative, allocate their resources bearing in mind this goal, and have the management skills to set up a creative work environment are more likely to innovate. Moreover, Baron and Tang (2011) found that enhancing creativity is related to new innovation ventures, and affects more especially the radicalness of these innovations.

In spite of the above arguments, it is also possible to develop a theoretical proposition positing a curvilinear relationship between level of creativity and innovation. In other words, the previous causal relation between creativity and innovation can be refined.

By definition, creativity can be associated to the pure generation of ideas, and we could assume that a firm cannot successfully complete and implement all this creative material. An excess of creativity can lead to a breakdown between the phases of the innovation process with detrimental consequences. Koput (1997) provided three related reasons why too many ideas may have a negative influence on performance. First, there may be a large number of ideas for the firm to manage and choose between ('the absorptive capacity problem'). Second, many ideas may come at the wrong time and in the wrong place, thereby preventing them from being fully exploited ('the timing problem'). Third, since there are so many ideas, few of these ideas are taken seriously or given the required level of attention or effort to bring them to implementation ('the attention allocation problem') (in Laursen and Salter 2006:135). Creativity benefits may rise only up to a threshold, after which point they become negative. This proposition recognizes that more creativity may not be associated with parallel increases in innovation across the entire relevant continuum. The challenge, then, is to generate creativity, but not so much that it precludes exploitation by the firm.

Creativity is associated to the size of the firm's creative staff. A high-density creative workforce may also have dark side effects on innovation. As the size of the workforce increases, interaction problems would become more complicated and costly, and thus negative to the innovation outcomes (Chen and Huang 2010). A high-density creative workforce contributes to the organization not only a total pool of creativity-related skills, know-how, and perspectives, but also the potential for more comprehensive and creative innovation processes via informational conflicts (Milliken and Martins 1996; Simons, Pelled, and Smith 1999). Accordingly, the higher the density of the creative workforce is, the costlier it will be to achieve effective communication and coordination among creative individuals, and will thus negatively affect innovation outcomes.

Moreover, further reviewing, particularly in the field of psychology, reveals the existence of the so-called *dark side of creativity*. This literature questions the dominant assumption of the positive effects of creativity and ignores the fact that a great deal of creativity pursues negative ends (James, Clark, and Cropanzano 1999). Sometimes creativity is deliberately aimed at causing harm to others or there are accidental negative effects resulting from well-intentioned acts (Cropley 2010). In our case we focus on the negative effects of excessive creativity.

In addition, we captured some ideas and insights from related theoretical perspectives to contextualize this curvilinear relationship. Evidence of this effect can be seen in the fact that economies of scale often become diseconomies at some level. First, the trust literature posited a curvilinear relationship with some firms' outputs. Trust improves innovation performance, although under certain conditions high levels of trust can result in a negative effect for performance (Langfred 2004). Second, Palich, Cardinal, and Miller (2000) analyzed different

relationships between diversification and performance, including an inverted U-shaped relationship. While diversification benefits accrue, at some point these efforts are also associated with higher costs. Furthermore, the proposition that the learning curve reaches a point for the amount of cumulative production beyond which improvements are insignificant (Stock, Greis, and Fischer 2001) is relevant to our study. Berman, Down, and Hill (2002) looked at how shared experience affected performance and, moreover, McFadyen and Cannella (2004) examined the influence of the number of exchange partners on the amount of knowledge that a person creates. On the relation between cognitive distance and innovation performance, Nooteboom (1992; 1999) proposed that there is an inverted U-shaped relationship. First, as cognitive distance increases, it has a positive effect on learning by interaction because it yields opportunities for novel combinations of complementary resources. However, at a certain point, cognitive distance becomes so large as to preclude the sufficient mutual understanding needed to utilize those opportunities.

In clusters, the existence of systemic capacities may generate redundancies with respect to those developed internally by firms. In this vein a recent study by Molina-Morales and Martínez-Fernández (2009) provided strong evidence that intensity of relations and trust on innovation performance in cluster firms can be described using an inverted U-shaped function.

Finally, linking creativity and innovation, Chen and Huang (2010) expected creative workforce density to have a curvilinear effect on innovation performance, and speculated on what the optimal level of creativity would be to maximize the innovation results. Before the optimal level, the creative workforce density would enhance innovation performance because increasing creativity gives rise to more discussions and knowledge sharing. On the other hand, innovation performance would decrease as the creative workforce density increases beyond the optimal level, because of the coordination difficulties and potential conflicts that arise.

In conclusion, extending this curvilinear perspective to our case, initially, below the optimal level, creativity is expected to enhance innovation, although diminishing returns are also expected later on when the level of creativity increases beyond the optimal level. This implies that the level of creativity reached in an organization may have its bright side and its dark side, and so it is hard to explain a direct relationship between creativity and innovation. The non-linear inverted U-shaped relationship is the one that best captures expectations based on the argument. The above reasoning leads to the following hypothesis.

*Hypothesis 1: The level of creativity that a clustered firm maintains has a quadratic (inverted U-shaped) relationship with its innovation outcomes.*

## **2.2. Firm's position in the cluster network and innovation performance**

New models of innovation have suggested that many innovative firms have changed the way they search for new ideas, adopting open search strategies that involve the use of a wide range of external actors and sources to help them achieve and sustain innovation (Laursen and Salter 2006), the ability to exploit external knowledge being a critical component of innovative performance (Cohen and Levinthal 1990). Those firms that are willing to increase their competitiveness, must have the relevant knowledge to enhance innovation (Akgün et al., 2008) and all the creative ideas come from the previous knowledge available.

Following Laursen and Salter (2006), there are three theoretical approaches that confirm that idea: the "open innovation model" (Chesbrough 2003a, 2003b; Sakkab 2002), network models (Shan, Walker, and Kogut 1994; Ahuja 2000), and research in evolutionary economics.

Open innovation models suggest that the advantages that firms gain from internal R&D expenditure have declined, and now many innovative firms spend little on R&D and yet they are able to successfully innovate by drawing on knowledge and expertise from a wide range of external sources (Chesbrough 2003a;2003b). The focus of the open innovation model is how

firms use ideas and knowledge from external actors in their innovation processes. Thus, the “connect and develop” model is based on the idea that external sources of ideas may often be more valuable than internal ones (Sakkab 2002), and so open innovators are those who integrate these external sources within their innovation processes and competitive strategy (Chesbrough 2003a;2003b.). The movement toward open innovation is a change in the way firms go about searching for new ideas and technologies for innovation (Laursen and Salter 2006).

Secondly, scholars have drawn on the network literature to highlight the importance of external resources available to the firm through its networks (McEvily and Marcus 2005; Gnyawali and Madhavan 2001; Gulati 1999). Previous research (Björk and Magnusson 2009) focused on the influence of network characteristics on innovation has, for instance, studied (1) business units’ connectivity in an intraorganization network regarding the innovation and performance of the unit (Tsai 2001); (2) firms’ positions in an industry network and the firms’ innovation outputs (Ahuja 2000); and (3) managers’ likelihood of coming up with good ideas, depending on their position within a network (Burt 2004). The location of the firm in its network of relationships is becoming more and more a key factor to enhance the value creation of firms.

On the other hand, the network centrality perspective views ties as pipes through which knowledge flows (Ahuja 2000). The position of the firms inside the network becomes important and affects innovation. Closeness represents the capacity of an actor to access the others using other nodes as a bridge, so it is the possibility of using direct and indirect ties to connect with the other members of the network (Freeman 1979). Ahuja (2000) finds that indirect and direct ties influence the ability of the firm to innovate. The extent to which an actor is well connected to others in the network is a benefit in terms of knowledge that it receives and its potential learning. Since interactions in networks dissolve the boundaries between organizations and stimulate the formation of a common interest, actors gain access to other actors’ valuable resources by participating in networks (Gulati 1999). A firm that is well connected in a network has different mechanisms through which to generate and transfer innovation: by systematically exploring new territories; second, by searching through past experiences in a creative way; and, third, by proposing hidden combinations between internal resources and sources of knowledge (Hargadon 1998). In addition, maintaining a presence in innovation networks further enhances a firm’s innovative capabilities by developing and maintaining its absorptive capacity (Cohen and Levinthal 1990; Powell, Koput, and Smith-Doerr 1996). Particularly, firms holding central network positions are favored by strategic benefits such as timely access to a large volume of diverse knowledge, which increases the extent to which they can learn from their networks (Beckman and Haunschild 2002). These benefits of network centrality affect a number of aspects of the firm, such as advantages in performance, competitive capabilities, and innovation (Phelps, Heidl, and Wadhwa 2012; Tsai 2001; Tsai and Ghoshal 1998).

Thirdly, evolutionary economists highlight the role of searches in the external environment in helping organizations to find sources of variety, thereby allowing them to create new combinations of knowledge and technologies that can improve their ability to innovate (Nelson and Winter 1982). In industries with high levels of technology, a firm will often need to search more widely and deeply in order to gain access to critical knowledge sources, while in industries where there are low technological opportunities, a firm has weaker incentives to draw from external knowledge sources and may foster internal sources (Klevorick et al. 1995).

We particularly seek to explain the implications of the position in a network on the innovation performance of clustered firms. An important aspect for generating innovation is having access to knowledge sources. Operating in an industrial cluster – a context of proximity (Inkpen and Tsang 2005) – could be conceived as a network in a production context in a geographically defined area (Boschma and Ter Wal 2007; Branston et al. 2005; Parrilli and Sacchetti 2008). Final producers, suppliers, customers, and other actors are close, both physically and cognitively, thus favoring their access to better knowledge and sources, and enhancing innovation and value creation (Capello 1999; Maskell and Malmberg 1999). On the other hand, some authors have questioned the effect of centrality on clustered firms. These scholars, focusing on the geographic or territorial aspect, argue that because of the special contextual

conditions centrality in a network of geographically close actors has either no strategic effect (Owen-Smith and Powell 2004) or only a small positive influence (Whittington, Owen-Smith, and Powell 2009). However, a great deal of prior research has been conducted that supports the notion that actors that are better positioned in the network receive more innovation-related knowledge resources than others (Becker 1970). Firms can improve their innovative capabilities using the network (Ahuja 2000) and, in fact, network scholars often treat innovativeness as a function of network position (Galunic 1998; Hargadon and Sutton 1997).

In addition, proximity and co-location (Tallman et al. 2004) are facilitators for the transmission of tacit knowledge and so the organizations involved receive the benefits of the flow of knowledge (Uzzi 1996). In clusters, firms release their technical information to actual and potential competitors, and those actors in an industry thus build on each other's expertise. The fluid exchange of technical information also generates new technical knowledge. Following evolutionary economics, in a cluster strategies for searching for Knowledge sources are strongly influenced by the richness of technological opportunities.

Due to the internal heterogeneity of the cluster firms (Camuffo 2003), knowledge in a network is distributed in an uneven way (Giuliani and Bell 2005; Giuliani 2007b), restraining its access to a specific group of actors (Morrison and Rabellotti 2009). Industrial clusters contain heterogeneous firms (Boschma and Ter Wal 2007), with distinct attributes, stock of internal resources, and network positioning (Giuliani and Bell 2005). Firms in social relations connected with other firms in the same area have access to knowledge that further physical proximity makes available (Beschi and Lissoni 2001). Opportunities and constraints are also asymmetrically distributed within regional clusters (Giuliani 2007b). As a consequence of that, individual firms show significant differences in innovation performance. Some authors (Coombes, Deeds, and Ireland 2009) have argued for a positive association between network connectedness in the cluster and innovation. So, better connections between the firms in an industrial cluster and other players in the network (number of direct and indirect ties) can be expected to provide knowledge resources related to innovation; consequently, this can be expressed more formally as the following hypothesis.

*Hypothesis 2: Occupying a more central position in the cluster network is positively associated to the innovation performance of the firm.*

The research model can be seen in the Figure 1.

FIGURE 1.  
Research model

### 3. Empirical setting

The ceramic tile industry can be found in many locations in the world, such as China, Italy or Brazil, mainly in cluster-type geographical concentrations. Despite being known as a traditional industry, it has emerged as a dynamic and fairly knowledge-intensive activity (Russo 1985), especially regarding the technological advances focused especially on process and product improvements.

Our empirical study is based on the Spanish ceramic tile cluster located within a radius of 20 kilometers in the province of Castellón, Spain, where 90% of the Spanish ceramic output is produced. The ceramic tile cluster covers not only the production of wall and floor tiles but also

special pieces and auxiliary activities, such as the production of frits and glazes, chemical additives, raw materials, and machinery, among others.

The Spanish ceramic tile industry has already been identified and analyzed as a district and cluster in seminal works such as Ybarra (1991) and more recently Boix and Galleto (2006) and Boix (2009), where it was identified as a case of Marshallian-type industrial cluster (district). The Castellón cluster, which is cited in several empirical papers (Russo 2004; Hervás-Oliver, Albors-Garrigós, and Dalmau-Porta 2008; Albors-Garrigós, Hervás-Oliver, and Márquez 2008) has been recognized as an industrial district phenomenon (Giner and Santa María 2002). Molina-Morales (2002) offered a comprehensive description of the whole process of creation of knowledge and innovation in this cluster. Finally, Molina-Morales et al. (2002) and Molina-Morales (2005) analyzed the role played by the specific local institutions in the transmission of knowledge in this cluster.

### **3.1. Data collection**

The primary data for this study were collected from the core of the Spanish ceramic tile cluster at the firm level using questionnaires and interviews. The survey was carried out with the firms' managers and engineers in charge of R&D activities or the production process. Given the characteristics of the companies we consider this profile the most adequate to answer our questionnaire. The survey was carried out between February 2011 and July 2011 and was directed toward companies operating in the different cluster activities, that is, ceramic floor and wall tiles, decorative pieces, chemical additives, glazes and frits, machinery and equipment, and atomized clay producers. The survey was directed toward a universe of 280 cluster companies; finally, we collected a total of 155 complete questionnaires accounting for 55.35% of the total.

In order to build the Technological Knowledge Network, we based our work on (Giuliani 2007a; Morrison and Rabellotti 2009; Ramírez-Pasillas 2010; Giuliani and Bell 2005). To compute the value of exchange activities, we asked the respondents about the destination of their knowledge and the origin where they gather it from. It was collected through a roster recall method. Technical knowledge includes aspects such as: production techniques, product applications, chemical additives, raw materials, characteristics and performance of machinery and technology, enamel applications, new technologies, and so forth.

### **3.2. Variables**

#### *3.2.1 Dependent variable*

*Innovation.* To collect the innovation results, we used the 13 items included in the National Innovation Survey about innovation in firms, which is carried out by the Spanish National Statistics Institute. The items include information about four kinds of innovation: product, process, organizational, and marketing. The variable shows the percentage of these 13 innovations that the firm has achieved.

#### *3.2.2 Independent variables*

*Creativity Overlap Index.* In order to assess creativity, we followed the work of Mathisen and Einarsen (2004). They concluded that two instruments, TCI (Anderson and West 1998) and KEYS (Amabile et al. 1996), were the most adequate. In addition, Moultrie and Young (2009) found that the KEYS of Amabile et al. (1996) is much more detailed, less generalizable, and built around the process of creativity. Bearing in mind the above-mentioned authors, in order to assess creativity in an organization we built the Creativity Overlap Index (COI), based on Amabile (1988), in order to assess creativity. Amabile describes *the Creativity Intersection* as the overlap between all three types of factors which affect creativity and innovation: motivation, resources, and techniques.

The organization controls three elements: Resources, Techniques, and Motivation. Resources are the essential elements in a particular domain. For the organization, resources consist of the funds, materials, systems, people, and information available to aid work in the identified task domain (Amabile 1988:155). Techniques operate the resources and it is skills' management at

all levels of the organization that nurtures the conception, development, and implementation of creative ideas (Amabile 1988:156). Motivation is the most important of the three components. Resources and Techniques make innovation possible, but the necessary catalyst is Motivation, the forward-looking, risk-oriented vision that comes from the highest level of the organization (Amabile 1988:156). We have used 8 different items (two of them negative) to measure Motivation, 9 items to evaluate Resources, and 11 items to measure Techniques. All of them were assessed by a dichotomous variable (0 = no, 1 = yes), and the calculation of each of the three components is the sum of the items with a positive answer.

Our COI was built with the aim of finding the intersection between the three types of factors mentioned above, namely: resources, motivations, and techniques. The greater the overlap between the three categories of factors is, the greater the likelihood of true creativity will be. To operationalize the indicator, we multiplied the indices for each firm's resources, skills, and motivation. The index ranges from zero to 594 (6 x 9 x 11), but it has been standardized for the statistical analysis.

*Centrality.* We measured centrality through the closeness centrality. We used Social Network Analysis (SNA) (Freeman 1979).

### 3.2.3 Control variables

*Size.* The firm's size is measured by the natural logarithm of the number of employees in the firm. Taking the logarithm reduces the effect of the skewness of the firm size distribution. Following Acs and Audretsch (1991), size and innovation are linked. We assume that larger organizations have more capacity to acquire and generate knowledge resources and consequently are more likely to show a greater capacity for innovation (Damanpour 1991; Tsai and Ghoshal 1998).

*Absorptive capacity.* We capture the Absorptive capacity through the R&D effort by computing R&D expenditure as a percentage of total revenue. This approach has already been used in some previous research performed by authors like Cohen and Levinthal (1990) or Tsai (2001).

### 3.3. Analysis techniques

We took several diagnostic procedures to control for multi-collinearity problems between the variables involved. We checked the correlation coefficients and all of them were below the 0.80 level (Hair et al. 2010). We also conducted a Variance Inflation Factor Analysis (VIF) and the VIF values for the theoretical variables ranged between 1.21 and 2.34. These figures are far from the cut-off value of 10 (Belsley 1991). Finally, we checked the tolerance values and all of them were above 0.10 (Hair et al. 2010). So, according to the previous results, multi-collinearity was not a problem in this study.

### 3.4. Results

In Table 1 we present the basic descriptive statistics and Pearson's correlation for all variables.

TABLE 1.  
Descriptive statistics and correlations of the measures

Variables	Mean	S.D.	1	2	3	4	5
(1) Innovation	0.554	0.312	1				
(2) Firm Size	3.985	1.101	.398***	1			
(3) Absorptive capacity	2.70	1.451	.511***	.228***	1		
(4) Centrality	2.720	.0932	.457***	.434***	.326***	1	
(5) Creativity	-0.004	1.002	.515***	.478***	.327***	.338***	1

N= 96; \*\*\*p< .01 and \*\* p< .05

To test the hypotheses we ran a stepwise hierarchical regression approach to assess the explanatory power of each set of variables. The models are as follows:

**Model 1:** Innovation =  $\alpha_1 + \beta_1$  Firm Size +  $\beta_2$  Absorptive capacity +  $\beta_3$  Centrality

**Model 2:** Innovation =  $\alpha_1 + \beta_1$  Firm Size +  $\beta_2$  Absorptive capacity +  $\beta_3$  Centrality +  $\beta_4$  Creativity

**Model 3:** Innovation =  $\alpha_1 + \beta_1$  Firm Size +  $\beta_2$  Absorptive capacity +  $\beta_3$  Centrality +  $\beta_4$  Creativity +  $\beta_5$  Creativity<sup>2</sup>

Model 1 presents the base case controlling for firm size, absorptive capacity, and centrality.

Model 2 introduces creativity and finally Model 3 examines the proposed inverted U-shape.

Model 3 reports the regression results for Hypotheses 1 and 2. The curvilinear model attempts to validate the existence of a non-linear relationship between creativity and innovation in cluster firms. In order to statistically justify the proposed Inverted U-shape, we ran a regression analysis with curvilinear estimation to find a quadratic relation.

The results of Model 3 are shown in Table 2, which confirm the possible existence of significant correlation between variables. In our case, the F-statistic result is significant, which means the variance of the dependent variable is significantly explained through the quadratic model. Results confirm the significant relationship between creativity and innovation adjusted to the inverted U-shape. The regression coefficients – both creativity and creativity squared – are significant. It is also noticeable that the sign of creativity squared is negative, thereby indicating an inverted U-shaped relationship. This means increasing values of the variables of creativity run parallel to the increasing values for innovation, although at a certain point additional increases are negatively associated with innovation. Hence, the positive effect of creativity was eroded by making intensive use of it.

Table 2 also shows that size is not significantly associated to innovation. In fact this result can be expected, since in these territorial agglomerations it has been argued that size is not such a relevant factor because there is an intense division of labor among specialized firms. For instance, Russo (1985) argued how economies of scale are not significant in these contexts. By contrast, as expected, absorptive capacity showed a highly significant impact on the dependent variable. In accordance with some previous innovation research we consider firms' absorptive capacity to be one of the most important determinants (Zahra and George 2002). The concept of absorptive capacity has been defined by Cohen and Levinthal (1989; 1990) as the ability of a firm to identify, assimilate, and exploit knowledge from the environment.

#### 4. CONCLUSIONS

In this paper we have considered the relation between creativity and innovation performance of firms in a cluster. Creativity has been interpreted in terms of the Creativity Overlap Index (COI) based on Amabile (1988). The key finding is that the hypothesis of an inverted U-shaped effect of creativity on innovation performance of firms is confirmed. Moreover, as expected, we found that the positive effect of holding a central network position for firms is also supported by results.

The implications are important, for theory and practice. Rather than assuming that creativity is unconditionally good for innovation, we posit that at a certain point creativity becomes so large as to preclude the sufficient internal capacity needed to utilize those opportunities. This result confirms calls for additional and more sophisticated research on the effects of creativity (Çokpekin and Knudsen 2012). In addition findings can be interpreted in line with the reservations expressed by the so-called *dark side of creativity*, which questions the dominant assumption of the positive effects of creativity (Cropley 2010; James, Clark, and Cropanzano 1999).

Regarding the network and cluster literatures, our results coincide with some previous research such as Phelps, Heidl, and Wadhwa (2012), Tsai and Ghoshal (1998), and Tsai (2001) in confirming a positive association between centrality and innovation performance, and more particularly inside the cluster, as argued by Coombs et al. (2009), Galunic (1998), and Hargadon and Sutton (1997). In this way, results contradict or at least contrast with the more ambiguous findings obtained by Owen-Smith and Powell (2004) and Whittington, Owen-Smith, and Powell (2009).

One limitation of the present study is that we used indicators of the main variables that can be refined and adapted for specific contexts. We accept the definition of creativity proposed by Amabile (1988), but we are aware that many other alternatives can be found and consequently results can be affected. Similarly, our indicators of innovation can be adapted more precisely to the context of research and, for instance, technical and market components can be differentiated. On the other hand, the specific features of our empirical setting lead us to be cautious about generalizing the results. Hence, our findings cannot be extrapolated to other industries or clusters, therefore making it necessary to test whether these results are applicable in other contexts.

The following points can be viewed as possible future avenues of research for the development of this study. The fine-grained process through which network structure is created or modified is an interesting and important area for future research. Another fruitful area of inquiry is the dynamics of how firms' networks evolve and change in response to external challenges and opportunities. This research should be completed in order to trace and follow individual changes in network configurations over a lifetime, which would thereby require the use of longitudinal research designs (Björk and Magnusson 2009; Kratzer and Lettl 2008).

## RESUMEN

*Desde la literatura se ha señalado la importancia de los beneficios de la relación para explicar la lealtad hacia el establecimiento comercial. Por otra parte, se ha destacado la necesidad de innovar para diferenciarse en sectores altamente competitivos como es el comercio minorista. Sin embargo, hasta la fecha no se ha dedicado atención a la posible influencia de la capacidad de innovación del minorista sobre la relación entre beneficios relacionales y lealtad del cliente. Por ello, el presente trabajo pretende profundizar en el vínculo entre los beneficios de la relación y la lealtad hacia la tienda, examinando el papel moderador de la capacidad de innovación del minorista en estas relaciones. De los resultados obtenidos a partir de un estudio realizado entre 820 clientes de cadenas de tiendas pertenecientes a diversos sectores, se infiere una serie de implicaciones para la gestión por lo que se refiere a la priorización de distintos tipos de innovación por parte del minorista.*

## Palabras clave:

Beneficios de la relación, lealtad, innovación relacional

---

\* Este estudio ha sido realizado con el apoyo financiero prestado por el proyecto I+D del Plan Nacional del Ministerio de Educación y Ciencia, ref. ECO2010-17475.

## **1. Introducción**

La investigación empírica en el marco de la teoría de la contingencia sugiere que el nivel de dinamismo del entorno generado a través de la capacidad de innovación es un factor clave en las decisiones estratégicas de la empresa (Miller, 1988; Miller y Dröge, 1986). En entornos altamente competitivos, como es el caso del comercio minorista, existe una gran presión sobre los establecimientos comerciales que les empuja a innovar (Homburg et al., 2002). Sin embargo, hasta la fecha se ha prestado escasa atención a la innovación en el ámbito de la distribución comercial debido a que, por su pertenencia al sector servicios, no se dedica a la producción de productos nuevos o técnicamente mejorados (Quinn et al., 2013).

Por otra parte, el estudio de la innovación en el comercio minorista se ha centrado tradicionalmente en la predicción del grado de aceptación de una nueva tecnología de servicio, considerando que los minoristas son fundamentalmente usuarios de las innovaciones desarrolladas por otras empresas (Pantano, 2014). En este sentido, sería de utilidad para los minoristas priorizar aquellas innovaciones que permitan fidelizar, en mayor medida, a la clientela.

Por otra parte, desde el punto de vista de la empresa, y en particular, del comercio minorista, resulta de gran interés el conocimiento de los beneficios percibidos por el cliente, ya que se ha observado la existencia de una relación entre dichos beneficios y la lealtad hacia el establecimiento (Hennig-Thurau et al., 2002). Una clientela satisfecha y leal permite aumentar el volumen de ventas de la empresa (Gwinner et al., 1998), reducir los costes de comunicación para atraer a nuevos clientes (Payne y Frow, 2005) y crear capital de marca (Bhattacharya y Sen, 2003).

Por ello, centrándonos en el sector de la distribución minorista, el presente trabajo se plantea un doble objetivo. En primer lugar, se trata de contrastar la positiva influencia de los beneficios de la relación sobre la lealtad hacia el minorista. En segundo lugar, se pretende analizar el posible papel moderador de la capacidad de innovación del minorista sobre el vínculo entre los distintos tipos de beneficios de la relación y la lealtad. De esta forma se espera obtener evidencia que oriente a los gestores del comercio minorista acerca del tipo de beneficios en el que deben centrar sus esfuerzos de innovación.

## **2. Revisión de la literatura**

### ***2.1. Beneficios de la relación***

En los últimos años, se observa en la literatura un creciente interés por investigar qué tipo de beneficios obtienen los consumidores de sus relaciones de larga duración con las empresas (Gwinner et al., 1998; Reynolds y Beatty, 1999; Yen y Gwinner, 2003; Marzo-Navarro et al., 2004; Vázquez-Carrasco y Foxall, 2006). Esto ha representado un giro en la investigación en el ámbito académico, al pasar de centrarse en las relaciones a largo plazo en el marco de las relaciones interorganizacionales a las relaciones entre las empresas y los consumidores finales.

En este sentido, diversos trabajos se han perseguido como meta identificar los beneficios que reciben los clientes como resultado de transacciones en una relación a largo plazo con empresas de servicios (Gwinner et al., 1998; Reynolds y Beatty, 1999; Patterson y Smith, 2001; Hennig-Thurau et al., 2002). Así, se ha identificado la presencia de una serie de beneficios derivados de la simple existencia de la relación con el proveedor del servicio, con independencia del servicio principal (Barnes, 1994). Estos beneficios se refieren a cualquier esfuerzo activamente realizado por el proveedor para aumentar el valor percibido por el cliente más allá del producto o servicio recibido (De Wulf y Odekerken-Schröder, 2003).

La mayor parte de estos trabajos señalan la existencia de tres tipos de beneficios para el consumidor derivados de su relación con el proveedor; a saber: beneficios de la confianza,

beneficios sociales, y beneficios de trato especial (Gwinner et al., 1998; Patterson y Smith, 2001; Hennig-Thurau et al., 2002; Yen y Gwinner, 2003; Park y Kim, 2006).

Entre los beneficios de la confianza se encontrarían factores de tipo psicológico relacionados con la menor ansiedad y la percepción de un riesgo inferior en el resultado de la transacción que se deriva de la existencia de una relación con el proveedor del servicio (Berry, 1995). De manera más específica, los beneficios de la confianza se derivan de la fiabilidad percibida en el proveedor del servicio en cuanto al mantenimiento de sus promesas (Grönroos, 1990; Bitner, 1995).

Los beneficios sociales se refieren a la fraternización, la familiaridad y el reconocimiento personal entre el cliente y el personal de la empresa, que puede, incluso, derivar en una relación de amistad (Berry, 1995).

Por último, entre los beneficios de trato especial o preferencial se encuentran los descuentos, ahorro de tiempo y servicios adicionales no disponibles para otros clientes, derivados de la consideración de cliente especial, debida a la historia de la relación. Si bien los ahorros monetarios representan la principal motivación para entablar relaciones de intercambio (Peterson, 1995; Sheth y Parvativar, 1995), los beneficios de trato especial combinan beneficios económicos y de personalización del servicio que los clientes perciben al mantener relaciones con las empresas de servicios.

Alternativamente, otros trabajos agrupan los beneficios relacionales en dos tipos: beneficios funcionales y beneficios sociales (Reynolds y Beatty, 1999; Pedraja y Rivera, 2002; Marzo-Navarro et al., 2004). En este caso, los beneficios funcionales incluyen ahorros de tiempo y dinero, conveniencia y asesoramiento personal que facilitan las decisiones de compra. Siguiendo a Reynolds y Beatty (1999), este tipo de beneficios incluye los beneficios de la confianza y de trato especial de Gwinner et al. (1998).

Por otra parte, los beneficios sociales incluyen el disfrute derivado de la relación personal con el personal de la empresa proveedora del servicio. En este sentido, este tipo de beneficios es muy similar a los beneficios sociales identificados por Gwinner et al. (1998).

## **2.2. Lealtad**

La lealtad ha sido definida como la combinación de una actitud positiva y la repetición de compra (Dick y Basu, 1994), considerando conjuntamente de esta manera las dos perspectivas – actitudinal y conductual - tradicionalmente discutidas en la literatura. De acuerdo con la perspectiva actitudinal, la lealtad se define como una actitud que en ocasiones implica una relación con la empresa. Desde la segunda perspectiva, la lealtad se considera en términos de comportamiento revelado a través de repetición de compra (Uncles et al., 2003).

La lealtad en el sector servicios es quizás más difícil de conceptualizar en comparación con los bienes, debido a la intangibilidad, la inseparabilidad, la variabilidad y el carácter perecedero de los servicios (Bloemer et al., 1998; Mittal y Lassar, 1998), siendo fundamental el papel de las relaciones con los clientes.

En particular, en el contexto del comercio minorista, se pueden encontrar definiciones que adoptan uno de los dos tipos de enfoques tradicionales – actitudinal y conductual – o una combinación de ambos. Así, la lealtad a la tienda se ha definido como la respuesta conductual positiva de repetición de compra, expresada a lo largo del tiempo, de un consumidor hacia un establecimiento de entre un conjunto de tiendas. Esta conducta es una consecuencia de procesos evaluativos y de toma de decisiones que resultan en el compromiso (Bloemer y Ruyter, 1998; Knox and Walker, 2001). La parte fundamental de esta definición es el compromiso hacia la tienda, ya que en ausencia del mismo, la repetición de compra es mera lealtad espúrea, es decir, el comportamiento de repetición de visita se debe únicamente a la inercia (Dick y Basu, 1994).

Alternativamente, Srinivasan et al. (2002) definen la lealtad al establecimiento comercial como una actitud favorable del cliente hacia el minorista que se traduce en la repetición del comportamiento de compra. En esta línea, Arnett et al. (2003) conceptualizan la lealtad como la tendencia de ser leales a un determinado minorista demostrado por la intención de comprar en él como primera elección.

### ***2.3. Innovación relacional***

En los últimos años se ha empezado a prestar atención al concepto de “innovación relacional” o “innovación basada en la relación”. Sin embargo, no existe consenso acerca del contenido y de la dimensionalidad de este constructo.

Según UNIDO (2002), se pueden distinguir cuatro principales enfoques o formas de entender la innovación en el contexto de las relaciones dentro del canal de comercialización, a saber: innovaciones en producto, innovaciones en procesos, innovación funcional e innovación dentro de la cadena de valor. Las innovaciones de producto se basan en el conocimiento o la tecnología aplicada a la fabricación del producto, mientras que las innovaciones de proceso se centran en la producción o en las fases necesarias para combinar nuevos materiales con el fin de producir un producto terminado, reduciendo costes o mejorando la eficiencia. La innovación funcional, por su parte, implica asumir la responsabilidad de nuevas actividades en la cadena de valor. Por último, la innovación dentro de la cadena de valor se refiere a la adopción de nuevas posiciones en el canal de distribución.

En el ámbito académico, se ha tratado de profundizar en la identificación de las iniciativas de innovación a través de la relación entre los miembros del canal de distribución (Ganesan et al., 2009; Hu y Zhao, 2010). Según Musso (2010), la innovación en los canales de marketing sigue tres aproximaciones, a saber: tecnológica, relacional y estructural. La aproximación tecnológica comprende, en lo que se refiere a las relaciones con la demanda final, una serie de aplicaciones de las tecnologías de la información y de la comunicación centradas en la gestión de tesorería, fijación de precios dinámica, medios de pago, venta a distancia y on-line, y máquinas de venta automática y tecnologías de autoservicio, entre otras.

La perspectiva relacional se refiere a algunas aplicaciones que no son innovadoras en sí mismas, en la medida en que ya se han desarrollado y difundido ampliamente, pero representan áreas en las que las empresas pueden desarrollar soluciones innovadoras, como el surtido de productos éticos y socialmente responsables, los programas de fidelización, y las iniciativas encaminadas a garantizar la sostenibilidad medioambiental del establecimiento (Ganesan et al, 2009; Musso, 2010).

Por último, la aproximación estructural se centra en nuevas configuraciones de los canales, nuevos canales o canales múltiples, bien sean introducidas por iniciativa de las empresas industriales (p.e. franquicias, tiendas monomarca, canales directos multinivel, factory outlet, comercio electrónico), o bien como resultado de los mecanismos internos de la oferta comercial (p.e. estrategia multicanal).

Con todo, hasta donde tenemos conocimiento, han sido escasos los intentos de desarrollar una escala de medición de la innovación en el ámbito del comercio minorista en sus relaciones con los clientes. Entre estos destacamos la escala de valoración global de la capacidad de innovación del comercio minorista propuesta por Homburg et al. (2002), quienes definen este constructo como el grado en el que los minoristas que operan en determinado mercado adoptan nuestras ideas de merchandising o servicio, tratando de recoger así la valoración del consumidor acerca del número de innovaciones adoptadas, el momento en que se adoptan y la consistencia de la propensión a innovar por parte del minorista a lo largo del tiempo.

### 3. Hipótesis a contrastar y modelo propuesto

En el sector servicios, la participación del consumidor en la prestación del servicio añade una dimensión emocional a la lealtad (Javalgi y Moberg, 1997). En este contexto, la lealtad del cliente depende en gran medida de la capacidad de personalización del servicio (Ball et al., 2006), la gestión de las comunicaciones personales (Jones y Farquhar, 2003) y el sentimiento de disfrute o entretenimiento al realizar las compras en el establecimiento (Wong, 2004).

La literatura en marketing de servicios ha hecho hincapié en la importancia de los beneficios relacionales percibidos por el cliente como antecedente de la satisfacción del cliente y la lealtad hacia el proveedor de servicios (Gwinner et al., 1998; Patterson y Smith, 2001; Hennig-Thurau et al., 2002; Yen y Gwinner, 2003; Park y Kim, 2003; Thao y Swierczek, 2008). Así, se ha evidenciado empíricamente que los beneficios de la relación actúan como antecedentes de la lealtad hacia el proveedor de servicios (Beatty et al., 1996). En particular, siguiendo los resultados de trabajos previos, esperamos que la lealtad se encuentre influida positivamente por los beneficios de la confianza (Hennig-Thurau et al., 2002; Yen y Gwinner, 2003), los beneficios sociales (Reynolds y Beatty, 1999; Hennig-Thurau et al., 2002; Pedraja y Rivera, 2002; Marzo-Navarro et al., 2004), y los beneficios de trato especial (Yen y Gwinner, 2003).

A partir de todo lo anteriormente expuesto, enunciaremos la primera hipótesis como sigue:

*H<sub>1</sub>: Los beneficios de la confianza (H<sub>1a</sub>), los beneficios sociales (H<sub>1b</sub>), y los beneficios de trato especial (H<sub>1c</sub>) influyen positivamente en la lealtad del cliente hacia la tienda.*

Por otra parte, en el contexto del comercio minorista, se ha señalado que las innovaciones basadas en la relación pueden, en última instancia, mejorar el valor percibido por el cliente a través de un mejor surtido y de precios más bajos gracias a una mayor eficiencia en los procesos internos del establecimiento (Ganesan et al, 2009).

De forma similar, siguiendo la perspectiva tecnológica de innovación relacional de Musso (2010), en el ámbito del comercio minorista, son múltiples las aplicaciones que se pueden implantar en las tiendas: tecnologías para la gestión de clientes, gestión integral del negocio, tecnologías de respuesta rápida, datos de punto de venta, códigos universales de producto, medios de pago a través de las TIC (pago vía teléfono móvil, internet o transferencia bancaria), tecnologías de autoservicio, entre otras (Ellram et al., 1999; Weber y Kantamneni, 2002; Liljander et al., 2006; ONTSI, 2008).

Desde la literatura, se han resaltado los beneficios de las TIC en términos de ganancia en eficiencia de los procesos internos de la empresa y mejora en el servicio ofrecido al cliente (e.g. Lawson, 2001). En particular, desde el punto de vista de la tienda, las aplicaciones tecnológicas ofrecen una serie de ventajas en términos de ahorro de tiempo, ahorro de gastos de personal, fiabilidad, exactitud, reducción de errores, mejora en la gestión del inventario, mejora de la productividad a través de la mecanización de tareas intensivas en mano de obra, etc. (Ellram et al., 1999; Lawson, 2001) que se pueden traducir en sustanciales mejoras del servicio al cliente (Gurau y Ranchhod, 2002). Desde la óptica del consumidor, las TIC implantadas por el minorista permiten crear un ambiente agradable (Bäckström y Johansson, 2006) y ahorrar tiempo de compra, al poder disponer de un mayor surtido y realizar las compras en un único viaje (Messinger y Narasimhan, 1997).

Por otra parte, trabajos recientes en el ámbito del comercio electrónico, como el desarrollado por O’Cass y Carlson (2012), demuestran la existencia de una relación entre la innovación tecnológica, la confianza y la lealtad de los clientes.

Todo lo anteriormente expuesto puede llevar a concluir que la capacidad de innovación del minorista podría incidir positivamente en la intensidad del vínculo entre los beneficios de la relación y la lealtad.

Sin embargo, aunque la tecnología puede mejorar la gestión de las relaciones y la personalización del servicio, las TIC pueden ser fuente de satisfacción o insatisfacción del cliente en función de la actitud del mismo hacia la tecnología (Joseph et al., 1999; Parasuraman

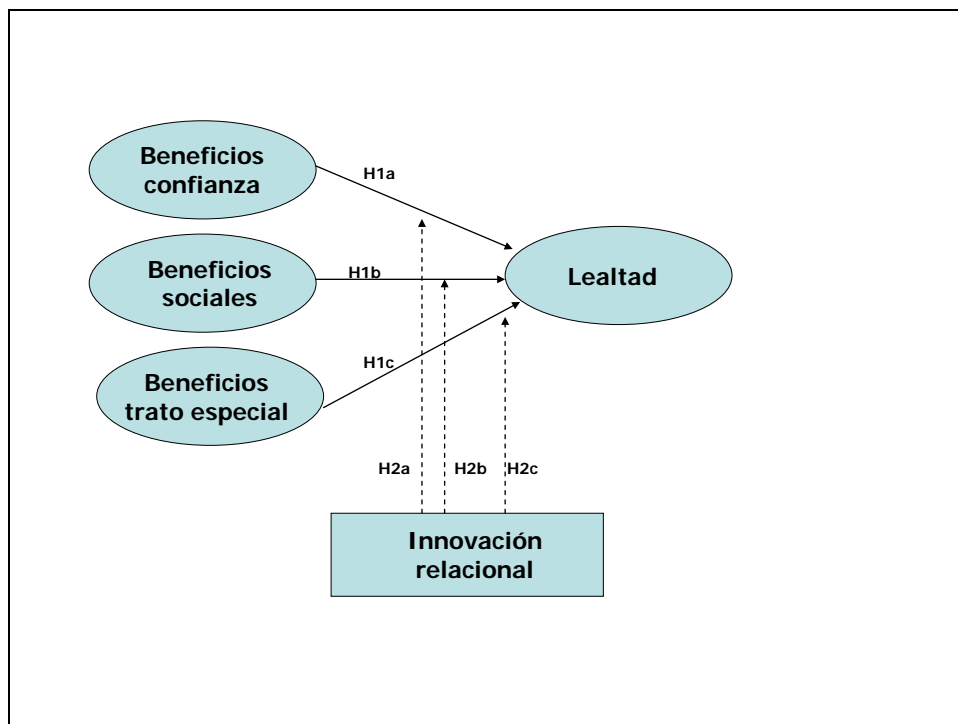

y Colby, 2001, Walker et al., 2002) y/o la capacidad de respuesta del empleado (Meuter et al., 2000; Bitner, 2001). En este sentido, cabe destacar que la valoración de los beneficios puede presentar diferencias significativas según el tipo de servicio y la forma en que éste es prestado (Gwinner et al., 1998; Patterson y Smith, 2001; 2003). En concreto, en los servicios personalizados y de alto contacto tienen una importancia significativamente mayor los beneficios de trato especial y de tipo social, en comparación con aquellos servicios impersonales o estandarizados.

Con todo, enunciaremos las siguientes hipótesis:

*H<sub>2</sub>: Para los clientes que perciben al minorista como más innovador, la intensidad de la relación entre beneficios de la confianza (H<sub>2a</sub>), beneficios sociales (H<sub>2b</sub>), y beneficios de trato especial (H<sub>2c</sub>) y la lealtad hacia la tienda es mayor que para los clientes que perciben menor capacidad de innovación del establecimiento comercial.*

En definitiva, esperamos que los beneficios relacionales influyan positivamente en la lealtad. Adicionalmente, se postula la existencia de un efecto moderador de la innovación relacional sobre las relaciones anteriormente señaladas. Las relaciones entre los distintos constructos se muestran en la Figura 1.

Modelo propuesto

#### 4. Metodología

Con la finalidad de contrastar el modelo propuesto, se desarrolló una encuesta personal estructurada a 820 individuos. En concreto, la encuesta se realizó en una provincia española. Los detalles de la investigación se resumen en la Tabla 1.

TABLA 1

<b>Técnicas estadísticas</b>	Análisis descriptivo Análisis de la varianza Análisis Factorial Confirmatorio Modelo de Ecuaciones Estructurales
<b>Software estadístico</b>	SPSS versión 19 EQS versión 6.1

Para realizar el análisis, se han seleccionado trece enseñanzas de los sectores de alimentación, textil, electrónica y hogar. Los establecimientos han sido retenidos en base a los productos ofertados y su posicionamiento en el mercado español, forman parte de los principales grupos de distribución en España y son considerados como algunas de las marcas minoristas europeas más sobresalientes y de mayor rendimiento. Adicionalmente, la mayoría de estos establecimientos fueron citados como referentes en sus respectivos sectores, según se desprende de un estudio anterior realizado por los autores. Con la finalidad de obtener una muestra más representativa de la población, las encuestas fueron realizadas a la salida de estos establecimientos, preguntándoles acerca de su relación con la tienda visitada. Para seleccionar a los encuestados se sigue un procedimiento de muestreo dirigido. La Tabla 2 refleja la distribución de la muestra según las variables de clasificación.

TABLA 2  
Distribución de la muestra

CARACTERÍSTICAS DE LOS CONSUMIDORES	FRECUENCIA	%
<b>Género</b>		
Hombres	293	35,7
Mujeres	527	64,3
<b>Edad</b>		
18-25 años	151	18,4
26-35 años	163	19,9
36-45 años	184	22,4
46-55 años	164	20,0
56-65 años	114	13,9
Más de 65 años	44	5,4
<b>Nivel de Estudios</b>		
Sin estudios	14	1,7
Educación Primaria	125	15,2
Educación Secundaria y Ciclos formativos	286	34,9
Estudios Universitarios	386	47,1
No contesta	9	1,1
<b>Ocupación</b>		
Estudiante	123	15,0
Ama de casa	67	8,2
Desempleado	102	12,4
Pensionista	76	9,3
Trabajador por cuenta propia	72	8,8
Trabajador por cuenta ajena	380	46,3

Para la recogida de la información se procedió a la administración de un cuestionario estructurado con preguntas cerradas, en el que el consumidor debía indicar su grado de acuerdo o desacuerdo con una serie de afirmaciones utilizando una escala Likert de 7 puntos, así como una serie de cuestiones de clasificación.

Los ítems incluidos en el cuestionario para el análisis de los constructos han sido propuestos en base a la revisión de diferentes estudios previos. Así, se ha adaptado la escala de beneficios de la relación a partir de Gwinner et al. (1998), y se han tomado los ítems de la escala de lealtad utilizada por Arnett et al. (2003). Por su parte, la innovación del minorista se ha medido a través de ítems adaptados a partir de la escala propuesta por Homburg et al. (2002).

Una vez recogidos los datos, se realiza un análisis de componentes principales (ACP) con el fin de agrupar los ítems utilizados en factores. A continuación, con el fin de confirmar la validez del modelo propuesto, se realiza un análisis de covarianzas o estimación de un modelo de ecuaciones estructurales siguiendo el procedimiento en dos etapas recomendado por Anderson y Gerbing (1988). Este procedimiento implica, en primer lugar, analizar la calidad de la medida de los constructos a través de un análisis factorial confirmatorio, y en segundo lugar, la estimación de un modelo estructural, teórico o causal que permite obtener información acerca de las relaciones entre los constructos a los que se refieren las hipótesis de este estudio. De esta forma, se pueden contrastar simultáneamente las hipótesis acerca de las relaciones de causalidad entre las variables latentes y/o observadas.

Por último, con el fin de contrastar la influencia del nivel de innovación del minorista con respecto a sus competidores en la relación entre los beneficios de la relación y la lealtad, se estima un modelo de ecuaciones estructurales multigrupo o multimuestra. A través de esta técnica tratamos de contrastar la existencia de diferencias significativas en las relaciones entre las variables analizadas en función del grado de innovación por parte del minorista en sus relaciones con los clientes.

## 5. Resultados

En primer lugar, a modo de análisis preliminar, se realiza un análisis de componentes principales (ACP) con rotación VARIMAX con el fin de obtener la estructura de relaciones entre las variables que componen las diferentes escalas. Tras esta primera fase exploratoria, los resultados del ACP fueron sometidos a un análisis factorial confirmatorio. Como resultado, se observa que los índices de ajuste oscilan alrededor de 0,9, lo que indica un ajuste aceptable del modelo (Tabla 3). Adicionalmente, el error cuadrático medio es bajo (RMSEA = 0,034).

TABLA 3  
Resultados del análisis factorial confirmatorio

Constructo	Ítem	Carga fact. estand. (error est.)	t	$\alpha$ Cronbach	Fiabilidad compuesta	Varianza extraída
Beneficios de la confianza	BC1. Comprando en esta tienda creo que tengo menos riesgo de que algo salga mal	0.827	-	0.909	0.915	0.782
	BC2. Creo que puedo confiar en esta tienda	0.918 (0.028)	32.712*			
	BC3. Tengo más confianza de que el servicio será prestado correctamente	0.906 (0.025)	36.485*			
Beneficios sociales	BS1. Conozco al empleado/s que presta/n el servicio	0.893	-	0.872	0.882	0.789
	BS2. Me conocen por mi nombre	0.884 (0.043)	19.007*			
Beneficios de trato especial	BT1. Obtengo descuentos u ofertas especiales que la mayoría de clientes no pueden obtener	0.923	-	0.972	0.973	0.924
	BT2. Me prestan servicios que no proporcionan a la mayoría de los clientes	0.979 (0.028)	36.602*			
	BT3. Obtengo un servicio más rápido que el resto de clientes	0.980 (0.033)	30.859*			
Lealtad	L1. Me considero cliente leal	0.773	-	0.923	0.927	0.762
	L2. La tienda X es mi primera elección	0.904 (0.034)	33.814*			
	L3. No compraré en la competencia	0.898 (0.034)	29.242*			
	L4. Aún con producto similar, prefiero X	0.910 (0.035)	30.801*			
Innovación relacional	I1. Esta tienda adopta más nuevas ideas de prácticas de merchandising o servicios que otras	0.909	-	0.948	0.948	0.860
	I2. Adopta ideas nuevas de prácticas de merchandising o servicios antes que otras	0.925 (0.024)	41.870*			
	I3. Adopta ideas nuevas de prácticas de merchandising o servicios continuamente	0.947 (0.022)	46.453*			

Chi-cuadrado Satorra-Bentler: 154.60; grados de libertad: 80; CFI: 0.950; IFI: 0.990; Bentler-Bonett NNFI: 0.987; RMSEA: 0.034.

A partir de los resultados expuestos en la Tabla 3, se puede confirmar la fiabilidad de las escalas, ya que tanto la fiabilidad compuesta como el coeficiente alfa de Cronbach están por encima del valor recomendado de 0,8 para todos los constructos, las varianzas extraídas son

superiores al 50% y las cargas factoriales estandarizadas son estadísticamente significativas para todos los ítems. Todo ello nos permite confirmar la validez convergente del modelo.

Por otra parte, se calculan las correlaciones entre constructos con el fin de comprobar la validez discriminante (Tabla 4).

TABLA 4  
Medias, desviaciones típicas y correlaciones entre constructos

Constructo	Media	Desv. típ.	Correlaciones				
			F1	F2	F3	F4	F5
F1. Beneficios de la confianza	4.970	1.587					
F2. Beneficios sociales	1.673	1.427	0.255 (0.10, 0.41)				
F3. Beneficios de trato especial	1.350	1.020	0.106 (0.03, 0.19)	0.632 (0.41, 0.85)			
F4. Lealtad	3.998	1.847	0.439 (0.26, 0.62)	0.346 (0.17, 0.53)	0.327 (0.20, 0.45)		
F5. Innovación relacional	4.238	1.776	0.375 (0.17, 0.58)	0.006 (-0.18, 0.19)	-0.037 (-0.14, 0.07)	0.174 (-0.02, 0.36)	

Para ello, calculamos el intervalo de confianza descrito por Anderson y Gerbing (1988) para las correlaciones entre todos los pares de constructos. Esta prueba requiere el cálculo de un intervalo de confianza de + / - dos errores estándar para la correlación entre dos constructos y determinar si este intervalo incluye el valor 1. En caso de que este intervalo no incluya el valor 1, la validez discriminante queda confirmada. En este caso, como se puede comprobar en la Tabla 4, ninguno de los intervalos incluye la unidad, quedando así confirmada la validez discriminante.

Una vez confirmada la validez, estimamos el modelo de ecuaciones estructurales que aparece en la Figura 1, obteniendo los resultados que se muestran en la Tabla 5.

TABLA 5  
Resultados del modelo de ecuaciones estructurales

Relación	Parámetro estandarizado	Error estándar	t	Hipótesis
Beneficios de la confianza → Lealtad	0.397	0.036	11.092*	H1a aceptada
Beneficios sociales → Lealtad	0.125	0.032	3.739*	H1b aceptada
Beneficios de trato especial → Lealtad	0.228	0.043	8.010*	H1c aceptada

Chi-cuadrado Satorra-Bentler: 333.02; grados de libertad: 51; CFI: 0.943; IFI: 0.943; Bentler-Bonett NNFI: 0.926; RMSEA: 0.08.

\* Significativo, p < 0.05

Como resultado se obtiene apoyo al primer grupo de hipótesis, que sostenían la influencia positiva y significativa de los beneficios de la confianza, los beneficios sociales y los beneficios de trato especial sobre la lealtad del cliente al minorista. Estos resultados se encuentran en la línea de la evidencia empírica previa, que señala la existencia de una relación positiva entre beneficios de la relación y lealtad (Gwinner et al., 1998; Hennig-Thurau et al., 2002).

El ajuste global del modelo es aceptable, ya que los índices de ajuste se encuentran alrededor del valor recomendado de 0,9 y el RMSEA se encuentra en torno al valor de referencia de 0,08.

Adicionalmente, de acuerdo con el segundo grupo de hipótesis, esperamos encontrar diferencias significativas en la valoración de los beneficios de la relación y en la lealtad del cliente, así como en las relaciones entre estos constructos en el modelo, en función del grado de innovación del establecimiento. Con el fin de contrastar estas hipótesis, en primer lugar, se divide la muestra en dos submuestras en función del grado de innovación del minorista percibida por el consumidor. Para ello, se calcula la mediana del promedio de los tres ítems de la escala (que en este caso es 4) y se consideran dentro del grupo de innovación baja los elementos muestrales que toman valor inferior a 4 y en el grupo de innovación alta los que presentan valor promedio superior a 4, eliminando todos los elementos muestrales que tomen un valor exactamente igual a 4. A continuación, se calculan los valores medios y se contrasta la existencia de diferencias significativas entre dos grupos de tiendas (nivel de innovación bajo y alto) para los constructos relativos a los beneficios de la relación y la lealtad del cliente hacia el establecimiento comercial

(Tabla 6). Como resultado de este análisis, se observa que los valores obtenidos para los beneficios de la confianza y la lealtad son significativamente superiores para los minoristas más innovadores, no existiendo diferencias significativas para los beneficios sociales y de trato especial ( $p < 0.05$ ). De este resultado se puede inferir la superior credibilidad que inspiran los establecimientos que se esfuerzan por introducir servicios novedosos frente a los ofrecidos por la competencia, así como la mayor fidelidad de los clientes hacia los establecimientos percibidos como más innovadores.

TABLA 6

**Dimensiones y valoración global del capital de marca de la tienda e intenciones conductuales en función del grado de avance tecnológico de la tienda: Valores medios y diferencias significativas**

	Innovación baja (N=285)	Innovación alta (N=391)	F	p valor
F1. Beneficios de la confianza	4.49	5.42	72.21	0.000
F2. Beneficios sociales	1.72	1.68	0.15	0.698
F3. Beneficios de trato especial	1.41	1.29	2.17	0.141
F4. Lealtad	3.82	4.23	10.88	0.001
F5. Innovación relacional	2.37	5.69	2445.09	0.000

A continuación, se lleva a cabo un análisis multigrupo. De esta manera, se trata de contrastar la existencia de diferencias significativas en las relaciones entre constructos en función del grado de innovación por parte del minorista. Los resultados obtenidos se muestran en la Tabla 7.

TABLA 7

**Resultados del análisis multigrupo**

	Innovación baja (N=285)	Innovación alta (N=391)	Chi <sup>2</sup>	p-valor
Beneficios de la confianza → Lealtad	0.472	0.339	0.954	0.329
Beneficios sociales → Lealtad	0.169	0.124	5.695	0.017
Beneficios de trato especial → Lealtad	0.216	0.204	7.017	0.008

Chi-cuadrado Satorra-Bentler: 365.8;5 grados de libertad: 105; CFI: 0.936; IFI: 0.937; Bentler-Bonett NNFI: 0.920; RMSEA: 0.061.

\* Significativo,  $p < 0.05$

A partir de los resultados obtenidos, cabe resaltar la existencia de diferencias significativas entre los establecimientos que son percibidos como más innovadores y los considerados como menos innovadores por lo que respecta a la intensidad de la relación entre los beneficios sociales y la lealtad del consumidor hacia el establecimiento comercial, por una parte, y los beneficios de trato especial y la lealtad, por otra. En particular, la intensidad de la relación entre los beneficios sociales y la lealtad del cliente es más fuerte para los establecimientos con menor nivel de innovación frente a los más innovadores ( $p < 0.05$ ). Esta evidencia se puede explicar por el hecho de que la innovación puede conllevar la introducción de, por ejemplo, las tecnologías de la información y de la comunicación (TIC) en ciertos procesos habitualmente realizados por el personal del establecimiento. Esto puede ser percibido por los clientes como una pérdida del trato personal, del vínculo emocional con el empleado del establecimiento, debilitando la intensidad de la relación entre beneficios sociales y lealtad en los establecimientos más innovadores frente a los más tradicionales.

De forma similar, el grado de sofisticación influye significativamente en la intensidad de la relación entre beneficios de trato especial y lealtad, en el sentido de que la relación entre estos constructos es más fuerte para los establecimientos percibidos como menos innovadores frente a los más innovadores ( $p < 0.01$ ). De nuevo, el superior grado de innovación de ciertos establecimientos puede redundar en un trato más impersonal, por lo que el vínculo entre beneficios de trato especial y lealtad es más fuerte para las tiendas tradicionales frente a los minoristas más innovadores.

En cambio, no se observa un efecto moderador de la innovación sobre las relaciones entre los beneficios de confianza y la lealtad.

## 6. Conclusiones

El grado de innovación relacional del minorista ha sido señalado como un factor diferenciador importante. No obstante, se trata de un constructo al que todavía se le ha prestado escasa atención, y para el que no existe consenso acerca de su conceptualización y dimensionalidad. Por otra parte, hasta donde tenemos conocimiento, este es el primer trabajo en el que se aborda el estudio de su papel moderador en la relación entre beneficios relacionales y lealtad.

Los resultados obtenidos en el presente estudio, en primer lugar, vienen a corroborar la evidencia obtenida por estudios previos en lo que se refiere al papel de los beneficios de la relación como generadores de lealtad hacia la tienda, destacando entre ellos los beneficios de la confianza. En segundo lugar, aquellos establecimientos valorados como más innovadores presentan puntuaciones significativamente superiores en lo que se refiere a los beneficios de la confianza y la lealtad del cliente. En este sentido, los consumidores valoran positivamente la introducción de novedades en servicios por parte de los minoristas frente a sus competidores, entendiendo que el esfuerzo realizado por la tienda redundará en beneficio del cliente, quien le concede su confianza en mayor medida y la tiene en mejor consideración para futuras compras.

En cambio, se observa un papel moderador de la innovación relacional en sentido exactamente contrario al que cabría esperar por lo que respecta a la relación entre beneficios sociales y de trato especial y lealtad. Así, las relaciones entre beneficios sociales y de trato especial con respecto a la lealtad son más fuertes para los establecimientos tradicionales en comparación con los más innovadores. De este resultado se podría inferir que las innovaciones introducidas por algunos comercios vienen a minar los atributos del servicio valorados por los consumidores como beneficios sociales y de trato especial que emanan de la relación a largo plazo con el minorista.

A partir de estos resultados, se puede vislumbrar la importancia de la implicación continuada del minorista en procesos de innovación relacional, siempre que dichos cambios permitan mejorar la eficiencia en la gestión, la minimización de errores y la fiabilidad de los procesos, elementos que pueden influir positivamente en la generación de beneficios de la confianza y, en última instancia, fidelizar en mayor medida al cliente. Pero al mismo tiempo, se debe cuidar el trato personal y no descuidar el aspecto humano que, si bien los beneficios sociales son los que contribuyen en menor medida a la lealtad, sigue siendo una cuestión altamente valorada por los consumidores. Así, por ejemplo, la utilización de las nuevas tecnologías para acercar el establecimiento al cliente, a través del correo electrónico, los SMS, las aplicaciones de mensajería instantánea o las redes sociales, debe cuidar aspectos tales como la personalización del destinatario de los mensajes – dirigidos al cliente con su nombre –, la inclusión de contenidos que pueda ser de su interés – en función de los datos de compras anteriores de los que dispone el establecimiento –, y la personalización del emisor del mensaje – gestor personal o persona de contacto en el establecimiento –.

Adicionalmente, entendemos que las innovaciones introducidas por el minorista deben considerar asimismo el desarrollo de nuevas formas de reconocer la fidelidad del cliente a través de la operativización de diversos beneficios de trato especial. Así, la emisión de una tarjeta de socio cliente o la clasificación de los clientes en diferentes categorías que les permitan acceder a ventajas especiales, no disponibles para otros consumidores, serían fórmulas valoradas positivamente por la clientela, que redundarían en una mayor lealtad hacia los establecimientos más innovadores.

No obstante, entendemos que la presente investigación no está exenta de limitaciones. La primera se refiere al ámbito geográfico restringido de aplicación del estudio. En este sentido, sería interesante poder comparar los resultados derivados de este trabajo con las percepciones de los consumidores de otras zonas, ya que es de esperar que la estructura comercial, la cultura y costumbres de los consumidores influya en sus percepciones.

Por otra parte, en el presente trabajo consideramos como medida de la capacidad de innovación del minorista una valoración global de la misma por parte del consumidor. Entendemos que se

requiere un análisis más pormenorizado de las distintas facetas de la innovación del minorista, pues a partir de los resultados del mismo se podrían inferir implicaciones relevantes para los gestores de los establecimientos comerciales. Con todo, entendemos que este estudio representa una primera aproximación a la consideración de la innovación relacional en el contexto de los beneficios de la relación y debería inspirar futuras investigaciones encaminadas a desarrollar una escala de innovación relacional que permita identificar las distintas dimensiones de este constructo y su relación con los beneficios de la relación y la lealtad hacia la tienda.

Por último, la lealtad del consumidor hacia la tienda ha sido vinculada a factores personales y situacionales (Bloemer y Odekerken-Schröder, 2002). Así, cabría considerar en el análisis la influencia de diversas características sociodemográficas de los consumidores y de las motivaciones de compra a la hora de explicar el rol moderador de la innovación en la relación entre beneficios relacionales y lealtad.

*Universidad de Valladolid*

## RESUMEN

*Las industrias creativas constituyen un sector que se caracteriza por la creatividad, entendida como la apuesta por nuevas ideas desde la libertad del artista. Por otro lado, en este sector, también se pueden implementar otras innovaciones tecnológicas y en servicios, que no son en sí nuevas creaciones, sino la aplicación de elementos innovadores, nuevos para la organización, pero no para el mercado. En el presente trabajo tomamos como ejemplo el caso de los museos para analizar cómo creatividad e innovación contribuyen a ampliar y diversificar las audiencias y a mejorar la imagen y el prestigio de la organización. Además, proponemos que la influencia de la creatividad y la innovación sobre estos resultados está condicionada por la capacidad de los museos de cautivar las emociones del visitante a partir de una gestión eficaz de las experiencias.*

## Palabras clave:

Creatividad, innovación, innovación tecnológica, experiencias, museos.

---

<sup>1</sup> El presente trabajo forma parte del proyecto de investigación “La innovación en los museos europeos. Un análisis de actividades, determinantes e indicadores de eficiencia” (ref. ECO2012-38552) financiado por el Ministerio de Economía y Competitividad. Plan Nacional de I+D+i 2008-2011.

## 1. Introducción

El concepto de industrias creativas es una noción relativamente reciente, que ha comenzado a utilizarse para describir a “aquellas industrias que utilizan el talento, la creatividad y la capacidad emprendedora para producir bienes y servicios creativos” (Bakhshi y Throsby, 2010: 10). Esta categoría incluye tanto bienes y servicios culturales (arte, música, artes escénicas, literatura, cine, televisión, vídeo), como otros con un fin meramente comercial (moda, software).

A pesar de la amplia utilización y expansión de este concepto, hay que señalar que se trata de una noción subjetiva y aún “en construcción” (Tremblay, 2011), debido sobre todo a la propia indefinición del concepto de creatividad. En todo caso, es evidente que hay organizaciones, en especial, las culturales, donde la innovación y la creación y su adecuada gestión constituye en el contexto actual un requisito esencial para garantizar la consecución de sus objetivos y asegurar su viabilidad financiera. Sin embargo, la innovación y, sobre todo, la creatividad pueden no ser apreciadas por el consumidor si no se canalizan a través de las herramientas necesarias para ponerlas en valor a través de una experiencia de consumo satisfactoria.

Partiendo de este contexto, el objetivo de este trabajo es analizar en qué medida la creatividad y la innovación en las industrias creativas influyen en los resultados de las organizaciones a través de la adecuada gestión de la experiencia del visitante (interacción, adaptación, experiencia sensorial). En concreto, en el presente trabajo tomando como caso de estudio los museos españoles, pretendemos analizar el efecto de la creatividad, la innovación y la gestión de la experiencia del visitante sobre resultados ligados a la captación de audiencias y a la mejora de la imagen y el prestigio de la organización. Además, proponemos analizar en qué medida la influencia de la creatividad y la innovación sobre estos resultados está condicionada por la capacidad de los museos de ofrecer experiencias que cautiven el interés del público.

## 2. Creatividad e innovación: el caso de los museos

El significado más convencional del término innovación en las empresas hace referencia a un nuevo producto o servicio, un proceso de producción, una estructura, un sistema administrativo, un plan o programa que pertenece a los miembros de una organización (Damanpour, 1991). La creatividad, por su parte, es un concepto borroso cuyas fronteras son difíciles de determinar (Markusen et al., 2008). Una interpretación es la que considera la creatividad como una capacidad: la capacidad de algunos individuos de crear e imaginar cosas nuevas. Esta idea se encuentra en la base del emergente concepto de “economía creativa” (Florida, 2002; Lazzaretti, 2013). Otra interpretación es la que entiende la creatividad como un proceso: el proceso por el cual las ideas se generan, conectan y transforman en valor (UNCTAD, 2010). Desde esta última perspectiva, es evidente que creatividad e innovación son dos conceptos interrelacionados, cuando no utilizados como sinónimos.

En el caso de las industrias creativas, como se ha señalado, la creatividad es el elemento que las define, pero eso no resta importancia a la implementación de otro tipo de innovaciones de carácter tecnológico, en productos o en procesos. Por tanto, en el presente trabajo vamos a analizar de forma diferenciada el papel de la creatividad y de la innovación sobre los resultados, y lo vamos a ejemplificar en un caso concreto de industria creativa: los museos. Para ello nos vamos a tratar la creatividad y la innovación como dos dimensiones de un mismo proceso innovador, pero que encierran matices distintos:

- En las industrias creativas la creatividad podría considerarse como un tipo de innovación que atañe al núcleo de la propia industria (*core business*) y donde prima un componente artístico, estético o simbólico (Stoneman, 2009). Ese componente es el que define principalmente la originalidad y la novedad de una creación. Es más, esa creatividad no nace únicamente de una orientación al consumidor y de dar respuesta a la demanda del mercado, sino que está más vinculada al espíritu creativo e imaginativo del artista. El artista es el principal agente del

cambio. Es lo que Castañer y Campos (2002) definen como innovación de contenido en el ámbito artístico.

- Otras innovaciones que se pueden implementar en industrias creativas tienen una naturaleza funcional o tecnológica. Son aquellas que nacen de dar respuestas específicas al mercado mediante el uso de tecnologías o la oferta de servicios no necesariamente nuevos para el mundo, pero sí nuevos en dicha industria. Atañen más a la forma en la que se presenta el producto o servicio que al contenido (Castañer y Campos, 2002). Sería el caso de la distribución de música o libros digitales, la oferta de servicios educativos o culturales online o la programación en un museo de obras que no habían sido exhibidas antes.

### ***2.1. La gestión de la creatividad en los museos***

La gestión de la creatividad en los museos supone atraer y potenciar la capacidad artística, imaginativa, la curiosidad y, en definitiva, la capacidad de creación de ciertos individuos (artistas, científicos). En el caso de los museos ello implica promover y producir la actividad de artistas e investigadores, estimular la creación y el conocimiento y apostar por el riesgo en nuevos proyectos.

La gestión adecuada de la creatividad puede redundar en una mayor eficiencia de la organización. Es de esperar que la apuesta por el talento y el riesgo creativo dote al museo de una imagen de prestigio, vanguardia y renovación, que le permita ser valorado positivamente por la prensa especializada, museos y otros agentes externos. Por otro lado, aunque la creatividad permite ofrecer experiencias distintas para el público, ello no supone que esas experiencias sean percibidas como superiores y relevantes. La creación, el riesgo y la renovación pueden conseguir sorprender y entusiasmar al visitante o bien frustrarle y decepcionarle. Aunque el creador parta de una idea o de un mensaje dirigido al público, no se puede asegurar que dicho mensaje sea comprendido por los receptores. Como señalan Castañer y Campos (2002) la creatividad implica altos niveles de riesgo e incertidumbre en relación con la respuesta de la audiencia y con los resultados. De ahí que no sea evidente el efecto de la creatividad y el riesgo artístico sobre los resultados en audiencias.

***H1a. La creatividad influye de forma positiva en la imagen del museo.***

***H1b. La creatividad influye de forma negativa en la captación de audiencias.***

### ***2.2. La gestión de la innovación en los museos***

El componente artístico y arriesgado estéticamente que define la innovación en las industrias creativas, no impide que también se desarrollen otro de tipo de innovaciones relacionadas con la presentación del producto, los servicios o las tecnologías aplicadas. En los museos, estas innovaciones son incrementales, relacionadas con las mejoras y los cambios en la forma y presentación de los productos y servicios ofrecidos. En concreto, Bakhshi y Throsby (2010, 2012) señalan dos tipos de innovaciones culturales relacionadas con la forma de presentación de la oferta: la innovación tecnológica y la innovación en la creación de valor añadido a través de nuevas posibilidades de explotar los activos culturales.

La innovación en la creación de valor añadido en los museos se manifiesta en la amplitud de su oferta, a través de las exposiciones temporales, la diversidad en programación, la oferta educativa, los programas de amigos, etc. También es corriente que los museos manifiesten interés por facilitar y hacer ameno su discurso a los visitantes mediante recursos diversos como proyecciones de cine y vídeo, charlas o conciertos, entre otras muchas actividades.

La innovación tecnológica, por su parte, implica el uso de nuevas tecnologías ya experimentadas en otros ámbitos (desarrollos tecnológicos en el mundo de la imagen, de la comunicación, del diseño, de la estética, de la arquitectura, etc.) y posibilitan innovaciones en la presentación de la colección y en mejorar el servicio al visitante (pantallas táctiles, visitas virtuales, programas educativos online, etc.).

En el ámbito cultural y de museos, Voss, Montoya-Weiss y Voss (2006) demuestran que la innovación en el producto (en su caso, nuevas producciones teatrales) está correlacionada de forma significativa con los ingresos por ventas. En cuanto a las nuevas tecnologías, éstas pueden conseguir atraer a un público más diverso (estudiantes, docentes, familias, entre otros), así como ofrecer servicios más amplios a otros públicos objetivo (prensa, agencias turísticas). Si a ello unimos que las TIC aplicadas en los museos pueden mejorar el aprendizaje del visitante, estaríamos admitiendo que la innovación en los museos puede contribuir a una mejora en los resultados en audiencias y educativos (Camarero y Garrido, 2008). Por lo tanto, proponemos que:

***H2. La innovación en la creación de valor añadido (H2a) y la innovación tecnológica (H2b) influyen positivamente en la imagen del museo***

***H3. La innovación en la creación de valor añadido (H3a) y la innovación tecnológica (H3b) influyen positivamente en la captación de audiencias.***

### **3. La gestión de la experiencia del visitante**

En 1998, Pine y Gilmore, en su artículo *Welcome to the experience economy*, acuñaron el concepto de “economía de la experiencia”. Pine and Gilmore (1999, p.2) observan que se ha pasado de una economía de servicios a una economía, en la que la función económica ya no es la provisión de servicios, sino la teatralización de experiencias sensoriales y la oferta de hechos memorables. Ante esta idea las empresas se cuestionan cómo se han de diseñar los productos y servicios para proporcionar dichas experiencias. Parte de la respuesta nos la ofrecen Pine y Gilmore (1998, p. 98), quienes definen el uso empresarial de las experiencias en los siguientes términos: “una experiencia tiene lugar cuando una empresa utiliza intencionadamente los servicios como escenario y los bienes como apoyo para involucrar a consumidores individuales de una manera que genera un evento memorable”. Recientemente, Pine II and Gilmore (2014) proponen varias formas de crear valor en el ámbito de la economía de la experiencia: customización de productos y servicios, diferenciación a través de experiencias, fusionar la tecnología digital con la realidad y crear experiencias transformadoras. También Wu (2012) indica que una estrategia de marketing experiencial debería fortalecer una imagen de marca vinculada a la experiencia y promover la interactividad como un elemento básico de la oferta.

#### ***3.1. Gestión de la experiencia y resultados***

En nuestro estudio hemos centrado las propuestas experienciales de los museos en tres ámbitos:

**Adaptación.** La adaptación a las necesidades y características del visitante es el elemento básico, imprescindible para que la experiencia vivida pueda ser memorable. Como señalábamos anteriormente, Pine II y Gilmore (2014) proponen la customización como una vía para crear experiencias. En el caso de un museo es necesario que la visita esté adaptada tanto en contenido, en tiempo o en actividades propuestas a los intereses de cada visitante. Algunos museos proponen diferentes recorridos en función del tiempo del que dispone el visitante. En otros casos se proponen visitas guiadas alternativas (para niños, para familias, para expertos). De hecho, se puede intentar involucrar al público en la elección de temas y contenidos de algunas exposiciones.

**Interactividad y la participación.** La interactividad y la participación del visitante son probablemente los dos elementos más mencionados en la literatura de museos como mecanismos para generar experiencias (Falk y Dierking, 2000). Los museos se preocupan por animar a los visitantes a ser sujetos activos y a participar e interactuar lo máximo posible durante la visita. En el trabajo realizado por Ingle (1994) revela que la manipulación de los objetos, el hecho de poder tocarlos y sentirlos personalmente, así como otras actividades que permitían la participación activa (disfraces, simulación, dramatización, actividades manuales, discusión de opiniones, etc.) resultaron tener un efecto positivo sobre el aprendizaje de los visitantes.

Experiencia sensorial. El marketing sensorial analiza cómo el estímulo de los sentidos del consumidor puede afectar a su comportamiento. Diferentes aspectos sensoriales de un producto (tacto, gusto, olor, sonido o la apariencia visual) pueden afectar a nuestras emociones, memorias, percepción, preferencias, elecciones y consumo (Krishna, 2010, p. 2). En los museos, la oferta de experiencias multisensoriales puede ir más allá de la mera experiencia visual fruto de la observación de una exposición. La experiencia del visitante se puede reforzar a través de otros elementos visuales (iluminación, proyecciones), del tacto (mediante la posibilidad del visitante de manipular e interactuar con los objetos de la exposición), del olfato (por ejemplo, en museos industriales o relacionados con la ciencia que recrean experiencias olfativas), del oído (acompañando la visita con música o con conciertos en vivo), o, incluso, del gusto (es el caso de museos etnográficos o industriales en los que el visitante puede degustar productos relacionados con la temática del museo). Como han señalado algunos autores (Csikszentmihalyi, 1998; Hooper-Greenhill, et al., 2004; Ping-Tsan y Hsin-Yu, 2010) las experiencias más agradables estéticamente provocan más diversión y comprensión por parte del visitante.

***H4. La adaptación (H4a), la interactividad (H4b) y la experiencia sensorial (H4c) influyen de forma positiva en la captación de audiencias.***

### ***3.2. De la creatividad y la innovación a los resultados a través de la experiencia***

De acuerdo con la lógica dominante en servicio, los consumidores son siempre co-creadores de valor (Vargo y Lusch (2004, 2008). Las innovaciones y la oferta de nuevos productos y servicios que realiza la empresa son meras propuestas de valor que sólo adquieren valor real en uso. Como indican Grönroos y Voima (2013), el valor es acumulado, experimentado y percibido por el consumidor durante todo el proceso de interacción con el producto o servicio. Pero para que dicha co-creación sea efectiva, las empresas y proveedores de servicios deben involucrar a los consumidores en el proceso de creación de valor durante la interacción y ofrecerle la posibilidad de crear valor conjuntamente.

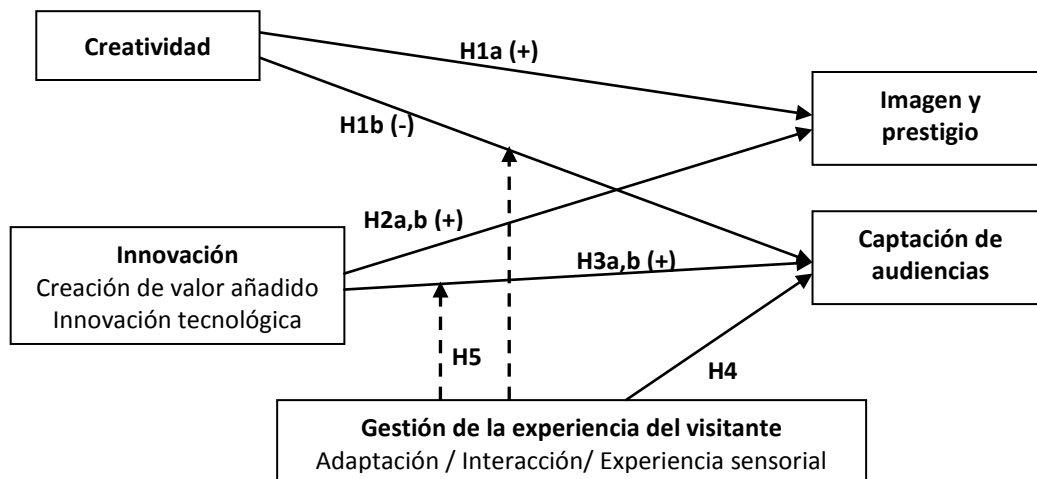

Desde esta perspectiva, las empresas deberían facilitar valor al consumidor y gestionar el proceso de co-creación a través de interacciones empresa-consumidor (Grönroos y Voima, 2013). Aunque algunos autores se centran en la co-creación de valor durante el proceso de innovación y desarrollo de nuevos productos, la co-creación es un concepto más amplio que también implica la co-creación de experiencias e incluye toda la interacción entre empresa y consumidor dirigida a crear un entorno experiencial personalizado (Prahalad y Ramaswamy, 2004).

En el caso de los museos, como hemos señalado anteriormente, la creatividad y la innovación crean valor para los visitantes ofreciendo nuevas propuestas culturales, nuevos servicios, nuevas tecnologías y nuevas formas de presentar las obras. Son propuestas de valor que adquieren valor real para el visitante durante la interacción con dichos servicios. Pero para ello es necesario una gestión proactiva por parte del museo enfocada a facilitar que el visitante sea co-creador de valor y pueda vivir realmente una experiencia personalizada. La oferta más creativa y vanguardista, los nuevos servicios ofrecidos o las nuevas tecnologías han de ir acompañadas de una propuesta experiencial para transformarse realmente en experiencias memorables (estéticas, educativas, escapistas) que aporten valor al consumidor, mejorando así los resultados en audiencias, educación o imagen y prestigio. Por tanto,

***H5. La implementación de experiencias para el visitante refuerza el efecto positivo de la creatividad (H5a), de la innovación en valor añadido (H5b) y de la innovación en tecnología (H5c) sobre la captación de audiencias***

El conjunto de hipótesis propuestas se resume en la Figura 1.

FIGURA 1  
Propuesta de hipótesis

## 4. Metodología

### 4.1. Universo de población y selección de la muestra

El universo de población considerado consistía en 900 museos españoles incluidos en la página web del Ministerio de Educación, Cultura y Deporte. La recogida de información se realizó mediante encuesta postal dirigida a los directores de los museos. El desarrollo del cuestionario exigió, en primer lugar, un exhaustivo análisis de las particularidades y evolución de este tipo de organizaciones a través de la consulta de noticias en prensa, páginas web de museos, revistas especializadas en museos y exposiciones y otras fuentes secundarias. Asimismo, mantuvimos entrevistas en profundidad con algunos directores y gerentes de museos. Estos contactos nos sirvieron como pretest y nos permitieron corregir y enriquecer el cuestionario.

El cuestionario se envió mediante correo postal incluyendo la opción de contestar el cuestionario online. La recogida de información se ha extendido durante los meses de febrero, marzo y abril de 2014. El total de respuestas obtenidas a lo largo de todo el proceso una vez eliminados cuestionarios incompletos alcanzó la cifra de 201, lo que representa un ratio de respuesta del 22%. El incentivo para el director del museo fue la promesa de facilitarles los resultados finales del estudio. Los museos que forman parte de la muestra engloban diferentes áreas temáticas (arqueológicos, arte contemporáneo, artes decorativas, bellas artes, casa museo, ciencia y tecnología, ciencias naturales e historia natural, sitio, especializado, etnografía y antropología, historia, general) y tamaño (28.2% con menos de 5.000 visitantes anuales, 19.3% entre 5.000 y 10.000, 35% entre 10.000 y 50.000 y 17.5% más de 50.000).

### 4.2. Medición de variables

Para la medición de las variables se han creado escalas ad hoc basadas en la revisión de la literatura sobre innovación e indicadores de resultados en la cultura y en museos, especialmente el informe de Bakhshi y Throsby (2010) sobre innovación en organizaciones artísticas y culturales. Así, la creatividad recoge el apoyo del museo a proyectos arriesgados, y la producción y el estímulo a la obra de artistas e investigadores. La innovación en creación de valor añadido y tecnológica se ha medido, respectivamente, como la cantidad y variedad de actividades culturales propuestas y el total de innovaciones tecnológicas implementadas. Para medir la gestión de la experiencia del visitante se han considerado nueve indicadores que recogen el interés del museo por ofrecer servicios adaptados al visitante, experiencias interactivas y experiencias sensoriales. Los resultados en cuanto a imagen y prestigio del museo aluden a la mejora en la valoración del museo entre diferentes agentes y públicos (otros museos, prensa, agencias, residentes, etc). Los resultados en audiencias y educativos se refieren a la

difusión del contenido entre mayor número y diversidad de público, residentes, estudiantes, investigadores o personas con problemas de exclusión. Las medidas se muestran en la Tabla 2, junto con los estadísticos descriptivos.

TABLA 2  
Medición de variables y estadísticos descriptivos

	Media/ %	Desv. típ.
<b>Creatividad</b> ( <i>escalas Likert de 1 a 5</i> )		
En el museo se combinan proyectos arriesgados (que pueden fracasar) con otros exitosos	2,53	1,246
Se promueven y apoyan proyectos generadores de conocimiento	3,52	1,243
Servimos de escaparate para que artistas o investigadores realicen exposiciones de su trabajo	2,67	1,392
Producimos obras de artistas actuales	1,90	1,323
Estimulamos la creación de obras para espacios concretos de nuestro museo	2,00	1,245
<b>Innovación en creación de valor añadido</b>		
Programamos nuevas actividades ( <i>escala Likert de 1 a 5</i> )	3,30	1,336
Nº exposiciones	7,67	8,165
Diversidad de oferta cultural ( <i>número de total de otras actividades que realiza</i> ) Proyecciones cinematográficas; Talleres didácticos; Representaciones teatrales; Conciertos; Talleres literarios; Desfiles de moda; Espectáculos de baile; Otras esferas culturales		
<b>Innovación tecnológica</b> ( <i>Número de innovaciones tecnológicas implementadas dentro del museo</i> )		
Tours multimedia; Paneles informativos interactivos; Simulación y experiencias de realidad virtual; Wifi; Espectáculos de sonido, láser y luz; Presentaciones IMAX; Atracciones temáticas; Dispositivos móviles para el visitante durante el recorrido; Paneles interpretativos; Reconstrucciones 3D; Proyecciones holográficas; Realidad aumentada		
<b>Gestión de la experiencia del visitante</b> ( <i>escalas Likert de 1 a 5</i> )		
<b>Experiencia sensorial</b>		
El museo ofrece experiencias multisensoriales al visitante	2,34	1,301
Tratamos de crear sensaciones físicas que acompañan a la obra e intensifican la experiencia	2,27	1,305
Se recrean ilusiones que afectan a los cinco sentidos	2,01	1,287
<b>Interacción y participación</b>		
En las actividades propuestas se anima al visitante a participar e interactuar	3,29	1,250
Intentamos que los visitantes se convierten en los actores de la exposición	2,63	1,208
Utilizamos distintas técnicas para implicar al visitante durante la exposición	2,77	1,207
<b>Adaptación</b>		
Adaptamos las visitas a las características de los visitantes (niños, grupos, etc.)	3,98	1,094
Se ofrecen distintos recorridos en función del tiempo del que dispone el visitante	3,32	1,427
Las rutas de las visitas guiadas cambian en función de las preferencias de los visitantes	3,36	1,368
Tratamos de involucrar al público en la elección de los temas de las exposiciones	2,20	1,238
<b>Resultados en audiencias</b> ( <i>escalas Likert de 1 a 5</i> )		
Ha aumentado el número de visitantes anuales	3,25	1,378
Los visitantes muestran entusiasmo y satisfacción tras la visita	4,01	,948
Se ha conseguido mayor diversidad de audiencias	3,48	1,102
El museo ha contribuido a una mayor difusión de su contenido entre los residentes	3,83	1,047
El museo ha contribuido a la formación de estudiantes o investigadores	3,73	1,183
El museo ha aumentado la audiencia de públicos con problemas de exclusión	2,84	1,232
<b>Imagen y prestigio</b> ( <i>escalas Likert de 1 a 5</i> )		
Hemos conseguido logros significativos en nuestro ámbito en relación a otros museos de la categoría	3,51	1,207
Ha mejorado la imagen del museo dentro de la comunidad de museos	3,59	1,122
Ha mejorado la valoración del museo por parte de la prensa especializada	3,41	1,102
Ha mejorado la valoración del museo por parte de las agencias turísticas	3,29	1,194
El museo se ha convertido en una referencia cultural de la zona	3,66	1,150
El museo ha fortalecido su reputación y prestigio	3,65	1,156

#### 4.3. Análisis de la información y resultados

Para la estimación de las hipótesis propuestas proponemos la estimación de un modelo de regresión jerárquico. De dichos análisis, aún en fase incipiente, cabe esperar poder identificar en qué medida la apuesta de los museos por potenciar el talento y la creatividad constituye una política arriesgada pero que puede llegar a cautivar a la audiencia a través de una correcta gestión de la experiencia. Igualmente, consideramos que las innovaciones promovidas por el mercado pueden ser el mecanismo alternativo que facilite la difusión de los museos entre las audiencias y facilite el logro de los objetivos.

## 5. Conclusiones

En el orden académico, nuestro estudio introduce el concepto de creatividad como un aspecto de la innovación que puede ser analizado de forma independiente porque sus efectos sobre los resultados de la organización no resultan evidentes. Asimismo, desde el marco conceptual y teórico que nos brinda la lógica de dominante en servicio, conjugamos la innovación con la co-creación de valor y experiencia del consumidor para valorar como la innovación es un proceso que debe incluir necesariamente al consumidor, no sólo en la gestión o desarrollo de ideas sino también, y especialmente en el caso de los servicios, en las fases de interacción, experiencia y relación del consumidor con el servicio, puesto que en esos momentos se genera el valor que obtiene el consumidor.

# THE EFFECTS OF PREDEVELOPMENT ACTIVITIES ON NEW PRODUCT PERFORMANCE

---

MARÍA MORENO MOYA

*Universidad de Murcia*

## RESUMEN

*Effectively managing predevelopment activities is one of the most important and difficult challenges facing innovation managers. Its importance lies in the fact that effectively performing predevelopment activities can reduce costs during the new product process and contribute directly to the success of a new product. Unfortunately, research and framework-building in this area has been limited. In fact, difficulties occur in studying the predevelopment stage as it is dynamic, often unstructured, has traditionally been characterized by low levels of formalization and it is extraordinarily difficult to evaluate its performance. With these arguments in mind, this study aims to analyze the relationship between predevelopment and project performance. We test our hypotheses on a sample of 207 manufacturing firms, applying the technique of structural equation modelling. Our results demonstrate the importance of predevelopment activities on the operational and market results of new products.*

## Palabras clave:

Innovation, predevelopment activities, new product performance, product innovation

## 1. Theoretical background

Firms today face intense competition due to increasing globalization (Gumusluoglu and Ilsev, 2009), rapid changes in technology and customer demand (Birdi, Leach, and Magadley, 2012) as well as a reduction in product life cycles (Langerak, Hultink, and Griffin, 2008). Innovation and new product development are therefore key to business survival (Calantone et al., 2006). In fact, the strategic importance of innovation to enhance the competitiveness of enterprises has been widely recognized, not only at a professional level but also academically (Markham and Lee, 2013). Numerous studies have analyzed the key success factors of innovation (Evanschitzky et al., 2012, Henard and Szymanski, 2001). However, innovation is risky and expensive, so despite major efforts made by academics and managers to improve new product development, the rate of failure of new products is still very high (Evanschitzky et al., 2012). This evidence, in turn, adds weight to the importance of the key success factors of innovation and the need to carry out further studies on this subject.

One of the success factors that is generally considered to be critically important is the study of predevelopment activities. In fact, it has been found that the steps that precede the design and development of the product make the difference between winning and losing (Cooper, 2001). New-product projects featuring a high quality of execution of activities that precede the development phase are more successful. In the Cooper (2001) reported the following results: a success rate of 75.0% (versus only 31.3% for projects where the predevelopment activities are found to be lacking); a higher rated profitability (7.2 out of 10 versus only 3.7 for projects where predevelopment activities are poorly undertaken); a market share of 45.7% (versus 20.8%). However, although these activities are crucial to the success of any new product, little attention has been paid to the predevelopment (Markham, 2013), partly because difficulties occur in studying the predevelopment stage as it is dynamic, often unstructured, and has traditionally been characterized by low levels of formalization (Murphy and Kumar, 1997). On the other hand, two of the major sources of confusion in this area are the use of different terms (e.g. Kim and Wilemon, 2002; Langerak et al., 2004) and the difficulty of evaluate predevelopment performance (e.g. Ho y Tsai, 2011). Over the last decade, the number of publications on predevelopment activities is increasing, and the literature provides more detailed insights into this area. However, most papers on predevelopment activities are theoretical (Zhang and Doll, 2001; Reid and de Brentani, 2004; Reid and de Brentani, 2012) or explorative studies (Khurana and Rosenthal 1998; Montoya-Weiss and O'Driscoll, 2000; Koen et al., 2001; Rosenthal and Capper, 2006). Considering the small number of empirical studies so far, it is not surprising that Kahn et al. (2003, p. 193) still see the predevelopment as an important issue in future research on product development management. Thus, it is thought that a deeper understanding of predevelopment and its impact on new product development success could help firms to be more successful in their efforts to develop new products (Verworn et al., 2008).

With these arguments in mind, this study aims to achieve a number of objectives. From an academic standpoint, we try to shed light on predevelopment, going in depth into its results (concept complexity and novelty, strategic renewal and effectiveness) and its impact on product performance (adherence to schedule and budget, product novelty, competitive advantage and market performance). Concept complexity and novelty are equivalent measures of the product novelty but in the first stage (E.g. Martinsuo and Poskela, 2011). Also, predevelopment performance has been measured in some academic researches by its strategic renewal (Martinsuo and Poskela, 2011) and effectiveness (Ho y Tsai, 2011). From this point of view, strategic renewals deals with the future potential of the developed idea and effectiveness of predevelopment is based on achieving the expected outcome of predevelopment (such as explicit and stable product concept, novel ideas, project plan, etc.). From a business standpoint, we try to offer recommendations on how to effectively manage these predevelopment activities and the impact that this management has on the results obtained with its new products.

## 2. Methodology

### 2.1. Data collection

The initial sampling frame included 2,230 Spanish firms operating in a wide and varied number of sectors and involved in developing new products for their markets. The advantage of this selection is that it enables the generalization of the results beyond the idiosyncratic nature of a specific industry. These firms were selected from a national report that lists the most innovative businesses according to different indicators. Data were collected through a Web-based questionnaire sent to the person in charge of predevelopment activities of new product development process at each company. Before collecting the data, the questionnaire was pretested with six managers and seven academics. Several attempts, email and telephone were conducted in order to reach all the firms selected. Also, respondents were offered a gift and a summary of the most relevant findings of the study for their response. Finally, we obtained a total of 207 complete questionnaires, a response rate similar to other studies in the area of new product development. To test for non-response bias, early and late respondents were compared in all the variables of interest and in their firm size (Armstrong and Overton, 1977). Table 1 shows the sample characteristics.

TABLE 1.  
Sample characteristics

Number of employees		Sales volume (mill. €)	
<10	9,2%	< 10	30%
10-49	16,9%	10-50	36,7%
50-249	47,3%	> 50	28,9%
> 250	26,6%	No response	4,4%
	207		207

The unit of analysis was the new product project. Respondents were asked to base their answers on a new product representative of the firm that had been fully completed within the past three years. It should have been on the market for more than 12 months to ensure that the firm had sufficient data on the resulting performance. To assure quality of the answers, respondents were asked to indicate their degree of knowledge about the new product and the degree of involvement in the predevelopment activities and in the development and launching using a seven-point Likert scale (1 very limited; 7 very substantial). The mean responses were 6.24, 6.04 and 6.11 respectively, thus showing a high knowledge level not only on the new product selected but also on the whole process.

### 2.2. Measures

Our multi-item scales were adapted from those employed in prior studies. All items used 7-point Likert-type scales.

**Predevelopment performance:** Strategic renewal was operationalized according to Poskela and Martinsuo (2009). In order to measure concept complexity and novelty, we used the scale proposed by Martinsuo and Poskela (2011). Effectiveness was assessed using four items from Ho and Tsai (2011).

**Project performance:** Product novelty was operationalized with three items from Rodríguez et al., (2011). Adherence to budget and schedule was operationalized with two items from Tatikonda and Montoya-Weiss (2001) and Langerak, Hultink, and Robben (2004). Competitive advantage was assessed using a two-item measure adapted from the work of Tatikonda and Montoya-Weiss (2001). New product performance was measured using four items adapted from Tatikonda and Montoya-Weiss (2001) and Langerak, Hultink, and Robben (2004).

**Controls:** Two control variables were included to reduce the possibility of alternative explanations: development and launching effort.

**Unidimensionality, Reliability, and Validity.** The data were analyzed using path modeling using the structural equations software AMOS 18. However, the descriptive and psychometrics properties of the scales were analyzed first using SPSS20 and AMOS18 respectively (Anderson and Gerbing, 1988; Bagozzi and Yi, 1988; Fornell and Larcker, 1981). The internal consistency, reliability, and convergent validity were investigated by performing a confirmatory factor analysis. Composite reliabilities estimates exceeded the standard suggested by Bagozzi, Yi, and Phillips (1991). Values of average variance extracted (AVE) provided satisfactory results. Standardized item loadings for all constructs were greater than .50 and significant ( $p < .05$ ), evidencing good convergent validity (Bagozzi et al. 1991). An inspection of alpha coefficients revealed that all values were equal or greater than .80, which indicates good reliability. Evidence of discriminant validity among the dimensions was provided by three different procedures recommended in the literature as follows: (1) the 95% confidence interval constructed around the correlation estimate between two latent variables never includes the value 1 (Anderson and Gerbing, 1988); (2) the comparison of the square root of the AVE with the correlations among constructs reveals that the square root of the AVE for each component is greater than the correlation between components, in support of discriminant validity (Fornell and Larcker, 1981). Together the results of the tests suggest that the reflective scales used in this study possess sufficient unidimensionality, reliability and validity.

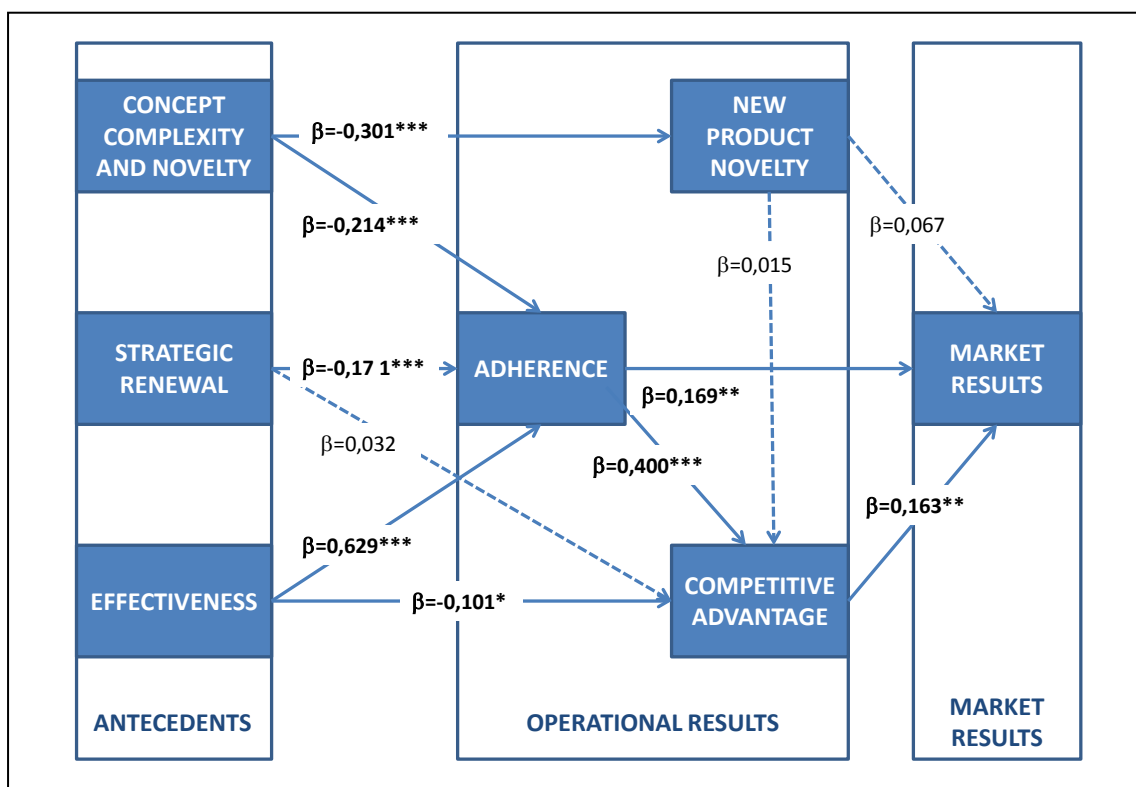

Most researchers agree that common method variance is a potentially and serious biasing threat in behavioral research and its potential effect should therefore be accessed. Therefore, Harman's one-factor test was conducted. Neither a single factor nor a general factor that could account for the majority of the covariance in the measures emerged. This provided evidence that common method variance was not a problem in the sample.

### 3. Empirical testing of hypothesized model

Structural equation modeling was then used to test the hypothesized relationships. The fit indices for the full model were as follows: chi-square (d.f. = 45) = 127.39  $p < 0.001$ ; CFI = .93; IFI = .94 NFI = .92; and standardized RMSEA = .07. These values collectively indicate that the structural model has an acceptable fit.

The detailed results show that almost all hypothesized main effects are significant (see Figure 1).

FIGURE 1.  
Result model

#### 4. Major results and implications

This study has several implications from both an academic and a managerial point of view. Academically, we gain a deeper understanding of one of the most important determinants of product success: predevelopment activities. First, the results obtained have allowed us to verify the impact of predevelopment activities in the project performance. This influence had been proposed in the literature but had not been found empirically in the literature. Thus, we can say that effective management of predevelopment activities positively influences the final result of the new product. Our research also has important contributions from a managerial point of view. According to our results, product managers should acknowledge that a good way of ensuring that their innovation projects are profitable is to pay special attention to the generation of ideas and their screening, as well as to the definition and selection of concepts. An efficient implementation of these activities allows the adherence to schedule and budgets and also superior products on the market. So, product managers should make a major change in their philosophy, since those activities that they tend to devote less attention and importance to, such as predevelopment, are in fact key to the success of their projects.

## RESUMEN

*Las exigencias planteadas en el Espacio Europeo nos llevan a plantearnos fórmulas que fomenten el aprendizaje cooperativo en el aula. En este trabajo describimos una experiencia docente en la que, basándonos en el Modelo del Cerebro Total de Herrmann (1989), se forman los equipos de trabajo (con perfiles homogéneos y heterogéneos) para el desarrollo práctico de la asignatura Técnicas de Ventas del Grado de ADE. Los objetivos a alcanzar son tres: 1) fomentar la cooperación; 2) analizar el funcionamiento, rendimiento y satisfacción de los equipos de trabajo; 3) obtener información sobre cómo diseñar equipos eficientes y optimizar sus recursos. El objetivo, en última instancia, es ajustar nuestros métodos de enseñanza a los estilos de aprendizaje de los alumnos.*

## Palabras clave:

Estilos de aprendizaje, Modelo del Cerebro Total, Universidad

## 1. Introducción

La implementación de las exigencias derivadas del Espacio Europeo (EEES) de educación Superior han comportado una profunda reflexión sobre la configuración de las titulaciones universitarias y la forma de transmitir el conocimiento utilizada por el profesorado. En este contexto, El EEES defiende focalizar la atención en la formación de los estudiantes y más concretamente, en su desarrollo competencial (Cano, 2008). El nuevo enfoque docente se basa en la evaluación de competencias específicas (propias de cada asignatura) y competencias transversales (cuyo principal objetivo es la formación integral de la persona y su crecimiento personal) y cuya asunción es requisito fundamental para los alumnos de cualquier titulación (Baena y Padilla, 2012; Espinosa et al., 2006). Esta circunstancia implica una reforma substancial en las metodologías utilizadas y una apuesta clara por un aprendizaje en el que el alumno sea parte activa y protagonista en su proceso formativo, asumiendo responsabilidades que le permitan estar más preparado para enfrentarse a los avatares del mercado profesional (Baena, 2010; De Juan et al., 2008; González y García, 2007).

En este sentido, EEES pretende favorecer aquellas metodologías docentes que fomenten la planificación, desarrollo y evaluación de las competencias transversales en las que desarrollo del trabajo en equipo supone un elemento clave para modificar las estructuras de metas de grupo de clase, tradicionalmente competitiva e individualista, introduciendo una serie de elementos que favorecen la cooperación como medio principal de enseñanza. El aprendizaje cooperativo supone una interesante alternativa para organizar los procesos de enseñanza y de adquisición de las competencias. Se trata de una forma de trabajo en grupo basado en la construcción colectiva del conocimiento y el desarrollo de habilidades mixtas (aprendizaje y desarrollo personal, social y laboral), donde cada miembro del grupo es responsable de su aprendizaje y del de los restantes miembros del grupo (García y Troyano, 2010). En este sistema de aprendizaje la finalidad del producto académico no es exclusiva e individualista, sino que desplaza aquella en busca de la mejora de las propias relaciones sociales, donde para alcanzar tanto los objetivos académicos como los relacionales se enfatiza en la interacción grupal. Los alumnos inmersos en una metodología cooperativa generan una interdependencia positiva, interacción cara a cara, responsabilidad individual, mejoran sus habilidades sociales y desarrollan un procesamiento grupal autónomo (Johnson y Johnson, 1989). Este tipo de aprendizaje es más profundo y duradero (Gil, et al., 2006) ya que el alumno es parte activa y protagonista en su proceso formativo, asumiendo responsabilidades que le permitan estar más preparado para enfrentarse a los avatares del mercado profesional (Baena, 2010; De Juan et al., 2008; González y García, 2007). Estos razonamientos han motivado que diversos especialistas de educación postulen la necesidad de introducir el trabajo en equipos cooperativos dentro de la dinámica habitual de trabajo en el aula (Espinosa et al., 2006). Sin embargo, existen investigaciones que demuestran que la práctica de agrupar a los estudiantes no necesariamente genera un espacio de construcción colectiva, ya que esto depende de las estrategias y contenidos que se trabajan dentro del aula y de los perfiles de los alumnos integrados en el equipo (Pulido de Bazán y Contrera, 2005). Para propiciar el trabajo cooperativo no basta con poner a trabajar a los alumnos en torno a una mesa, es necesario conocer su forma de aprender, el sistema de selección, de procesamiento y la forma de empleo de la información de los mismos. El logro de un buen proceso de enseñanza-aprendizaje redundará en la óptima conjunción entre la metodología a utilizar y el proceso de aprendizaje de los alumnos (Pulido de Bazán y Contrera, 2005). El descubrimiento de las capacidades individuales permitirá, siguiendo planteamientos gestálicos, que el grupo salga potenciado por la suma de las particularidades de cada uno de sus integrantes.

Las diversas teorías o modelos sobre los estilos de aprendizaje: la Teoría de Sperry (1973), la Teoría del Cerebro Triuno (MacLean, 1990), el Modelo de las Inteligencias Múltiples (Gardner, 1983), el Modelo del Cerebro Total de Herrmann (1989), entre otros, resultan de obligatoria consulta al presentar diversas perspectivas sobre el funcionamiento del cerebro en los procesos de aprendizaje. En este sentido, el profesor como facilitador de los procesos pedagógicos, ha de desplegar una serie de estrategias en las que apoyándose de los conocimientos aportados por los

modelos o teorías de aprendizaje, contribuya a la construcción del conocimiento y al mayor desarrollo de la potencialidad del grupo. Hoy sabemos que, tal y como señala Pulido de Bazán y Contreras (2005), conocer cómo aprenden nuestros alumnos y determinar cuáles son los factores que influyen sobre los procesos de aprendizaje son aspectos muy importantes en el momento de planificar el dictado de la asignatura.

En este trabajo proponemos una experiencia basada en el Modelo del Cerebro Total. Los planteamientos de esta teoría suponen un recurso interesante al permitir al profesor averiguar el perfil individual de cada estudiante, saber que capacidades de su cerebro tiene más potenciadas y, de esta forma, obtener información que fomente el aprendizaje cooperativo defendido en el EEES. En base a esta línea, presentamos una actividad docente realizada en la asignatura obligatoria de 4º curso Técnicas de Ventas del Grado de ADE consistente en la creación de equipos de trabajo de acuerdo a los perfiles de dominancia de los alumnos matriculados. Esta experiencia tiene un triple objetivo: 1) desarrollar la competencia transversal del aprendizaje cooperativo; 2) analizar el funcionamiento, rendimiento y satisfacción de los equipos de trabajo dependiendo de si el grupo está formado por alumnos con el mismo perfil de aprendizaje (equipos homogéneos) o distinto perfil (equipos heterogéneos); 3) tomar decisiones en base a los resultados obtenidos que nos permitan diseñar los equipos en posteriores cursos así como adoptar la metodología de enseñanza más eficaz según las características del grupo.

En la redacción de este trabajo en primer lugar, describimos las teorías o modelos sobre los estilos de aprendizaje y más concretamente el Modelo del Cerebro Total, en segundo lugar relatamos la experiencia docente, analizamos los datos y resultados y finalmente aportamos las conclusiones.

## **2. Las teorías sobre los hemisferios cerebrales: el modelo de Herrmann**

### ***2.1. Teorías sobre los hemisferios cerebrales***

Los modelos sobre los estilos de aprendizaje relacionados con el funcionamiento del cerebro provienen, en sus orígenes, de los estudios sobre sus particularidades y relación con la conducta humana efectuados desde la neurociencia. En este sentido, los resultados más relevantes de la investigación consisten en el descubrimiento de dos hemisferios cerebrales que difieren significativamente en su funcionamiento. La naturaleza de esta diferencia ha sido intensivamente estudiada desde la década de los años 50 por biólogos, neurólogos y psicólogos (Gómez, 2003). Uno de los trabajos pioneros en esta área fue el realizado por Sperry (1973) y que dio origen a la Teoría del Cerebro Derecho vs. El Cerebro Izquierdo, siendo el punto de partida para otras interpretaciones sobre el funcionamiento del cerebro y el aprendizaje como la Teoría del Cerebro Triuno y el Modelo del Cerebro Total.

La Teoría de Sperry (1973) establece que los dos hemisferios controlan diferentes modos de pensamiento y que depende de cada individuo el priorizar uno sobre otro. Los resultados de estas investigaciones permitieron conocer aspectos relacionados con el control de la conducta, por ejemplo, que el lado izquierdo está controlado principalmente por el hemisferio derecho y que el lado derecho por el hemisferio izquierdo. Otras investigaciones (Gazzaniga et al., 1962) estuvieron orientadas a determinar el intercambio de información entre los hemisferios. En esta línea, el aporte más significativo es haber descubierto que los dos hemisferios son responsables de diferentes maneras de procesar la información y, por ende, de establecer diferentes estilos de pensamiento. Así, el cerebro izquierdo está especializado en el procesamiento secuencial, paso a paso. Es lógico, racional, lingüístico, objetivo y coherente. En cambio, el cerebro derecho está especializado en el proceso simultáneo o en paralelo, integra partes y las organiza en un todo. Es memorístico, espacial, sensorial, intuitivo, holístico, sintético y subjetivo (Velásquez et al., 2007).

Por otro lado, la Teoría del Cerebro Triuno (MacLean, 1990) presenta otra visión del funcionamiento del cerebro y sus implicaciones para la educación, sirviendo de complemento de la teoría anterior. MacLean considera que existen tres cerebros integrados en uno: el reptiliano,

el sistema límbico, y la neocorteza. El cerebro reptiliano o básico es el responsable de la supervivencia del individuo, de la conducta automática o programada. El sistema límbico está formado por el cerebro afectivo, en el que se dan los estados de calidez, amor, odio y el resto de emociones. Por último, la neocorteza está formada por los dos hemisferios en donde se llevan a cabo los procesos intelectuales superiores. El hemisferio izquierdo se ocupa del razonamiento lógico mientras que el hemisferio derecho se ocupa del razonamiento abstracto.

Otro investigador, Gardner (1983), propone el Modelo de las Inteligencias Múltiples y concibe la inteligencia no como un todo unitario sino como un conjunto de inteligencias múltiples, distintas y semi-independientes. Gardner define la inteligencia como una habilidad que se puede cultivar a través de la educación y no como algo innato. Todos los individuos son capaces de conocer el mundo desde ocho inteligencias diferentes: la inteligencia lingüística, la lógico-matemática, la corporal-Kinestésica, la musical, la espacial, la naturalista, la interpersonal y la intrapersonal. La diferencia entre unos individuos y otros estriba en la intensidad de estas inteligencias y en la forma en las que se recurre a las mismas para solucionar los problemas. Los individuos aprenden, representan y utilizan el saber de muchos y diferentes modos.

Además de estos modelos, tal y como señalan otros autores como Pérez (2001) y Gómez et. al. (2010), existen otros que estudian el estilo de aprendizaje de acuerdo con criterios como: el sistema de selección de la información, tal y como mantiene la Programación Neurolingüística (estilos visual, auditivo y cinestésico), el de procesamiento de la información (estilos lógico y holístico), la forma de empleo de la información (activo, reflexivo, teórico y pragmático) (Kolb, 1984; Kolb y Kolb, 2005) o criterios mixtos, como el del Modelo de las Cuatro Categorías Bipolares (activo/reflexivo, sensorial/intuitivo, visual/verbal y secuencial/global) (Felder y Silverman, 1988). La revisión de los mismos muestra la importancia, tal y como se señala desde la neurociencia, de utilizar metodologías de carácter mixto que combinen técnicas secuenciales con otras que permitan el desarrollo de pensamientos visuales y espaciales, la fantasía, el lenguaje evocador y la experiencia directa. Sobre esta idea de potenciar la utilización de distintas partes de nuestro cerebro como método de aprendizaje eficaz se basa el Modelo del Cerebro Total de Herrmann (1989) y en el que nos centramos en este trabajo.

## ***2.2. El Modelo del Cerebro Total de Herrmann***

En base a los estudios sobre la Dominancia Cerebral (Sperry, 1973) y el Cerebro Triuno (MacLean, 1978), Herrmann (1989) elaboró el Modelo del Cerebro Total. En su modelo, Herrmann integra la neocorteza (hemisferio izquierdo y derecho) con el sistema límbico dividiéndolos en cuatro cuadrantes interrelacionados que constituyen modalidades autónomas de procesamiento diferencial de la información, las cuales pueden ser convenientemente desplegadas de manera individual o combinada, tanto secuencial como simultáneamente, en los diferentes procesos del funcionamiento cerebral (véase Figura 1). Cada cuadrante se especializa en la realización de unas determinadas funciones. Así, el lóbulo superior izquierdo (cuadrante A) se especializa en el pensamiento lógico-analítico, cualitativo, matemático y basado en hechos. Mientras que el lóbulo inferior izquierdo (cuadrante B), se dedica al pensamiento secuencial, organizado, planificado y detallado. Por otro lado, el lóbulo inferior derecho (cuadrante C) supone el pensamiento emocional, comunicador, sensorial, espiritual y humanístico. Por último, el lóbulo superior derecho (cuadrante D) se basa en el pensamiento conceptual, holístico-intuitivo, estratégico, integrador, creativo, espacial y visual.

Con la aplicación del Instrumento de Dominancia Cerebral de Herrmann (HBDI) se detecta el perfil de combinación de cuadrantes, el cual indica qué cuadrantes son dominantes, formando así cuatro modalidades de pensamiento: 1) realista, propio del hemisferio izquierdo (cuadrantes A y B); 2) idealista, propio del hemisferio derecho (cuadrantes C y D); 3) pragmático (cuadrantes A y D); e instintivo (cuadrantes B y C). El individuo manifiesta una dominancia cerebral, es decir, una tendencia a utilizar más las funciones de un hemisferio que las de otro para interactuar con su medio (Salas et al., 2004), en uno/s cuadrante/s u otro/s. La mayoría de los sujetos procesa la información desde varios cuadrantes. El HBDI permite determinar el

perfil distintivo de los individuos estableciendo la dominancia según las puntuaciones alcanzadas en el test. En este sentido, una puntuación superior a los 67 puntos implica una clara dominancia en un determinado perfil, dominancia primaria; entre 34 y 66 puntos, supone una dominancia secundaria o indecisión; y menos de 34 puntos, dominancia terciaria o rechazo. Los perfiles de los cuadrantes se representan por los números 1, 2 y 3, de acuerdo con la puntuación obtenida por cada uno, en la secuencia A, B, C, D. De esta manera, el perfil 1-2-3-2, por ejemplo, significa que hay dominancia primaria en el cuadrante A, dominancia secundaria en el B, terciaria en el C y secundaria en el D. El perfil 1-1-1-1 significa que se tiene una dominancia primaria en todos los cuadrantes (cuádruple dominancia), en el extremo opuesto se tiene el perfil 3-3-3-3 (cuádruple rechazo) y el perfil 2-2-2-2 significa que no hay dominancia ni rechazo por ninguno de los cuadrantes. Existen entonces, bajo todas las combinaciones posibles, los siguientes grados de dominancias: simple, doble, triple y cuádruple. Partiendo de una muestra de más de 500.000 sujetos Herrmann observa que sólo el 6% de los individuos tienen una dominancia simple. El 60% tiene una dominancia doble y procesa la información desde dos cuadrantes siguiendo alguna de las siguientes combinaciones AB; CD; AD; AC y BC. El 30% tiene una dominancia triple y genera sus pensamientos desde las combinaciones ABC, BCD, CDA, DAB. Por último, una minoría compuesta por el 3% de los individuos tiene dominancia cuádruple.

FIGURA 1  
El Modelo del Cerebro Total

Fuente: Basado en Cazau (2004).

El individuo con dominancia simple en el cuadrante A (cortical izquierdo) es frío, de pocos gestos, intelectualmente brillante, capaz de evaluar y criticar, competitivo e individualista. Los procesos cognitivos que desarrolla son: el análisis, el razonamiento, la lógica, el rigor, la claridad, el gusto hacia los modelos y las teorías, colecciona hechos y prefiere la palabra precisa. Las estrategias de procesamiento de información que conforman este cuadrante constituyen la referencia básica de la enseñanza, la formación científica y la capacitación profesional en aquellas especialidades asociadas con el rigor del pensamiento analítico y cuantitativo. Las competencias que posee son la abstracción, las matemáticas, las finanzas y la resolución de problemas (Velásquez et al., 2007). Este cuadrante se asocia el esfuerzo constante, la experiencia y la capacitación profesional.

El individuo con dominancia simple en el cuadrante B (límbico izquierdo) es introvertido, emotivo, maniático, tiende a monologar, es secuencial, metódico, es conservador y fiel. Los procesos cognitivos que desarrolla son la planificación, la formulación, la estructuración y la definición de procedimientos. Las estrategias que conforman el cuadrante B pueden ser definidas como operacionales y dirigidas fundamentalmente a la ejecución de acciones previamente diseñadas (no concibe la búsqueda de alternativas distintas a las pautadas), lo importante es administrar recursos y supervisar el desempeño de las metas. Si un individuo con dominancia en el cuadrante B no cuenta con elementos suficientes para la planificación, la ejecución y la evaluación de procesos se hace difícil alcanzar la eficiencia y la calidad deseada.

Las competencias que posee son: la administración, la organización y la capacidad de liderazgo (Velásquez et al., 2007).

El individuo con dominancia simple en el cuadrante C (límbico derecho) es extrovertido, emocional, espontáneo, gesticulador, lúdico, hablador, espiritual y reacciona negativamente hacia las críticas. Los procesos cognitivos que desarrolla son: la integración mediante la experiencia, la tendencia hacia el placer, la fuerte implicación afectiva y la escucha activa, siente la necesidad de compartir y evalúa los comportamientos. Presenta una clara tendencia a involucrarse en relaciones interpersonales de cooperación y amistad, en proyectos sociales y comunitarios y en causas humanitarias. Las competencias que posee son: la relación interpersonal, la propensión al diálogo, el gusto por la docencia, la tendencia al trabajo en equipo y la comunicación (Velásquez et al., 2007).

El individuo con dominancia simple en el cuadrante D (cortical derecho) es original, con sentido del humor, gusto por el riesgo, discutidor, futurista, de discurso brillante e independencia. Los procesos cognitivos que desarrolla son: conceptualización, síntesis, imaginación, visualización, asociación, integración por imágenes. Sus principales competencias son la innovación, la creación, el espíritu empresarial y la investigación (Velásquez et al., 2007).

En este trabajo, nos basamos en el Modelo de Cerebro Total para comprender el estilo de aprendizaje individual utilizado por los alumnos y diseñar fórmulas óptimas que sirvan para la mejora del aprendizaje cooperativo de los trabajos en grupo, potenciando así el rendimiento académico. En este sentido, analizaremos qué perfiles y dominancias pueden cooperar de forma más eficaz y lograr la mayor satisfacción individual.

### **3. Descripción de la actividad docente**

La cooperación, comparada con esfuerzos competitivos e individualistas tiende a resultar, en altos niveles de logro, una mayor retención a largo plazo de lo aprendido, un uso más frecuente de niveles altos de razonamiento y una mayor voluntad para persistir en tareas difíciles (Gil et al., 2006). Además, implica una mayor motivación intrínseca y una mayor facilidad para transferir el aprendizaje de una situación a otra. Sin embargo, tal y como se ha descrito en apartados anteriores, para el logro del éxito del trabajo en equipo resulta fundamental la elección correcta de los perfiles del estilo de aprendizaje de sus miembros. En este sentido se plantea el trabajo que a continuación se detalla.

#### **3.1. Objetivos**

En el contexto descrito, el objetivo más inmediato de esta experiencia es que los alumnos trabajen de manera colaborativa a través de un proceso de conocimiento compartido en el que el alumno sea capaz de comprender, analizar y adoptar la perspectiva del resto de los miembros del grupo, llegar a acuerdos y encontrar soluciones y resultados compartidos en aras a alcanzar un objetivo común. Esta forma de trabajar genera un sentimiento de interdependencia, confianza y responsabilidad en el grupo que fomenta la interacción de sus miembros en la construcción conjunta de ideas y, por tanto, en la configuración conjunta del trabajo final encargado por el profesor. Para alcanzar este objetivo nos proponemos:

- Desarrollar en el alumnado, al margen de su perfil de dominancia y desde la cooperación, las habilidades conceptuales necesarias para superar con éxito la asignatura.
- Fomentar la habilidad procedimental del trabajar en grupo. Esto implica fomentar en el alumno las destrezas necesarias para la negociación, la correcta planificación, el diálogo, la asertividad y la empatía para aprender del perfil de los compañeros.
- Potenciar la cooperación entre compañeros con diversos perfiles de dominancia.

A este objetivo general se suman dos objetivos cuyo logro se sitúan más en el corto y medio plazo y que también son propósito de esta experiencia docente:

- Conocer el grado de satisfacción percibido por el alumnado en su relación con el equipo al que ha sido asignado y con el que ha trabajado.
- Obtener información sobre los perfiles de dominancia de la titulación y cuáles son las combinaciones más adecuadas para obtener los mejores resultados en el trabajo cooperativo generado en esta asignatura. Esto nos permitirá incrementar la efectividad en el diseño de los equipos del próximo curso, así como adoptar la metodología de enseñanza a las características del grupo.

### **3.2. Metodología**

Para llevar a cabo este proyecto se utiliza una muestra de conveniencia de 84 sujetos, 39 hombres y 45 mujeres, con edades comprendidas entre los 22 y los 30 años, estudiantes de la asignatura Técnicas de Ventas, obligatoria de 4º curso del Grado en Administración de Empresas de la Universitat Jaume I, impartida durante el primer semestre del curso 2013-2014.

La metodología utilizada para la valoración del aprendizaje cooperativo se fundamenta en el método del caso y en la realización de un trabajo final en equipo consistente en la redacción de un manual de ventas de una empresa de libre elección.

Los instrumentos de valoración para el grado de consecución de los objetivos propuestos son:

- 1) El sistema de evaluación de la asignatura a través de la nota académica. Dicho sistema nos permite obtener información sobre el éxito de la metodología utilizada. En este sentido, la evaluación se compone de un examen teórico/práctico (50% de la puntuación) al que hay que sumarle la nota obtenida en la parte práctica de la asignatura. Las prácticas se desarrollan en equipo y suponen la resolución de casos prácticos (20% de la puntuación) y la redacción de un manual de ventas (30% de la puntuación).
- 2) El cuestionario elaborado por Jiménez (2006) que tiene su antecedente inmediato en el *Herrmann Brain Dominance Instrument* (HBDI) y que permite la obtención del perfil de dominancia de cada alumno y, por lo tanto, posibilita la formación posterior de equipos de trabajo (homogéneos y heterogéneos).
- 3) El cuestionario elaborado por Viles et al. (2013) para medir la satisfacción del alumno con el equipo asignado.

### **3.3. Cronograma de acción**

El desarrollo de esta experiencia docente se distribuye y temporaliza en las siguientes fases:

#### **Fase 1: Formación del profesorado.**

Durante el segundo semestre del curso 2012-2013 los profesores de la asignatura, tanto de la parte teórica como de la práctica, asisten a un curso organizado por la Unidad de Soporte Educativo de la Universitat Jaume I sobre modelos de aprendizaje. Como resultado del mismo surge la creación de un Seminario Permanente de Innovación Educativa (SPIE) cuyo objetivo es aprender a formar equipos de trabajo en el aula.

#### **Fase 2: Planificación del proyecto.**

Al comienzo del semestre se establecieron una serie de reuniones entre el profesorado con el fin de plantear objetivos comunes, discutir sobre el instrumento de medida idóneo y establecer reparto de responsabilidades y el calendario de acciones.

#### **Fase 3: Respuesta al cuestionario sobre los cuadrantes cerebrales por parte de los alumnos.**

Para realizar la medición y evaluación respecto a los estilos de aprendizaje dominantes de los estudiantes, el instrumento de medida utilizado fue el elaborado por Jiménez (2006) que tiene su antecedente inmediato en el *Herrmann Brain Dominance Instrument* (HBDI), instrumento de

papel y lápiz elaborado por Herrmann (1989), ampliamente utilizado por su autor en muestras norteamericanas, y elemento clave en la conformación de su Modelo del Cerebro Total.

Concretamente, este instrumento de 40 ítems (ver Tabla 1), supone un proceso de auto-evaluación en el que el entrevistado debe mostrar, en una escala tipo Likert de 5 puntos (donde 1 es “lo que hago peor” y 5 es “lo que hago mejor”), su opinión respecto a su grado de desempeño en cada uno de los aspectos o actividades asociados a los distintos cuadrantes cerebrales (10 ítems asociados a cada cuadrante). La valoración total en cada cuadrante se obtiene multiplicando por dos los resultados obtenidos en cada uno de ellos.

TABLA 1  
**Escala de medición para el diagnóstico del Modelo del Cerebro Total**

<b>CUADRANTE A (superior izquierdo cerebral)</b>
<ol style="list-style-type: none"> <li>1. Tengo habilidades específicas en el campo de las matemáticas y las ciencias.</li> <li>2. Pienso que la mejor forma de resolver un problema es siendo analítico.</li> <li>3. Me inclino hacia la crítica en todos los asuntos.</li> <li>4. Tengo habilidades para solucionar problemas complejos de manera lógica.</li> <li>5. Antes de tomar algo como verdadero, lo compruebo, e indago otras fuentes.</li> <li>6. Tengo capacidad de comprender, manipular números y estadísticas de acuerdo con un fin.</li> <li>7. Me gusta solucionar problemas inclinándome a conocerlos y buscar mediciones exactas.</li> <li>8. Tengo la capacidad frente a los problemas de razonar en forma deductiva, a partir de alguna teoría.</li> <li>9. Descompongo ante un problema las ideas y las relaciono con la totalidad.</li> <li>10. Selecciono alternativas sobre la base de la racionalidad y la inteligencia, en oposición al instinto, a la emoción.</li> </ol>
<b>CUADRANTE B (inferior izquierdo límbico)</b>
<ol style="list-style-type: none"> <li>11. La planificación y la organización son prioritarias en mis actividades.</li> <li>12. Es importante para mí tener un lugar para cada cosa y cada cosa en su lugar.</li> <li>13. Acostumbro escuchar las opiniones de los demás y hacer aclaraciones.</li> <li>14. Prefiero las instrucciones específicas en lugar de aquellas generales que dejan muchos detalles opcionales.</li> <li>15. Pongo mucha atención en los pequeños detalles o partes de un proyecto.</li> <li>16. Tengo capacidad de control y dominio de mis emociones cuando elaboro un plan o proyecto.</li> <li>17. Pienso que trabajar con un método paso a paso es la mejor manera de resolver mi problema.</li> <li>18. Tengo habilidades específicas en el manejo de auditorio o hablar en público.</li> <li>19. Formulo métodos o medios para alcanzar un fin deseado antes de pasar a la acción.</li> <li>20. Tengo la capacidad de coordinar a las personas o de ordenar los elementos para lograr relaciones coherentes y armoniosas.</li> </ol>
<b>CUADRANTE C (inferior derecho límbico)</b>
<ol style="list-style-type: none"> <li>21. Prefiero trabajar en equipo que hacerlo sólo.</li> <li>22. Es importante para mí estar en muchas oportunidades acompañado.</li> <li>23. Creo en la trascendencia humana, en algo superior o espiritual.</li> <li>24. Soy emotivo frente a las situaciones difíciles.</li> <li>25. A menudo actúo para solucionar problemas de tipo social.</li> <li>26. En muchas ocasiones prima más en mis decisiones, lo emotivo que lo lógico y lo racional.</li> <li>27. Disfruto, observo y me emociono frente a la belleza de la naturaleza.</li> <li>28. Tengo habilidades para percibir, entender, manipular posiciones relativas de los objetos en el espacio.</li> <li>29. Utilizo todos mis sentidos con frecuencia para resolver problemas (olfato, vista, gusto, tacto, oído).</li> <li>30. Tengo la capacidad de desarrollar y mantener buena comunicación con diferentes tipos de personas.</li> </ol>
<b>CUADRANTE D (superior derecho cerebral)</b>
<ol style="list-style-type: none"> <li>31. Tengo un interés muy fuerte o talento con la música, la poesía, la escultura. También para pintar, dibujar, esquematizar etc.</li> <li>32. Tengo la capacidad de razonar en forma avanzada y creativa, siendo capaz de adquirir, modificar y retener conocimientos.</li> <li>33. Produzco nuevas ideas e innovaciones en mi trabajo.</li> <li>34. Tengo la capacidad de entender y hacer uso de imágenes visuales y verbales para representar</li> </ol>

- semejanzas y diferencias.
35. Tengo la capacidad de percibir y entender una problemática global sin entrar en el detalle de los elementos que la componen.
  36. A menudo mis mejores ideas se producen cuando no estoy haciendo nada en particular.
  37. Prefiero ser conocido y recordado como una persona imaginativa y fantasiosa.
  38. Frecuentemente me anticipo a la solución de los problemas.
  39. Tengo la capacidad de utilizar o comprender objetos, símbolos y señales complejas.
  40. Utilizo el juego y el sentido del humor en muchas de mis actividades.

Fuente: Jiménez (2006).

#### **Fase 4: Construcción de equipos de trabajo.**

En base a los resultados obtenidos en el cuestionario de Jiménez (2006) se construyen los equipos de trabajo. En este sentido se realizan un total de 14 equipos con 6 integrantes cada uno, 8 equipos heterogéneos con perfiles de dominancias mixtas y 5 equipos homogéneos con perfiles de dominancia pura, 5 del hemisferio izquierdo y 1 del derecho. A los alumnos no se les notifica su perfil de dominancia con el fin de no sesgar su compartimiento frente al equipo.

#### **Fase 5: Planteamiento de los casos prácticos por parte del profesorado.**

Los profesores diseñan los casos prácticos a resolver por equipo. En este sentido, se plantean 6 casos representativos de todos los estilos de aprendizaje, 3 más adaptados a las características propias del hemisferio izquierdo (su óptima resolución necesita de la capacidad analítica, planificadora y secuencial) y 3 con un perfil más propio del hemisferio derecho (su óptima resolución necesita de la capacidad holística, creativa, intuitiva, sintetizadora, emocional para su resolución).

#### **Fase 6: Toma de contacto del alumno con su equipo: LA ISLA.**

Para conseguir la aproximación y conocimiento de los estudiantes con el equipo se realiza la práctica de LA ISLA. Esta consiste en que, a diversos equipos, una vez dotados de material propio de manualidades y de plástica (colores, pegamento, cartulina, plastilina), se les pide la ejecución de lo que entienden por el concepto isla (ver Figura 2). Esta actividad didáctica permite ver un diferente desarrollo según el perfil dominante en el grupo. Además genera relaciones interpersonales, habilidades comunicativas, crítica constructiva, creatividad, empatía y asertividad, habilidades, todas ellas, propias del desarrollo de una metodología cooperativa. A continuación observamos algunos ejemplos de las islas realizadas.

FIGURA 2  
La Isla

#### **Fase 7: Resolución de casos prácticos en el aula**

Los alumnos resuelven y discuten de forma cooperativa los casos en la propia aula y reciben el *feedback* del profesor y de la crítica constructiva resto de equipos.

#### **Fase 8: Reunión de control**

Los profesores, hacia la mitad del semestre, se reúnen para discutir la marcha de los equipos y la metodología utilizada.

## Fase 9: Presentación de los manuales de venta

A través de dos sesiones prácticas, los equipos exponen públicamente los manuales de venta. En esta fase, para la evaluación de los mismos, se invita al director comercial de una importante empresa del sector azulejero para que ayude al profesor en las tareas de asesoramiento y consulta.

## Fase 10: Respuesta a cuestionario sobre la satisfacción grupal

En relación a la medición de la satisfacción del alumno con respecto a su equipo de trabajo recurrimos a la escala de medida desarrollada por Viles et al. (2013) (ver Tabla 2). Este instrumento de medida se compone de un total de 23 ítems (ver Tabla 2), en el que el alumno debe mostrar, en una escala tipo Likert de 5 puntos, su grado de acuerdo con una serie de afirmaciones relacionadas con el funcionamiento de su grupo de trabajo a lo largo del semestre (donde 1 es “totalmente en desacuerdo” y 5 es “totalmente de acuerdo”) sobre una serie de dimensiones fundamentales: la participación en la toma de decisiones (3 ítems), la gestión de conflictos (2 ítems), la resolución de problemas (2 ítems), la cooperación (3 ítems), el liderazgo (2 ítems), la comunicación interna (3 ítems) y el *feedback* (8 ítems).

TABLA 2  
Escala de medición para el diagnóstico de la satisfacción grupal

<b>PARTICIPACIÓN EN LA TOMA DE DECISIONES</b>	
1.	Se han establecido normas internas que han facilitado el trabajo en equipo.
2.	Todos los miembros han participado en las tareas del equipo.
3.	Las decisiones en el equipo se han tomado teniendo en cuenta la opinión de todos los miembros.
<b>GESTIÓN DE CONFLICTOS</b>	
4.	Las discrepancias en el equipo han permitido considerar nueva ideas o nuevos puntos de vista.
5.	No ha habido conflictos de tipo interpersonal y si los ha habido, se han resuelto sin que nadie se haya sentido perjudicado.
<b>RESOLUCIÓN DE PROBLEMAS</b>	
6.	Se han utilizado los datos o se ha seguido algún tipo de método para la resolución del caso planteado.
7.	Se ha potenciado la creatividad para la resolución de los problemas o propuestas planteadas.
<b>COOPERACIÓN</b>	
8.	Las tareas y actividades concretas que cada miembro del equipo debería realizar han estado claras desde el inicio tanto en contenido como en plazo.
9.	Tus compañeros han contribuido al equipo tal y como se estableció y ha sido necesario.
10.	Ha existido colaboración entre los miembros del equipo (nos hemos ayudado, compartido información, comunicado las dificultades, etc...).
<b>LIDERAZGO</b>	
11.	El líder del equipo ha sido aceptado por todos los miembros del equipo.
12.	El líder del equipo ha dirigido y coordinado las actividades del equipo.
<b>COMUNICACIÓN INTERNA</b>	
13.	El trabajo del equipo ha transcurrido en un ambiente de confianza.
14.	A pesar de las diferencias entre los miembros del equipo, ha existido un ambiente de respeto entre todos.
15.	En general, la comunicación ha sido buena entre los miembros del equipo.
<b>FEEDBACK</b>	
16.	Los objetivos se han transmitido bien al equipo y han sido comprendidos.
17.	El profesor ha facilitado los recursos (información, materiales, tiempo, o de otro tipo) que el equipo ha necesitado.
18.	Las tareas y actividades concretas a realizar por el equipo han estado claras tanto en contenido como en plazo.
19.	Los criterios de evaluación se han transmitido bien al equipo y han sido comprendidos al inicio del trabajo.
20.	Como equipo, hemos tenido acceso a la información que hemos necesitado.
21.	En caso de necesidad, el equipo ha podido comunicarse fácilmente con los profesores de las asignaturas involucradas.
22.	Como equipo, hemos recibido información acerca del resultado de nuestro trabajo ( <i>feedback</i> del trabajo realizado, fallos cometidos, puntos a destacar).
23.	El trabajo ha sido de alguna manera valorado públicamente al resto de la clase.

Fuente: Viles et al. (2013)

## Fase 11: Elaboración de las conclusiones

Finalizado el curso los profesores se reúnen para analizar los resultados obtenidos y el grado de satisfacción manifestado por los alumnos con la metodología utilizada. Los análisis, resultados y conclusiones permiten observar el grado de consecución de los objetivos propuestos en esta experiencia. Además, los mismos, serán de utilidad para formar equipos de trabajo óptimos en la asignatura Técnicas de Ventas en el próximo curso.

### 4. Resultados

Los datos fueron analizados mediante técnicas de análisis descriptivo y de frecuencias, análisis de la varianza (ANOVA) y análisis de varianza múltiple (MANOVA) utilizando el programa estadístico SPSS 18.0, con tal de analizar al estudiante tanto de forma individual como a nivel de equipo.

#### 4.1. Análisis atendiendo a criterios individuales

En primer lugar, tal y como se recoge en la Tabla 3, se lleva a cabo un análisis descriptivo respecto a los valores promedio de cada uno de los cuadrantes así como de los perfiles de dominancia observados en los estudiantes.

TABLA 3  
Análisis descriptivo de las dominancias cerebrales de la muestra

Cuadrantes	A	B	C	D
Media	65,46	70,24	63,93	60,95
Desv. típica	10,15	9,03	10,64	13,39
Dominancias	% (muestra)	% (muestra)	% (muestra)	% (muestra)
Terciaria (0 - 33)	0,0% (0)	0,0% (0)	1,2% (1)	4,8% (4)
Secundaria (34 - 66)	53,6% (45)	42,9% (36)	61,9% (52)	64,3% (54)
Primaria (67 - 100)	46,4% (39)	57,1% (48)	36,9% (31)	31,0% (26)
Dominancias primarias			%	Muestra
Sin dominancias primarias			17,9%	15
Dominancia hemisferio izquierdo			34,5%	29
Dominancia hemisferio derecho			10,7%	9
Dominancia mixta (hemisferio izquierdo y derecho)			36,9%	31

Atendiendo a los valores promedio de cada uno de los cuadrantes, los alumnos encuestados presentan dominancias primarias en el cuadrante B (70,24). De hecho, observamos que, al valorar la distribución en cuanto a la importancia de cada dominancia (primaria, secundaria y terciaria) para cada uno de los cuadrantes, salvo en este cuadrante B en el que el mayor porcentaje es de dominancia primaria (57,1%), en el resto de cuadrantes el mayor peso lo tienen las dominancias secundarias. Así, en general los alumnos analizados pertenecientes al Grado de Administración de Empresas presentan una dominancia simple en el cuadrante B (2122). Las personas con dominancia simple se comportan de forma previsible y la coherencia es un rasgo dominante. Sin embargo, pueden tener conflictos externos con personas que no tienen esta dominancia. Éste es un caso que podemos considerar atípico puesto que lo normal es encontrar dominancias dobles o triples.

Centrándonos en las posibles combinaciones de dominancias primarias existentes en la muestra vemos que, a pesar de que como suele ser habitual la mayoría de los estudiantes presentan una dominancia mixta (36,9%), su importancia es compartida con aquellos estudiantes que presentan dominancias en el hemisferio izquierdo (34,5%). De hecho, atendiendo a los valores de la Tabla 3 podemos ver como los cuadrantes C y D son los que presentan los valores medios más bajos (63,93 y 60,95 respectivamente), así como los menores porcentajes de dominancia primaria (36,9 y 31,0).

Tomando como punto de partida estas valoraciones, relacionadas con las dominancias cerebrales de los estudiantes, se plantean diferentes cuestiones que nos permiten detectar el carácter diferenciador que los perfiles de dominancia pueden tener sobre los equipos de trabajo.

#### 4.2. Análisis atendiendo a criterios grupales de los equipos de trabajo

Finalmente, centramos nuestros análisis en diversas cuestiones relacionadas con el ámbito del equipo, tratando de determinar la existencia de posibles diferencias en su rendimiento en función de sus perfiles de dominancia.

*¿Existen diferencias en los resultados del equipo en base a sus perfiles de dominancia?*

Para contrastar el rendimiento final del equipo en función del perfil de dominancia se revisan los 14 equipos de trabajo de los alumnos a lo largo del curso procediendo a su catalogación (tanto respecto a cuadrantes como a hemisferios cerebrales). Concretamente, realizamos diversos análisis asociados a las diferentes tipologías de trabajo realizadas por los equipos a lo largo del curso. Por un lado, el proyecto semestral consistente en el desarrollo de un manual de ventas y, por otro lado, los casos semanales resueltos en el aula. En este último aspecto, se diferencian aquellos casos de tipología más cercana al hemisferio izquierdo de aquellos más cercanos al hemisferio derecho. Como puede observarse en la Tabla 4, los resultados apuntan a que, en global, los alumnos pertenecientes a equipos con dominancia en el hemisferio izquierdo (en especial con perfiles del cuadrante A) y con dominancia mixta tienen mejores notas grupales (8,46 y 8,79 respectivamente) que los alumnos pertenecientes a equipos con dominancias en el hemisferio derecho (7,51).

Adicionalmente, los resultados obtenidos demuestran que la heterogeneidad de opinión propia de los equipos mixtos dificulta la capacidad de rápida resolución asociada a la metodología del caso (presentan las valoraciones más bajas en todas las notas asociadas a casos). Sin embargo, esta diversidad de habilidades y destrezas les llevan a conseguir las mejores valoraciones en los proyectos semestrales, en los que el tiempo disponible para llegar a una solución se incrementa.

Más aún, si atendemos a la tipología de los casos observamos una correspondencia directa entre los perfiles de los equipos y la propia naturaleza del caso. Así en los casos asociados al hemisferio izquierdo las notas más altas son las logradas por los equipos de dominancia en este hemisferio (8,48), mientras que en los casos asociados al perfil derecho, hace lo propio el equipo con dominancia en tal hemisferio (9,53).

TABLA 4  
Perfiles de dominancia y notas de equipo

Perfiles de los equipos (cuadrantes)	% (muestra)	Nota global	Nota plan	Nota casos	Casos izq.	Casos der.
A	7,1% (1)	9,00	9,00	9,13	9,00	9,40
B	28,6% (4)	8,29	8,47	8,61	8,31	9,01
C	7,1% (1)	7,51	7,00	8,77	8,39	9,53
D	0,0% (0)	-	-	-	-	-
Mixto	57,2% (8)	8,79	9,21	8,36	7,95	8,87

*¿Existen diferencias en el funcionamiento satisfactorio del equipo en base a sus perfiles de dominancia?*

Tal y como muestran los resultados recogidos en la Tabla 5, en todas las dimensiones asociadas al funcionamiento del equipo, la diversidad de opinión y heterogeneidad de criterios y habilidades que se da entre los miembros de los equipos heterogéneos o mixtos hace que el trabajo en el mismo resulte más satisfactorio que en el caso de los equipos con perfiles de dominancia pura. De hecho, conviene resaltar el caso de los equipos con cuadrante A en los que la sensación de sus miembros respecto al funcionamiento del equipo resulta insatisfactoria en prácticamente todas las dimensiones consideradas (considerando el 3 como el valor umbral entre insatisfacción y satisfacción)

## 5. Conclusiones

Las nuevas metodologías propuestas por el EEES y que propician el trabajo en equipo buscan modificar la estructura de metas del grupo en clase, tradicionalmente competitiva e individualista, e introducir actividades que favorezcan el establecimiento de la cooperación como medio principal de aprendizaje. El alumno, en este proceso construye su propio conocimiento a través la interacción con compañeros de diverso perfil. Para lograr el éxito del trabajo en equipo y el establecimiento de las bases cooperativas es muy importante determinar el perfil de aprendizaje y, de esta forma, diseñar los equipos más eficaces.

En este sentido, según los resultados de nuestro estudio, el estilo de aprendizaje de los estudiantes del Grado Administración de Empresas presenta una dominancia simple en el cuadrante B y, si nos fijamos en las dominancias dobles, se observa que tanto los perfiles de dominancia mixtos (36,9%) como los de dominancia del hemisferio izquierdo (34,5%) tienen la misma importancia. Esto va en línea con trabajos anteriores que mantienen la existencia de una relación entre el perfil de dominancia y la preferencia en la elección de titulaciones universitarias y futura ocupación profesional. La dominancia en el cuadrante A es propia de los alumnos de titulaciones de las ciencias en general (naturales, sociales y jurídicas). El cuadrante B es dominante en el perfil de aquellos alumnos de titulaciones relacionadas con las ciencias naturales, de la administración de empresas y la contabilidad. El perfil de dominancia en el cuadrante C es propio de las titulaciones relacionadas con la enseñanza, la sociología, el periodismo, la enfermería y el trabajo social. Por último, la dominancia en el cuadrante D se manifiesta en las titulaciones de publicidad, bellas artes, música o arquitectura (Herrmann, 1989). Sin embargo, el perfil de aprendizaje más completo es el que supone una dominancia en

todos los cuadrantes y, por lo tanto, la máxima representación del funcionamiento del cerebro total. Encontrar alumnos con un perfil de dominancia cuádruple, tal y como sostiene Herrmann, resulta difícil pero subsanable, formando equipos completos en los que aparezcan representados los diferentes perfiles de aprendizaje.

En este sentido, con respecto al trabajo en equipo y su composición, nuestros resultados muestran que los alumnos pertenecientes a equipos homogéneos (dominancias primarias puras) alcanzan mejores resultados que los alumnos de equipos heterogéneos, siempre y cuando la práctica se ajuste a su perfil de aprendizaje. Sin embargo, en general, los equipos heterogéneos, con dominancias mixtas, presentan mayores dificultades en la solución de los casos prácticos. Esto es consecuencia directa de que los casos prácticos se solventan de forma rápida en el aula y, en este sentido, las diferencias de perfiles entre los alumnos de estos equipos ralentiza su eficacia al necesitar de mayor tiempo para organizarse, planificarse y coordinarse correctamente. Sin embargo, cuando disponen de mayor tiempo, como sucede en el caso del manual de prácticas (trabajo semestral), consiguen vencer estas dificultades y los resultados académicos son superiores. En esta línea podríamos decir que la composición idónea para trabajar en grupo en la asignatura Técnicas de Ventas y obtener el mejor rendimiento académico es aquella formada por miembros con distintos perfiles, preferentemente alumnos con el perfil de dominancia cerebral propio de la titulación (en nuestro caso el B) y perfiles de dominancia mixto, puesto que estos tienen puntos en común con los perfiles de dominancia puros (lateralizados) pero a la vez son capaces de pensar de otra forma y enfocar una situación de aprendizaje de forma distinta.

Los equipos de trabajo heterogéneos en su forma de aprender tienen como principal reto la capacidad para aprender a gestionar sus diferencias y a ser tolerantes con las distintas formas de pensar (Herrmann, 1989; Pujolàs, 2008) y, si lo logran, obtendrán resultados enriquecedores. Además, la formación de equipos heterogéneos supone la preparación del alumno hacia las demandas de un mercado laboral que, no sólo necesita titulados con una gran capacitación técnica, sino que puedan adaptarse a los cambios, que sean permeables y flexibles. La sociedad actual necesita profesionales interdisciplinarios capaces de enfrentarse al cambio constante, de trabajar con equipos heterogéneos, adaptarse al know-how de cualquier empresa y sector empresarial. En este sentido, los profesores universitarios tenemos la responsabilidad de formar a los estudiantes no sólo en las competencias que requieren específicamente cada titulación, sino en aquellas otras que potencien su polivalencia. Los nuevos titulados deben ser formados para utilizar los dos hemisferios cerebrales, siempre que las necesidades lo requieran.

En este sentido, proponemos desarrollar metodologías de aprendizaje a partir del Modelo del Cerebro Total. Para ello, en un primer paso el profesor debe conocer el estilo de aprendizaje de los estudiantes para formar equipos heterogéneos. En segundo lugar, desarrollar actividades que incluyan distintas formas de aprender y que no estén condicionadas por el currículum formativo de la especialidad. Es decir, presentar actividades que obliguen a los alumnos a potenciar los dos hemisferios. El objetivo es formar titulados universitarios completos, capaces de enfrentarse a los retos del mercado laboral de una forma abierta, capaces de cooperar y enriquecerse de otras perspectivas. En definitiva hay que formar grupos e individuos que supongan en sí mismos un gran cerebro total.

La principal limitación de la experiencia descrita se refiere a que su campo de aplicación se constriñe a una sola asignatura y durante un semestre concreto. No obstante, actualmente estamos trabajando en la ampliación de esta experiencia docente a otras titulaciones contando para ello con profesores de otras áreas (comunicación, periodismo e ingenierías). Esta colaboración y cooperación interdisciplinaria en el seno de la universidad nos permitirá comparar resultados y llegar a conclusiones más amplias y profundas.

## RESUMEN

*El entorno universitario actual está atravesando importantes cambios que deben gestionarse de forma eficiente para garantizar el éxito de las instituciones de educación superior. Los principales clientes de las universidades son los estudiantes y éstos deben estar satisfechos con la educación recibida. Cada vez son más conscientes de lo que demanda el mercado y de lo que tienen que conseguir de su paso por la institución universitaria: adquirir conocimientos y también competencias. Los alumnos participantes en este estudio cursaban estudios en universidades públicas de dos países distintos, España y Turquía. Los resultados obtenidos muestran que las ocho competencias transversales consideradas (trabajar en equipo; aprendizaje autónomo; toma de decisiones aplicando los conocimientos a la práctica; análisis de problemas con razonamiento crítico; comunicación oral, comunicación escrita, participación activa en clase y uso de herramientas informáticas) determinan la satisfacción de los estudiantes con las asignaturas en las que se matriculan.*

## Palabras clave:

Satisfacción, competencias, educación superior, estudiante, docencia en marketing

## 1. Introducción

Las Administraciones Públicas (AAPP) son las instituciones acreditadas para facilitar bienes y servicios básicos para los ciudadanos. Su cometido es clave tanto para asegurar el bienestar social como por la responsabilidad derivada de que esos bienes y servicios sólo pueden ser viables gracias al esfuerzo de todos los contribuyentes. En este sentido, las AAPP -y las universidades públicas como parte de las mismas- tienen como obligación responder ante este objetivo haciéndolo del modo más eficiente posible. Sin embargo, lamentablemente, muchas de las AAPP son culpadas de no cumplir con su cometido y, en consecuencia, de defraudar a los contribuyentes. Esta situación está obligando a que nos enfrentemos al paradigma de la ‘nueva gestión pública’, cuyas premisas se importan del sector privado al público.

Concretamente la nueva gestión pública se basa en utilizar los métodos y técnicas de la empresa privada en las AAPP para conseguir actuar con eficacia y eficiencia (Olías de Lima, 2006). Ante esta situación las AAPP en general y las Universidades como parte de las mismas en particular, se vuelven conscientes de la necesidad de aplicar modelos de medición de la satisfacción de los usuarios similares a los utilizados por las empresas privadas (Alves y Raposo, 2003 y Zuluaga-Duque, 2004).

El entorno universitario europeo está atravesando importantes cambios que deben gestionarse de forma eficiente para garantizar el éxito de las instituciones de educación superior. Los principales clientes de las universidades son los estudiantes (Browne, Kaldenberg, Browne y Brown, 1998; Tsarenko, Mavondo y Gabbot, 2004), quienes al fin y al cabo garantizan su éxito o fracaso (Siu y Wilson, 1998). Sin embargo, estos clientes ya no son rehenes de sus universidades cercanas.

El abanico del que dispone en la actualidad un estudiante para formarse es muy amplio. Qué duda cabe que la trayectoria de las universidades depende de que éstas puedan financiarse y parte de esa financiación proviene de mantener o, mejor aún, de aumentar el número de matriculados en sus centros, en definitiva del número de clientes (Bailey, 2000). Para alcanzar este objetivo, además de las decisiones políticas, es necesario que los estudiantes estén satisfechos con la educación recibida. En la literatura, la concepción del rol de los estudiantes es muy variada, se les ha llamado desde clientes (como se apuntaba anteriormente) o productos, hasta consumidores o ciudadanos (Bailey, 2000; Halbesleben, Becker y Buckley, 2003). A pesar de todas esas metáforas, la mayor parte de los investigadores están de acuerdo en que la satisfacción de los estudiantes con su experiencia educativa es fundamental (Suhre, Jansen y Harskamp, 2007).

Dando un paso más en el diseño curricular de los grados, el nuevo proyecto de educación, cristalizado con el Plan Bolonia, no busca transmitir solamente contenidos y conocimientos específicos, sino también un conjunto de destrezas y competencias que son aplicables a diferentes tipos de empleo y a la resolución de problemas específicos en el ámbito profesional. Los estudiantes se están convirtiendo en verdaderos aprendices activos, autónomos, cooperativos y verdaderamente responsables, que se transformarán en los profesionales competentes del futuro. Ello determina un importante cambio en su mentalidad derivado, entre otros factores, del cambio que ya ha sufrido el profesorado. El trabajo por competencias se convierte así en uno de los ejes centrales en la reforma educativa que supone la creación del nuevo EEES (Armengol, Castro, Jariot, Massot y Sala, 2010).

Diversos estudios han demostrado la influencia de las competencias en la satisfacción (Marzo, Pedraja y Rivera, 2005; De-Juan-Vigaray y González-Gascón, 2013, entre otros) confirmando la validez como variables antecedentes de este instrumento. Sin embargo, no hemos encontrado en la literatura estudios que indaguen sobre cuáles de las competencias adquiridas por los estudiantes pueden representar mayor satisfacción para ellos. Por lo tanto, consideramos relevante seguir investigando sobre cuáles son las competencias que pueden repercutir en mayor medida en la satisfacción de los estudiantes con su experiencia educativa, y cuáles son los consecuentes de esa satisfacción. Específicamente, nuestra atención de investigación se centra en examinar los antecedentes:

*¿Qué competencias afectan y en qué medida, a la satisfacción de los estudiantes con las enseñanzas recibidas en las instituciones públicas? Y comprobar los consecuentes ¿Una vez satisfechos con la institución, los estudiantes son leales a la misma?*

Para dar respuesta a estas cuestiones de investigación el objetivo de esta investigación es doble. Por un lado, analizar cómo influye cada una de las competencias transversales estudiadas en la satisfacción de los estudiantes y, por otro, analizar la relación entre la satisfacción de los estudiantes y su lealtad a la institución. Con la finalidad de comprobar la validez externa de los resultados se ha replicado el estudio en dos países distintos. El trabajo se estructura, en primer lugar, presentando una breve revisión de la literatura sobre la satisfacción, la lealtad y sobre las competencias. A continuación se expone la metodología utilizada y los resultados obtenidos. Terminamos con un resumen de las principales conclusiones obtenidas de los análisis y las futuras líneas de investigación.

## **2. La satisfacción de los estudiantes en las instituciones de educación superior**

Para poder modelizar y medir la satisfacción de un cliente con un servicio es necesario conocer los procesos a través de los que se forma la propia satisfacción, las variables que la conforman y la relación entre ellas, los antecedentes y consecuentes. En esta área de investigación se distinguen principalmente tres paradigmas. El paradigma relacional que se centra en los aspectos psicológicos de la relación empresa-cliente (Gruning y Huang, 2000), que en el sector público hace referencia al usuario-administración y en el universitario al estudiante-universidad. Concretamente tiene en cuenta la influencia de la confianza y el compromiso mutuo entre el receptor y el suministrador del bien o servicio (Bruning y Ledingham, 1999). Sin embargo, no resulta operativo porque no determina la satisfacción ni cuál o cuáles son las variables que la maximizan.

El paradigma de la calidad subjetiva, toma como punto de partida las escalas del bienestar y las de satisfacción (Hagerty *et al.*, 2001). El inconveniente es que pone en un mismo nivel el bienestar y la satisfacción, cuando muchas investigaciones demuestran que son constructos diferentes (Sirgy *et al.*, 2006). Tampoco encuentra, como ocurre con el anterior, las consecuencias ‘conductuales’ de los estados de satisfacción del usuario.

El paradigma intencional toma como base la psicología social y sí que explica los procesos de fidelización del cliente o usuario. Ajzen y Fishbein (1980) identifican la evaluación de la calidad de los servicios como antecedente de la intención de los clientes. En este sentido, las normas sociales y/o las actitudes de los individuos determinan sus intenciones en relación con la adquisición de un servicio. Por su parte, Bagozzi (1992) demostró que la elección racional no es suficiente, además se necesita un deseo para que la adquisición de un servicio tenga lugar. En definitiva este paradigma difiere de los anteriores en que propone un modelo causal y una variable final que determina todo el proceso: la fidelidad del cliente o usuario.

Es cierto que en la literatura (Browne, Kaldenberg, Browne y Brown, 1998; Aldridge y Rowley, 1998) existen distintas definiciones de satisfacción en relación con los estudiantes (Elliot y Healy, 2001), así como ciertas limitaciones en las investigaciones que escapan al control de las instituciones. Entre estas últimas destacan los rápidos cambios en el mercado o los planes de estudio, limitaciones que se pueden traducir en ocasiones en diplomas obsoletos, que pueden afectar a la evaluación de la satisfacción del estudiante. Pero incluso no existiendo unanimidad en cuanto a su definición y a sabiendas de sus limitaciones, lo que sí está generalmente aceptado es su naturaleza multidimensional (Hartman y Schmidt, 1995). Las discrepancias sobre cuáles son esas dimensiones son las que conducen a indagar más en este respecto y a proponer una visión más parsimoniosa y explicativa de la realidad actual. Más oferta educativa de calidad se traducirá en más y mejores estudiantes (Serenko *et al.*, 2010).

### **3. Las competencias y su relevancia en el nuevo marco europeo**

Las nociones de competencia se han convertido en el eje central de la formación de los estudiantes desde la escuela primaria (Perrenoud, 2001) hasta la educación universitaria (De Miguel Díaz, 2006). La participación del alumno en el proceso de enseñanza aprendizaje resulta primordial en el actual contexto de la educación superior, puesto que el nuevo proyecto de educación no trata de transmitir sólo contenidos y conocimientos específicos, sino también un conjunto de destrezas y competencias definidas como transversales aplicables a diferentes tipos de resolución de problemas específicos en el ámbito profesional.

La competencia hace referencia a la cualidad de una persona cuando recurre a sus capacidades para llevar a cabo un trabajo o tarea con el estándar de calidad requerido en su entorno profesional y que, como señala Aristimuño (2005), se apoya en conocimientos, pero no se reduce únicamente a ellos. Según el proyecto “Tuning Educational Structures in Europe”, desarrollado con el objeto de hallar vías prácticas que permitan avanzar en la construcción del área europea de educación superior, el término competencias constituye una combinación de atributos -con respecto al conocimiento y su aplicación, a las actitudes y a las responsabilidades-, que describen el nivel o grado de suficiencia con que una persona es capaz de desempeñarlos. En el informe final del proyecto, las competencias hacen referencia a ‘conocer y comprender’ (referidos al conocimiento teórico de un campo académico), ‘saber cómo actuar’ (la aplicación práctica y operativa del conocimiento en situaciones determinadas) y ‘saber cómo ser’ (los valores como parte integrante de la forma de percibir a los otros y vivir en un contexto social).

En definitiva, el concepto de competencia describe conocimientos, capacidades, destrezas, actitudes y valores necesarios para ejercer una profesión determinada, llamándose genéricas o transversales las que son necesarias para cualquier profesión, o para desarrollarse de forma activa en la sociedad, y específicas las propias de un determinado campo de estudio. El Proyecto Tuning (2011), clasifica las primeras en tres categorías: (a) instrumentales, que pueden ser a su vez cognoscitivas, metodológicas, tecnológicas y lingüísticas; (b) interpersonales, que tienden a favorecer los procesos de interacción social y comunicación; y (c) sistémicas, o la combinación de comprensión, sensibilidad y conocimiento, para permitir al individuo ver cómo las partes de un todo se relacionan y se agrupan (Gómez y Lamarche, 2013).

Dentro de las competencias genéricas instrumentales se puede mencionar: la comunicación oral y escrita en la lengua materna y/o extranjera, el uso de herramientas informáticas y la toma de decisiones aplicando los conocimientos a la práctica. Entre las competencias transversales interpersonales se encuentra la competencia para analizar problemas con razonamiento crítico sin prejuicios con precisión y la participación activa en clase. Por último, entre las genéricas sistémicas se encuentran la autonomía en el aprendizaje y el trabajo en equipo.

Sánchez Guzmán (2008) puntualiza que la competencia no está realmente en los recursos que se activan, sino en la movilización misma de estos recursos. La movilización, pues, según la autora, implica que la aplicación de competencias dependa del individuo, de su medio, de su esfuerzo y de los recursos disponibles para su ejecución, dentro del marco de expectativas generadas por un ambiente socio-cultural determinado. Las competencias se han estudiado incluso para conocer los factores determinantes del rendimiento del alumnado universitario relacionados con el ámbito de la gestión universitaria (Zabalandikoetxea y García Merino, 2013), pero no estrictamente sobre la satisfacción de los estudiantes con sus estudios de marketing.

### **4. Modelo propuesto**

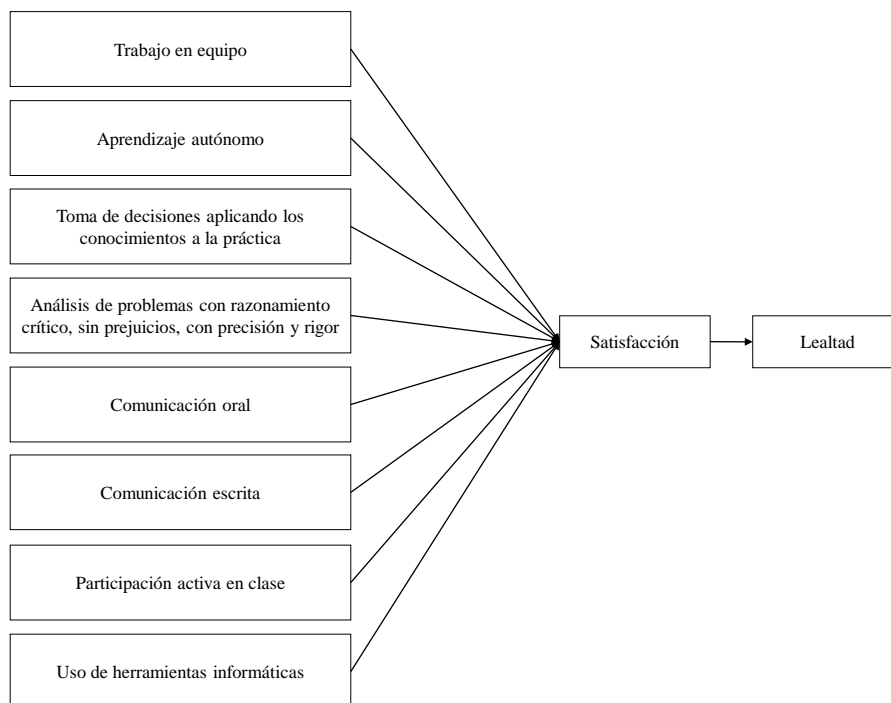

En el actual proceso de cambio metodológico y curricular se han generado numerosos estudios en diversos ámbitos relacionados con la educación universitaria. Por una parte, existen trabajos que analizan y definen los nuevos conceptos de competencias que deben constituir el eje central en la formación de los estudiantes, así como su inserción en una nueva estructura curricular de la universidad (Perrenoud, 2001). Existen también trabajos específicos que presentan metodologías para

desarrollar las competencias concretas de las distintas asignaturas de cada titulación, y en un sentido más amplio de las distintas titulaciones agrupadas por rama de conocimiento (Rojas Soriano, 2002 y Dueñas, 2001). Ejemplos de aplicaciones concretas de desarrollo de competencias para asignaturas y titulaciones específicas se pueden encontrar en los trabajos de Dueñas (2001), para las Ciencias de la Salud; de Font (2002), para las Matemáticas, y de Rojas Soriano (2002) para las Ciencias Sociales, entre otros. Sin embargo, no hemos encontrado estudios que profundicen en este tema en el campo del marketing ni en la preponderancia de una/s competencias sobre las demás a la hora de influir en la satisfacción percibida por los estudiantes.

Las investigaciones indican también que la satisfacción es un antecedente de la lealtad, relación que también se produce en el sector de la educación superior (Alves y Raposo, 2004). Teniendo en cuenta el concepto y las dimensiones que influyen en la satisfacción, así como la relación entre ésta y la lealtad, se plantea el modelo de la Figura 1.

FIGURA 1.  
**Modelo propuesto: Influencia de las competencias transversales.**

Fuente: Elaboración propia

Según Armengol *et al.*, (2010) la competencia hace referencia al conjunto de conocimientos, procedimientos y actitudes que se complementan entre sí, y que capacitan al estudiante para actuar con eficacia en las diferentes situaciones profesionales. La competencia aporta un saber (conocimientos), un saber hacer (destrezas) y un saber estar (actitudes) en cada actuación. Existen además otro tipo de competencias que afectan a un abanico más amplio de estudiantes y que no son patrimonio única y exclusivamente de un único estudio de grado, son las competencias genéricas o transversales (Corominas, 2001; ANECA, 2005). Se trata de competencias habituales en muchas profesiones y transferibles, dado que pueden ponerse en práctica en distintas esferas (Corominas, 2001).

Además de revisar la literatura sobre el tema objeto de estudio, a la hora de determinar el conjunto final de competencias a tener en cuenta, las investigadoras (que forman parte de una red interdisciplinar en docencia) llevaron a cabo diversas sesiones con expertos y se asesoraron a partir de jueces versados en la materia tales como el equipo vicerrectoral de asuntos académicos o comisiones

académicas. Se propusieron, cribaron y seleccionaron aquellas competencias transversales que mejor se adaptaban a las distintas asignaturas impartidas en ciencias sociales.

En la literatura, el desarrollo de las competencias no se ha considerado como una dimensión que conforma la satisfacción de los estudiantes. Sin embargo, su desarrollo resulta de vital importancia para la incorporación posterior de los estudiantes al mercado laboral. Tal y como señalan Pérez, Quijano y Pérez (2005), la formación adquirida por los estudiantes tiene que mejorar sus posibilidades de conseguir un empleo de calidad, que se adapte a sus expectativas. Máxime cuando cada vez es más frecuente que una persona tenga que cambiar varias veces de profesión a lo largo de su vida. Las reformas en el mundo profesional requieren un nuevo tipo de formación.

Las empresas de hoy en día demandan profesionales polivalentes, flexibles, con facilidad de adaptarse a los cambios que en el entorno puedan ocurrir, con capacidades comunicativas y de trabajo en equipo, con cierto nivel de autonomía en el trabajo, siendo capaces de “autodirigirse” y de tomar decisiones por ellos mismos. Las empresas buscan empleados en los que poder delegar con la seguridad y la confianza de que el trabajo quedará bien hecho. Un titulado universitario sin estas competencias tendrá muy difícil su inserción en el competitivo mundo laboral. Y los estudiantes ahora son más conscientes que nunca de lo que demanda el mercado y de lo que tienen que conseguir de su paso por la institución universitaria, aprender conocimientos y aprender competencias. Por todo ello, teniendo en cuenta la asignatura que decide escoger el estudiante para completar sus estudios, se plantea la hipótesis siguiente:

- H1. El desarrollo de la competencia de ‘trabajo en equipo’ influye positivamente sobre la satisfacción del estudiante.
- H2. El desarrollo de la competencia ‘aprendizaje autónomo’ influye positivamente sobre la satisfacción del estudiante.
- H3. El desarrollo de la competencia ‘toma de decisiones aplicando los conocimientos a la práctica’ influye positivamente sobre la satisfacción del estudiante.
- H4. El desarrollo de la competencia ‘análisis de problemas con razonamiento crítico, sin prejuicios, con precisión y rigor’ influye positivamente sobre la satisfacción del estudiante.
- H5. El desarrollo de la competencia ‘comunicación oral’ influye positivamente sobre la satisfacción del estudiante.
- H6. El desarrollo de la competencia ‘comunicación escrita’ influye positivamente sobre la satisfacción del estudiante.
- H7. El desarrollo de la competencia ‘participación activa en clase’ influye positivamente sobre la satisfacción del estudiante.
- H8. El desarrollo de la competencia ‘uso de herramientas informáticas’ influye positivamente sobre la satisfacción del estudiante.

En la mayoría de la literatura sobre los servicios en general, las variables satisfacción y lealtad aparecen relacionadas entre sí (Lervik y Johnson, 2003), siendo la satisfacción la variable antecedente (Alves y Raposo, 2004 y Lervik y Johnson, 2003). El concepto se ha evaluado también para determinar si se produce repetición en las ventas, en el aumento de los beneficios, en las recomendaciones ‘boca a boca’ (Mavondo y Zaman, 2000) y lo más importante, la lealtad de los clientes (Seiders, Voss, Grewal y Godfrey, 2005). En el sector de la enseñanza superior, diversos estudios apuntan que esta relación también se cumple (Browne, *et al.*, 1998; Tsarenko, *et al.*, 2004; Wiers-Jenssen, *et al.*, 2002).

La satisfacción de los estudiantes se considera una actitud resultante de su experiencia educativa. Por ejemplo, Arambewela y Hall (2009) detectan cómo la satisfacción de los estudiantes juega un rol fundamental en la gestión del marketing de las instituciones y se evalúa para conocer el aumento de tasas, las recomendaciones ‘boca a boca’ positivas (Mavondo y Zaman, 2000) y la lealtad. Estas conclusiones apoyan la importancia de la relación entre la satisfacción de un cliente (un estudiante) y el éxito de una institución (la universidad) (Kevin y Dooyoung, 2002).

La atracción de estudiantes evitándose que acudan a otras instituciones supone el activo de las instituciones de educación superior. De tal forma, como se ha indicado previamente, varios estudios corroboran una relación causal entre el concepto de satisfacción y el de lealtad. Centrando el objetivo de este estudio se deduce la siguiente hipótesis:

H9: La satisfacción del estudiante influye positivamente sobre la lealtad hacia las asignaturas en las que decide matricularse.

## 5. Metodología

A continuación se detalla la metodología seguida para la realización de esta investigación. En concreto se presenta la muestra, las escalas y los indicadores utilizados para medir las variables del modelo, la explicación de cuándo y cómo se administra la prueba y los análisis estadísticos realizados, tanto para comprobar la fiabilidad del instrumento de medida como para el contraste de las hipótesis planteadas.

Los alumnos que han participado en este estudio cursaban estudios en universidades de dos países distintos, España y Turquía. En ambos casos se trata de universidades públicas, la Universidad de Alicante (España) y la Hacettepe University (Turquía). Los datos se recogieron durante el curso académico 2012-2013, al final del periodo docente, pero antes de realizar las pruebas finales de evaluación. De esta forma los contenidos habían sido impartidos y la evaluación continua había sido llevada a cabo. Todos los estudiantes fueron informados de que su participación era absolutamente voluntaria y anónima, así como de los objetivos de la investigación y de que la información facilitada sería utilizada única y exclusivamente con fines investigadores.

Todos los estudiantes tenían en común que cursaban estudios en el ámbito del marketing. Los estudiantes españoles pertenecían a la diplomatura en Ciencias Empresariales (EUCE, con 197 matriculados) y la licenciatura en Administración y Dirección de empresas (ADE, 97 matriculados). La asignatura escogida por estos estudiantes fue Distribución Comercial. Los estudiantes turcos, por su parte, cursaban una licenciatura en ADE y la asignatura escogida fue Fundamentos de Marketing (con 200 estudiantes matriculados).

Como se puede observar en la Tabla 1, se ha conseguido un total de 355 cuestionarios válidos. En el caso de los españoles la muestra final fue de 169 cuestionarios, de un total de 294 posibles, lo que representa una tasa de respuesta de 57,48%, y para un nivel de confianza del 95%, un nivel máximo de error del 4,9%. Para la muestra de los estudiantes turcos, se obtuvieron un total de 186 cuestionarios válidos de 200 posibles, lo que representa una tasa de respuesta del 93% y para un nivel de confianza del 95%, un nivel máximo de error del 1,9%.

En relación a los descriptivos de ambas muestras, la distribución es similar tanto en el porcentaje de mujeres (59,7% y 55,9%) como en el de los hombres (40,3% y 44,1%), encontrándose en ambos países mayor cantidad de féminas estudiando. La edad oscila entre 19 y 43 años para los estudiantes españoles y entre 20 y 27 para los estudiantes turcos.

TABLA 1  
Descriptivos de la muestra

		Número	%	Edad		
				Mínimo	Máximo	Media
Españoles	Hombres	68	40,3	19	37	23,60
	Mujeres	101	59,7	19	43	22,13
	Total	169	100	19	43	22,72
Turcos	Hombres	82	44,1	20	27	22,52
	Mujeres	104	55,9	20	25	21,51
	Total	186	100	20	27	21,97
Total		355				

### 5.1. Diseño del instrumento de medida

Para medir las competencias en este estudio se han utilizado escalas procedentes de la literatura. Las escalas están formadas por varios ítems que puntúan aditivamente, de tipo Likert de 7 puntos [(1) “total desacuerdo”; (2) “muy en desacuerdo”; (3) “algo en desacuerdo”; (4) “indeciso”; (5) “algo de acuerdo”; (6) “muy de acuerdo” y (7) “total acuerdo”].

Para medir la variable desarrollo de competencias se ha optado por utilizar la escala de De-Juan-Vigaray *et al.*, (2012), también utilizada por De-Juan-Vigaray y González-Gascón (2013). La escala considera ocho competencias, que en este trabajo han sido tratadas como indicadores individuales, con el objetivo de contrastar las hipótesis y dar respuesta a la pregunta de investigación.

Siguiendo a Marzo *et al.*, (2005) y a De-Juan-Vigaray y González-Gascón (2013), para medir la satisfacción del estudiante, se ha utilizado el ítem “estoy satisfecho/a con la asignatura”, que también oscila entre (1) “total desacuerdo” y (7) “total acuerdo”. Para medir la lealtad del estudiante se utiliza una escala de dos ítems: “voy a recomendar esta asignatura” y “volveré a matricularme en asignaturas similares”.

### 5.2. Procedimiento

El cuestionario fue autoadministrado a los estudiantes de ambas universidades. Como se ha mencionado anteriormente, los participantes contestaron el cuestionario en la última etapa del cuatrimestre en el que se impartía la asignatura. La fiabilidad del instrumento de medida se ha comprobado mediante el coeficiente alfa de Cronbach. Para los contrastes de la varianza se ha utilizado la prueba no paramétrica “K muestras independientes”, ya que no se han cumplido las condiciones necesarias (normalidad y homocedasticidad) para utilizar ANOVA. Para el contraste de las hipótesis planteadas se ha utilizado la regresión lineal.

## 6. Resultados

### 6.1. Descriptivos del instrumento de medida

En la Tabla 2 se muestran los descriptivos de las variables utilizadas en el estudio. Los resultados muestran que los estudiantes (de ambas universidades) tienen una opinión favorable sobre el desarrollo de las competencias analizadas, con valores para la media del estadístico obtenida, que oscilan entre el 4,54 para el *uso de herramientas informáticas* y el 5,74 para la *participación activa en clase*, frente a la media aritmética (3,5).

TABLA 2  
Descriptivos de las variables utilizadas.

Indicador / Escala	Origen	Mín.	Máx.	Media	Error típico	Desviación típica
Trabajar en equipo	E	1	7	5,51	0,11	1,41
	T	1	7	5,33	0,09	1,23
Aprendizaje autónomo	E	1	7	5,38	0,09	1,17
	T	1	7	5,34	0,08	1,15
Toma de decisiones aplicando los conocimientos a la práctica	E	1	7	5,64	0,09	1,15
	T	1	7	5,41	0,08	1,12
Análisis de problemas con razonamiento crítico, sin prejuicios, con precisión y rigor	E	1	7	5,41	0,10	1,25
	T	1	7	5,25	0,08	1,08
Comunicación oral	E	1	7	5,09	0,11	1,47
	T	1	7	5,05	0,11	1,43
Comunicación escrita	E	1	7	4,88	0,11	1,46
	T	1	7	5,03	0,10	1,34
Participación activa en clase	E	1	7	5,74	0,10	1,35
	T	1	7	5,15	0,11	1,49
Uso de herramientas informáticas	E	1	7	4,54	0,13	1,75
	T	1	7	4,80	0,10	1,31
Satisfacción del estudiante	E	2	7	6,01	0,09	1,12
	T	1	7	5,70	0,08	1,04

Indicador / Escala	Origen	Mín.	Máx.	Media	Error típico	Desviación típica
Lealtad	E	2	14	12,00	0,19	2,45
	T	3	14	11,29	0,14	1,90

Al comparar los resultados por universidades, los estudiantes españoles declaran que las asignaturas cursadas han incrementado en mayor medida (que los estudiantes turcos) las siguientes seis competencias: *trabajar en equipo; aprendizaje autónomo; toma de decisiones aplicando los conocimientos a la práctica; análisis de problemas con razonamiento crítico, sin prejuicios, con precisión y rigor; comunicación oral y participación activa en clase*. Para las competencias *comunicación escrita y uso de herramientas informáticas* los estudiantes turcos declaran un mayor incremento frente a los españoles.

La variable *satisfacción del estudiante* se ha medido utilizando un indicador (De-Juan-Vigaray y González-Gascón (2013)). A este respecto, los estudiantes españoles declaran estar muy satisfechos con la asignatura cursada (con un valor medio del estadístico de 6), mientras que los estudiantes turcos, que también declaran estar satisfechos, obtienen un valor algo menor (5,7).

Para el caso de la variable *lealtad*, los datos muestran una situación muy parecida a la variable *satisfacción*, los estudiantes españoles manifiestan su intención de recomendar la asignatura y volver a matricularse en asignaturas similares con unos valores de media superiores a los estudiantes turcos (12,00 vs. 11,29) siendo en ambos casos, los estadísticos, valores que claramente indican una elevada lealtad.

En la Tabla 3 se muestran los resultados del análisis de la varianza de las variables utilizadas en el estudio. Al realizar las pruebas para contrastar la hipótesis de la normalidad, tanto Kolmogorov-Smirnov como Shapiro-Wilk, arrojan unos resultados significativos ( $p < 0,05$ ), por lo que se rechaza la hipótesis nula de normalidad. Por tanto, como se ha mencionado, para realizar los contrastes se ha utilizado la prueba no paramétrica “K muestras independientes.

TABLA 3  
Análisis de la varianza de las variables utilizadas.

Indicador / Escala	Prueba de Kruskal-Wallis	
	Chi-cuadrado	Sig.
Trabajar en equipo	3,498	0,061
Aprendizaje autónomo	0,031	0,861
Toma de decisiones aplicando los conocimientos a la práctica	5,201	0,022
Análisis de problemas con razonamiento crítico, sin prejuicios, con precisión y rigor	3,575	0,059
Comunicación oral	0,102	0,749
Comunicación escrita	0,961	0,327
Participación activa en clase	17,312	0,000
Uso de herramientas informáticas	0,637	0,425
Satisfacción del estudiante	13,829	0,000
Lealtad	24,226	0,000

De los resultados obtenidos se puede afirmar que se acepta la hipótesis nula de que las medias de las competencias *trabajar en equipo, aprendizaje autónomo, análisis de problemas con razonamiento crítico, sin prejuicios, con precisión y rigor, comunicación oral, comunicación escrita y el uso de herramientas informáticas* son iguales en los diferentes grupos de estudiantes (españoles y turcos). No están asociadas en la población de la que provienen la muestra estudiada, pudiendo achacarse las pequeñas diferencias apreciadas al puro azar o error aleatorio del muestreo. Es decir, no tenemos pruebas para rechazar la hipótesis nula, y por tanto se acepta la igualdad de medias.

En cambio para las competencias *toma de decisiones aplicando los conocimientos a la práctica y participación activa en clase* las diferencias de medias sí son estadísticamente significativas. Aunque con este tipo de contrastes no paramétricos no es posible realizar contrastes a posteriori, los descriptivos de la Tabla 2 muestran tanto para la primera como para la segunda variable, valores superiores en el caso de los estudiantes españoles (5,64 vs. 5,41 y 5,74 vs. 5,15).

Para las variables dependientes *satisfacción del estudiante* y *lealtad*, los datos muestran que las diferencias sí son estadísticamente significativas. Al igual que con las variables anteriores, tampoco es posible realizar contrastes a posteriori, pero como ya se ha señalado, los estudiantes españoles declaran estar muy satisfechos con la asignatura cursada (6), mientras que los estudiantes turcos obtienen un valor algo menor (5,7). Situación que se repite para la variable lealtad (12,00 vs. 11,29). Para ambas variables el valor de los estadísticos indica claramente que los estudiantes están realmente satisfechos y declaran una elevada lealtad, en el sentido de que recomendarían las asignaturas.

## 6.2. Fiabilidad del instrumento de medida

El resultado del análisis realizado (alfa de Cronbach) para medir la fiabilidad de la escala *lealtad del estudiante* se puede considerar como óptimo para la muestra de los estudiantes españoles ( $\alpha = 0,832$ ), mientras que para la muestra de los estudiantes turcos el valor obtenido ( $\alpha = 0,669$ ) está rozando el límite inferior para el alfa de Cronbach, según el acuerdo general (Robinson, Shaver y Wrightsman, (1991), que es de 0,70, aunque puede bajar a 0,60 en la investigación exploratoria (Nunnally, 1987). En estudios previos, los autores De-Juan-Vigaray y González-Gascón (2013) reportan una fiabilidad de 0.861.

## 6.3. Contraste de hipótesis

Para realizar el contraste de las hipótesis planteadas se ha utilizado como método estadístico la regresión lineal. En la Tabla 4 se pueden observar los resultados obtenidos para ambas muestras.

TABLA 4  
Contraste de las Hipótesis.

Hipótesis	Descripción relación variables	Origen	R <sup>2</sup>	F	p
H1	Trabajar en equipo → Satisfacción	E	0,251	57,192	0,000
		T	0,210	50,294	0,000
H2	Aprendizaje autónomo → Satisfacción	E	0,284	67,587	0,000
		T	0,289	79,258	0,000
H3	Toma de decisiones aplicando los conocimientos a la práctica → Satisfacción	E	0,294	71,091	0,000
		T	0,197	46,529	0,000
H4	Análisis de problemas con razonamiento crítico, sin prejuicios, con precisión y rigor → Satisfacción	E	0,294	71,111	0,000
		T	0,227	55,303	0,000
H5	Comunicación oral → Satisfacción	E	0,198	42,570	0,000
		T	0,123	26,869	0,000
H6	Comunicación escrita → Satisfacción	E	0,101	19,811	0,000
		T	0,095	20,464	0,000
H7	Participación activa en clase → Satisfacción	E	0,335	85,452	0,000
		T	0,129	28,364	0,000
H8	Uso de herramientas informáticas → Satisfacción	E	0,074	14,440	0,000
		T	0,102	22,099	0,000
H9	Satisfacción del estudiante → Lealtad	E	0,541	198,729	0,000
		T	0,277	72,013	0,000

Al analizar cada una de las hipótesis planteadas, los resultados muestran que todas ellas tienen una relación significativa ( $p=0.000$ ), por lo que no se puede rechazar ninguna de ellas. El coeficiente de determinación ( $R^2$ ) indica la proporción de la varianza explicada por la variable independiente de la variable dependiente. De tal manera se puede observar cuál de las diferentes competencias estudiadas posee un mayor porcentaje de explicación de la variable dependiente (*satisfacción del estudiante*) que era uno de los objetivos del presente estudio.

Observando los resultados se comprueba que se obtienen valores diferentes para cada una de las muestras, por lo que primero se comentará una y después la otra. En lo referente a los estudiantes españoles, la variable dependiente *satisfacción del estudiante* con la asignatura escogida, viene explicada en un 33,5% por la competencia *participación activa en clase*, siendo la que mayor porcentaje de explicación posee (H7).

Compartiendo el segundo lugar figuran las competencias *toma de decisiones aplicando los conocimientos a la práctica y análisis de problemas con razonamiento crítico, sin prejuicios, con precisión y rigor* con un 29,4% de explicación de la *satisfacción del estudiante* (H3 y H4).

En un cercano tercer lugar la competencia *aprendizaje autónomo* representa un 28,4% (H2). La competencia que tiene un menor coeficiente de regresión (aunque no por ello bajo) es el *uso de herramientas informáticas*, con un 7,4% (H8). Para concluir con los estudiantes españoles, comentar que el porcentaje de la variable *lealtad del estudiante*, que viene explicada por la *satisfacción* del estudiante con la asignatura elegida, es de un 54,1% (H9).

Al observar los datos obtenidos con los estudiantes turcos la competencia que posee un mayor porcentaje de explicación de la variable *satisfacción* es el *aprendizaje autónomo* con un 29,1% (H2). En segundo lugar, con un 22,7% de explicación figura la competencia *análisis de problemas con razonamiento crítico, sin prejuicios, con precisión y rigor* (H4) y en tercer lugar la competencia *trabajar en equipo* (H1) con un 21%. La competencia que tiene un menor coeficiente de regresión (que en este caso es superior al inferior valor obtenido para los estudiantes españoles) es la *comunicación escrita*, con un 9,5% (H6). La variable *satisfacción del estudiante* explica un 27,7% de la variable *lealtad* del estudiante (H9). Cabe destacar que este porcentaje es notablemente inferior que el valor obtenido con los estudiantes españoles.

## 7. Conclusiones

Los resultados obtenidos muestran que las ocho competencias transversales consideradas en este estudio *trabajar en equipo; aprendizaje autónomo; toma de decisiones aplicando los conocimientos a la práctica; análisis de problemas con razonamiento crítico, sin prejuicios, con precisión y rigor; comunicación oral, comunicación escrita, participación activa en clase y uso de herramientas informáticas* determinan la *satisfacción de los estudiantes* con las asignaturas en las que se matriculan. El resultado se mantiene, aunque con valores distintos, en las dos muestras analizadas en países diferentes (universitarios que cursaban estudios en el ámbito del marketing en España y en Turquía).

Dado el interés de la satisfacción de los estudiantes con respecto a las instituciones en las que estudian, los docentes pueden favorecer el desarrollo de las competencias transversales de sus discentes. Si los estudiantes están bien preparados tanto en contenidos como en competencias, esto les permitirá una más rápida incorporación al mercado laboral y desarrollar con mayor éxito su carrera profesional, sea cual sea la rama de conocimiento elegida. Además de lo mencionado, los docentes pueden conseguir un mayor grado de *satisfacción* de sus estudiantes, tanto con las asignaturas cursadas como con quienes las imparten. Ello revertirá en una mejor reputación tanto para el profesorado como para las instituciones en las que éste desempeña su labor, ya que los estudiantes, identifican, entienden y reconocen la utilidad práctica de las competencias adquiridas a lo largo del curso.

En este estudio también se comprueba que la *satisfacción del estudiante* con la asignatura, afecta positivamente a la *lealtad*, que está medida a partir de la intención de recomendar la asignatura cursada y el propósito de matriculación en asignaturas similares. Considerando los resultados obtenidos para cada una de las muestras, el primer dato a destacar es el elevado porcentaje explicativo de las diferentes competencias transversales estudiadas, que oscila entre el 33,5% y el 7,4%. Cabe reseñar que las competencias transversales *uso de herramientas informáticas* (para el caso de los estudiantes españoles) y *comunicación escrita* (estudiantes turcos) obtienen porcentajes inferiores al 10% de explicación de la variable *satisfacción del estudiante*.

En el caso de los discentes españoles seis competencias (véase la Tabla 4) obtienen coeficientes de regresión superiores (o muy cercanos) al 20%, siendo cuatro el número de competencias para los turcos. Las competencias comunes a ambas muestras son: *trabajar en equipo; aprendizaje autónomo; toma de decisiones aplicando los conocimientos a la práctica y análisis de problemas con razonamiento crítico, sin prejuicios, con precisión y rigor*.

La competencia *participación activa en clase* merece una reflexión en particular, por dos motivos. El primero es que es la competencia que mayor porcentaje de explicación de la *satisfacción* obtiene con

los estudiantes españoles, llegando a un 33,5% y sin embargo, para el caso de los estudiantes turcos es uno de los coeficientes más bajos 12,9%. El segundo motivo es que es la competencia que mayor diferencia arroja en los porcentajes de explicación (20,6%) para ambas muestras. Cabe recordar que es una de las dos competencias cuyas medias eran significativamente diferentes (5,74 para el caso de los españoles vs. 5,15 para los turcos), aunque en ambos casos los valores del estadístico se pueden considerar claramente por encima de la media aritmética. Todo ello se puede interpretar como que los estudiantes de ambas muestras declaran que la asignatura cursada desarrollaba su competencia de *participación activa* en clase. Una explicación puede estar basada en el hecho de que los docentes que impartieron las asignaturas eran distintos (aunque ambos utilizaron metodologías de enseñanza aprendizaje similares).

En línea con Sánchez Guzmán (2008) los estudiantes de España y Turquía pueden estar movilizando sus recursos disponibles de forma diferente, ya que pueden tener marcos de expectativas dispares, haber realizado esfuerzos académicos desiguales y, finalmente, por encontrarse en ambientes socio-culturales distintos. Hay que tener en cuenta las posibles diferencias entre ambos sistemas educativos y lo acostumbrados a la participación que puedan estar los estudiantes en sus respectivos entornos, así como su madurez y la preparación previa sobre la materia que se está estudiando.

En cualquier caso, como las posibles diferencias son aplicables a todas las competencias estudiadas, los investigadores se inclinan a pensar que la justificación más plausible es que los estudiantes turcos valoran en menor medida que los españoles la participación en clase como un componente de la satisfacción, posiblemente por ser una competencia menos desarrollada a lo largo de su experiencia en el sistema educativo.

Para terminar destacar que el desarrollo de competencias transversales es valorado muy positivamente por los estudiantes y adquiere un elevado protagonismo no sólo durante su estancia en la institución educativa, sino a lo largo de toda su carrera profesional.

Como líneas de investigación futuras se plantea realizar el estudio en otros contextos universitarios, así como conocer la posible distinción en la satisfacción con la institución si se trata de estudiantes de universidades públicas o privadas.

## RESUMEN

*Esta investigación presenta los resultados de un proyecto de innovación docente basado en la creación de un canal en la plataforma YouTube de apoyo a la docencia en la asignatura Introducción al Marketing. En la actividad, los alumnos pudieron crear vídeos sobre conceptos de marketing que posteriormente fueron subidos al canal. Posteriormente, se llevó a cabo un estudio empírico para detectar el impacto de la participación en el proyecto sobre diferentes aspectos del aprendizaje. Los resultados muestran que la participación del estudiante en el proyecto favorece la adquisición de competencias transversales y el rendimiento académico. Si bien la participación no incrementa el aprendizaje subjetivo ni la satisfacción con la asignatura, sí que favorece indirectamente estas variables mediante la adquisición de competencias académicas.*

## PALABRAS CLAVE:

YouTube, resultados del aprendizaje, satisfacción, competencias transversales.

## 1. Introducción

Cada vez con mayor frecuencia las instituciones académicas están integrando nuevas tecnologías en sus sistemas educativos (Schmid et al., 2014) debido a las oportunidades que éstas ofrecen para aumentar la motivación del estudiante y los resultados del aprendizaje (p.ej. Roblyer y Wiencke, 2003). Recientes investigaciones sugieren que el uso de las nuevas tecnologías puede mejorar la comprensión de conceptos por parte del estudiante, su experiencia del aprendizaje (Blasco et al., 2013), su actitud (Barlés et al., 2011), o incluso la calificación final obtenida (Huffman y Huffman, 2012).

Tradicionalmente, la mayor parte de la literatura científica en esta temática se ha centrado en estudiar la adopción de plataformas de e-learning (p.ej. Sumak et al., 2011; Hernández et al., 2011). Más recientes son los estudios relativos al uso de nuevas tecnologías que favorecen la interacción entre alumnos y entre alumnos y profesor. En este sentido, diversos trabajos han analizado los efectos del uso de clickers (o mandos de respuesta) en clase (p.ej. Blasco et al., 2013), la integración de sistemas de mensajería instantánea y videoconferencias como Skype (p.ej. Sivula, 2011), o el uso de “tablet PCs” (p.ej. Ifenthaler y Schweinbenz, 2013).

Sin embargo, este trabajo se centra en el análisis de las consecuencias derivadas de la integración en una asignatura de la plataforma virtual y red social YouTube, que permite a sus usuarios subir, visionar, comentar y compartir videos de manera online. La integración de esta tecnología en el aula es especialmente pertinente hoy en día debido a la proliferación de herramientas de grabación digital de bajo coste (cámaras y videocámaras digitales, dispositivos móviles), el desarrollo del streaming (la posibilidad de visionar un archivo de vídeo o escuchar un archivo de audio a la vez que se descarga), o al hecho de que los medios audiovisuales ofrecen un gran potencial de expresión y comunicación. A su vez, según la página Web de medición de tráfico [www.alexacom.com](http://www.alexacom.com), YouTube es el tercer sitio Web más visitado del mundo, tan sólo por detrás de Google y Facebook, y el visionado de vídeos a través de Internet se encuentra generalizado en el público juvenil (ONTSI, 2011). En concreto, los autores de este trabajo han desarrollado un canal en YouTube dedicado a la asignatura Introducción al Marketing de primer curso del Grado en Administración y Dirección de Empresas de la Universidad de Zaragoza. En este canal, los alumnos han podido subir, visionar, comentar y difundir vídeos realizados por ellos mismos. Los objetivos del proyecto son mejorar el proceso de aprendizaje y la comprensión de los conceptos teóricos impartidos en la asignatura, tratando que los alumnos mostrasen su aplicación práctica a través de la realización de vídeos. Asimismo, se pretende fomentar la interactividad entre alumnos y profesores, acercar las nuevas tecnologías de la información y comunicación a la docencia universitaria, o fomentar el desarrollo de competencias transversales, tales como la capacidad creativa o el trabajo en equipo.

A pesar de la potencialidad de este tema, pocos trabajos se han centrado todavía en el uso de YouTube en el aula (p.ej. Krauskopf et al., 2012), sin profundizar en sus consecuencias más allá de las habilidades comunicativas (Jenkins y Dillon, 2013) o de la consecución de una mayor implicación por parte del alumnado (Clifton y Mann, 2011). Por ello, con el propósito de avanzar en la comprensión de esta emergente cuestión, el principal objetivo del estudio es analizar el impacto de la participación en el canal de YouTube de la asignatura sobre los resultados del aprendizaje. Para ello se analizarán tres resultados del aprendizaje que también se relacionan entre sí:

- Competencias adquiridas por el alumnado; de manera que se analizará si el alumno que ha participado en la actividad percibe una mayor o menor adquisición de las competencias especificadas en la guía docente de la asignatura (p.ej.: capacidad de aplicar los conocimientos en la práctica; comunicarse correctamente por escrito y oralmente, poniendo énfasis en la argumentación; capacidad de análisis y síntesis; capacidad de trabajo en equipo; etc.). En concreto, se considerará la percepción que el alumno tiene de haber adquirido tanto competencias transversales como específicas (lo que se define como el aprendizaje subjetivo).
- Satisfacción del alumnado con la asignatura, entendida como un resultado afectivo de la misma. La satisfacción puede definirse como una condición afectiva del individuo que resulta de una evaluación global de todos los aspectos que forman parte de la relación en la que

interviene (Severt, 2002); en este caso, de su relación con la asignatura. Así será posible evaluar si también existen o no diferencias afectivas entre los alumnos que han participado en el canal de YouTube y los que no.

- Calificación final obtenida por el alumnado en la asignatura, entendida como un resultado objetivo de la misma. De esta forma, esta investigación permitirá comprobar si los estudiantes que han participado en la asignatura han obtenido calificaciones superiores o inferiores a los que no han participado.

Con el ánimo de cumplir con estos objetivos, el presente artículo se estructura de la siguiente manera: en primer lugar, se realizará una breve revisión de la literatura relativa a la integración de las nuevas tecnologías de información y comunicación en los sistemas educativos, profundizando en el caso del empleo de canales de vídeo en la docencia. A continuación, se desarrollarán las hipótesis de trabajo para seguidamente explicar el caso objeto de análisis y la metodología empleada. Finalmente, se presentarán los principales resultados de la investigación así como sus principales conclusiones y futuras líneas de investigación.

## **2. Revisión de la literatura: integración de nuevas tecnologías en los sistemas educativos**

Tal y como se ha comentado con anterioridad, la principal corriente de la literatura relativa a la integración de nuevas tecnologías en la docencia se ha basado en las plataformas de e-learning (p.ej. Moodle, WebCT, etc.). Por una parte, algunos autores (p.ej. Chen, 2010; Sánchez-Franco, 2010; Sánchez y Hueros, 2010; Hernández et al., 2011) se han centrado en el análisis de los principales antecedentes que llevan a la aceptación y uso de este tipo de plataformas, siendo la actitud y las creencias propuestas por el Modelo de Aceptación Tecnológica (utilidad y facilidad de uso percibidas [Davis, 1989]) los principales factores determinantes de la adopción (Sumak et al., 2011). Estos trabajos se han realizado tanto desde la perspectiva del profesor (p.ej. Chen, 2010) como del estudiante (p.ej. Sánchez-Franco, 2010). Por contra, otros autores han tratado de averiguar cuáles son las principales consecuencias que se derivan de la participación del alumnado en este tipo de plataformas, proponiendo –entre otras– una mejora en la interacción percibida entre alumnos y entre alumnos y profesores cuando se implementan estas nuevas tecnologías en la docencia (Beauchamp y Kennewell, 2010). De hecho, Cotner et al. (2008) sugieren que los métodos tradicionales de enseñanza limitan la interactividad en el aula y, en este sentido, la incorporación de nuevas tecnologías puede ayudar a incrementarla (Blasco et al., 2013).

Debido al relevante papel que la interacción percibida tiene para aumentar la satisfacción del alumnado (Sun y Hsu, 2013), su implicación o los resultados del aprendizaje (Blasco et al., 2013), varios autores se han centrado en analizar las consecuencias derivadas de la introducción de otras herramientas que también favorecen la interactividad. A modo de ejemplo, se han investigado los clickers o mandos de respuesta (p.ej. Blasco et al., 2013), sistemas de mensajería instantánea y videoconferencias como Skype (p.ej. Sivula, 2011), los “tablet PCs” (p.ej. Ifenthaler y Schweinbenz, 2013; Dündar y Akçayir, 2014), o hasta los juegos y mundos virtuales (p.ej. Merchant et al., 2014). Así mismo, la mayor parte de estos estudios han sugerido la existencia de consecuencias positivas para el estudiante derivadas del uso de todas estas herramientas. Por ello, en la literatura se continúa analizando el impacto de la integración de las nuevas tecnologías de información en los sistemas educativos, siendo el uso de YouTube en clase uno de los casos más recientes (p.ej. Krauskopf et al., 2012). Si bien parece que los efectos de esta integración son también positivos (Jenkins y Dillon, 2013; Clifton y Mann, 2011), en este trabajo se va a profundizar en mayor medida en las consecuencias derivadas de la creación de un canal de YouTube para una asignatura concreta.

### **2.1. El uso de YouTube en educación**

YouTube constituye una de las principales herramientas de la web 2.0, que facilita la búsqueda de videos de cualquier contenido o tema, fomenta la colaboración y ayuda en el proceso de aprendizaje de sus usuarios (Domínguez y Llorente, 2009). Es uno de los canales de entretenimiento más utilizados en internet, y recientemente se está ampliando su uso en el mundo educativo universitario como herramienta de aprendizaje (Fralinger y Owens, 2009; Chan, 2010; Sherer y Shea, 2011; Tugrul,

2012; Torres-Ramírez *et al.*, 2014). Tras la pionera Universidad de California (Berkeley) ([youtube.com/ucberkeley](https://www.youtube.com/ucberkeley)), otras universidades han puesto en marcha sus propios canales de YouTube.

El uso de YouTube como plataforma para colgar vídeos educativos realizados por los alumnos resulta ventajosa al facilitar el poder compartir contenidos en tiempo real y obtener comentarios de los estudiantes sobre la totalidad del canal o sobre un vídeo en concreto, así como obtener estadísticas acerca del número total de reproducciones, entre otros datos (Chan, 2010; Torres-Ramírez, *et al.* 2014).

Las nuevas generaciones de estudiantes, consideradas como las “generaciones red” (Domínguez y Llorente, 2009) o “nativos digitales” (Chan, 2010), están muy familiarizadas con este tipo de aplicaciones ya que han crecido en una sociedad caracterizada por las Nuevas Tecnologías de la Información que les ha permitido desarrollar una forma distinta de pensar, expresarse y relacionarse con los demás (Domínguez y Llorente, 2009).

Aprovechando esta coyuntura, y siguiendo las recomendaciones del EEES por las que el trabajo del estudiante adquiere mayor protagonismo en la educación superior, la herramienta YouTube se ha convertido en un instrumento muy adecuado para enganchar y motivar al estudiante en el aprendizaje de sus asignaturas (Frallinger y Owens, 2009; Sherer y Shea, 2011). La percepción del estudiante por el uso de esta herramienta en la docencia es muy satisfactoria (Tugrul, 2012; Torres-Ramírez *et al.*, 2014). Las áreas de aplicación de YouTube como herramienta educativa son muy variadas encontrando trabajos al respecto en disciplinas tan diferentes como las médicas (Duncan *et al.*, 2012), las ciencias exactas (Everson *et al.*, 2013) y las artes (DeWitt *et al.*, 2013).

En la mayoría de los casos mencionados, el estudiante actúa como espectador del material que se cuelga en Youtube. Desde este rol, la utilidad del uso de imágenes grabadas en el ámbito de la educación superior ha sido contrastada ampliamente. Así, algunos trabajos han hallado que esta herramienta es ampliamente aceptada por los estudiantes (Almécija *et al.* 2011; García Fernández, 2011); logra un mayor compromiso del estudiante con la materia, incrementa su capacidad crítica, facilita su aprendizaje (Clifton y Mann, 2011); potencia su actitud positiva tanto afectiva como cognitiva hacia la información recibida, mejora sus hábitos de estudio (Kay, 2012) y, finalmente, se ha observado que incrementa sus resultados académicos (Dupuis *et al.*, 2013).

También puede ocurrir que el estudiante adopte un rol más activo en la asignatura, creando su propio video ya sea de forma individual o en equipo. En este caso, son escasos los trabajos que abordan situar al estudiante como generador de contenidos educativos en vídeo, aunque algunas experiencias encuentran resultados positivos en cuanto a generar interés, aprendizaje, consecución de objetivos, adquisición de habilidades o competencias de trabajo en grupo (Frallinger y Owens, 2009) y que dichos resultados mejoran si los comparamos con los resultados alcanzados siguiendo metodologías didácticas tradicionales (Pereira *et al.*, 2014).

Siguiendo esta línea, plantear esta actividad dentro de la docencia de una asignatura, favorece que el estudiante adquiera, además de las competencias mencionadas anteriormente, la habilidad de búsqueda de información, de organización y resolución de problemas, habilidad tecnológica, etc. En este caso, si los videos se suben a la plataforma YouTube y se comparten, convendría que el docente o la institución universitaria facilitara unas instrucciones básicas sobre formato y contenido para garantizar que el video está relacionado con los conceptos teóricos de la asignatura y para asegurarnos de que se cumple con unos mínimos requisitos legales y éticos (Chan, 2010).

### **3. Formulación de hipótesis**

La Figura 1 recoge el modelo de medida propuesto con las hipótesis a analizar. La participación del alumno en el proyecto supone una mayor dedicación a los aspectos relacionados directamente con esta actividad de aprendizaje. Así, el tiempo y esfuerzo dedicado a estas tareas repercute sobre la adquisición de competencias diversas por parte de los alumnos. En este sentido, Frallinger y Owens (2009) encuentran que el uso de YouTube favorece la adquisición de habilidades o competencias de trabajo en grupo. Del mismo modo, la participación en la actividad podría conllevar una mayor formación y adquisición de experiencia acerca del uso de software para la edición y publicación de

videos, un mayor conocimiento del canal de YouTube, así como la adquisición de habilidades sociales en la forma de presentar la información y cautivar visualmente a todo aquel que vea el vídeo o durante la presentación en el aula. Finalmente, también se fomenta la creatividad y capacidad de análisis en la generación de la idea, realización del vídeo y su vinculación al contenido de la asignatura. Por todo ello, nuestra primera hipótesis vincula la participación en el proyecto con la adquisición de competencias transversales por parte del alumnado:

**Hipótesis 1:** La participación del alumno en el proyecto afecta positivamente a la adquisición de competencias transversales.

Sin embargo, la participación en el proyecto también supone una mayor atención a los aspectos teóricos y prácticos plasmados en la materia estudiada, dado que es preciso que los vídeos reflejen estos contenidos y favorezcan el aprendizaje y difusión de los mismos. Por tanto, proponemos que la participación también conlleva un mayor aprendizaje subjetivo por parte de los alumnos (medido a través de las competencias específicas que los alumnos perciben haber adquirido):

**Hipótesis 2:** La participación del alumno en el proyecto afecta positivamente al aprendizaje subjetivo.

De forma similar, la participación en el proyecto supone un reto para los alumnos dadas las numerosas habilidades que han de adquirir para la creación de videos de cierta calidad para ser subidos a YouTube. Este hecho permite que los alumnos perciban que han logrado sus objetivos al ser capaces de completar este proceso relativamente complejo. Además, la propia participación activa como creadores de contenidos audiovisuales acerca del mundo que les rodea, para difundirlo mediante una red social de la que habitualmente solo son espectadores pasivos, también podría motivar una generación de satisfacción entre los jóvenes participantes. Esta idea es coherente con los resultados de estudios previos que indican que la percepción del estudiante por el uso de YouTube en la docencia es muy satisfactoria (Tugrul, 2012; Torres-Ramírez et al., 2014). Así mismo, teniendo en cuenta que la satisfacción se forma a partir de la confirmación de las expectativas que el individuo tiene a priori (p. ej. Oliver, 1980), la satisfacción con la asignatura puede aumentar en tanto en cuanto los alumnos perciben que el proyecto en el que participan es atractivo y poco habitual en el resto de asignaturas del plan académico. Esto es, por su novedad, el proyecto puede ayudar a confirmar las expectativas iniciales de los alumnos con la asignatura aumentando su satisfacción. De este modo, se propone una relación causal positiva entre la participación en la actividad y la satisfacción con la asignatura:

**Hipótesis 3:** La participación del alumno en el proyecto afecta positivamente a la satisfacción con la asignatura.

Asimismo, la participación de los alumnos en la actividad podría verse reflejada en un mejor rendimiento académico en la nota final. La creación de vídeos que posteriormente serán publicados supone cierto grado de esfuerzo tanto en la elaboración de los mismos como en los conocimientos adquiridos durante ese proceso. Por tanto, esa participación puede mejorar el resultado del apartado dedicado al tema abordado en la actividad (por ej., trabajo final) o la evaluación final como resultado de una mayor implicación y dedicación a la asignatura. En este sentido, estudios recientes han encontrado una mejora en los resultados académicos derivada del uso de YouTube (p. ej., Dupuis et al., 2013), por lo que proponemos una vinculación positiva entre la participación en la actividad y el rendimiento académico:

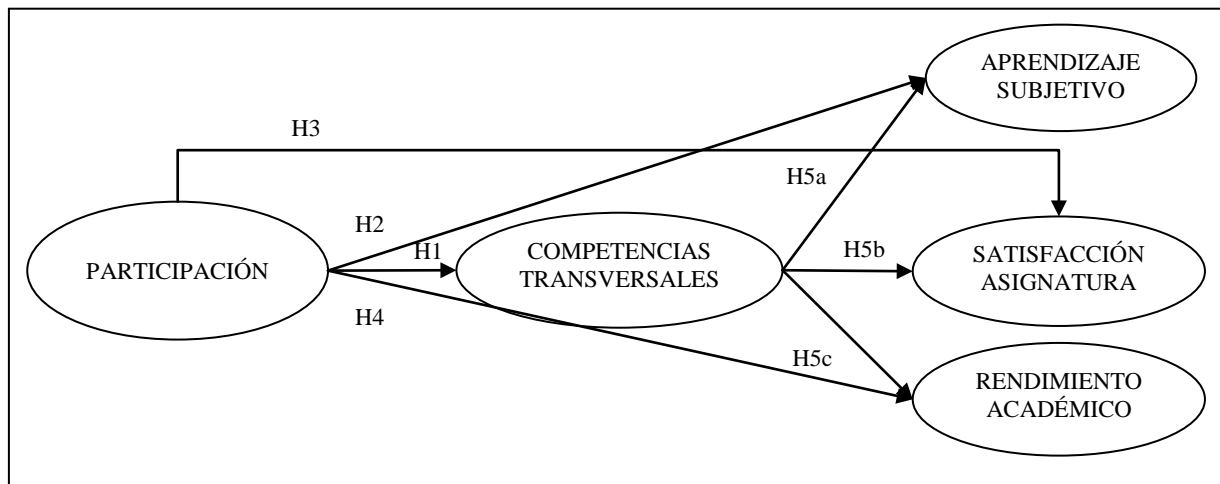

**Hipótesis 4:** La participación del alumno en el proyecto afecta positivamente al rendimiento académico.

Por otro lado, la adquisición de competencias transversales es un factor crucial para la adquisición de una formación completa y la consecución de objetivos de aprendizaje concretos a lo largo de toda la formación académica. No en vano, la adaptación al nuevo Espacio de Educación Superior supone un refuerzo de aspectos como la participación, la tecnología aplicada al aprendizaje y la adquisición de habilidades intelectuales más allá de la memorización. Así pues, poseer competencias transversales en los nuevos estudios de grado (por ej. habilidades sociales, uso de TIC, capacidades académicas generales), facilita y fomenta el aprendizaje específico de cada materia por parte de los alumnos. Asimismo, esta apuesta por la adquisición de habilidades más generales puede ser percibida por el alumno como un objetivo más provechoso, más satisfactorio en lo que conlleva a su protagonismo en

el aprendizaje y su mayor adquisición de competencias que le sirvan para su futuro profesional. Además, la adquisición de mayores niveles de competencias transversales puede resultar útil en el momento en el que los estudiantes se enfrenten a la evaluación final, pudiendo mejorar su resultado académico gracias a estas habilidades generales. Así pues, la última hipótesis refleja los efectos positivos de las competencias transversales sobre el aprendizaje subjetivo, la satisfacción y el rendimiento académico. En resumen, tal y como se propone en la literatura actual (p. ej., Merchant et al., 2014), se espera que la integración en el aula de una nueva tecnología (YouTube en nuestro caso) tenga consecuencias positivas sobre el alumnado, ya sea de manera directa o indirecta.

**Hipótesis 5:** La adquisición de competencias transversales afecta positivamente (H5a) aprendizaje subjetivo, (H5b) la satisfacción con la asignatura y (H5c) el rendimiento académico.

FIGURA 1  
Modelo propuesto e hipótesis

## 4. Metodología

### 4.1. Caso de Estudio

#### 4.1.1. Contexto

El Departamento de Dirección de Marketing e Investigación de Mercados de la Universidad de Zaragoza ha puesto en marcha en el presente curso académico 2013-2014 el proyecto de innovación docente sobre la creación de un canal de YouTube para la docencia en la asignatura Introducción al Marketing. Ésta es una asignatura obligatoria de primer curso del grado en Administración y Dirección de Empresas, de formación básica, que se imparte en el primer semestre. Así, contamos con un total de 426 alumnos matriculados en el curso 2013-2014, repartidos en la Facultad de Economía y Empresa de Zaragoza (301 alumnos), la Facultad de Empresa y Gestión Pública de Huesca (72 alumnos) y la Facultad de Ciencias Sociales y Humanas de Teruel (53 alumnos).

Introducción al Marketing supone un contexto adecuado para el desarrollo de esta actividad, debido a varios motivos: en primer lugar, uno de los elementos básicos de evaluación está centrado en el desarrollo de un trabajo en grupo sobre una empresa o institución real y sus estrategias comerciales. La implantación de un canal de YouTube supone la posibilidad de que los grupos de trabajo desarrollen un vídeo sobre un concepto de marketing, que pueden ilustrar a través del caso real de la empresa o institución sobre el que versa su trabajo.

En segundo lugar, los estudiantes conocen y utilizan con frecuencia los servicios ofrecidos por Youtube. En España, el estudio llevado a cabo por el Observatorio Nacional de las Telecomunicaciones y la Sociedad de la Información (ONTSI, 2011) revela que YouTube se encuentra entre las redes sociales más utilizadas por el segmento de edad de 16 a 25 años. Este hecho representa una oportunidad para acercar la docencia a los medios sociales en los que se desenvuelven los estudiantes.

En tercer lugar, los docentes, especialmente en el área de marketing, precisan herramientas que complementen los métodos tradicionales de enseñanza. La proyección de vídeos prácticos puede adquirir una dimensión mayor mediante la capacitación de estudiantes para el diseño, elaboración y análisis de estos vídeos. De esta forma los estudiantes pueden asimilar mejor los conocimientos que allí se tratan, además de aumentar la motivación y desarrollar competencias difícilmente asumibles de otro modo.

Finalmente, el departamento, así como el propio grado y las facultades donde se imparte, demandan una mayor visibilidad de las actividades que realiza la Universidad con diversos fines: atraer estudiantes, fomentar la transmisión de conocimiento a la sociedad, etc. El hecho de contar con un canal público de Youtube donde se expongan estos trabajos sin duda cumple esta función, cohesiona la docencia entre centros y está en sintonía con los medios de difusión en auge empleados para tal fin.

#### ***4.1.2 Procedimiento para el desarrollo de la actividad***

Dada la novedad de la actividad, se hizo necesaria la realización de una sesión introductoria a la misma. Esta sesión tuvo lugar durante los primeros días de clase de prácticas. Así, los profesores explicaron la actividad a los alumnos, establecieron los objetivos que se pretenden conseguir, especificaron los materiales a utilizar y las instrucciones para la realización del vídeo:

- Explicación de la actividad: los alumnos, en grupos de 4-5 personas, deben producir un vídeo cuyo contenido esté basado en los conceptos del temario de la asignatura.
- Objetivos que se pretenden alcanzar con la actividad:
  - Generales: facilitar el aprendizaje de los aspectos teóricos de la asignatura; tangibilizar la teoría tratando que los alumnos muestren la aplicación práctica de los conceptos teóricos; mejorar el proceso de aprendizaje (mayor retención de los conceptos); incrementar la implicación del alumnado; mejorar la capacidad de síntesis; desarrollar la capacidad creativa; mejorar la capacidad para trabajar en equipo.
  - Específicos: acercar las nuevas tecnologías de la información a la docencia universitaria; utilizar redes sociales como método de difusión de la información y conocimiento; mejorar la confianza y la complicidad de los alumnos de una misma clase como consecuencia de la necesidad de compartir material; incrementar la percepción de utilidad por parte de los alumnos con respecto a los conocimientos que han ido adquiriendo en la asignatura; fomentar la interactividad entre alumnos y profesores; promocionar la Universidad de Zaragoza en las redes sociales a través de la participación activa del alumnado en la elaboración de material audiovisual, que pueda servir como complemento docente de carácter divulgativo
- Materiales a utilizar:
  - Grabación del vídeo: videocámaras digitales, cámaras digitales, teléfonos móviles con cierta calidad de grabación.
  - Contenido del vídeo: el contenido de los vídeos se dejará a la elección del grupo de trabajo. Se dieron algunas sugerencias a los estudiantes (presentación oral llevada a cabo por el grupo de trabajo, entrevistas a expertos, formato documental -combinación de imágenes, clips de vídeo y narración de fondo-, presentación de powerpoint dinámica con voz de fondo, escenificación,
- Instrucciones para la realización del vídeo: todos los vídeos deben tener unas características comunes:
  - Duración: entre 3 y 5 minutos.
  - Formato del clip: DV, AVI, MOV, MPEG, WMV, Flash Video.
  - Contenido: el vídeo debe comenzar con una cabecera que identifique claramente que está realizado por estudiantes del Grado en Administración y Dirección de Empresas de la Universidad de Zaragoza. Los profesores responsables de la asignatura se encargan de facilitar la plantilla que debe ser utilizada. También deben especificarse las personas participantes en el proyecto, el grupo al que pertenecen y el tema tratado.

- **Edición del vídeo:** en la sesión introductoria, los profesores de la asignatura dan algunas nociones sobre la utilización de herramientas comunes de edición, como Windows Movie Maker o el editor de vídeos de YouTube.
- **Subir el vídeo al canal:** los profesores de la asignatura son los encargados de crear el canal en YouTube y subir los vídeos. Además, los profesores supervisan todas las actividades, reservándose el derecho de poder eliminar aquellos vídeos que hayan sido subidos sin su autorización o no cumplan los criterios anteriores.

Al final de la sesión introductoria, los profesores sondearon a los alumnos sobre su grado de comprensión de la actividad, así como sobre su intención de llevarla a cabo. Posteriormente, los profesores de la asignatura fueron supervisando el trabajo de los alumnos que decidieron realizar la actividad. La fecha límite para la realización del vídeo se estableció en el último día de clase previo al periodo vacacional de final de año (22 de diciembre de 2013). Posteriormente los profesores crearon el canal en la plataforma YouTube ([www.youtube.com/channel/UCXj1vWQprt0bGUSnEweGjHA](http://www.youtube.com/channel/UCXj1vWQprt0bGUSnEweGjHA)) y subieron los vídeos creados por los alumnos. Se crearon tres listas de reproducción correspondientes a los vídeos creados por los estudiantes de los campus de Zaragoza, Huesca y Teruel. Las imágenes 1, 2 y 3 muestran la portada del canal, la descripción del mismo, y las listas de reproducción, respectivamente.

Página principal del canal de Introducción al Marketing

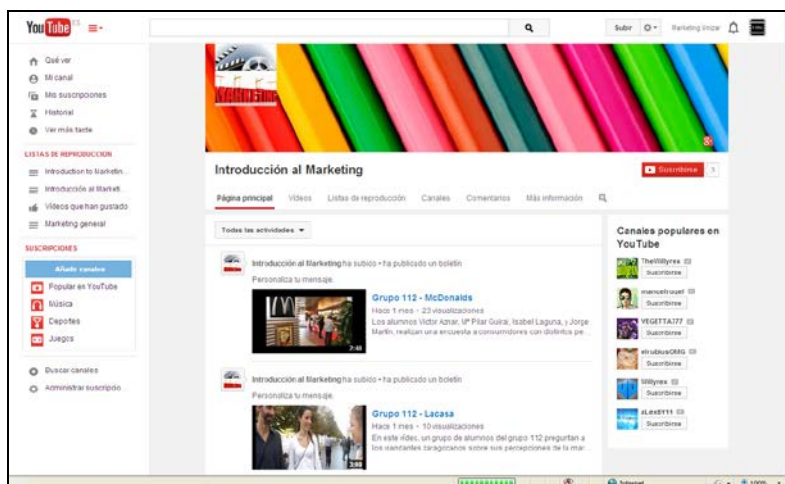

IMAGEN 2  
Descripción del canal de Introducción al Marketing

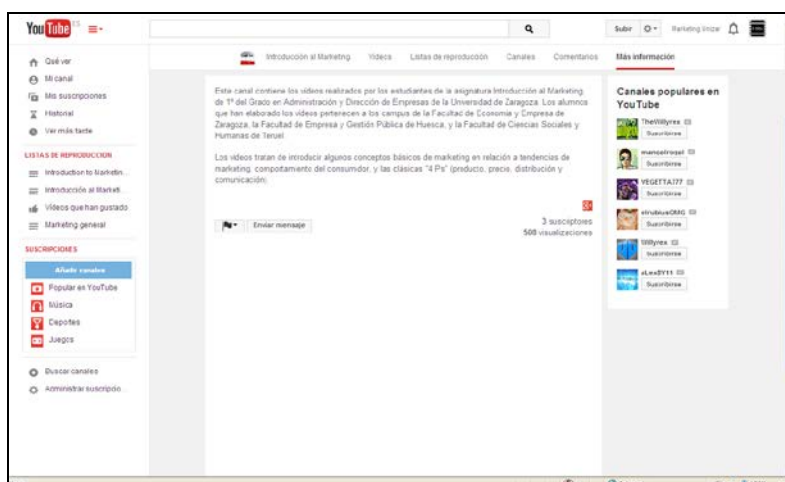

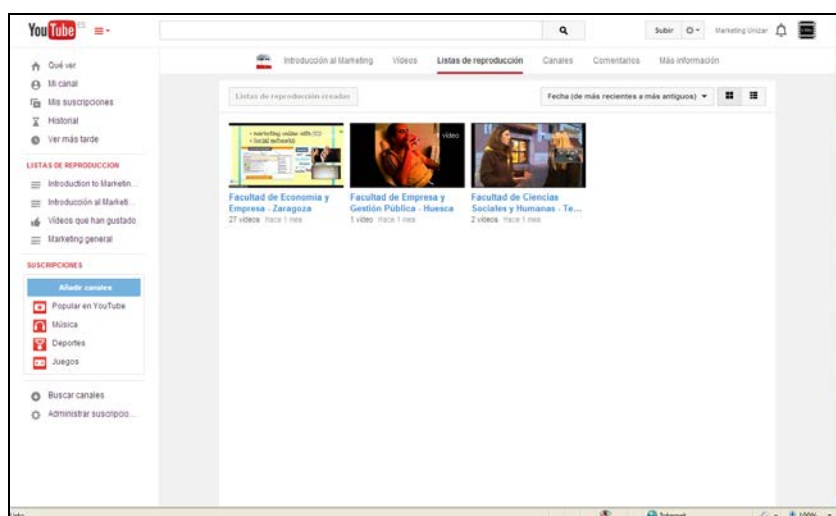

IMAGEN 3

**Listas de reproducción del canal de Introducción al Marketing****4.2. Cuestionario****4.2.1. Recogida de datos**

En las últimas semanas de docencia en el aula, se realizó una encuesta destinada a todos los alumnos de todos los grupos de la asignatura del Grado. Mediante este proceso se obtuvieron un total de 221 cuestionarios válidos. De éstos, 108 cuestionarios fueron respondidos por participantes en la actividad mientras que 113 no habían participado en la misma.

**4.2.2. Medición**

Las medidas consideradas en el cuestionario fueron tomadas de diversas fuentes en función de su validez de contenido teórico y su utilidad práctica para la consecución de los objetivos del proyecto. Así pues, los seis ítems para la variable Competencias Transversales se obtuvieron de la memoria de verificación del grado, los dos ítems de Aprendizaje Subjetivo surgieron de la guía de la asignatura y los tres ítems para la medida de la Satisfacción con la Asignatura surgieron de una adaptación de la escala de satisfacción (Casaló et al., 2011). Estas escalas tuvieron el formato Likert de 7 puntos. Por otro lado la Participación en la actividad fue operacionalizada como una variable dicotómica (1 = ha participado en la actividad, 0 = no ha participado en la actividad), y la calificación final global de la asignatura (de 0 a 10) sirvió como medida del Rendimiento Académico.

**4.2.3. Procedimiento analítico**

Los datos fueron analizados en primer lugar para confirmar la validez del modelo de medida y posteriormente para conocer las relaciones entre variables. Conforme a la tendencia creciente en investigación en marketing y otras disciplinas se utilizó el procedimiento de estimación de regresión de mínimos cuadrados parciales (Partial Least Squares, PLS), utilizando Smart PLS 2.0 como software para los análisis (Ringle et al., 2005). Esta metodología de estimación es particularmente útil puesto que no asume normalidad en la distribución de las variables y está especialmente indicada para estudios con muestras pequeñas (Chin y Newsted, 1999; Stan y Saporta, 2005), como es nuestro caso.

**5. Resultados****5.1. Análisis Descriptivo**

De los 426 alumnos matriculados, 125 realizaron un vídeo que posteriormente fue subido al canal. Se crearon un total de 30 vídeos, de los cuales 27 se hicieron por alumnos del campus de Zaragoza, 1 por alumnos del campus de Huesca, y 2 por alumnos del campus de Teruel. Teniendo en cuenta que no todos los alumnos matriculados siguieron el sistema de evaluación continua, y que la realización del vídeo no conllevaba una vinculación directa a la nota final, se considera un índice de participación aceptable.

La duración media de los vídeos fue de 3 minutos, con un mínimo de 1 minuto y 4 segundos, y un máximo de 5 minutos y 27 segundos. En relación al contenido de los vídeos, la gran mayoría de grupos (87%) se basó en la empresa o institución real sobre la que hacía el trabajo de la asignatura. Sin embargo, sólo 13 vídeos trataban de explicar un concepto teórico de marketing. El resto se centró en desarrollar una presentación general de la empresa o en realizar una encuesta a los viandantes o clientes sobre sus percepciones de la misma.

Tal y como se ha detallado anteriormente, los alumnos de la asignatura contestaron a un cuestionario al finalizar la actividad. Además de las preguntas descritas en el apartado 4.2.2, los alumnos que no participaron (113) indicaron las causas de no participación. En concreto, contestaron a una serie de indicadores tipo Likert de 7 puntos, cuya descripción aparece detallada en la Tabla 1, así como los datos descriptivos de las respuestas dadas. En este sentido, cabría destacar que la falta de tiempo fue la razón fundamental por la que los estudiantes decidieron no llevar a cabo la actividad. Asimismo, se dejó un espacio para que los estudiantes indicaran cualquier causa adicional, donde de nuevo la falta de tiempo fue el principal motivo argumentado. La falta de un conocimiento más detallado sobre la actividad, y razones de carácter más personal (p. ej. “me daba vergüenza”, “lo hice pero me quedó muy pobre”), también fueron citadas por los estudiantes.

TABLA 1  
Causas de no participación en la actividad

Causa	Media	d.t.	Mín.	Máx.
La actividad requiere invertir demasiado tiempo	4,99	1,44	1	7
Realizar la actividad requiere conocimientos avanzados	3,46	1,58	1	7
La actividad apenas influye sobre la calificación final de la asignatura	3,48	1,59	1	7
La actividad precisa recursos tecnológicos de difícil acceso para mí	2,84	1,64	1	7

## 5.2. Análisis del modelo estructural

En primer lugar, se llevó a cabo la validación de los instrumentos de medida. En este sentido, el análisis factorial confirmatorio constató que todos los ítems tenían cargas superiores a 0,8 sobre su respectivo constructo, es decir, por encima del 0,7 sugerido por la literatura (Henseler et al., 2009). Tal y como muestra la Tabla 2, todas las variables multi-ítem presentaron valores de fiabilidad compuesta por encima de 0,8, lo que indica la fuerte consistencia interna de los constructos. Asimismo, la varianza extraída media (Average Variance Extracted, AVE) de estos constructos fue en todos los casos superior a 0,7, asegurando la validez convergente de las escalas. Finalmente, para evaluar la validez discriminante, confirmamos que la raíz cuadrada del AVE era mayor a la correlación entre cada par de variables (Fornell y Larcker, 1981), cumpliéndose en todos los casos tal y como se observa en la Tabla 2.

TABLA 2  
Estadísticos descriptivos, fiabilidad compuesta, validez convergente y discriminante.

	Media	d.t.	$\rho_c$	AVE	1	2	3	4	5
1. Participación	0,49	NA	NA	NA	NA				
2. Comp. Transversales	4,84	1,35	0,906	0,616	0,322	<b>0,784</b>			
3. Aprendizaje Subjetivo	5,87	1,10	0,930	0,871	-0,030	0,490	<b>0,933</b>		
4. Satisfacción Asignatura	5,23	1,33	0,932	0,820	0,073	0,591	0,485	<b>0,906</b>	
5. Rendimiento Académico	5,60	0,81	NA	NA	0,353	0,218	0,086	0,083	NA

Nota: Los elementos de la diagonal (en negrita) son la raíz cuadrada del AVE. Los elementos por debajo de la diagonal son las correlaciones entre constructos. NA: No aplicable.

Una vez fueron validadas las escalas, se procedió a estimar el modelo de relaciones causales entre variables y su significatividad conforme a la técnica de bootstrap o muestreo aleatorio de 500 interacciones recomendado por Chin (1998). La Tabla 3 recoge el resumen de los resultados y el contraste de hipótesis.

Los resultados del estudio muestran que la Participación en el proyecto tiene un efecto positivo y significativo sobre las Competencias Transversales ( $\beta = 0,322$ ,  $p < 0,01$ ) así como sobre el Rendimiento Académico ( $\beta = 0,316$ ,  $p < 0,01$ ), por lo que se confirman las Hipótesis 1 y 4 respectivamente. Sin embargo, y en contra de lo esperado inicialmente, el efecto de la Participación

sobre el Aprendizaje Subjetivo es negativo y significativo ( $\beta = -0,210, p < 0,01$ ). Puesto que el sentido del efecto es el contrario al esperado, se rechaza la Hipótesis 2. A su vez, la Hipótesis 3 también se rechaza, dado que el efecto de la Participación sobre la Satisfacción con la Asignatura no es significativo ( $\beta = -0,131, p > 0,1$ ). En conjunto, estos resultados indican que los alumnos participantes en el proyecto adquieren un mayor nivel de Competencias Transversales y un mejor Rendimiento Académico en la evaluación de la asignatura, pero que su percepción de Aprendizaje es menor y su Satisfacción similar a la del resto de alumnos.

Respecto a los efectos de las Competencias Transversales sobre el resto de variables dependientes, se confirma la relación causal propuesta en dos de las tres hipótesis. Concretamente, las Competencias Transversales afectan positivamente y significativamente al Aprendizaje Subjetivo ( $\beta = 0,558, p < 0,01$ ), así como a la Satisfacción con la Asignatura ( $\beta = 0,634, p < 0,01$ ). De este modo se confirman las Hipótesis 5a y 5b. Sin embargo la adquisición de mayores niveles de Competencias Transversales no afecta significativamente al Rendimiento Académico de los alumnos en la asignatura ( $\beta = 0,116, p > 0,1$ ), por lo que se rechaza la Hipótesis 5c.

El modelo propuesto consigue explicar cierto grado de varianza explicada de las variables dependientes. Este indicador es menor para constructos que podrían deberse a otras múltiples causas, como es el caso las Competencias Transversales ( $R^2 = 0,104$ ) o el Rendimiento Académico ( $R^2 = 0,137$ ), y mayor para constructos como el Aprendizaje Subjetivo ( $R^2 = 0,280$ ) y la Satisfacción con la Asignatura ( $R^2 = 0,365$ ).

TABLA 3  
Resumen de los resultados y contraste de hipótesis del modelo.

Hipótesis	Efecto ( $\beta$ )	Resultado
H1 Participación $\rightarrow$ Comp. Transversales	0,322*	Confirmada
H2 Participación $\rightarrow$ Aprendizaje Subjetivo	-0210*	Rechazada <sup>a</sup>
H3 Participación $\rightarrow$ Satisfacción Asignatura	-0,131	Rechazada
H4 Participación $\rightarrow$ Rendimiento Académico	0,316*	Confirmada
H5a Competencias Transversales $\rightarrow$ Aprendizaje Subjetivo	0,558*	Confirmada
H5b Competencias Transversales $\rightarrow$ Satisfacción Asignatura	0,634*	Confirmada
H5c Competencias Transversales $\rightarrow$ Rendimiento Académico	0,116	Rechazada

Notas: \* $p < 0,01$ ; <sup>a</sup>Efecto significativo en sentido contrario al esperado.

### 5.2.1. Análisis post-hoc

Con el objetivo de ampliar el alcance de las conclusiones del estudio, consideramos conveniente ahondar un poco más en el análisis de las Competencias Transversales y sus relaciones con el resto de variables del modelo. Dado que las Competencias Transversales de una titulación hacen referencia a diferentes aspectos del aprendizaje, resulta especialmente interesante conocer mejor su contenido específico para obtener mejores implicaciones para la innovación docente. Atendiendo al contenido de los ítems que formaban la variable Competencias Transversales, se observó que las dos primeras cuestiones se referían a Competencias Sociales (“Esta asignatura me ha sido útil para... (1) desarrollar habilidades sociales, (2) elaborar mis ideas en público y someterlas a debate”), las dos siguientes estaban relacionadas con el uso de las TIC (“... (3) conocer las herramientas básicas de comunicación informativa, (4) mejorar mi capacidad para usar las TIC en el desempeño profesional”), y las dos últimas se referían a Competencias Académicas (“... (5) adquirir capacidad de síntesis, (6) fomentar la creatividad”). Por todo ello, se realizó un análisis post-hoc exploratorio que consistió en contrastar las mismas hipótesis del modelo, fraccionando la variable general Competencias Transversales en tres variables más concretas: Competencias Sociales, Competencias Uso TIC, y Competencias Académicas. La fiabilidad compuesta y el AVE de los tres nuevos constructos superaron los valores recomendados y también se verificó la validez discriminante según el test de Fornell y Larcker (1981) mencionado anteriormente.

Los resultados del análisis post-hoc muestran que la Participación tiene un efecto positivo y significativo sobre las Competencias Sociales ( $\beta = 0,261$ ,  $p < 0,01$ ), Competencias Uso TIC ( $\beta = 0,346$ ,  $p < 0,01$ ), y Competencias Académicas ( $\beta = 0,252$ ,  $p < 0,01$ ). Por otro lado, las Competencias Sociales y las Competencias Uso TIC no tienen efectos significativos sobre el Aprendizaje Subjetivo ( $\beta = 0,087$  y  $\beta = 0,206$ , respectivamente;  $p > 0,1$ ), la Satisfacción con la Asignatura ( $\beta = 0,146$  y  $\beta = 0,224$ , respectivamente;  $p > 0,1$ ), y el Rendimiento Académico ( $\beta = 0,075$  y  $\beta = 0,020$ , respectivamente;  $p > 0,1$ ). Por su parte, la adquisición de Competencias Académicas afecta positivamente y significativamente al Aprendizaje Subjetivo ( $\beta = 0,336$ ,  $p < 0,05$ ) y a la Satisfacción con la Asignatura ( $\beta = 0,346$ ,  $p < 0,01$ ), pero no al Rendimiento Académico en la misma ( $\beta = 0,032$ ,  $p > 0,1$ ). En resumen, los resultados del análisis post-hoc muestran que la participación en la actividad es beneficiosa para la adquisición de Competencias Transversales diversas, si bien estas no afectan significativamente en ningún caso al Rendimiento Académico de la asignatura. Sin embargo, un mayor grado de Competencias Sociales y de Uso de las TIC no implican un mayor Aprendizaje Subjetivo, o Satisfacción con la asignatura; mientras que una mayor adquisición de Competencias Académicas consigue aumentar las percepciones subjetivas de Aprendizaje y la Satisfacción con la Asignatura.

## 6. Discusión general y conclusiones

Este trabajo analiza el impacto del uso de un canal de YouTube como apoyo a la docencia en marketing en alumnos de primer curso de Grado. Existe cierta escasez de literatura especializada centrada en el análisis de las implicaciones del uso de esta herramienta tecnológica de forma activa por parte de los estudiantes. Así, esta investigación supone un paso adelante en el estudio de la influencia de la utilización de la plataforma YouTube en términos de resultados de aprendizaje del alumnado.

Los análisis efectuados ponen de manifiesto que los alumnos participantes en la actividad adquirieron un mayor nivel de Competencias Transversales y un mejor Rendimiento Académico en la asignatura, que aquéllos que no participaron en dicho proyecto. No obstante, debemos señalar que los datos indican que la participación activa en la actividad no influyó sobre los niveles de satisfacción con la asignatura. Por su parte, en contra de lo esperado, la participación en el proyecto afectó negativamente al aprendizaje subjetivo.

Una posible explicación de estos resultados puede encontrarse en el hecho de que la mayoría de los vídeos que se subieron a la plataforma no cumplían estrictamente con el requisito de estar centrado en la explicación y/o profundización en uno de los conceptos teóricos de la asignatura. Es por ello que la actividad podría no mejorar el aprendizaje percibido de los conceptos básicos del temario. Asimismo, la población objeto de estudio eran alumnos de primer curso, en una asignatura del primer semestre. Debido a la falta de experiencia de estos estudiantes con la metodología docente universitaria, la realización del vídeo pudo ser percibida como una carga adicional de trabajo, más que como un incentivo para mejorar su aprendizaje y comprensión de la asignatura. Finalmente, cabría destacar que la participación en el proyecto era voluntaria, esto es, no era evaluada como parte de la calificación final ni suponía una nota adicional. Así, los alumnos podrían haber percibido una mayor carga de trabajo en la asignatura que no se vería reflejada en su calificación, lo que podría haber afectado a sus niveles de satisfacción. En este sentido, sería interesante plantearse algunos cambios tales como la dedicación de sesiones de clase exclusivamente a la explicación, seguimiento y apoyo a la actividad, así como la incorporación de incentivos a la participación que tuviera reflejo en la nota final del estudiante. Sin duda, todas estas cuestiones serán consideradas para los próximos cursos académicos.

Si bien el hecho de participar en la actividad no ha repercutido directamente sobre las percepciones del estudiante en relación a su aprendizaje y a su grado de satisfacción con la asignatura, sí se ha podido observar un efecto indirecto a través de las competencias transversales adquiridas. De acuerdo con los resultados del análisis post-hoc, la realización del vídeo ha incrementado las percepciones del estudiante sobre su capacidad de desarrollar habilidades sociales, de utilización de las TIC, y académicas. Estas últimas competencias, concretamente la adquisición de capacidad de síntesis y de desarrollo de la actividad, han influido sobre el aprendizaje subjetivo y la satisfacción con la asignatura. Futuras investigaciones deberán encaminarse a estudiar todas estas relaciones en mayor

profundidad, utilizando mediciones más rigurosas de los constructos tratados, y determinado los efectos directos e indirectos de manera más específica.

Finalmente, a través de este caso de estudio se han mostrado los resultados obtenidos con la actividad y mediciones específicas, pero sería importante complementar la investigación con metodologías alternativas, o proponiendo diferentes actividades en distintos grupos para comprobar la efectividad de las acciones de apoyo a la docencia con YouTube. Además de los resultados favorables, la introducción del canal de YouTube también ha sido beneficiosa desde la propia opinión de los docentes, por lo que animamos a incorporar este tipo de herramientas entre los profesores universitarios de marketing.

## RESUMEN

*A pesar de la importancia de las nuevas tecnologías en la educación y del alcance del uso de las herramientas 2.0, tanto para educadores como estudiantes, éstas no siempre son utilizadas de forma adecuada en el proceso educativo. Los trabajos existentes en la actualidad, se limitan en muchas ocasiones a determinar qué herramientas son más utilizadas y con qué frecuencia, según la edad, género o estudios, aunque sin interrelacionar dichas variables (Hernández, 2008; Moreno, 2012; Koçak y Oyman, 2012; García y García, 2013). La presente investigación pretende cubrir esa laguna identificando perfiles de estudiantes 2.0 a partir de los estilos de aprendizaje característicos (Kolb, 1984; Honey y Mumford, 1986), estudios cursados, género y frecuencia de uso de las herramientas docentes de Web Social. Los resultados obtenidos a partir de una muestra de 292 estudiantes de Marketing de Enseñanzas Medias, nos han permitido identificar tres perfiles mediante segmentación latente. La identificación por parte del profesorado de las características obtenidas en cada perfil, permitirá la adecuación de las herramientas docentes 2.0 a lo largo del proceso de enseñanza-aprendizaje.*

## Palabras clave:

Web Social, Herramientas docentes 2.0, Estilos de aprendizaje, Segmentación latente, Perfil del estudiante

## 1. Introducción

Como afirman Fumero y Roca (2007), la Web Social nace con la intención de resolver una necesidad social y, aunque algunas de sus propuestas pueden generar beneficios, se trata más de un movimiento social (movimiento 2.0) que de un modelo empresarial. La Web 2.0 implica no tanto la aplicación de una nueva tecnología, como el hecho de asumir una nueva filosofía, por eso se habla de la actitud 2.0 que supone compartir los recursos propios y beneficiarse al mismo tiempo de los ajenos (Arroyo, 2007).

Una parte importante del éxito de la Web Social o 2.0 reside en la aplicabilidad de su filosofía y sus herramientas a cualquier ámbito, siendo cada vez más habitual que las actividades de las personas y de las organizaciones se trasladen al entorno digital, encontrándonos con: Educación 2.0, Empresa 2.0, Periodismo 2.0, Marketing 2.0, Biblioteca 2.0 e, incluso, como Fútbol 2.0 (Arroyo 2007; Celaya, 2011). En cada caso, es imprescindible involucrar a los usuarios fomentando la comunicación bidireccional.

Este siglo XXI, siglo de la Revolución Digital, lleva aparejado un cambio o redefinición en los modelos de negocios de empresas e instituciones, máxime si tenemos en cuenta que las empresas deben contar entre su plantilla o entre sus posibles competidores con una nueva generación de personas, que se están formando ya en Centros Educativos utilizando las nuevas tecnologías en los procesos de aprendizaje. Esta generación rechazará a las empresas donde no se tenga en cuenta esta nueva forma de intercambiar y gestionar el conocimiento (Celaya, 2011).

El sistema educativo actual, que no es ajeno a la revolución digital, otorga un papel cada vez más importante al alumnado, considerándolo un sujeto activo que se encuentra en el centro del proceso de enseñanza-aprendizaje. En este contexto es muy importante determinar las Estrategias y Estilos de Aprendizaje seguidos por los alumnos para “aprender a aprender” (Cano, 2000). Se pretende que el estudiante alcance una mayor flexibilidad y autonomía en su forma de aprender, de forma que este auto-aprendizaje pueda trascender los límites académicos y prepararlos para un mercado laboral en constante cambio donde las competencias más valoradas son la autoformación y la formación continua (Adán, 2008). De esta nueva realidad se hacen eco las enseñanzas no universitarias, conscientes de que, gracias a los procesos de enseñanza-aprendizaje, sus estudiantes van a adquirir y desarrollar las competencias personales necesarias para su futuro, por eso la principal finalidad<sup>1</sup>, tanto de bachillerato como de los ciclos formativos, es proporcionar a los estudiantes formación, madurez intelectual y humana, así como los conocimientos y habilidades que les permitan desarrollar sus funciones sociales y laborales con responsabilidad, competencia y solidaridad, contribuyendo al desarrollo económico del país y capacitándolos tanto para acceder a la educación superior, como para adaptarse a los cambios profesionales y sociales que se puedan producir a lo largo de su vida.

La Web 2.0 está abriendo las puertas a un nuevo modelo de enseñanza, el aprendizaje 2.0 que, con la utilización de sus herramientas de marketing 2.0 en el aprendizaje se favorece el desarrollo de las mismas competencias que se están exigiendo a los trabajadores para su incorporación al mercado laboral, concretamente favorecen el desarrollo del pensamiento crítico, la autonomía, la iniciativa, el trabajo colaborativo y la responsabilidad individual (Esteve, 2009).

La incorporación de las nuevas tecnologías no van a suponer una innovación educativa en sí misma si esta no viene acompañada de un cambio metodológico en la práctica docente (Esteve, 2009). La tecnología de uso educativo supone mejoras a nivel cuantitativo, enseñanzas no presenciales, pero sobre todo a nivel cualitativo, al disponer de nuevos recursos que enriquecen su proceso de aprendizaje (Cobo y Pardo, 2007), que repercutirá positivamente en la gestión estratégica y comercial del Centro.

Por ello, el objetivo general de nuestra investigación consiste en analizar la Web 2.0 y sus herramientas y cómo estas pueden contribuir a la estrategia empresarial y comercial llevadas a cabo por los Centros Educativos y cómo favorecen el cambio que está experimentando el modelo de educación actual, variando la metodología para adaptarse a los diferentes estilos de aprendizaje individuales que tienen los estudiantes y que son necesarios para alcanzar las competencias necesarias en su futuro académico y profesional.

---

<sup>1</sup> Artículo 3 Decreto 85/2008, de 17-06-2008, currículo del bachillerato en la Comunidad Autónoma de Castilla-La Mancha. Artículo 2 del R.D. 1147/2011, de 29 de julio, ordenación general de la formación profesional del sistema educativo.

En suma, conociendo los principales perfiles a partir del análisis de los estilos de aprendizaje dominantes de los estudiantes, podremos definir la metodología docente, diseñando actividades y utilizando recursos didácticos en las que se aprovechen las ventajas de las herramientas Web 2.0, con el objeto de conseguir un proceso de enseñanza-aprendizaje más efectivo y eficiente, permitiendo una mejor gestión y organización del aula por parte de los docentes, que repercutirá en la gestión estratégica y comercial del Centro Educativo.

## 2. Marco teórico

### 2.1. Web 2.0 y sus herramientas. La Web 3.0

No existe un amplio consenso entre los autores de cuál sería la definición de Web Social o 2.0, pero sí se han dado diferentes aproximaciones. El término se atribuye a O'Reilly (2005), para el cual era una segunda generación en la historia de la Web, basada en comunidades de usuarios y un conjunto de servicios y aplicaciones de Internet como *wikis*, blogs o redes sociales entre otros, que se modifican gracias a la participación social. Más recientemente, atendiendo a Celaya (2011, p.9), la etiqueta Web 2.0 “representa una Web más colaborativa que permite a sus usuarios acceder y participar en la creación de un conocimiento ilimitado y, como consecuencia de esta interacción, se generan nuevas oportunidades de negocio para las empresas”.

Aun sin haber unanimidad en la definición, sí se puede afirmar, que hay dos conceptos que están íntimamente ligados a la Web 2.0 y han servido de base para definirla: la inteligencia colectiva<sup>2</sup> y la arquitectura de la participación<sup>3</sup> (O'Reilly, 2005; Arroyo, 2007).

Por tanto, podríamos decir que los valores fundamentales que definen los principales atributos de la Web 2.0 son la interacción, la participación y el intercambio, que está en clara consonancia con el objetivo final de las herramientas 2.0. Estos valores vienen a representar las nuevas características de los usuarios en la Web Social.

El nuevo rol de los usuarios, como centro de las plataformas sociales, hace que estos sean a la vez consumidores, productores, difusores y editores que añaden constantemente valor a los contenidos existentes (Shin y Kim, 2008).

Las herramientas Web 2.0 han adquirido una importancia estratégica en contextos personales, sociales, profesionales y educativos en los últimos años, constituyendo útiles herramientas de marketing, cuya implementación se está extendiendo a todos los sectores mencionados.

No existe una clasificación unificada de los servicios y herramientas Web 2.0, dada la gran cantidad de las que disponemos y que muchas de ellas en un periodo breve de tiempo son renovadas por otras que presentan una tecnología más avanzada, si bien, siguiendo lo indicado por Cobo y Pardo (2007) podemos ordenar las aplicaciones, recursos y herramientas que ofrece la Web Social en cuatro líneas fundamentales, teniendo todas ellas como nexo común el hecho de ser herramientas útiles, fáciles de usar y gratuitas: redes sociales, diseñadas para la creación de comunidades virtuales que favorecen intercambios sociales (e.g. *Facebook*, *Tuenti*, *Twitter*); contenidos, herramientas de lectura y escritura en línea que favorecen la distribución, intercambio y creación colectiva (e.g. *Wikipedia*, *GoogleDocs*, *SlideShare*, *Flickr*, *YouTube*); organización Social e intelectual de la información, permiten etiquetar, sindicar e indexar, para facilitar el orden y almacenamiento de la información ayudando a los usuarios (e.g. *Google*, *Itunes*, *Spotify*, *Vimeo*, *Delicious*); aplicaciones y servicios (*Mashups*), software, plataformas en línea y un híbrido de recursos, creados para ofrecer un servicio y proporcionar valor añadido al usuario (e.g. *Dropbox*, *Podcast*, *WhatsApp*).

Cuando todavía no hemos acabado de interiorizar la Web Social aparece en el horizonte una nueva generación de Internet, la Web 3.0, denominada también Web semántica (*Semantic Web*). Este nuevo modelo pretende dar un paso más, aportando más información a los contenidos ya difundidos por los usuarios, con esta información complementaria los *internautas* serán capaces de encontrar y reutilizar el contenido de forma más productiva (Celaya, 2011).

La evolución de la Red no se detiene, e incluso, ya se habla de Web 4.0 y 5.0. En ella se permitirá la integración en la Web de los objetos, el desarrollo de redes sensoriales y emotivas o la integración

---

<sup>2</sup> Entendida como el conocimiento compartido por todos y que da lugar a una obra colectiva, convirtiendo a la Web en una especie de cerebro global (O'Reilly, 2005). El ejemplo más característico sería *Wikipedia* (<http://www.wikipedia.org>).

<sup>3</sup> Esta implica una nueva forma de construir los sitios web para que todos los usuarios puedan participar a la vez (Arroyo, 2007).

de la Web semántica, dando acceso a información más relevante y personalizada, que cambiará la estructura tal y como la conocemos hoy. Se pretende integrar las tecnologías móviles, y la difusión de un nuevo modelo de conexión a Internet, consiguiendo que los *internautas* prescindan de las aplicaciones locales (INTECO, 2011).

## **2.2. Herramientas Web 2.0 de uso educativo**

El cambio en la metodología, lleva implícito la utilización de herramientas Web 2.0, sin embargo, es imprescindible que el binomio metodología-herramientas Web 2.0 sea el adecuado para conseguir unos resultados positivos y efectivos en el proceso de enseñanza-aprendizaje. Por ello, estas herramientas deben de presentar las siguientes características (Hernández, 2008; Moreno, 2012): interactividad e interacción; conectividad y conexión con el mundo real; abiertas y dinámicas; simples, intuitivas y gratuitas.

En general, las aplicaciones Web 2.0 se pueden clasificar en dos grandes grupos, ya que no todas requieren las mismas habilidades, ni son utilizadas para los mismos fines (García y García, 2013):

- Aplicaciones sociales o emocionales, se centran más en el fomento de las relaciones personales a través de la creación de perfiles o publicaciones de contenidos multimedia y que tienen un uso más intuitivo (por ejemplo, redes sociales virtuales, *YouTube*, *Skype*, etc...). Son las más utilizadas y conocidas entre los estudiantes universitarios (Koçak y Oyman, 2012).
- Aplicaciones instrumentales, son utilizadas en educación y que requieren más habilidades para usarlas (por ejemplo, *wikis*, blogs o herramientas de ofimática *online*).

Como hemos comentado anteriormente, el abanico de aplicaciones Web 2.0 es muy amplio, variado y evoluciona rápida y constantemente. Sin embargo, en el entorno educativo resultan especialmente útiles las siguientes herramientas y aplicaciones sociales (Cobo y Pardo, 2007; Conole y Alevizou, 2010): *Blogging*, versión educativa *edublogs*. En la actualidad, éxito de los *microblogging* (e.g. *Twitter*); *Wikis* y herramientas de edición colaborativas, permiten la escritura colaborativa, dentro y fuera del aula (e.g. *Wikipedia*, *GoogleDrive*); Colaboratorios, plataformas que permiten compartir haciendo el proceso de aprendizaje más dinámico y participativo (e.g. *PowerPoint* en línea o podcasts); RSS, herramientas que permiten recibir información personal de las novedades y las aportaciones relacionadas con los temas de estudio; Comunicación, facilita la comunicación fluida y continua profesor-alumno (e.g. *Skype*, *Gmail*); Mapas digitales y geolocalización, permiten visualizar información de mapas (e.g. *GoogleMaps*, *Street view*, *GoobleEarth*); uso compartido multimedia, permiten crear y descargar de la Red sus propios archivos fomentando la creatividad (e.g. *TeacherTube*, *Flickr*, *Slideshare*); buscadores, permiten el acceso a información muy variada (e.g. *Google*, *Yahoo*); redes sociales virtuales, en el ámbito educativo, permitir el intercambio y la discusión en temas de interés escolar (e.g. *Facebook*); mensajería instantánea, chat y foros de conversación, en el ámbito educativo se pueden establecer foros de discusión en torno a materias específicas; Juegos y mundos virtuales, permiten interactuar con otros usuarios, favoreciendo el intercambio de experiencias en el aprendizaje (e.g. simuladores empresariales, económicos); marcadores sociales, en educación el profesor puede diseñar marcadores específicos por materias o temas (e.g. *Delicious*).

## **2.3. Estilos de aprendizaje y nuevas tecnologías como elementos de gestión del Centro Educativo**

Las investigaciones realizadas en las últimas décadas nos confirman que existe un gran interés por conocer, no sólo la forma de aprender de cada individuo, sino también la forma en la que mejor aprende. Por tanto, podemos afirmar que los estilos de aprendizaje son una variable importante en el proceso de aprendizaje en cualquier nivel educativo (López-Aguado, 2011).

No existe una definición unánime del concepto de Estilo de Aprendizaje. De modo general, García, Santizo y Alonso (2009, p. 3) reunificaron el término, definiendo Estilos de Aprendizaje como “los rasgos cognitivos, afectivos, fisiológicos, de preferencias por el uso de los sentidos, ambiente, cultura, psicología, comodidad, desarrollo y personalidad que sirven como indicadores relativamente estables, de cómo las personas perciben, interrelacionan y responden a sus ambientes de aprendizaje y a sus propios métodos o estrategias en su forma de aprender”.

La revisión de la literatura nos muestra que, de las tipologías del aprendizaje existentes, destacan las realizadas por: Kolb (1984), Honey y Mumford (1986) y Alonso (1995). Así lo corroboran las

investigaciones realizadas sobre estilos de aprendizaje desde el año 2000, en las que los instrumentos de medición y clasificación de los estilos de aprendizaje utilizados en la mayoría de ellas, han sido los creados por estos autores (Bahamón, Vianchá, Alarcón y Bohórquez, 2012).

Concretamente, los instrumentos de medición de estilos de aprendizajes definidos por estos autores son:

- *Learning Style Inventory* (LSI), conocido en España como Inventario de Estilos de Aprendizaje (Kolb, 1984), este instrumento tiene una gran versatilidad, ya que aunque en origen fue creado para determinar los estilos de aprendizaje de los directivos y personas adultas, se ha usado indistintamente, tanto en el plano académico como empresarial. Hasta este momento, son seis las versiones que se han publicado de la LSI (Castaño, 2004; Kolb y Kolb, 2005; Web oficial<sup>4</sup>)
- *Learning Style Questionnaire* (LSQ), Cuestionario de Estilos de Aprendizaje (Honey y Mumford, 1986). La versión original del cuestionario consta de 80 ítems, desarrollándose posteriormente una versión abreviada de 40 ítems. Aunque las dos versiones permiten explorar las preferencias de las personas por los estilos de aprendizaje, esta nueva versión emplea menos tiempo en realizar el cuestionario y, además, utilizan un vocabulario más conciso y adecuado para los posibles participantes (Honey y Mumford, 2000).
- Cuestionario Alonso-Honey de Estilos de Aprendizaje (CHAEA), consiste en la adaptación del LSQ al ámbito académico español (Alonso, Gallego y Honey, 1995). El cuestionario consta de 80 ítems valorados en una escala dicotómica. A cada uno de los estilos de aprendizaje le corresponden 20 ítems.

Los modelos de clasificación de los estilos de aprendizaje definidos por Kolb (1984), Honey y Mumford (1986) y Alonso et al. (1995), sirven de referencia para conocer las preferencias y características principales que presentan los individuos a la hora de aprender, sin embargo, las investigaciones recientes, siendo conscientes del papel protagonista que tienen las nuevas tecnologías en los procesos de enseñanza-aprendizaje, van un paso más allá.

Como afirman Ocepek, Bosni`c, Servec y Rugelj (2013), la combinación de estilos de aprendizaje definidos por Kolb, junto con las preferencias que los estudiantes muestran hacia unos materiales multimedia, proporcionan diferentes tipos de aprendizaje multimedia que son más precisos, fiables y acordes a la sociedad de la comunicación, la información y las nuevas tecnologías, favoreciendo la eficacia de los procesos de aprendizaje de los alumnos, al poder cada estudiantes seleccionar los materiales más apropiados.

La Web 2.0 ofrece muchas posibilidades al sistema educativo, al permitir la participación social de un grupo de personas en la elaboración de contenidos, acercando la figura del profesor al papel de mediador y la del alumno al del verdadero valedor de sus conocimientos, siendo una parte muy activa de su formación (Moreno, 2012). La Web Social está inmersa en el proceso formativo desde hace varios años a través de la Escuela 2.0, también conocida como Aprendizaje 2.0 o Aula 2.0, su implantación ha requerido introducir una serie de cambios.

El educador ha pasado a tener un nuevo estilo más innovador, fomentando la investigación y la creación de conocimiento por parte de los alumnos. El profesor debe de potenciar la autonomía individual y colectiva. Para ello es imprescindible que este abierto para adaptarse a los cambios (Fernández y Cubo, 2011). El aprendizaje apoyado por la Web 2.0, descansa en sus dos principios básicos: contenidos generados por el usuario y arquitectura de la participación, donde tanto estudiantes como docentes pueden aportar sus conocimientos, favoreciendo la cooperación, multiplicando así las posibilidades de aprender (Cobo y Pardo, 2007). Para que esto sea posible es imprescindible que las nuevas herramientas Web 2.0 no se utilicen simplemente para sustituir los recursos tradicionales.

En la misma línea, los Sistemas Educativos con apoyo tecnológico en la Web tienen como principal finalidad atender a cada alumno de forma personalizada, teniendo en cuenta que cada uno de ellos tiene necesidades diferentes, conocimientos previos y/o estilos de aprendizaje y que, además, estas enseñanzas deben de proporcionar experiencias de aprendizaje. Por ello, la combinación de variables como los estilos de aprendizaje y los rasgos cognitivos, contribuyen de manera beneficiosa a

---

<sup>4</sup> <http://learningfromexperience.com/> [consultada: 16 abril 2014]

las enseñanzas online, ya que dicha unión genera sinergias en los procesos de enseñanza-aprendizaje de los estudiantes (Graf, Liu, Chen y Yang, 2009).

#### 2.4. Planteamiento de cuestiones a investigar

El presente trabajo trata de proporcionar una mejor comprensión de los efectos, experiencias y potencialidades que las herramientas 2.0 pueden ofrecer a los centros educativos para llevar a cabo estrategias de gestión formativa en el proceso de enseñanza-aprendizaje. Junto a estos objetivos, el trabajo también proporciona una panorámica del uso de este tipo de tecnologías 2.0 mediante la realización de una segmentación latente de los estudiantes a partir de la intensidad con que ellos las utilizan de acuerdo con su estilo de aprendizaje dentro y fuera del aula, así como por el curso académico en el que actualmente se encuentran y el género.

En resumen, este trabajo proporcionará respuestas a las siguientes proposiciones de investigación:

- P1. ¿Cuáles son las prioridades de los estudiantes en el uso de la Web Social como herramienta de aprendizaje?
- P2. ¿Afecta el género en el grado de adopción de la Web 2.0 en un contexto educativo?
- P3. ¿Afecta el tipo de estudios cursados en el grado de adopción de la Web 2.0 en un contexto educativo? ¿
- P4. ¿Cómo influyen las capacidades de los estudiantes para aprender y para conseguir los resultados en las competencias que deben alcanzar al finalizar la etapa educativa?
- P5. ¿Qué tipos de segmentos de estudiantes podemos encontrar a partir del nivel de adopción y uso de aplicaciones 2.0 como herramientas de estudio?
- P6. A partir de los perfiles encontrados, ¿de qué manera influye el estilo de aprendizaje del estudiante en el uso de las herramientas 2.0?
- P7. ¿Qué estrategias de gestión estratégica y comercial han de adoptar los centros educativos para atender a las demandas observadas en los diferentes perfiles de estudiantes?

### 3. Metodología

En el cuadro 1 se muestra la ficha técnica resumen del método utilizado en nuestra investigación.

CUADRO 1  
Ficha técnica

Universo poblacional	Estudiantes de enseñanzas medias
Muestra	292 estudiantes de Marketing Bachillerato (173) Grado Medio (33) Grado Superior (86)

Software utilizado	SPSS 21® Latent Gold®

## 4. Resultados

### 4.1. Análisis descriptivos

#### 4.1.1. Uso de herramientas 2.0 en la docencia

Existen múltiples y variadas herramientas sociales. Para el presente estudio hemos analizado un total de dieciocho herramientas 2.0 que pueden ser utilizadas por los alumnos en sus procesos de enseñanza-aprendizaje.

Concretamente, del conjunto de herramientas Web 2.0, entre las que presentan un mayor porcentaje de uso destacamos: los servicios de mensajería (*WhatsApp*) (76% de los estudiantes), seguidas de, redes sociales virtuales (*Facebook, Twitter,...*) (66,1%), herramientas de vídeo (*YouTube, Vimeo...*) (24,3%) y de comunicación (*Google Talk, Skype...*) (13,7%), mientras que las herramientas que menos utilizan diariamente los alumnos son: espacios de documentos y presentaciones (*SlideShare, Docstoc...*) (3,4%), marcadores sociales (*Deicious, Stumbleupon...*) (2,7%), agregadores RSS (*RSS Feed, Google Reader,...*) (1,4%), y, por último, esquemas y mapas mentales (*CmapTools...*) (0,7%).

Por otro lado, debemos hacer una apreciación en la frecuencia de uso de dos herramientas 2.0, concretamente, el aula virtual y las *wikis* (*Wikipedia, Wikispaces..*), que aun siendo la quinta y sexta herramienta más utilizada (con un 12,7% y un 12,3% respectivamente), si consideramos la frecuencia de uso semanal, pasarían a ser más utilizadas que las herramientas de comunicación (32,5%), ocupando las *wikis* el cuarto lugar (44,5%) y el aula virtual el quinto (35,0%).

#### 4.1.2. Uso de herramientas 2.0 en función del género

En este epígrafe, utilizando la técnica descriptiva de tablas de contingencias y, mediante la prueba de independencia chi-cuadrado, determinaremos si existe relación o no entre la frecuencia de uso de dichas herramientas distinguiendo entre hombres y mujeres.

Hemos observado que la frecuencia de uso de las herramientas Web 2.0 es superior en las mujeres cuando se trata de calendarios y agendas (35,2% frente a un 14,6%), mientras que en los hombres se observa una mayor frecuencia en las herramientas de audio (31,8% frente al 20,3%), vídeo (77,2% frente al 61,5%) y aquellos espacios para guardar y compartir documentos (32,4% frente a un 24,7%), en el resto de las herramientas no observamos una frecuencia de uso diferenciado entre ambos.

Según la prueba de independencia chi-cuadrado, el uso de las herramientas sociales depende del género del usuario, concretamente en las herramientas de audio ( $\chi^2=16,549$ ; sig.=0,005), vídeo ( $\chi^2=17,858$ ; sig.=0,003), espacios para guardar y compartir documentos ( $\chi^2=11,803$ ; sig.=0,038) y los blogs ( $\chi^2=16,386$ ; sig.=0,006), son más usadas por los hombres. En el resto de las herramientas no se aprecia una diferencia significativa entre el uso de las mismas y el género (véase la Tabla 1).

TABLA 1  
Uso herramientas Web 2.0 – Género

Herramientas 2.0	$\chi^2$	Sig.
Herramientas de audios (Webs con <i>Podcasts, Itunes ..</i> )	16,549	0,005
Vídeo ( <i>Youtube, Dailymotion, Vimeo</i> )	17,858	0,003
Espacios para guardar y compartir documentos ( <i>Dropbox, Box, Sugar Sync, Google Drive, iCloud</i> )	11,803	0,038
Blogs	16,386	0,006

#### 4.1.3. Uso de herramientas Web 2.0 según estudios cursados

De la misma forma que con el género, hemos analizado si existe relación entre la frecuencia de uso y el curso académico en el cual se encuentran los alumnos (1º y 2º Bachillerato Ciencias, Bachillerato Humanidades y Bachillerato Ciencias Sociales; 1º y 2º Grado Medio; 1º y 2º Grado Superior), utilizando la misma técnica descriptiva de tablas de contingencias y la prueba de independencia chi-cuadrado.

La frecuencia de uso de las herramientas sociales en relación con los estudios cursados muestra que las herramientas más utilizadas en todos los cursos son la mensajería (71,0%, 81,3%, 69,0%, 75,0%, 75,0%, 92,9%, 66,7%, 77,8%, 89,8% y 75,7% respectivamente para cada uno de los cursos analizados, de 1º de Bachillerato de Ciencias a 2º de Grado Superior), las redes sociales virtuales

(62,9%, 56,3%, 62,1%, 75,0%, 66,7%, 71,4%, 50,0%, 55,6%, 73,5% y 70,3% respectivamente) y, en tercer lugar las herramientas de video (40,3%, 37,5%, 13,8%, 15,0%, 0,0%, 28,6%, 29,2%, 22,2%, 26,5% y 10,8% respectivamente). Analizando los diferentes estudios cursados en su conjunto, observamos que los ciclos formativos, tanto de grado medio como de grado superior, hacen un mayor uso de todas las herramientas 2.0, especialmente destaca 2º de grado medio.

Según la prueba de independencia chi-cuadrado, el uso de algunas herramientas sociales depende de los estudios cursados. Concretamente, el aula virtual ( $\chi^2=130,026$ ; sig.=0,000), los espacios para guardar y compartir documentos ( $\chi^2=75,354$ ; sig.=0,003) y las herramientas de ofimática ( $\chi^2=73,814$ ; sig.=0,004) son más utilizadas por los alumnos que cursan estudios de grado medio y grado superior, los vídeos ( $\chi^2=84,191$ ; sig.=0,000) son usado en menor medida por los estudiantes de 2º de bachillerato en cualquiera de las modalidades, las imágenes ( $\chi^2=73,171$ ; sig.=0,005) se utilizan sobre todo en los estudiantes de 1º de bachillerato y ciclos formativos de grado medio, las aplicaciones de mapas ( $\chi^2=76,486$ ; sig.=0,002) especialmente utilizadas por los alumnos que estudian 2º de bachillerato, modalidad de ciencias sociales, los marcadores sociales ( $\chi^2=64,904$ ; sig.=0,028), los calendarios y agendas ( $\chi^2=67,721$ ; sig.=0,016), las herramientas de audio ( $\chi^2=63,333$ ; sig.=0,037) y los buscadores personales ( $\chi^2=65,842$ ; sig.=0,023) más usados por los alumnos de grado medio, sobre todo en el segundo curso. En el resto de las herramientas no se aprecia una relación significativa (Véase Tabla 2).

TABLA 2  
Uso herramientas Web 2.0 – Estudios cursados (Bachillerato/Ciclos Formativos)

Herramientas 2.0	$\chi^2$	Sig.
Aula Virtual	130,026	0,000
Espacios para guardar y compartir documentos ( <i>Dropbox,Box,SugarSync,GoogleDrive,iCloud</i> )	75,354	0,003
Ofimática ( <i>GoogleDocs,Thinkfree</i> )	73,814	0,004
Imagen ( <i>Flickr,Picasa,Panoramio</i> )	73,171	0,005
Aplicaciones sobre mapas ( <i>GoogleMaps,BingMaps</i> )	76,486	0,002
Marcadores sociales ( <i>Delicious,Stumbleupon</i> )	64,904	0,028
Calendarios y agendas ( <i>GoogleCalendar,AirSet</i> )	67,721	0,016
Herramientas de audios ( <i>Podcasts,Itunes</i> )	63,333	0,037
Buscadores personalizados ( <i>Tecnorati,GoogleBooks,GoogleAcadémico</i> )	65,842	0,023
Vídeo ( <i>Youtube,Dailymotion,Vimeo</i> )	84,191	0,000

#### 4.1.4. Capacidades de aprendizaje y resultados obtenidos

Por último, dentro de los análisis descriptivos, se han analizado, mediante porcentajes, las capacidades que los alumnos de la muestra presentan a la hora de aprender y para conseguir los resultados.

A la vista de los resultados obtenidos, en cuanto a las capacidades para aprender, observamos que, excepto para la utilización de la biblioteca para conseguir información (el 44,9% consideran que son totalmente incapaces o poco capaces), para el resto de capacidades los estudiantes se muestran capaces, destacando la capacidad para finalizar las tareas y actividades en el plazo previsto (51,7%), tomar notas durante las clases (32,2%), utilizar Internet para desarrollar las actividades y tareas (46,6%), organizar un lugar de estudio sin distracciones (32,5%) y participar en discusiones de clase (29,5%).

Observamos que los resultados obtenidos en las dos capacidades directamente relacionadas con la obtención de información para las actividades de aprendizaje, en la biblioteca o en Internet, están en clara consonancia con la muestra objeto de estudio, mayoritariamente nativos digitales.

En cuanto a la capacidad para conseguir los resultados, observamos que la principal dificultad encontrada es a la hora de expresarse en más de un idioma (26%), mientras que no encuentran dificultades, principalmente, para trabajar en equipo (47,8%), identificar, analizar y definir la

información que define un problema (49,0%), aprender y trabajar de forma continua, autodirigida y autónoma (46,9%) y, la utilización y aplicación de las tecnologías de la información y la comunicación (38,4%). Estos resultados están en concordancia con el rol que en la actualidad deben de tener los alumnos en la educación, como participantes activos en el proceso, capaces de trabajar autónomamente, pero guiados por el docente, realizando trabajos colaborativos y, bajo el marco de las nuevas tecnologías como eje central del proceso de educación.

#### **4.2. Perfil del estudiante: uso de herramientas 2.0 y estilos de aprendizaje**

Se ha utilizado la metodología de segmentación latente para clasificar y definir el perfil de los estudiantes de centros educativos de Educación Secundaria, con respecto al uso, actitud y percepciones de las herramientas de la Web 2.0. Este tipo de procedimiento permite asignar los estudiantes a los segmentos a partir de sus probabilidades de pertenencia a los grupos, rompiendo con la restricción de asignación determinista propia del análisis *cluster* no jerárquico (Dillon y Kumar, 1994). Esta metodología asigna los individuos a los diferentes segmentos, bajo la suposición de que los datos provienen de una mezcla de distribuciones de probabilidad, es decir, de varios grupos o segmentos homogéneos que están mezclados en proporciones desconocidas (McLachlan y Basford, 1988). La ventaja de los modelos de clases latentes es que se pueden incorporar variables con diversas escalas de medición (continua, ordinal o nominal) (Vermunt y Magidson, 2005). Además, los modelos por lo general pueden incorporar las variables independientes que se pueden utilizar para describir (en lugar de definir o medir) las clases latentes. Estas variables exógenas son conocidas como covariables o variables de agrupación (MCutcheon, 1987; Hagenaars, 1993; Vermunt y Magidson, 2005).

En este estudio, las variables utilizadas como indicadores para el análisis *cluster* se han basado en la frecuencia en que los estudiantes usan las herramientas 2.0, dentro y/o fuera del aula, en sus procesos de enseñanza-aprendizaje, utilizando para ello una escala diferencial-semántico ordinal de seis puntos (nunca, muy esporádicamente, cada dos o tres meses, varias veces al mes, varias veces a la semana, todos los días) de las 18 herramientas de Web Social incluidas en el cuestionario.

En función de los posicionamientos de los distintos individuos en relación a estas variables, pretendemos obtener agrupaciones que cumplan los principios de máxima coherencia interna y máxima diferenciación externa. Para ello hemos optado por utilizar el *software* estadístico LatentGold 4.5<sup>5</sup>.

Basándonos en los indicadores anteriormente mencionados y con el fin de realizar una segmentación de estudiantes en función de sus estilos de aprendizaje, se han introducido como covariables dentro del modelo de segmentación las escalas de Honey y Mumford (LSQ) en su versión reducida, y la de Kolb (LSI), previamente contrastadas en publicaciones académicas, lo que nos ha permitido asegurarnos la fiabilidad y validez de las mismas. En este caso, hemos identificado los cuatro estilos de aprendizaje de ambas escalas: teórico, pragmático, activo y reflexivo, para la escala de Honey-Mumford; así como experiencia concreta (EC), observación reflexiva (OR), conceptualización abstracta (CA) y experimentación activa (EA), para la escala de Kolb.

Siguiendo las escalas propuestas por los autores, la escala LSQ se ha medido mediante una escala *Likert* de cinco puntos para cada uno de los 40 ítems que la componen. La escala LSI se ha medido mediante una escala diferencial-semántico ordinal de cuatro puntos en la que se tenía que indicar el orden de preferencia del ítem.

Una vez identificados los cuatro estilos de cada escala (LSQ y LSI), hemos convertido las puntuaciones originales en dicotómicas. El objetivo de la conversión dicotómica reside en conseguir comparar ambas escalas entre las puntuaciones obtenidas por cada individuo encuestado (Barron, 1996), así como para definir los puntos de corte que determinan cada uno de los tipos de estilos de aprendizaje (Kolb y Kolb, 2005). Para desarrollar dicha conversión, se han dividido por percentiles las puntuaciones indicadas por los estudiantes (Kolb y Kolb, 2005). Así, a partir de la media obtenida para cada tipo de estilo de aprendizaje se estableció una dicotomía, numerando como 1 las puntuaciones por encima de la media y como 0 las restantes. Este procedimiento sigue la lógica de que quien esté por encima de la media es quien realmente presenta el tipo de aprendizaje en cuestión.

---

<sup>5</sup> No se incluye la tabla de indicadores obtenida en la segmentación latente, debido su extensión. Los valores p-valor indican diferencias significativas en el uso de todas las herramientas-indicadores. La explicación de los indicadores se detalla en los perfiles obtenidos.

Asimismo, como covariables, hemos introducido dos variables descriptivas con el objetivo de perfilar el análisis de segmentación: el género y el curso que el estudiante estaba realizando cuando realizó de la encuesta.

El primer paso de la estimación consiste en la elección del número óptimo de segmentos, por lo que el modelo fue estimado desde 1 (no existe heterogeneidad) hasta 8 (existen 8 segmentos).

El ajuste del modelo fue evaluado con el criterio de información bayesiana (*bayesian information criterion*, BIC), que permite identificar el modelo con el menor número de clases que se ajusta mejor a los datos. El menor valor del BIC fue considerado como indicador del mejor modelo (Vermunt y Magidson, 2005). En nuestro caso, la mejor alternativa es dividir la muestra en tres grupos distintos de estudiantes, donde el BIC se minimiza, en la Tabla 4 se muestra los resultados para el cluster 3.

TABLA 4  
Resumen de los resultados de los modelos

Número de conglomerados	LL	BIC(LL)	Npar	Class.Err.	$E_s$	$R^2$
3-Cluster	-7283,7488	15951,788	244	0,0511	0,8764	0,8813

LL=log-likelihood; BIC=criterio de información bayesiana; Npar=número de parámetros; Class.Err.=error de clasificación;  $E_s$ = estadístico de entropía (*entropy R-squared*);  $R^2$ =R cuadrado (*Standard R-squared*)

Una vez escogido el número de segmentos más idóneos según el ajuste del modelo indicado, pasamos a determinar el perfil de los segmentos obtenidos. El nombre asignado a los tres grupos, ordenados de menor a mayor uso de las herramientas 2.0 utilizadas en el proceso de enseñanza-aprendizaje ha sido: cluster “introvertido-reflexivo” representa el 43,01% de los estudiantes; cluster “novel-pragmático” el 35,77%; y cluster “social-activo” el 21,21%.

Finalmente, para todos los indicadores, es decir, las herramientas 2.0 utilizadas en el proceso de enseñanza-aprendizaje, se ha obtenido un p-valor significativo asociado con el estadístico de Wald, lo que indica que cada indicador discrimina entre los *clusters* de forma significativa (Vermunt y Magidson, 2005). Por lo tanto, existe independencia entre pertenecer a un grupo u otro tanto en lo que respecta a cada una de las aplicaciones 2.0 analizadas (aceptando el uso del WhatsApp al 87% de nivel de confianza).

Partiendo del análisis de indicadores previamente señalado y con el fin de observar la composición de los tres segmentos a partir de los estilos de aprendizaje de los estudiantes, en la Tabla 5 se han incluido las puntuaciones medias que toma cada segmento en cada una de las covariables relativas a los dos estilos de aprendizaje estudiados (LSQ y LSI). Téngase en cuenta que los indicadores correspondientes a las escalas de los estilos de aprendizaje pueden tomar valores entre 0 y 1, ya que los ítems que componían cada escala se dicotomizaron para posibilitar su comparación. Ello nos lleva a obtener cada grupo ordenado de menor a mayor grado de reflexión versus actividad respecto al estilo de aprendizaje del estudiante, coincidentes con el orden obtenido en los indicadores (i.e. de menor a mayor uso de las herramientas 2.0).

Por último y con el fin de completar la composición de los tres segmentos obtenidos, se ha analizado el perfil de los grupos resultantes de acuerdo con la información de otras dos covariables: género y etapa educativa en curso.

Los contrastes asociados al estadístico Wald y el p-valor concluyen que existen diferencias significativas entre los segmentos en cuanto a todas las tipologías que constituyen ambas escalas (i.e. LSQ: teórico, pragmático, activo y reflexivo; LSI: EC, OR, CA y EA), así como en las dos restantes covariables analizadas (i.e. género y etapa educativa). Por lo tanto, existe independencia entre pertenecer a un grupo u otro tanto en lo que respecta a cada estilo de aprendizaje (aceptando el estilo teórico a un 88% de nivel de confianza), el género y la etapa educativa.

TABLA 5  
Perfil de los segmentos obtenidos (covariables)

	Covariables	Introvertido-reflexivo	Novel- práctico	Social	Wald	p-valor
Escala de Honey y Mumford (LSQ)*	Teórico	0,7152	0,7139	0,7125	3,4328	0,12

	Grado Superior	38,68%	11,57%	41,39%		

\* Se ha indicado la media de las respuestas afirmativas (variables dicotómicas)

En negrita se señala la mayor importancia relativa entre cada categoría de cada segmento

A partir de los resultados obtenidos, podemos distinguir los tres segmentos con las siguientes características:

- “Introvertido-reflexivo”. Es el grupo de estudiantes más elevado (43,01% de la muestra) y se caracterizan por presentar un estilo de aprendizaje teórico y reflexivo (según escala LSQ) y de OR y CA (según escala LSI), y cuyo uso de las herramientas 2.0 para el aprendizaje no es excesivamente elevado. En definitiva, se caracterizan por ser el grupo más reflexivo y teórico en su aprendizaje y menos activo en la Web Social. El 25,53% nunca utiliza el aula virtual, el 58% nunca utiliza calendarios web, un 42,83% no utiliza formatos de audio como *podcasts*. Sí utilizan formatos de vídeo (35,14%), aunque en menos porcentaje que el resto de grupos. Pero el uso de *Dropbox* no es utilizado nunca por casi la mitad de los estudiantes encuestados (46,56%), e igualmente sucede con *Google Talk* (41,58%), aplicaciones de presentación como *Slideshare* (49,47%), aplicaciones de etiquetado como *Delicious* (95,83%), *Google Books* (70,09%), *Blogs* (38,35%), aplicaciones web para compartir fotos como *Flickr* (51,96%), uso de mapas perceptuales (82,74%), uso de herramientas de ofimática (73,38%), uso de las redes sociales virtuales (8,42%), herramientas de *geolocalización* como *Google Maps* (43,77%) y *RSS* (89,14%). En el caso de las *Wikis*, este segmento lo utiliza todos los días mayor proporción que en el caso del grupo intermedio (i.e. “novel-pragmático”). Sin embargo, el *WhatsApp* lo utilizan todos los días un mayor porcentaje que el segmento “Social-activo” (73,20%). Este segmento está compuesto especialmente por chicas (64,62%). Y, con respecto a la etapa educativa cursada, el porcentaje más predominante es el de estudiantes que cursan Bachillerato de Humanidades (19,08%). En suma, se trata de un perfil caracterizado por no utilizar en exceso las herramientas 2.0 para su aprendizaje, son metódicos, reflexivos y teóricos, principalmente mujeres y de disciplinas formativas relacionadas con las Humanidades.
- “Novel-pragmático”. Este segmento lo compone el 35,77% de la muestra analizada. Se caracterizan por presentar un estilo de aprendizaje pragmático (70,84%, según escala LSQ) y de EC (73,18%, según escala LSI). El nivel de uso de las TICs es medio. Herramientas 2.0 como aula virtual (22,50%), aplicaciones como *podcasts* (19,04%), vídeo (44,91%), *Dropbox* (20,94%), *Google Talk* (25,46%) y redes sociales virtuales (14,57%), las utilizan varias veces por semana. Este segmento utiliza en mayor porcentaje las herramientas de mensajería instantánea como *WhatsApp* (83,97%) y de comunicación como *Google Talk* y *Skype* (20,30%). El resto de herramientas las utilizan con menor asiduidad para el aprendizaje, aunque en mayor proporción que el segmento anterior. Un 77,16% está conformado por mujeres y, respecto a los estudios cursados, este grupo se caracteriza por realizar Bachillerato de Ciencias (55,23%) y Bachillerato de Ciencias Sociales (18,87%). En suma, este grupo presenta una actividad media en el uso de aplicaciones 2.0 para su proceso de enseñanza-aprendizaje, son más prácticos y concisos en su estilo de aprendizaje, mayoritariamente están formados por estudiantes del género femenino y cursan principalmente el Bachillerato de Ciencias y de Ciencias Sociales.
- “Social-activo”. Este grupo lo compone el 21,21% de la muestra. Se caracterizan por presentar un estilo de aprendizaje activo (67,16%, según escala LSQ) y de EA (63,29%, según escala LSI). En comparación con los otros dos grupos, muestra el mayor porcentaje de uso diario de

todas las herramientas 2.0 analizadas (i.e. aula virtual un 18,53%, *Google Calendar* un 17,15%, *podcasts* un 17,48%, aplicaciones de vídeo como *YouTube* un 31,69%, *Dropbox* un 20,17%, *Slideshare* un 10,29%, *Delicious* un 9,39%, *Google Books*, un 20,02%, *Blogs* un 23,02%, *Wikis* un 25,07%, *Flickr* un 14,31%, mapas conceptuales un 2,58%, *Office* un 18,49%, redes sociales virtuales un 69,41%, *Google Maps* un 13,87% y *RSS* un 5,41%). Curiosamente este grupo utiliza en menor grado, frente al resto, la aplicación *WhatsApp* de mensajería instantánea. Se caracteriza este grupo por estar principalmente compuesto por chicos (68,01%), cuya etapa académica es Grado Medio y Grado Superior (22,48% y 41,39% respectivamente). En suma, este segmento presenta un mayor grado de actividad con las herramientas 2.0, es activo y experimental en su estilo de aprendizaje, principalmente del género masculino y con una formación en curso más elevada que el resto de grupos.

## 5. Conclusiones e implicaciones. Limitaciones y futuras líneas

### 5.1. Conclusiones teóricas

Con la recensión de la literatura se pone de manifiesto de qué manera la incursión de la Web social en los Centros Educativos y, más concretamente a través de sus herramientas 2.0, puede contribuir a una mejora de su estrategia de gestión formativa y organizativa. Asimismo, se ha indagado si estas nuevas aplicaciones web están pasando a formar parte de la manera de organizar el Centro Educativo, teniendo como eje central, no sólo dichas herramientas, sino también a sus protagonistas principales: profesores y estudiantes. Las herramientas 2.0, sin embargo, no son utilizadas por los jóvenes de la misma manera, sino que son las herramientas denominadas emocionales (García y García, 2013), las que tienen un mayor impacto, destacando entre ellas las redes sociales virtuales, las aplicaciones de mensajería y las herramientas de vídeo (Koçak y Oyman, 2012). Por ello, implementar dichas herramientas en los procesos educativos y, más concretamente, formando parte de la metodología de trabajo, puede llevar a mejorar los resultados (Hernández, 2008; Moreno, 2012).

Esta nueva forma de gestionar los Centros Educativos, tiene como finalidad, no sólo que el alumnado alcance las competencias educativas básicas de cada etapa, sino que, además, los prepare para su futuro laboral, dónde la Web 2.0 es una realidad y, las competencias demandadas a los trabajadores son coincidentes (Esteve, 2009). Así mismo, debemos de tener en cuenta que los alumnos que actualmente forman parte del sistema educativo son nativos digitales.

### 5.2. Conclusiones e implicaciones para la gestión del Centro Educativo

Dando respuesta a la proposición de investigación P1 (i.e. ¿Cuáles son las prioridades de los estudiantes en el uso de la Web Social como herramienta de aprendizaje?), del conjunto de herramientas sociales, las que más utilizan los estudiantes y, en consecuencia, los Centros Educativos, son los servicios de mensajería, seguidas de redes sociales, herramientas de vídeo y de comunicación, mientras que entre las que menos utilizan están los espacios de documentos y presentaciones, los marcadores sociales, los agregadores RSS y, en último lugar, esquemas y mapas mentales. Este resultado está en sintonía con los principales *sites* visitados en España; con las estadísticas de usuarios en redes sociales virtuales, que revelan que redes sociales virtuales como *Facebook* y *Twitter* cuentan en la actualidad con 17 y 4,7 millones de usuarios, respectivamente, registrados en España<sup>6</sup>; y, por último, con los datos que revelan que *WhatsApp* es la aplicación más usada por los usuarios es sus dispositivos 3G (AIMC, 2013). Cabe destacar también la frecuencia de uso que los alumnos hacen de una herramienta 2.0 concreta, los blogs que, de forma general y sin hacer ninguna distinción por género o nivel educativo, están cayendo en desuso a favor de otras herramientas sociales (AIMC, 2013). Estos resultados son acordes con investigaciones anteriores (e.g. García y García, 2013), donde las herramientas sociales más utilizadas, valoradas y que les reportan una mayor satisfacción son las redes sociales virtuales, seguidas por las herramientas vídeo, mientras que la menos conocidas y usadas son los marcadores sociales (Kocak y Oyman, 2012; García y García, 2013).

---

<sup>6</sup> Datos del año 2012. Estadísticas de usuarios en redes sociales. Agencia de Marketing *online* Concepto 05. Disponible en: <http://www.concepto05.com/2013/07/estadisticas-usuarios-redes-sociales-en-espana-2013/> (consultada: 1 de septiembre de 2013).

Dando respuesta a las proposiciones de investigación P2 y P3 (i.e. ¿Afecta el género y el nivel de estudios cursados sobre el grado de adopción de la Web 2.0 en un contexto educativo?), hemos observado que existen diferencias significativas.

Atendiendo al género (P2) existen diferencias de uso en algunas de estas herramientas, concretamente, las mujeres hacen un uso más frecuente de los calendarios y agendas web, mientras que los hombres utilizan más las herramientas de audio, vídeo y aquellos espacios para guardar y compartir documentos. En el resto de herramientas, no se observa una discriminación significativa. Los resultados obtenidos son coincidentes con los arrojados por la investigación de García y García (2013), donde los hombres muestran una mayor preferencia y un uso más frecuente por herramientas instrumentales, mientras que las mujeres disfrutan más con las herramientas sociales y emocionales.

En relación con los estudios cursados (P3) observamos que los ciclos formativos, tanto de grado medio como de grado superior, hacen un mayor uso de todas las herramientas 2.0, especialmente destaca 2º de grado medio. Entre las principales herramientas que ofrecen una diferencia significativa con respecto a la etapa educativa que cursan los alumnos, destacan: el aula virtual, los espacios para guardar y compartir documentos y las herramientas de ofimática, más utilizadas por los alumnos que cursan ciclos formativos de grado medio y grado superior; los vídeos menos usados por los estudiantes de 2º de bachillerato en cualquier modalidad; las imágenes más utilizadas si los alumnos cursan 1º de bachillerato y ciclos formativos de grado medio; las aplicaciones de mapas, especialmente utilizadas por los alumnos que estudian 2º de bachillerato, en la modalidad de ciencias sociales; los marcadores sociales, los calendarios y agendas, las herramientas de audio y, los buscadores personales más usados por los alumnos de grado medio, sobre todo en el segundo curso.

Con el fin de dar respuesta la proposición de investigación P4 (i.e. ¿Cómo influyen las capacidades de los estudiantes para aprender y para conseguir los resultados en competencias que deben alcanzar al finalizar la etapa educativa?), podemos concluir que, respecto a las capacidades de aprendizaje, los alumnos solo presentan dificultades en la utilización de la biblioteca para obtener información, el resto de capacidades no les suponen ninguna dificultad. En cuanto a la capacidad para conseguir resultados, la mayor dificultad la encuentran en expresarse en más de un idioma, para la cual se siente poco o totalmente incapaces, mientras que para el resto de capacidades no presentan dificultades. Basándonos en Esteve (2009), podemos afirmar que los alumnos se sienten capaces de alcanzar las competencias principalmente demandadas en el mercado laboral.

A partir del análisis de segmentación latente hemos dado respuesta a las proposiciones de investigación P5 (i.e. ¿Qué tipos de segmentos de estudiantes podemos encontrar a partir del nivel de adopción y uso de aplicaciones 2.0 como herramientas de estudio?) y P6 (i.e. ¿de qué manera influye el estilo de aprendizaje del estudiante y sus características personales en el uso de las herramientas 2.0?), obteniendo tres perfiles diferentes:

- Introvertido-reflexivo. A este segmento pertenecen la mayoría de los estudiantes de la muestra. Sus estilos de aprendizaje característicos son teórico y reflexivo (según la escala LSQ) y de OR y CA (según la escala LSI). No hacen mucho uso de las herramientas 2.0 para sus procesos de enseñanza-aprendizaje, podríamos decir que es el grupo menos activo en la Web Social. Los alumnos pertenecientes a este segmento estudian Bachillerato de Humanidades, son mujeres y se caracterizan por ser metódicos, reflexivos y teóricos.
- Novel-pragmático. Este sería el segundo segmento con un mayor porcentaje de alumnos. Su estilo principal de aprendizaje es el pragmático (según escala LSQ) y de EC (según escala LSI). Hacen un uso medio de las herramientas 2.0. Está formado por mujeres, que realizan estudios, principalmente, en Bachillerato, en las modalidades de Ciencias y Ciencias Sociales. Los alumnos pertenecientes a este segmento son más prácticos, concisos y, realistas en su estilo de aprendizaje.
- Social-activo. Es el segmento menos numeroso de la muestra. Se caracteriza por un estilo de aprendizaje activo (según la escala LSQ) y de EA (según la escala LSI). Es el grupo que utiliza con mayor frecuencia las herramientas 2.0, haciendo el mayor uso diario de todas las analizadas. Destacando por ser el que menos utiliza las herramientas de mensajería. Es un segmento compuesto mayoritariamente por hombres que cursan ciclos formativos de grado medio o de

grado superior. Los alumnos que pertenecen a este segmento son más activos, espontáneos y arriesgados en sus aprendizajes.

Por último, para dar respuesta a la proposición de investigación P7 (i.e. ¿Qué estrategias de gestión estratégica y comercial han de adoptar los Centros Educativos para atender a las demandas observadas en los diferentes perfiles de estudiantes?, las herramientas sociales que mejorarían la práctica docente y se adaptarían a cada uno de los grupos encontrados, serían las siguientes:

- Introvertido-reflexivo. Herramientas que despierten el interés y provoquen la curiosidad, el pensamiento y la detección de incoherencias (e.g. *wikis* o *GoogleMaps*). Estos recursos permitirían despertar esa curiosidad de una manera más motivadora, pero centrándose sobre todo en la recogida y análisis de la información.
- Novel-pragmático. Se adaptarían mejor aquellas herramientas que permitan una aplicación práctica de las materias estudiadas (e.g. simuladores o juegos virtuales).
- Social-activo. Se adaptan mejor herramientas donde se desarrolla el trabajo de grupo, pero teniendo en cuenta que este trabajo no pueden tener un horizonte temporal a largo plazo (e.g., blogs, herramientas de ofimática o plataformas para compartir documentos, archivos de vídeo o imágenes).

### **5.3. Limitaciones y futuras líneas de investigación**

Una limitación encontrada en nuestra investigación es que únicamente hemos analizado el uso de las herramientas 2.0 y los estilos de aprendizaje desde la perspectiva de los estudiantes. Para futuras investigaciones proponemos que se analicen el uso que los docentes hacen de dichas herramientas, así como sus estilos preferentes de enseñanza. De esta forma se podría mejorar su uso con fines educativos, facilitando a los Centros el planteamiento de una formación que se ajuste a sus necesidades. Además, esta medida mejoraría la estrategia de gestión planteada por los Centros en sus proyectos educativos, al minimizar el rechazo que en muchas ocasiones presentan los docentes para introducir las herramientas sociales como un recurso didáctico más. Como afirman Pantoja y Huertas (2010), no solamente se deben de adquirir los conocimientos técnicos que permitan dominarlas, sino conseguir generar un cambio de mentalidad y una actitud positiva hacia el uso de las mismas.

En segundo lugar, nuestro trabajo ha analizado exclusivamente las herramientas 2.0. Sin embargo, el avance de las nuevas tecnologías sigue presente en la actualidad, siendo un elemento fundamental en la actividad económica de nuestra sociedad. Sería interesante para futuras investigaciones realizar un análisis de la nueva tecnología Web 3.0 con fines educativos. Como señala Celaya (2011) este nuevo modelo aporta una mayor información a los datos difundidos por los usuarios (la denominada era 3.0 o semántica web), lo que redundará en los *internautas*, al ser capaces de utilizarla de una manera más productiva. Además, gracias a ella los usuarios podrán identificar de una manera más sencilla la información de calidad (Cobo y Pardo, 2007). Dicha tecnología puede mejorar dos de los inconvenientes encontrados en la implantación de las herramientas 2.0 en el contexto educativo: el exceso de información y la falta de control y revisión de la información (Cabero, 2006; Moreno, 2012).

En tercer lugar, hemos de considerar que investigaciones previas afirman que los estilos de aprendizaje característicos de los alumnos de las distintas modalidades de bachillerato están en clara consonancia con las diferentes disciplinas universitarias (Segura, 2011; Santos y Santos, 2013; Williams, Brown y Etherington, 2013). En este sentido nos parece interesante plantear como futura línea de investigación la realización de un estudio comparativo con los estudiantes universitarios, concretamente aquellos que cursan el grado en Administración y Dirección de Empresas.

Por último, es importante destacar que nuestra investigación se ha realizado en un contexto concreto, la provincia de Cuenca, y más concretamente en una zona rural, pudiendo haber obtenido unos resultados limitados y relativamente sesgados. Para futuras investigaciones planteamos ampliar el estudio a toda la provincia, la Comunidad autónoma o, incluso, realizar una comparativa con otros países. Esta última línea de investigación estaría en concordancia con una de las variables que está cobrando mayor relevancia en los estudio de los últimos años (Alarcón, 2011; Choi y Totten, 2012).

Salvador del Barrio García  
Claudio Ruy Portela de Vasconcelos*

## RESUMEN

*El presente trabajo ofrece un estudio exploratorio acerca de cómo se modeliza el valor percibido en el caso de la educación superior y desde la perspectiva de los egresados. Así mismo, se analiza el impacto de los componentes sobre la satisfacción diferenciado según el sexo. Se obtienen siete dimensiones del valor: tres enmarcados en el valor social (integración en la sociedad, aceptación de amigos y familiares, y los amigos realizados durante la carrera), valor funcional, valor condicional, valor epistémico y emocional y el coste monetario como sacrificio percibido para obtener un título universitario. Para determinar la satisfacción, los valores epistémicos, emocionales y funcionales son los aspectos más importantes no habiendo diferencias según el género. El estudio supone una novedad dada la escasa literatura del valor en la universidad a pesar de que el estudiante realiza importantes sacrificios para obtener en título con la expectativa de conseguir unos beneficios laborales y personales adecuados. Además se analiza desde la óptica de los egresados y aplicado al contexto español.*

## PALABRAS CLAVE:

*Valor percibido, educación superior, satisfacción, diferencias según género*

## 1. Introducción

Las universidades poseen una larga historia de compromiso con el mundo y la sociedad. Las instituciones de educación superior son centros de formación, investigación y transmisión de conocimiento que además suponen un motor estratégico en el escenario productivo y económico de cualquier nación (Estudio GUNI, 2013). Las universidades, dada su importancia, deben transformarse y satisfacer a sus distintos públicos al ritmo de los tiempos debido a la gran influencia que ejercen en la sociedad y su potencial para contribuir al desarrollo humano y social.

Desde hace aproximadamente tres décadas las universidades han desarrollado y establecido políticas de marketing en su gestión (Litten, 1980; Naver y Slater, 1990; Mazzarol, 1998; Marzo, Pedraja y Rivera, 2006; Hemsley-Brown y Oplatka, 2006; Maringe y Mourad, 2012). Estas políticas han sido más complejas y difíciles de asimilar por las instituciones universitarias de carácter público. La adopción de prácticas de marketing ha sido una respuesta a los múltiples cambios políticos, tecnológicos y sociales (así como un aumento de la competencia y la internacionalización) que afecta al mundo de la educación superior.

Este contexto ha dado lugar a la preocupación de los gestores y académicos universitarios por analizar distintos factores que incrementen la mejora del servicio y permitan la correcta rendición de cuentas de la universidad al conjunto de la sociedad con los distintos públicos que la configuran.

La mayoría de la investigación se ha dirigido a conocer cómo es la percepción de los estudiantes acerca de la principal variable durante el transcurso de su experiencia, es decir, la calidad universitaria (Harvey, 1995; Bigné, Moliner y Sánchez, 2003; Munteanu et al., 2010; Sultan y Wong, 2012). Así mismo se ha investigado los resultados del servicio universitario como son la satisfacción (Elliot y Shin, 2002; Biggs, 2003; Alves y Raposo, 2004) o el comportamiento de intención universitaria (recomendación a otras personas, probabilidad de repetir la institución) (Felton et al., 1995; Zellweger et al., 2011).

Sin embargo, dentro de la educación superior se ha obviado prácticamente la importancia del valor percibido (Nguyen y LeBlanc, 1999; Alves y Raposo, 2011) a pesar de ser un elemento esencial puesto que el estudiante realiza importantes sacrificios con la expectativa de que su formación le repercuta positivamente en su experiencia laboral o aportación personal.

Recientes estudios sobre el sector de la educación superior como los de la Fundación BBVA (2012), Informe CYD (2012) o StudyPortals (2013) reconocen la importancia del valor estratégico de la universidad en la sociedad para el desarrollo de la misma. Además, el propio Informe de Expertos del Ministerio de Educación, Cultura y Deporte (2012) establece que deben realizarse estudios desde la perspectiva de los egresados puesto que este *stakeholder* es el único que puede determinar el auténtico valor de un título universitario en función del sacrificio realizado y los beneficios obtenidos.

De forma específica, los objetivos que se persiguen en este trabajo son:

1. Analizar el valor percibido dentro del sector universitario.
2. Explorar y evaluar los principales componentes que conforman el valor percibido desde la perspectiva de los egresados.
3. Conocer cuáles son los componentes el valor percibido que da lugar a un mayor nivel de satisfacción con la experiencia universitaria.
4. Estudiar las diferencias según el sexo del egresado respecto el impacto del valor en la satisfacción.

## 2. Aproximación al concepto de valor percibido

La definición de valor percibido resulta de gran complejidad puesto que se trata de un concepto multifacético y complicado por sus numerosas interpretaciones (Huber, Hermann y Morgan, 2001). El concepto de valor está vinculado con la Teoría de la Equidad que considera la relación obtenida entre lo que entrega el consumidor y los resultados obtenidos del proveedor (Oliver y DeSarbo, 1988). Tal concepto de equidad se refiere a la evaluación de los clientes sobre lo que es justo y merecido por el coste de un servicio (Bol-

ton y Lemon, 1999), así un cliente se siente equitativamente tratado si tiene un saldo positivo de la relación entre el sacrificio y el resultado logrado (Pakdil y Harwood, 2005). De este modo, pensando inicialmente en el servicio universitario, se correspondería con el hecho de que el estudiante tiene una percepción positiva sobre los resultados logrados de los años invertidos y de esfuerzo en su etapa universitaria.

Zeithaml (1988) define el valor percibido como la evaluación general de los consumidores de un producto o servicio, en base a su percepción de lo que "dan" y lo que "reciben" a cambio. Sin embargo, la conceptualización del valor percibido también implica otros factores como el coste percibido, sacrificio o atributos intrínsecos y extrínsecos que se han añadido desde la definición original de Zeithaml.

Por otra parte, Rust y Oliver (1994) consideran al valor como "una combinación de los que se recibe y lo que se sacrifica" mientras que Bigné et al. (2000) lo define como "la valoración global que hace el consumidor de la utilidad de una relación de intercambio basada en las percepciones de lo que da y de lo que recibe". La composición del valor percibido depende del contexto y las características de cada servicio (Dodds, 1991). Sánchez et al. (2006) conciben el valor percibido como una variable dinámica, que se experimenta antes de la compra, en el momento de la compra y de uso y después del uso.

### **2.1. Dimensionalidad del valor percibido**

El concepto de valor ha sido analizado en distintos y muy variados sectores tales como el turismo (Gallarza y Saura, 2006; Chen y Tsai, 2007), la restauración (McDougall y Levesque, 2000; Ryu, Lee y Kim, 2012), sector hotelero (Hu et al., 2009), sector deportivo (Cronin et al., 2000; Murray y Howat, 2002), transporte u automovilismo (Cronin et al., 2000), comercio electrónico (Tam, 2004; Chang et al., 2009), telefonía móvil (Turel, Serenko y Bontis, 2007; Philström y Brush, 2008), en el negocio de las auditorías (Caruana et al., 2000) o en el de la salud (Cronin et al., 2000).

Los estudios del concepto de valor percibido han tenido dos perspectivas fundamentales en la investigación académica: por una parte su modelización desde una perspectiva multidimensional y, por otro lado, desde un enfoque unidimensional.

En primer lugar, los modelos de estructura unidimensional (Patterson y Spreng, 1997; Webb y Jagun, 1997; McDougall y Levesque, 2000; Martensen et al., 2000; Murray y Howat, 2002; Alves y Raposo, 2007; Chen y Tsai, 2007; Lee, Yoon y Lee, 2007; Pihlström y Brush, 2008; Hu et al., 2009; Alves y Raposo, 2010; Sánchez Fernández et al., 2010; Wang, 2010; Alves, 2011; Moosmayer y Siems, 2012; Ryu, Lee y Kiim, 2012; Dib y Alnazer, 2013; Clemes et al., 2013) se desarrollaron con el objetivo fundamental de comprender la relación del valor con otras variables tales como la imagen o la satisfacción. En otras palabras, la cuestión que más interés ha despertado acerca del valor es profundizar en el estudio de éste con otras variables, y para ello, se han enfocado desde una perspectiva unidimensional.

Por otra parte, la perspectiva **multidimensional** (Sheth et al., 1991; Grönroos, 1997; LeBlanc y Nguyen, 1999; Sánchez et al., 2006; Ledden et al., 2007; Brown y Mazarrol, 2009; Lai et al., 2012), surge como una respuesta al hecho de que el valor no supone únicamente un resultado de beneficio/sacrificio donde el aspecto más importante es el precio o coste monetario realizado por el cliente o consumidor.

Este enfoque tiene en cuenta los elementos tanto afectivos como sociales o emocionales del consumidor. En este sentido el trabajo realizado por Sheth et al. (1991) fue clave en la modelización desde esta perspectiva. Realizaron un estudio empírico donde estaban implicadas distintas disciplinas (desde el marketing hasta la psicología clínica) en la cual establecieron la siguiente escala acerca de las dimensiones del valor:

- **Valor funcional:** se relaciona con la percepción de prestaciones/utilidad de un producto o servicio, es decir, la capacidad de la oferta para cumplir su función, así como los beneficios asociados con la posesión del producto o la realización del servicio.
- **Valor social:** representa los beneficios que se derivan a través de interacciones inter-personales así como la aceptabilidad en su entorno social.

- **Valor epistémico:** beneficios derivados de la capacidad del servicio o producto a despertar la curiosidad o satisfacer un deseo de conocimiento.
- **Valor emocional:** registra los beneficios obtenidos a partir de la capacidad de la oferta para despertar sentimientos. Representa sentimientos como la curiosidad o los buenos recuerdos con el servicio.
- **Valor condicional:** representa los beneficios que se derivan de un contexto situacional específico.

Otra escala multidimensional a destacar fue la desarrollada por Sweeney y Soutar (2001) dentro de su estudio en el sector minorista. Los autores concluyeron que el valor está formado por cuatro dimensiones (también según elementos cognitivos y afectivos): el valor emocional, la calidad percibida, el valor social así como el valor monetario (precio).

Por otra parte los modelos de estructura **unidimensional** (Patterson y Spreng, 1997; Webb y Jagun, 1997; McDougall y Levesque, 2000; Martensen et al., 2000; Murray y Howat, 2002; Alves y Raposo, 2007; Chen y Tsai, 2007; Lee, Yoon y Lee, 2007; Pihlström y Brush, 2008; Hu et al., 2009; Alves y Raposo, 2010; Sánchez Fernández et al., 2010; Wang, 2010; Alves, 2011; Moosmayer y Siems, 2012; Ryu, Lee y Kiim, 2012; Dib y Alnazer, 2013; Clemes et al., 2013) se desarrollaron con el objetivo fundamental de comprender la relación del valor con otras variables tales como la imagen o la satisfacción. En otras palabras, la cuestión que más interés ha despertado acerca del valor es profundizar en el estudio del valor con otras variables, y para ello, se han enfocado desde una perspectiva unidimensional.

### 3. El valor percibido en el sector de la educación superior

Como se ha visto en el epígrafe anterior, el concepto de valor ya no supone únicamente satisfacer las necesidades funcionales o de supervivencia sino que ese valor representa necesidades de seguridad, auto-expresión, curiosidad, buscar nuevas experiencias o, incluso, el placer puesto que hoy en día cualquier producto o servicio puede ofrecer un universo simbólico y genera experiencias que signifiquen algo más para las personas desde un punto de vista emocional. Por ello, el valor tiene unas connotaciones diferentes en el mundo universitario y la experiencia del estudiante por todo lo que se deriva y conlleva la experiencia y el paso por la universidad.

Resulta fundamental para las universidades, comprender que la educación superior no ofrece productos o prestan servicios, sino que ofrecen valor. Un estudiante universitario deposita grandes cantidades de esfuerzo, ilusión y confianza en la obtención de un título universitario y espera que se recompense con una buena formación, con la adquisición de conocimientos, con encontrar un trabajo, hacer buenos amigos o tener en el futuro un nivel de vida de acuerdo a sus expectativas. La universidad ofrece, por tanto, un valor emocional y funcional que determinará en gran medida la satisfacción y su percepción.

Así, en el contexto de la educación superior, Lovelock (1983) considera el valor en la universidad como un servicio que ofrece acciones intangibles en las mentes de las personas, el valor percibido se configura como un proceso complejo en el que se evaluarán los beneficios en el ámbito académico, social y personal y las condiciones de empleo, mientras que los sacrificios suelen ser de naturaleza monetaria (matrícula, viaje, alojamiento, etc) o basados en el esfuerzo personal.

Por otra parte, Petruzellis y Romanazzi (2010) consideran que el valor de un servicio universitario no está determinado tanto por las infraestructuras o la calidad de las instalaciones (como podría ser el caso de otros tipos de servicios), sino por el conocimiento que poseen los docentes, los conocimientos adquiridos, la eficacia de los procesos administrativos y la percepción pública de un título universitario. Este concepto de valor percibido se configura dentro del contexto universitario como el resultado neto de la vida universitaria (Stafford, 1994), la percepción de los beneficios recibidos versus sacrificios, y la satisfacción de necesidades (Unni, 2005). En la tabla 1 se ofrecen los estudios que han versado sobre el valor percibido en el sector de la educación superior.

### 3.1. Proceso de creación de valor en la universidad

En nuestro estudio de valor percibido se establece que tal dimensión podría surgir de la comparativa de un estudiante del servicio recibido con sus expectativas así como de la etapa laboral surgida tras su etapa universitaria en función de los sacrificios realizados. Todo ello desde un punto de vista tanto emocional como racional o cognitivo. Pero ¿cómo se lleva a cabo el proceso de creación de valor?

Dentro del sector servicios, Kotler et al. (2000) planteaba que los usuarios acuden a un determinado servicio a aquel proveedor que les pueda proporcionar la máxima expectativa de valor. Realizando un símil con el servicio universitario sobre los factores que exponía como claves en el valor, podemos destacar lo siguiente:

- Valor percibido: diferencia entre el beneficio y el coste total. En la educación superior supondría el saldo positivo percibido por el estudiante a cambio del esfuerzo realizado. De forma específica:
  - Beneficio total recibido: conjunto de ventajas que se ha recibido. Aquí se puede señalar distintos aspectos referido a los resultados: consecuencias laborales, académicas, vida social, calidad, etc.
  - Coste total: En el caso de la universidad supondría todo el esfuerzo monetario y de tiempo entre otros frente a los resultados alcanzados y la conformidad con el servicio universitario. En definitiva, la suma de todos los aspectos negativos que siente que no han sido compensados.

Por otra parte, si atendemos a estudios específicos del proceso de creación de valor universitaria, destaca el realizado por LeBlanc y Nguyen (1999) donde partiendo de la perspectiva multidimensional del valor de Sheth et al. (1991) establecen los siguientes componentes en la creación del valor en el estudiante:

- Valor funcional: en el contexto de la educación, este valor se relaciona con las expectativas de los estudiantes respecto a sus estudios elegidos y el empleo o los resultados laborales derivados de tales estudios.
- Valor social: se relaciona en el contexto educativo a través del valor que perciben los estudiantes sobre las amistades con los compañeros y su integración y aceptación del entorno y la sociedad.
- Valor epistémico: se refiere a que el que el principal beneficio es la adquisición de conocimiento.
- Valor emocional: se realiza a través del sentido del entusiasmo y el auto-rendimiento de los estudiantes en su carrera.
- Valor condicional: se relaciona fundamentalmente con los elementos tangibles (material escolar, infraestructuras, etc.).

Con todo este proceso, podríamos definir el valor en el contexto universitario como *el saldo resultante del juicio evaluativo entre el sacrificio percibido y el beneficio percibido en función de aspectos académicos, socia-*

les, de calidad, de crecimiento personal y resultados obtenidos tanto laborales como de confirmación de las expectativas.

Teniendo en cuenta todo este proceso de valor, en la educación superior dependería de las expectativas, de la percepción de calidad así como de los componentes cognitivos y afectivos que componen el valor donde entra en juego el sacrificio y el beneficio percibido. Todo ello desde la perspectiva del estudiante, pues no se debe obviar que la universidad debe ofrecer valor a sus distintos stakeholders y a la sociedad en general aunque en este punto se estaría limitado y sería difícil definir los sacrificios percibidos, por ejemplo, por parte de las empresas. El proceso de valor en el estudiante se representa de forma sintética en la figura 1.

FIGURA 1  
Proceso de creación en la universidad.

#### 4. Valor percibido y satisfacción

En el marco de la educación superior, Elliot y Healy (2001) afirman que la satisfacción de los estudiantes es una actitud a corto plazo derivada de la evaluación de su experiencia educativa. Por otra parte, Elliott y Shin (2002) la definen como la evaluación subjetiva de los estudiantes de los diferentes resultados (empleo, social, etc), así como sus experiencias de la educación y la vida en el campus y sus expectativas iniciales.

Normalmente la satisfacción de los estudiantes ha sido evaluada a lo largo de la literatura a través de cuestionarios que valoran la calidad docente y el contenido de las materias, o mediante servicios específicos como la biblioteca. Pero en menor medida se envían cuestionarios a los estudiantes donde puedan evaluar la institución tras finalizar la etapa universitaria. Los estudiantes participan en un proceso de educación constituyendo el principal stakeholder de la universidad y, de esta manera, el enfoque de satisfacción del alumnado va mano a mano con el desarrollo de una cultura de la mejora continua de la universidad (Harvey, 1995).

Biggs (2003) realiza una revisión de los estudios que han abordado la satisfacción universitaria concluyendo que lograr una alta satisfacción del estudiante permite obtener distintos beneficios en el proceso de aprendizaje: Mejor desempeño y el entusiasmo de los profesores al comprobar su alta valoración de su servicio y la institución está más dispuesta a los cambios, en el caso de la educación superior, por ejemplo, a asumir nuevos estilos de enseñanza / aprendizaje.

Por otra parte, dada la polisemia de la noción de valor, se ha señalado la existencia de dificultades para comparar distintos estudios empíricos y, con ello, la inconsistencia en los procedimientos de medición del valor percibido y satisfacción (Gallarza y Gil, 2006). En este sentido, existe consenso en cuanto a la multidimensionalidad del concepto de valor (Sweeney y Soutar, 2001), y su influencia sobre la satisfacción.

El valor percibido es un constructo diferente al de la satisfacción. Esta diferencia radica principalmente en que, mientras el valor percibido ocurre en el desarrollo de las diferentes etapas del proceso de adquisición de un producto o servicio, incluyendo la etapa de pre-compra (Woodruff, 1997), la satisfacción se define como una evaluación post-compra y post-consumo (Hunt, 1977; Oliver, 1981), siendo universalmente aceptada esta vi-

sión por los investigadores que han estudiado el concepto. Las percepciones del valor, por tanto, se podrían generar sin haber comprado o usado el producto, mientras que la satisfacción dependerá siempre de la experiencia de utilización del producto o servicio adquirido.

Mientras tanto, una serie de autores han aludido a la importancia de combinar la medición del valor con satisfacción (Woodruff, 1997, Oh, 2000). El valor percibido se ha estudiado extensamente en la investigación como antecedente de la satisfacción del cliente (Patterson y Spreng, 1997; Mittal et al., 1998). Se ha demostrado que el valor tiene una participación directa y específica con la satisfacción respecto a un determinado servicio (Rust y Oliver, 1994).

Así mismo, dentro del contexto universitario diferentes autores han confirmado la relación positiva del valor percibido como antecedente de la satisfacción (Webb y Jagun, 1997; Martensen et al., 2000; Ledden et al., 2007; Alves y Raposo, 2007; Brown y Mazzarol, 2009; Alves, 2010; Alves y Raposo, 2010; Sánchez Fernández et al., 2010; Alves, 2011; Lai et al., 2012; Moosmayer y Siems, 2012; Clemes et al., 2013).

Lai et al. (2012) ponen de relieve la importancia del valor percibido en las universidades para la identificación de las necesidades de los estudiantes y lograr su satisfacción. Todo con el fin de conseguir, en última instancia, modelos más eficaces de educación. Vila et al. (2007) también han estudiado los efectos del valor en cuanto a los posibilidades de trabajo mientras que Ledden et al. (2007) consideran que las personas perciben el valor dentro de un entorno socio/cultural global que define y forma los valores personales. Tales estudios llegan a la conclusión de que el valor es un determinante importante de la satisfacción.

## 5. Metodología

### 5.1. Muestra y trabajo de campo

El trabajo de campo se realizó durante el mes de julio de 2012. La selección de la muestra se hizo a través de un muestreo aleatorio mediante entrevistas telefónicas asistidas por ordenador (CATI) tomando como universo la población española de egresados que tuvieran al menos un título de diplomatura o licenciatura o postgrado (master o doctorado) con fecha posterior a 1997. La decisión de elegir un periodo no superior a 15 años desde la finalización de los estudios se basa en la idea de que más allá de ese tiempo la situación de la universidad española era muy diferente a la actual y los datos no serían del todo comparables, al margen del esfuerzo de memoria que deberían hacer los sujetos a la hora de responder al cuestionario.

El cuestionario constaba de los siguientes bloques de preguntas: motivos de elección de estudios universitarios, nivel de implicación, valor percibido, valoración de la calidad percibida, satisfacción, imagen, lealdad y variables sociodemográficas.

Finalmente se obtuvo una muestra de 537 respuestas válidas, que para un nivel de confianza del 95%,  $P=Q=0,5$ ; implica un error del 4,23% asumiendo que se cumplen los requisitos del muestro aleatorio simple. Está compuesta por un 56,6% de mujeres y un 43,4% de hombres. El 63,5% de los sujetos manifestaban estar trabajando frente al 36,5% que estaban en situación de desempleo.

Por área científica, los egresados de Ciencias Sociales son quienes tienen la mayor representación muestral suponiendo más de la mitad de los encuestados (55,6%). Por el contrario, Ciencias Experimentales es quien tienen una menor representación muestral (4,9%),

TABLA 2  
Características de la muestra

Variable	Categoría	Muestra	
		N	%
Género	Hombre	233	43.4
	Mujer	304	56.6
Situación laboral	Autónomo	39	7.3
	Contrato fijo	110	20.5
	Contrato temporal	85	15.8

	Funcionario	79	14.7
	Prácticas	23	4.3
	Sin trabajo	201	37.4
<b>Nivel de estudios</b>	Grado	455	84.7
	Posgrado	82	15.3
<b>Edad</b>	<25	80	15.0
	25-30	164	30.5
	31-35	144	26.8
	36-40	95	17.7
	>40	54	8.4
<b>Área científica</b>	Ciencias de la Salud	74	13.4
	Ciencias Experimentales	27	4.9
	Ciencias Sociales	302	55.6
	Enseñanzas Técnicas	66	12.1
	Humanidades	62	11.3

## 5.2. Medida de las variables

Para la medida multidimensional del valor percibido se recurrió a diversas escalas adaptadas de varios trabajos previos en el ámbito universitario (LeBlanc y Nguyen, 1999; Cronin et al., 1997; Ledden et al., 2007) que se inspiraban en las teorías del concepto de valor percibido de Sheth et al. (1991).

Respecto a la satisfacción se utilizó una escala adaptada de Cronin et al. (2000) de tipo Likert (de 1 a 5) de 4 ítems para medir la satisfacción con la experiencia universitaria. Esta escala fue utilizada en el sector de la educación universitaria por Ledden et al. (2007)

## 6. Análisis de datos

### 6.1. Exploración de las dimensiones del valor percibido

Dentro de las variables del cuestionario, el valor percibido era medido en el cuestionario a través de 27 ítems diferentes. Para sintetizar y comprender los factores que subyacían en tales variables, y que se deseaban investigar en el estudio, se procedió a realizar un análisis factorial exploratorio para comprender las agrupaciones homogéneas de tales variables. Durante el análisis se suprimieron cuatro ítems incluidos en el cuestionario, debido a que ofrecían una baja comunalidad (menor de 0,5): “La ciudad donde se localizaba mi universidad era muy atractiva”, “Fui a la universidad en el contexto social y económico adecuado”, “Creo que las empresas u organizaciones están interesados en contratar estudiantes de mi universidad” y el “El esfuerzo que requirió la consecución de mi título fue muy alto”. De este modo, el número total de variables en este momento se reducía a 23.

El análisis ofreció unos valores adecuados de KMO (0,89) y de prueba de esfericidad de Barlett ( $p=0,00$ ) favorables para la realización del análisis. Se seleccionó un número total de siete factores dado el criterio de escoger los autovalores superiores a 1. Estos factores suponen un 66% de la varianza total explicada. Luego se realizó una fase de rotación mediante el procedimiento Varimax para conocer la estructura de los siete factores. Se utilizó esta rotación ya que se trata de un método ortogonal y además de que es uno de los enfoques más ampliamente utilizados, tal como destaca Luque (2012). Los resultados no varían cuando se utilizan otros métodos de rotación ortogonales, como Quartimax o Equimax.

Los siete factores obtenidos son: “Valor social: aceptación del entorno” (6,8% de la varianza explicada); “Valor social: integración” (7,9%); “Valor social: amigos” (4,7%); “Valor funcional” (9,3%); “Valor condicional” (5,1%); “Valor epistémico y emocional” (25,8%) y “Valor: coste monetario” (6,5%).

En la tabla 3 se detallan la composición de tales factores o dimensiones contempladas en el análisis así como las comunalidades de cada uno de los diferentes ítems donde se pueden encontrar que los ítems “Las personas que me influyen veían bien que yo asistiera a la universidad” (0,83), “Mis familiares y amigos veían bien que yo asistiera a la universidad” (0,82) y “La localización de la facultad/escuela dentro de la ciudad era conveniente” (0,81) son las que están mejor representadas en la solución factorial. Por el contrario, “Estudiar

en mi universidad me proporcionó importantes contactos profesionales para el futuro” (0,51) y “La novedad de la experiencia universitaria despertó mi curiosidad” son las que tienen las comunales más bajas. En todos los factores se encontraron valores de alfa de Cronbach por encima de 0,7 excepto en los casos del “valor condicional” y “coste monetario” que oscilaban con valores entre 0,6 y 0,7.

**TABLA 3**  
**Dimensiones del valor percibido**

<b>FACTOR</b>	<b>VARIABLES</b>	<b>COMUNALIDAD</b>
FACTOR 1: Valor social: aceptación del entorno	Mis familiares y amigos veían bien que yo asistiera a la universidad	0,820
	Las personas que me influyen veían bien que yo asistiera a la universidad	0,831
FACTOR 2: Valor social: integración	Se valoró más mi opinión desde que obtuve el título en la universidad	0,680
	Haber asistido a mi universidad me ayuda a sentirme socialmente aceptado	0,655
	Haber realizado mi carrera contribuyó a mi desarrollo personal	0,612
FACTOR 3: Valor social: amigos	Los amigos que hice en la universidad fueron una parte importante de mi experiencia universitaria	0,560
FACTOR 4: Valor funcional	Mi título me ha permitido ganar un mejor sueldo ahora	0,672
	Mi título me ha permitido conseguir mis objetivos profesionales	0,782
	El conocimiento que adquirí durante mi carrera me ha permitido realizar mi trabajo mejor	0,530
	Mi carrera fue una buena inversión para mi futuro	0,712
	Estudiar en mi universidad me proporcionó importantes contactos profesionales para el futuro	0,509
FACTOR 5: Valor condicional	La localización de la facultad/escuela dentro de la ciudad era conveniente	0,810
	El ambiente de la universidad era agradable	0,659
FACTOR 6: Valor epistémico y emocional	El contenido de mis estudios me interesaba	0,555
	Haber estudiado en mi universidad fue una experiencia que me motivó intelectualmente	0,722
	La novedad de la experiencia universitaria despertó mi curiosidad	0,519
	Me siento orgulloso de haber estudiado en la universidad	0,524
	Haber estudiado en mi universidad ha supuesto la realización de una ambición	0,577
	La entrada en mi universidad fue un reto personal	0,703
	Haber asistido a mi universidad me hizo sentir auto-realizado	0,708
	Haber realizado mi carrera contribuyó a mi desarrollo personal	0,546
FACTOR 7: Coste monetario	El coste de la matrícula universitaria fue muy alto	0,736
	Los costes económicos derivados de mi estancia en la universidad fueron muy altos (ej. alojamiento, manutención, transporte, etc.)	0,747

En la exploración de los valores subyacentes del valor percibido según la perspectiva de los egresados hay notables diferencias con respecto a otros estudios que han modelizado esta variable dentro del contexto de la educación superior. En primer lugar, el valor social se fragmenta en tres diferentes dimensiones. El valor social percibido de su paso por la universidad tiene tres connotaciones distintas: la aceptación de las personas de su entorno (amigos y familiares), sentirse más integrado y valorado en la sociedad al tener un título universitario y, por último, hay un factor conformado por el valor otorgado a los amigos que hicieron durante la carrera universitaria (es el único factor representado con un solo ítem). En otros estudios (LeBlanc y Nguyen, 1999; Ledden et al., 2007; Brown y Mazzarol, 2009; Lai et al., 2011) la dimensión social estaba representado por un único factor. En sus estudios, era en todos los casos el valor funcional se dividía en distintas sub-dimensiones dada su importancia.

Otro aspecto a destacar en referencia los estudios mencionados es el hecho de que el valor epistémico y emocional estén unidos y carguen en un solo factor según nuestros resultados. De este modo existe una especial vinculación entre la curiosidad y el interés intelectual respecto a otras variables del valor emocional estrechamente relacionadas: la universidad como un reto personal, sentirse orgulloso de haber acudido a la universidad y que la experiencia haya aumentado la confianza en sí mismo.

**6.2. Efecto de los componentes de valor sobre la satisfacción**

Tras comprender las dimensiones que conforman el valor percibido desde la perspectiva de los egresados y dentro del contexto español, se procede a analizar su efecto en la satisfacción con la universidad. Tal objetivo será llevado a cabo mediante la realización de dos modelos de regresión lineal (uno para cada sexo) para conocer si existe diferencias según el sexo del graduado.

Por lo tanto las variables independiente son los 7 factores obtenidos anteriormente y la variable dependiente la satisfacción. Para medir la satisfacción se realizó un análisis factorial exploratorio de los cuatro ítems que miden tal variable en el cuestionario. El objetivo era comprobar si efectivamente hay una estructura homogénea y obtener una medida métrica única. El análisis factorial tuvo un test de esfericidad de Barlett ( $p=0,00$ ) adecuado y los 4 ítems presentaban altas comunalidades (por encima de 0,8) por lo que no se eliminó ninguno. La varianza explicada es del 77%.

**TABLA 3  
Análisis factorial Satisfacción**

	Ítems	Comunalidad
FACTOR 1: Satisfacción	En términos generales, estoy satisfecho con mi universidad	0,910
	Estoy satisfecho con el servicio prestado por mi universidad	0,856
	Tomé la decisión correcta cuando elegí esa universidad	0,919
	La experiencia con mi universidad fue satisfactoria	0,812

En los análisis de regresión realizados, tanto para el modelo de hombres y de mujeres, el análisis resultó significativo en su conjunto ( $p=0,00$ ). En cuanto a los  $R^2$  se obtuvo que la satisfacción era explicada en el caso de los hombres en un 47% mientras que en las mujeres aumentaba al 51%. En la tabla 4 aparecen los resultados de los análisis de regresión según hombres y mujeres:

**TABLA 4  
Resultados Valor-Satisfacción por sexo**

Dimensión	HOMBRES			MUJERES		
	<i>B</i>	Error	Sign.	<i>B</i>	Error	Sign.
Término independiente	,017	,052		0,14	0,041	
<b>Social (entorno)</b>	,075	,045	,099	,035	,045	,433
<b>Social (integración)</b>	,037	,051	,472	,034	,040	,388
<b>Social (amigos)</b>	,187	,049	,000	,126	,041	,002
<b>Funcional</b>	,272	,053	,000	,300	,039	,000
<b>Condicional</b>	,233	,051	,000	,279	,040	,000
<b>Epistémico y emocional</b>	,539	,050	,000	,559	,042	,000
<b>Coste económico</b>	-,041	,048	,389	-,076	,043	,076

Observando la tabla puede comprobarse que no existen prácticamente diferencias en el efecto de los distintos componentes de valor sobre la satisfacción según el sexo. En ambas regresiones las variables de “valor social (amigos)”, “valor funcional”, “valor condicional” y el “valor epistémicos y emocional” son significativas para determinar la satisfacción mientras que en los casos de otros valores de tipo social y el coste económico no son significativas (aunque en el caso de las mujeres es cuasi-significativa,  $p=0,076$ ). Por lo tanto, en consonancia con los resultados de Lai et al. (2011) no se encuentran diferencias según el sexo a la hora de analizar el valor sobre la satisfacción. Además, en ambos grupos el orden de importancia de las dimensiones de valor es el mismo. En un análisis pormenorizado de cada componente podemos destacar los siguientes aspectos:

En primer lugar, respecto a los distintos factores del valor social, la aceptación del entorno, es decir, la influencia para los egresados de sus familiares y personas cercanas no tiene un impacto importante para la satisfacción. Del mismo modo, para determinar la satisfacción, la aceptación de la sociedad y su estatus según el título académico no tiene un efecto significativo ni para los hombres ni para las mujeres. Ello

está en contraposición con Petruzellis y Romanazzi (2010) que establecían que la aceptación social era el aspecto más importante. En cambio, los egresados están más satisfechos por la dimensión social que supone los amigos de su experiencia universitaria. Las amistades se conforman (según el indicador *B* ofrecido en la tabla) como el cuarto aspecto más importante para la satisfacción en ambos sexos. Por lo tanto, el auténtico valor reside en las amistades y no asocian su satisfacción a la aceptación de terceros y la imagen social al tener un título universitario.

En segundo lugar, el valor funcional es significativo siendo el segundo aspecto más importante a la hora de configurar la satisfacción. De esta manera, tras obtener el título para los egresados es importante que el valor de su título se traduzca en un sueldo adecuado, en una profesión acorde a sus expectativas y que sientan que ha sido una apuesta de futuro acertada además de la propia pertinencia de la formación recibida, la calidad percibida o el profesorado. En definitiva, que el sacrificio realizado se traduzca en beneficios pragmáticos y que compensen al esfuerzo que se ha llevado a cabo. Estos resultados, contrastan con los estudios de Nguyen y LeBlanc (1999), Ledden et al. (2007), Brown y Mazzarol (2009) y Lai et al. (2011) que establecían que esta dimensión era la más importante para la satisfacción del estudiante.

En tercer lugar, referido al valor condicional, resultando significativo para la satisfacción es el tercer aspecto para aumentar el nivel de la misma. Esta dimensión se relaciona con los elementos tangibles (material escolar, infraestructuras, etc.) así como el ambiente y la localización de la universidad. Con ello podemos deducir, que para los egresados es importante que la universidad o el campus se encontrara en un lugar adecuado (o que incluso estuviera cerca de su hogar de origen para los estudiantes desplazados) y que el ambiente fuera afín a sus expectativas, algo que está estrechamente relacionado con el valor social de los amigos. Estos resultados validan los obtenidos por Nguyen y LeBlanc (1999).

En cuarto lugar, el valor epistémico y emocional es la dimensión más importante a tener en cuenta a la hora de satisfacer al estudiante universitario. Los egresados otorgan la máxima importancia al hecho de desarrollarse intelectualmente, de que la universidad les forme como personas o de que se sientan autorrealizadas. Tal como afirmaba Lovelock (1983) el valor en la universidad se basa en beneficios intangibles en las mentes de las personas. De este modo, tal como se expuso en la revisión de la literatura, el servicio de la educación superior se caracteriza por una mayor importancia de los aspectos emocionales en el concepto de valor dado el entusiasmo, la ilusión y la propia experiencia en el estudiante universitario.

Por último, el coste monetario no es significativo para la satisfacción (aunque en el caso de las mujeres es cuasi-significativo). Es la única relación que se establece de forma negativa, como resulta lógico pues un alto coste disminuye la percepción de valor. Estos resultados están en contraposición a Ledden et al. (2007) que encontraron que éste era un factor de importancia para la satisfacción.

Los resultados aquí comentados confirman la relación positiva del valor percibido como antecedente de la satisfacción al igual que otros estudios anteriores en el sector de la educación superior (Webb y Jagun, 1997; Martensen et al., 2000; Ledden et al., 2007; Alves y Raposo, 2007; Brown y Mazzarol, 2009; Lai et al., 2012; Moosmayer y Siems, 2012; Clemes et al., 2013) así como de otros estudios en otros sectores de servicios (Patterson y Spreng, 1997; Mittal et al., 1998)

## **7. Conclusiones**

El presente trabajo ha tenido como objetivo explorar las dimensiones del valor percibido en la educación superior y comprender su efecto sobre la satisfacción. El estudio supone una novedad dado los pocos estudios que versan sobre el valor ofrecido por la universidad (sobre todo desde un punto de vista multidimensional) además de ser de los pocos realizado desde la perspectiva del egresado y en el marco español.

Los resultados revelan que el valor está conformado por siete dimensiones: tres referidos al valor social ofrecido por la universidad (la integración con la sociedad, la aceptación de sus personas cercas y los amigos realizados durante la carrera), el valor funcional, valor epistémico y emocional, valor condicional, y valor como esfuerzo económico realizado. Por orden importancia, a la hora de determinar la satisfacción con la experiencia universitaria, para los egresados el aspecto emocional y epistémico es el más importan-

te seguido del valor funcional, valor condicional y, por último, los amigos. Además, los resultados son similares tanto para los egresados y las egresadas,

Los hallazgos de este trabajo podemos concluir que tienen implicaciones en tres niveles: en primer lugar, la universidad debe tener en cuenta que el desafío intelectual y la experiencia emocional son los principales atributos de valor para el egresado. En este sentido, la formación debe estar dirigida a motivar al alumno, a despertar la curiosidad y el interés por la novedad, en formarle en capacidad y habilidades, en la transmisión de conocimientos. Además es importante tener en cuenta que la autorrealización y desarrollo personal está vinculado estrechamente con la satisfacción.

En segundo lugar, los gestores universitarios deben poner un especial énfasis en la calidad funcional del servicio lo que implica tener en cuenta, sobre todo, el contacto con las empresas, la oferta de prácticas, la adecuación de los estudios al empleo posterior. En esta misma línea, se deben tener en cuenta a las empresas. Los egresados consideran que el valor de un título reside en gran medida en los resultados laborales alcanzados y el desarrollo profesional. Por último, en tercer lugar, el valor social como son los amigos y el condicional que implica un buen ambiente universitario y la pertinencia de la ubicación. Por lo tanto, las universidades deben fomentar actividades sociales y culturales que integren al alumno con la institución y le permita establecer nuevos contactos. Ello implica otros servicios como el alojamiento o, incluso, redes sociales.

El presente estudio presenta ciertas limitaciones como son que el valor de coste monetario y condicional aunque presenta valores aceptables no son óptimos en cuanto al alfa de cronbach así como que no se incluyen otros antecedentes de la satisfacción como puede ser la calidad o la imagen. En cuanto a futuras líneas de investigación sería interesante estudios que tuvieran en cuenta diferentes públicos de la universidad (estudiantes aún no graduados, ciudadanos, etc.) acerca del valor de la universidad o estudios transculturales además de modelos más completos de antecedentes y consecuencias de las dimensiones de valor.

## RESUMEN

*Las exigencias marcadas por el proceso de convergencia europeo de educación superior han abierto un gran campo para la innovación docente. La introducción de planteamientos pedagógicos más modernos y diferentes, permiten cambiar el papel del docente que pasa de instructor a facilitador en el tratamiento del conocimiento, además de favorecer una implicación mucho más activa del alumno. El ámbito de este trabajo en curso se circunscribe en la adaptación de nuevas metodologías docentes en el área de Comercialización e Investigación de Mercados, con la introducción de la figura de relator, de forma que el modelo docente se centra en el aprendizaje constructivo del alumno y apoyado en el desarrollo de competencias transversales.*

## Palabras clave

Innovación Docente, Constructivismo, Facilitador, Relator, Nuevas Metodologías, Conocimiento Transversal, Herramientas virtuales.

## 1. Introducción

El Espacio Europeo de Educación Superior busca mejorar la calidad en los resultados del aprendizaje en pro de unas mejores capacitaciones y competencias en los alumnos, tanto específicas, como genéricas. Estas últimas se refieren a que son compartidas por distintas ocupaciones o varios ámbitos del conocimiento, lo que implica el estar en posesión de conocimientos que aplicar a entornos nuevos, dentro de contextos más amplios o multidisciplinares.

El proceso de Convergencia Europea implica un "cambio de paradigma en los procesos de enseñanza" favoreciendo la utilización de procedimientos instrumentales (De Miguel *et al.*, 2006) con los que poder llevar la innovación docente al aula y aprovechar los beneficios en los desempeños, que en los estudiantes se pueden generar, con la introducción de nuevas metodologías docentes. Conseguir que la implementación de esta innovación docente, suponga la calidad de los resultados del aprendizaje, que pretende el Espacio Europeo de Educación Superior supone un reto. Para alcanzarlo, los docentes universitarios han de promover propuestas innovadoras que fomenten la formación integral al colectivo de estudiantes, así como una formación no sólo efectiva sino también eficiente, con miras a la repercusión que ésta tendrá en la sociedad del siglo XXI.

En línea con lo anterior, resulta fundamental la implantación de propuestas novedosas que aborden la consolidación y la actuación de conocimientos en todas las áreas del saber, mediante programas y contenidos didácticos que ayuden a procurar un aprendizaje atractivo, que motive a los alumnos en la aprehensión de conocimientos, como incentivo, a fin de mejorar los logros y frutos de ese aprendizaje (Bas, 2006). Entendemos que el concepto, *dinamización del aula*, no se trata tanto de un nuevo tipo o una nueva forma de docencia, sino de un impulso innovador al ya existente, con metodologías y recursos actualizados al mundo en el que nos desenvolvemos. En definitiva consiste en adoptar un nuevo rol en la docencia, adecuado al nuevo entorno, con el uso de metodologías innovadoras que permitan alcanzar destrezas (Villa *et al.*, 2007), competencias y acciones en el aula en pro de una formación para los estudiantes lo más completa y cercana posible a la realidad. Se refiere también a la utilización de herramientas virtuales, modos de trabajo e hitos evaluatorios, que persigan el objetivo de abrir un espacio de interacción entre docentes y alumnos y entre los propios alumnos, contribuyendo a la aparición de una comunidad y no a un conjunto de individuos aislados, que permitan alcanzar los resultados del aprendizaje previstos.

Con el presente trabajo en curso, se propone estudiar cómo puede afectar al resultado de las asignaturas de marketing en el nuevo contexto del EEES, el desarrollo de la *dinamización del aula*, a través de la actualización de metodologías y recursos ya existentes en general, y con la introducción de la figura del *relator* como innovación docente en particular. Esta figura que se utiliza en la asignatura "Introducción a la Investigación de Mercados", obligatoria en el 2º curso del Grado de Administración y Dirección de Empresas, puede contribuir a una mejora de la calidad docente mediante un aprendizaje por competencias, puesto que el modelo docente se centra en el aprendizaje constructivo del alumno y se apoya en el desarrollo de sus competencias transversales.

A continuación exponemos un apartado en el que se explican las diferentes estrategias didácticas en las que se puede fundamentar esta *dinamización del aula*, basadas en un enfoque constructivista, y a través de competencias transversales y de herramientas virtuales. Terminaremos este trabajo en curso con la propuesta de unos análisis y unas consideraciones finales.

## 2. Estrategias Didácticas

Dado que la sociedad actual se encuentra sometida a rápidos y constantes cambios, de tipo económico, científico, tecnológico y cultural, resulta fundamental que la universidad y los docentes universitarios adopten un rol multidimensional a la hora de relacionarse con los estudiantes, a través de dinámicas educativas que les permitan adecuarse a los nuevos escenarios cambiantes, en los que éstos se han de desenvolver en un futuro próximo, cuando se incorporen a la sociedad como profesionales formados en la universidad.

## 2.1. Enfoque Constructivista

La rica investigación existente sobre los procesos de aprendizaje y formación del conocimiento, nos ha permitido acercarnos a uno de sus paradigmas, el constructivismo. Se trata más que una teoría en sentido estricto, de un marco explicativo o conjunto articulado de principios, desde donde es posible diagnosticar, establecer juicios y tomar decisiones fundamentadas sobre la enseñanza (Coll y Salé, 1999). El constructivismo plantea fundamentalmente que, el conocimiento se va construyendo activamente por el sujeto a partir de su experiencia, lo que le permite adaptarse y aprender de forma activa a través de las nuevas situaciones que se le plantean. Su potencial para el docente es poder utilizarlo como herramienta para la planificación docente y como marco evaluador sobre la consecución de las metas que se persiguen en el aula.

El planteamiento constructivista (Carretero, 2009) no ve al ser humano como un receptor pasivo de experiencias y aprendizajes, sino como un constructor activo de habilidades y conocimientos (Chadwick, 2012). Lo que significa que, en el proceso de aprendizaje, el alumno estructura, extiende e interpreta las experiencias e informaciones que le facilita el docente, para construir conocimiento a través de su propio trabajo. De esta forma, el constructivismo asume que el conocimiento se va construyendo a través de aspectos cognitivos, sociales y afectivos. Su base se fundamenta en las teorías e investigaciones psicológicas y educativas llevadas a cabo por autores como Ausubel (1983), Bruner (1959; 1966), Piaget (1981; 1990) y Vigotsky (1978; 1985; 1991).

Con este enfoque, el alumno va construyendo su propio conocimiento a través de un aprendizaje significativo (Ausubel *et al.*, 1983). Para poder alcanzar dicho aprendizaje han de combinarse tres elementos: las actitudes, las aptitudes y los contenidos. Según estos autores, para lograr este tipo de aprendizaje, el estudiante ha de asimilar, relacionar y enjuiciar los nuevos conocimientos con aquellos que ya posee, desde una actitud interesada. Del mismo modo, el docente debe estructurar en el diseño de la asignatura un cuerpo de conocimiento que sea fácilmente asimilable para el estudiante (Bruner, 1966), mediante la organización de tareas, formación de grupos, secuenciación en los aportes de material, proponiendo la búsqueda de información, etc.

Con la implementación de este enfoque en las asignaturas de marketing en general, y la de "Introducción a la Investigación de Mercados" en particular, tratamos de desarrollar una metodología activa e inductiva en la que los estudiantes construyen su propio conocimiento a través de la investigación, el descubrimiento y la interpretación de sus experiencias. La forma de aplicarlo en el aula es mediante el planteamiento a los alumnos del desarrollo de trabajos expositivos, fundamentados en casos reales, los cuales les permiten a los estudiantes reflexionar, argumentar, crear, aplicar, explicar y resolver situaciones problemáticas. Una de las figuras que potencia, todavía más si cabe, este aprendizaje significativo es la de *relator*.

Los trabajos consisten en cinco casos prácticos<sup>1</sup>, realizados en equipos de cuatro a seis miembros, basados en el planteamiento de una investigación de mercados concreta, para la que se han de desarrollar respectivamente, los siguientes aspectos:

1. Determinar decisiones comerciales a tomar, recabar información necesaria y buscar fuentes de información para la propuesta de investigación.
2. Presentar los resultados de la aplicación de técnicas cualitativas y de observación para la propuesta de investigación.
3. Presentar un estudio basado en una encuesta y relacionarlo con la propuesta de investigación.
4. Presentar un experimento relacionado con la propuesta de investigación.
5. Exponer un informe final de toda la investigación de mercados realizada, revisada y mejorada.

Junto con este desarrollo se introduce la figura antes citada del *relator*. El papel del relator consiste en la elaboración, de comentarios críticos y constructivos que además permitan un punto de partida para el debate. Es decir, todos los casos elaborados en grupo y expuestos en clase, son "relatados" por otro

---

<sup>1</sup> Cabe apuntar que los alumnos que realizan estos casos prácticos, previamente han optado por el sistema de evaluación continua. Es decir, dichos casos prácticos suman una puntuación de hasta 3,5 puntos sobre el total de la nota final.

equipo previamente asignado. La función del equipo que relata es exponer una serie de comentarios al equipo que expone su trabajo, con la intención de destacar aquellas cuestiones de las ya planteadas que se pueden mejorar, resolver dudas, o incluso introducir innovaciones, en caso de detectar carencias en el tratamiento de determinados aspectos relacionados con dichos casos prácticos. De esta forma, cada equipo, una vez realizada la presentación de su caso práctico, debe contestar y defender de forma razonada su presentación ante los comentarios, dudas y propuestas de su equipo "relator", generando el establecimiento de un debate entre ambos equipos y el resto de la clase. Además, todos y cada uno de los equipos ejercen de relator a un equipo diferente a lo largo de las cinco sesiones prácticas, puesto que la asignación la realiza el profesor de forma aleatoria pero controlada. Así, se pone de manifiesto la importancia de la figura de relator, ya que a lo largo de toda la investigación, y específicamente en el desarrollo del informe final, los alumnos tienen que demostrar que han considerado e implementado todas las correcciones que les han sido recomendadas por los equipos que han ejercido dicho papel de relator y por supuesto, las realizadas por el profesor, que siempre ejerce de juez y dinamizador durante todo el proceso de las prácticas.

## **2.2. Competencias Transversales**

La adquisición de competencias transversales, es una necesidad que ha sido plasmada en las memorias de los títulos de grado, y que supera el ámbito del sistema docente universitario tradicional. Ya en el proyecto piloto apoyado por la Comisión Europea en el marco del programa Sócrates, cuyo objetivo consistía en "sintonizar las estructuras educativas en Europa" y denominado proyecto Tuning, se confirma la necesidad de que la capacitación del alumno venga de la mano de la asimilación por el mismo no sólo de competencias específicas sino también de lo que han venido a llamarse competencias genéricas o transversales (González y Wagenaar, 2003; 2006).

El desarrollar en la universidad competencias no tradicionales como las habilidades sociales de liderazgo (Brunner, 2009), habilidades de comunicación, o la capacidad de trabajo en equipo, la capacidad para planificar, organizar, dirigir y controlar tareas, personas y recursos, o la capacidad para resolver problemas y tomar decisiones con iniciativa, creatividad y razonamiento crítico, permiten a los egresados acceder a conocimientos fundamentales y básicos con los que poder competir y posicionarse en el mercado laboral. En nuestra sociedad se emplea el término empleabilidad (Alonso *et al.*, 2009) para referirse a las competencias y cualificaciones que refuerzan la capacidad de las personas para aprovechar las oportunidades de educación y formación con el objetivo de obtener mejores condiciones laborales.

Las competencias y conocimientos de naturaleza transversal (Guedea, 2008), son partes del conocimiento que todo universitario debe tener presente en su formación, sea cual sea la rama del conocimiento en la que se está formando, dado que en la actualidad resultan básicos e imprescindibles para el buen desarrollo y desenvolvimiento en el mundo en el que vivimos. A su vez el implementar estas competencias transversales en el aula, abre un gran abanico de posibilidades para el diseño, aceptación y aprovechamiento de los conocimientos o competencias específicas que los alumnos deben lograr en su formación, a partir del diseño de sus planes docentes.

En la formación universitaria de índole social, como son los grados en economía, y en concreto en el área de Comercialización e Investigación de Mercados, es determinante afrontar ese tipo de habilidades en su formación, para ir aproximando la enseñanza al contexto empresarial y comercial al que en un futuro próximo se encontrarán los alumnos de estas disciplinas, cuando desempeñen su actividad profesional, una vez que hayan finalizado sus estudios universitarios.

El fundamentar la docencia con nuevas metodologías de enseñanza-aprendizaje, potenciando la aprehensión de competencias transversales, requiere de un entorno de trabajo en la universidad que facilite la puesta en práctica de tareas que favorezcan la capacidad de trabajo cooperativo en equipo y de una actitud activa entre docentes y alumnos para la consecución de conocimientos. Todo ello significa que, a lo largo del curso el profesor adopta el rol de facilitador de conocimientos y el alumno debe asumir su responsabilidad en el proceso de generación de dicho conocimiento mediante su trabajo activo y participativo.

De ahí que fundamentar la asignatura de "Introducción a la Investigación de Mercados" en la búsqueda y aplicación de los procedimientos de diseño y ejecución de investigaciones, que tengan por objeto el

tratamiento de información relativa a hechos, actitudes, opiniones, conductas y actividades de carácter económico y social que puedan afectar a la actividad de la empresa y, en particular, a la actividad de marketing, permite el desarrollo y la evaluación de competencias transversales en los alumnos, al introducirlos en las tareas que configuran este sistema de información-investigación en el área de marketing. Permitiendo que el alumno adquiera, entre otras la capacidad de detectar y satisfacer necesidades de información para poder tomar decisiones relevantes en cualquier organización, la capacidad para resolver problemas con iniciativa, creatividad y razonamiento crítico, y en definitiva el desarrollo de actitudes, a lo largo del curso, que permitan a los estudiantes acceder y conformar conocimientos fundamentales y básicos con los que poder competir y posicionarse en el mercado laboral.

A lo largo de la asignatura los alumnos desarrollan este tipo de competencias transversales a partir de la búsqueda, identificación y selección de aquellas fuentes de información adecuadas para lograr sus objetivos de investigación de mercados, así como para lograr la planificación y optimización del tiempo para alcanzar las metas propuestas. Así mismo, a través de la exposición de los trabajos encomendados al grupo, o también denominados casos prácticos, de los comentarios de casos a relatar y de la participación en los debates que generan estas actividades, se potencian las competencias de desenvolvimiento comunicativo, tanto en modo oral como en modo escrito, de los conocimientos alcanzados por los estudiantes, de sus ideas y de los resultados obtenidos tras el trabajo a lo largo del curso. Por lo tanto, el esfuerzo de juzgar a sus iguales con espíritu crítico y constructivo permite establecer un feedback de conocimiento junto al docente, favoreciendo su proceso de maduración.

### **2.3. Herramientas Virtuales**

En muchos casos, el uso y la incorporación de las nuevas tecnologías de la información y comunicación (TIC) en la enseñanza universitaria, son clave para una asimilación práctica de todo tipo de competencias, incluidas, por supuesto, las transversales, ya que además de facilitar el aprendizaje potencian la interdisciplinariedad (Arias, 2003). La utilización de herramientas virtuales en el aula, permite abrir un espacio de interacción entre docentes y alumnos actualizado a nuestros días, a la vez que contribuyen a la aparición de una comunidad de aprendizaje y no a un conjunto de individuos aislados. Esta comunidad de aprendizaje favorece la actitud activa e interesada de los alumnos a la hora de investigar y autoformarse, participando y compartiendo con el resto del aula, dudas, opiniones, reflexiones, debates y en general ideas.

Los docentes han de hacer uso de la tecnología, como un medio más con el que alentar y facilitar la aprehensión de conocimientos, utilizando herramientas y recursos con los que el estudiante se sienta familiarizado, motivado y cómodo. Este sistema bien administrado y utilizado permite que aflore su gran logro, que es la construcción de un grupo de aprendizaje. Con el uso de herramientas virtuales en el aula el alumno tiene la posibilidad de aprender más de lo que aprendería por sí solo, fruto de la interacción de los participantes del curso (Guitert *et al.*, 2007) o también lo podríamos definir utilizando el concepto de aprendizaje colaborativo (Seitzinger, 2006).

La plataforma usada en la asignatura de "Introducción a la Investigación de Mercados" para lograr el propósito citado arriba es Blackboard learn 9.1, facilitada por la Universidad, como sistema virtual de gestión de cursos, y que nos permite como docentes poder gestionar el aprendizaje de la materia de una forma fácil, rápida, interactiva y participativa. En este sentido, dentro del diseño y planteamiento de la asignatura, está el facilitar desde el primer momento a través de la dicha plataforma virtual, todos los materiales necesarios para el desarrollo del curso, en cuanto a programa, fichas de equipo para poder realizar las prácticas, documentos explicativos sobre la gestión de prácticas, casos prácticos, calendarios sobre actividades teóricas y prácticas, lecturas básicas o enlaces de interés, entre otros. De igual modo la plataforma permite la comunicación constante entre docente y alumno, así como el compartir conocimiento a través de los foros de dudas.

### **3. Análisis previstos y consideraciones finales**

Para poder analizar la importancia de la inclusión de todas estas herramientas en la enseñanza adaptada a los nuevos grados, dentro del contexto de la EEES, y sobre todo, si el uso de todas estas herramientas está ayudando a los alumnos a alcanzar todos los resultados de aprendizaje propuestos,

sería necesario recoger dos tipos de información. Por un lado, pretendemos comparar los resultados alcanzados a lo largo de los cuatro primeros años de andadura del nuevo Grado en Administración y Dirección de Empresas. Concretamente, este curso 2013/2014 se van a graduar la primera promoción de alumnos en GADE, por lo que podremos obtener una primera serie de cuatro cursos, en los que se han desarrollado y aplicado en la docencia las herramientas diseñadas al efecto, e incluso, podremos comparar, las tasas de éxito en esta asignatura, con los datos de los egresados que cursaron la asignatura "Investigación de Mercados", antecesora de la actual, licenciados de la etapa anterior al proceso de Bolonia (en el que no se empleaban todas y cada una de las herramientas didácticas expuestas). Por otro lado, también sería necesario recabar información de los alumnos, (6 grupos, en 2º curso de GADE, con unos 60 alumnos matriculados por grupo, un total de unos 360), acerca de cuál es su opinión sobre si el uso de todas las herramientas utilizadas en general, y en particular, si el hecho de haber ejercido de *relatores*, les ha podido suponer una mejora en la adquisición de todos los conocimientos y competencias programados. Para ello, sería necesario diseñar una encuesta diseñada ad-hoc y que se administraría a través de la Plataforma Blackboard learn 9.1, utilizada para comunicarnos con los alumnos, una vez hubiera concluido el curso. La recogida de información debería incorporar no sólo una evaluación comparativa sobre los resultados de aprendizaje logrados en el curso, sino también abrir la posibilidad de evaluar las expectativas, el interés y la motivación de los alumnos a través de sus comentarios. Las opiniones de los alumnos nos permitirán manejar información básica con la que poder iniciar un debate abierto con ellos, acerca de cualquier tema relacionado con la metodología utilizada en la asignatura, las herramientas puestas a su disposición y las tareas llevadas a cabo en la misma. Las opiniones de los alumnos deberían de ser anónimas para que expresasen con total sinceridad sus reflexiones.

En cuanto a las consideraciones finales, podemos destacar que, la realización de tareas en grupo, de tipo cooperativo o colaborativo, diseñadas para la construcción de conocimiento con el trabajo constante del alumno y apoyadas con la utilización de herramientas virtuales, es uno de los aspectos más interesantes del diseño de la asignatura de "Introducción a la Investigación de Mercados", en cuanto a su eficacia para la construcción de conocimiento, para la obtención y desarrollo de competencias genéricas y transversales y para la adquisición de valores personales que les ayudarán en su vida profesional y social. Finalmente, nuestra valoración sobre el proceso de organización del currículo siguiendo las normas ECTS es positiva, y se nos plantea el reto necesario de recoger información, sobre todo el proceso seguido y la valoración de resultados de aprendizaje obtenidos, para poder ir incorporando en la medida de lo posible mejoras para cursos posteriores, de forma que la adaptación a plan Bolonia sea progresiva y efectiva.

### RESUMEN

*La evaluación es la forma en la que el profesor universitario valora los resultados del aprendizaje del estudiante de acuerdo con los objetivos fijados y las competencias adquiridas. El objetivo de nuestro trabajo es analizar los sistemas de evaluación reflejados en 546 guías docentes publicadas en grados de cuatro universidades españolas y analizamos las pruebas incluidas y los pesos otorgados a cada una de ellas. Los resultados preliminares nos permiten reflexionar sobre el grado de aplicación del sistema de evaluación continua, nuevas formas de evaluación y requerimientos del profesor para valorar el aprendizaje de los estudiantes universitarios en sus asignaturas.*

### Palabras clave:

Enseñanza superior; evaluación; guías docentes.

## 1. Introducción. La evaluación en la docencia universitaria

La investigación docente ha abordado las características que debe reunir un buen profesor/a (Zabalza, 2003; Martínez et al., 2006; Celdrán y Escartín, 2008; Gargallo et al., 2010; Casero, 2010; Voss y Gruber, 2011). No obstante, es un tema no resuelto porque, como señala Ruiz (2005, p.89) “aunque resulte paradójico no hay unanimidad a la hora de delimitar qué es una docencia de calidad. La actividad docente es una tarea compleja, multidimensional, en la que el profesor puede asumir diferentes roles, adoptando enfoques diferentes respecto a la enseñanza.” El EEES conlleva cambios en el proceso educativo que afectan al perfil del profesorado universitario, entre los que se encuentra el cambio en la centralidad del propio proceso educativo (López-Sidro, 2011), que se traslada del profesor al alumno. El EEES trae consigo una revisión tanto de los modelos de aprendizaje como de las fuentes y recursos empleados y de los sistemas de evaluación (Álvarez et al., 2009). Estas reflexiones acerca del perfil y competencias del profesor universitario han sido abordadas también desde la investigación docente a través de la utilización de valoraciones que el estudiante realiza sobre el profesor y sus características (estudios SET en terminología anglosajona: Student’s Evaluations of Teaching) (Marsh, 1987, p. 255). No obstante, en estos estudios se pregunta a los alumnos por el profesor que les ha impartido docencia. La heterogeneidad de enfoques y metodologías así como la diversidad de muestras utilizadas hace difícil extraer conclusiones generales. Dejando a un lado las valoraciones subjetivas de estudiantes y profesores, las guías docentes publicadas para cada asignatura suponen un contrato entre la universidad y el estudiante que puede incluir, con mayor o menor detalle, distintos aspectos como los objetivos, el índice del temario, las competencias que debe adquirir el estudiante, la forma de impartición de las clases, las pruebas y sistemas de evaluación, los pesos otorgados a cada sistema de evaluación y los resultados esperados del aprendizaje. Hay trabajos que señalan las pautas para elaborar guías docentes (García-Sanz, 2008; Zabalza y Zabalza, 2012). Zabalza y Zabalza (2012) proponen un modelo de guía docente que constituye un auténtico instrumento de orientación y diálogo con los estudiantes y que debe incluir los datos generales de la misma, su sentido curricular, sus propósitos formativos, los contenidos de la propuesta, las líneas metodológicas en la que se mueve y el sistema de evaluación utilizado. Además, estos autores sugieren que la construcción de una buena guía docente constituye una competencia básica de los buenos profesores, aquellos a los que no les basta con conocer bien el campo disciplinar, sino que saben cómo combinar ese conocimiento con las particulares condiciones en las que deben llevar a cabo su docencia. Por ello, sostienen que las guías deben ser mecanismos que se asemejen a contenedores abiertos y flexibles en los que los docentes van incorporando progresivamente todos los nuevos avances y conocimientos que consideren relevantes.

Por lo que se refiere a la evaluación y si nos fijamos en estudios previos, el sistema de evaluación deseado por los alumnos no incluye el examen final, centrándose en la evaluación continua y en la presentación de trabajos. Gargallo et al. (2010) encuentran que los métodos de evaluación que los alumnos proponen como idóneos son, por este orden: valoración de trabajos (86%), valoración del esfuerzo del alumno (68%) y exámenes parciales-valoración de la realización de las prácticas (ambas respuestas con la misma frecuencia, 54%). También son elegidos con frecuencias importantes la valoración de la asistencia a clase (48%), la valoración del interés del alumno (46%), y la valoración de las actividades diarias de clase (40%). Ningún alumno elija en este estudio la opción de sólo examen final.

En un estudio previo que hemos realizado con estudiantes preuniversitarios justo cuando llegan a la universidad (Autores), entre las formas de evaluación preferidas por los alumnos/as españoles/as destacan los exámenes parciales a lo largo del curso (72.4%), la entrega de trabajos sin exámenes (70%) y la realización de trabajos en grupo (64.3%). Entre las menos valoradas aparecen con un 8.6% la realización de un único examen al final del curso y los exámenes orales con un 7%. Cuando se les pide escoger un máximo de 3 aspectos a valorar en el sistema de evaluación ideal del profesor universitario eligen en las tres primeras posiciones y muy distanciadas del resto, la posibilidad de recuperar solo las partes no superadas (71.4%) y valorar el esfuerzo realizado durante el curso (67.9%).

Algunos autores, como Nicol (2007) llegan a proponer un conjunto de principios para que el estudiante sea la parte esencial en su evaluación, se implique y participe de forma muy activa en su aprendizaje y evaluación. De igual modo, Carless et al. (2006) señalan que el estudiante debe ser

gestor de su aprendizaje y el profesor/a universitario/a deber ser un orientador y facilitador del mismo, lo que adquiere gran importancia en sistemas de evaluación como la coevaluación y la autoevaluación (Trujillo, 2011; Ibarra et al., 2012). Además, no debemos olvidar la utilización de recursos electrónicos y nuevas tecnologías utilizados ampliamente en la docencia actual, en la interacción profesor-alumno y en la evaluación correspondiente, mediante recursos como Moodle, MUD, foros, etc (Fisher y Baird, 2005; Thomas, 2002; Ellis et al., 2006).

El *objetivo* de nuestro trabajo es analizar las guías docentes publicadas de cuatro universidades diferentes para conocer los sistemas de evaluación que se están aplicando en los grados adaptados al EEES y conocer así el grado de aplicación del sistema de evaluación continua, las nuevas formas de evaluación del estudiante y los pesos otorgados a cada sistema de evaluación, entre otros aspectos.

## 2. Estudio empírico

Para llevar a cabo el estudio empírico, los miembros del grupo de innovación docente I.M.@.G.E. (Innovación Multidisciplinar Aplicada a los Grupos de Enseñanza) registrado en nuestra Universidad, con profesores pertenecientes a cuatro universidades diferentes (tres públicas y una privada, tres españolas), buscaron y analizaron las guías docentes publicadas en cada universidad en todos los grados que se imparten (grados ya adaptados al EEES). En concreto, se analizan las guías docentes de 128 asignaturas de la universidad pública X, 106 de la universidad pública Y, 260 de la universidad pública Z (cuatro campus) y 51 de una universidad privada. La Tabla 1 recoge la ficha técnica del estudio y detalles de las variables analizadas en cada guía docente acordadas en diversas reuniones del grupo de innovación docente junto con otros profesores consultados.

TABLA 1

**Ficha técnica del estudio y variables analizadas**

Universo	Guías docentes universitarias publicadas en todos los grados adaptados al EEES en 4 universidades
Muestra	546 guías docentes de 4 universidades españolas (3 públicas y 1 privada)
Muestreo	Probabilístico (elegida la 5ª guía correspondiente a una asignatura obligatoria de cada curso dentro de cada grado y la 5ª asignatura optativa de último curso de grado).
Trabajo de campo	Enero, febrero y marzo de 2014
Recogida y análisis de datos	Miembros del grupo de innovación docente GID I.M.@.G.E.
Porcentaje de guías ofrecidas	97% sí están introducidas y entregadas en los departamentos (las de una de las universidades de la muestra no son públicamente accesibles en la web, pero sí las tienen los departamentos. En las demás universidades están introducidas y publicadas en la web institucional correspondiente)
Cursos a los que pertenecen las guías	20% guías de primer curso, 21% de segundo curso, 26% de tercer curso, 32% de cuarto curso y 1 de quinto curso.
Tipo de asignatura a la que corresponden las guías	60% obligatorias, 21% optativas y 19% básicas
Variables analizadas	-Universidad, grado, departamento, asignatura, número de profesores que imparten cada asignatura, curso. -Si distingue o no sistemas de evaluación, si los ponderan, si se marcan mínimos para pasar cada prueba de evaluación, si se relacionan sistemas de evaluación con competencias, si las pruebas de la convocatoria ordinaria y extraordinaria son las mismas o no. -Si se evalúa mediante examen final, examen parcial, pruebas de desarrollo, pruebas tipo test, examen oral final, un trabajo global final, un conjunto de prácticas parciales, varias pruebas orales, la participación en clase, la asistencia en clase, portafolios, autoevaluación, recursos electrónicos u otros sistemas. Y los pesos otorgados a cada sistema de evaluación utilizado.

## 3. Algunos resultados preliminares

Por lo que se refiere al número de profesores que imparten cada asignatura según refleja cada guía docente, en el 69% de los casos, sólo imparte un profesor la asignatura, en el 21% la imparten dos profesores, en el 5% imparten tres profesores y podemos destacar que en un 5% de los casos de la muestra que corresponden a asignaturas impartidas por más de tres profesores.

Como aspectos generales de los sistemas de evaluación recogidas en las guías analizadas, el 94,7% distingue sistemas de evaluación, el 90,2% ofrecen la ponderación o pesos de cada sistema de evaluación, el 60% señala mínimos para pasar cada prueba de evaluación y sólo un 6% relaciona los sistemas de evaluación con la adquisición de competencias. En el 34% de las guías docentes se

señalan sistemas de evaluación diferentes para la convocatoria ordinaria y la extraordinaria, un 21% indican los mismos sistemas en ambas convocatorias y un 45% no hace alusión a la convocatoria extraordinaria.

En cuanto a sistemas concretos de evaluación, el 78% incluye el examen final, el 29% exámenes parciales, el 25% especifica que se realizará un examen de desarrollo, el 18% especifica que se realizará un examen tipo test, el 5% un examen oral, el 29% la entrega de un trabajo final o global de asignatura, en el 71% de los casos se valora el conjunto de varias prácticas parciales y el 23% varias pruebas orales. En el 43% se valora concretamente la participación activa en clase, el 15% de las guías incluye como sistema de evaluación la asistencia a clase, el 6% portafolio, el 2% la autoevaluación y el 4% evalúa mediante el uso de recursos electrónicos<sup>1</sup>. Además, un 15% de guías recoge otros sistemas o pruebas de evaluación no codificados previamente, minoritarios, como la coevaluación, los debates, el herbario, prácticas de laboratorio, un cuaderno, escalas de actitudes, técnicas de observación, valoración cualitativa, trabajo de campo, fichas de observación sistemática, seminarios, diseño de pósters, asistencia a conferencias, comentarios de texto, comentarios de imágenes, participación en un juicio, que normalmente corresponden a campos específicos ligados a un grado concreto o sólo vienen contemplados en una guía docente en nuestra muestra.

En cuanto a los pesos otorgados a cada prueba de evaluación y dado que la variabilidad entre guías en algunos casos es grande (ej. el peso del examen final varía desde un 10% nada hasta un 80%), se ha calculado el peso medio otorgado a cada sistema de evaluación, de modo que el examen final tiene un peso medio de 52%, el examen parcial un 24%, el de desarrollo un 22%, el test un 14%, la prueba final oral un 6%, el trabajo escrito global un 16%, las prácticas parciales un 27%, las pruebas orales un 11%, la participación un 14%, la asistencia a clase un 4%, el portafolio un 4%, la autoevaluación un 1%, los recursos electrónicos un 3% y otras pruebas un 24%.

En este apartado de resultados preliminares obtenidos, también hemos podido observar diferencias significativas entre las guías de las distintas universidades de la muestra. Cada universidad tiene su normativa en cuanto a aspectos como la elaboración de las guías y los pesos máximos de los sistemas de evaluación utilizados para cada asignatura, pero sí podemos adelantar cierta comparación entre ellas. Hay universidades en que las guías publicadas están accesibles a cualquier usuario que consulte la web institucional, mientras que en otras no es así y en unas universidades se observa que se marcan mínimos para cada prueba en mayor medida que en otras. En la universidad privada de la muestra no se distingue la asistencia y participación en clase como sistema de evaluación específico, quizás porque se da por supuesta en la docencia en el marco del EEES y se señalan sistemas de evaluación que no hemos encontrado en las guías de las universidades públicas como las escalas de actitudes o las fichas de observación sistemáticas. Asimismo, se observan diferentes pruebas de evaluación según la Facultad o rama del conocimiento, como una mayor prevalencia de las pruebas orales en asignaturas de las facultades de Derecho y Humanidades.

#### 4. Consideraciones finales

El trabajo presentado aborda los sistemas de evaluación del estudiante universitario según las guías docentes publicadas en la docencia impartida en los grados adaptados al EEES. Los resultados preliminares muestran algunos datos llamativos. Hemos observado en varias guías docentes la impartición de asignaturas de 6 créditos por más de tres profesores, lo que puede dificultar la coordinación y aprendizaje del estudiante. Aunque hay estudios como el de Gargallo et al. (2010), que resaltaba la conveniencia de valorar el esfuerzo del estudiante y ese es el espíritu de la docencia en el EEES, hemos podido observar que el examen final sigue teniendo un peso importante en la evaluación. De igual forma, podemos señalar la escasa importancia otorgada a sistemas de evaluación tan útiles como la autoevaluación (2%) o la coevaluación, como señalan Trujillo (2011) o Ibarra et al. (2012). Así, con la autoevaluación, el estudiante se implica, se motiva y reflexiona sobre su propio aprendizaje, comprende mejor el rol del profesor, interactúa con el profesor y en la coevaluación,

<sup>1</sup> La suma total de porcentajes correspondientes a los sistemas de evaluación utilizados puede ser mayor que el 100% en cada guía docente (p.ej. una guía puede señalar evaluación mediante examen final con un peso del 30% y después indicar evaluación tipo test con un peso del 20% sin señalar el otro 10% restante a qué prueba de evaluación corresponde, por lo que en la base de datos aparece examen final 30% y examen test 20%).

interactúa con sus compañeros (Carless et al., 2006). Por otra parte, las TICs les permiten llevar a cabo un aprendizaje mucho más colaborativo con sus compañeros y profesores gracias a la comunicación interactiva, tal y como indicaban también los trabajos de Álvarez et al. (2009) y de De Pablo y Villaciervos (2005). Sin embargo y aunque los estudiantes valoran la utilización de las nuevas tecnologías por parte del profesor (Gargallo et al., 2010), en las pruebas de evaluación sólo un 4% los utiliza. Finalmente, llama la atención que se contemple explícitamente la asistencia a clase como un sistema de evaluación, probablemente algo que se supone obligatoria en la docencia actual y que no habría que puntuar sin que haya la correspondiente participación activa el estudiante en clase.

Dado que en este momento estamos trabajando en los resultados, queríamos proporcionar unos resultados preliminares para poder reflexionar conjuntamente sobre ellos y el objetivo último es poder comparar los sistemas de evaluación publicados en las guías docentes, las opiniones y preferencias de los estudiantes y de los profesores universitarios para obtener una comparación integral de los agentes implicados en la evaluación del estudiante en el marco del EEES. Este trabajo forma parte de un proyecto de innovación docente financiado por la universidad donde está registrado el grupo I.M.@.G.E. y no nos consta ninguno similar realizado hasta el momento.

## RESUMEN

*La compra a través de Internet cada vez es más frecuente debido a las importantes ventajas que ofrece como la opción de realizar la compra en horarios 24/7 desde la comodidad de nuestras casas, a precios más económicos y con la posibilidad de obtener información y opiniones de otros consumidores sobre lo que queremos comprar. Sin embargo, como en todo el sector de servicios, el comercio electrónico no es inmune a fallos. En España el 7,7% de las personas que realizaron alguna compra en Internet obtuvieron algún fallo. ¿Qué comportamiento adoptamos en esta situación? Dado que en este servicio pueden participar varias compañías ¿A quién culpamos? El objetivo de este trabajo es analizar cómo varía la percepción de justicia de un consumidor en un escenario de fallo y recuperación del servicio de una compra online. En concreto, se investiga la percepción de justicia, satisfacción, atribución y gravedad del fallo mediante la metodología de experimentación a través de dieciséis escenarios que abarcan elementos de justicia interpersonal, justicia procedimental y justicia distributiva.*

## Palabras clave

Atribución fallo, gravedad fallo, percepción justicia, recuperación servicio.

## 1. Introducción

Internet ha crecido exponencialmente en la última década, incrementando su poder de difusión y su impacto en la industria (Kim *et al.*, 2012). Ha afectado la manera en la cual la mayoría de los negocios trabajan y se ha convertido en una herramienta sumamente importante debido a su capacidad para ofrecer información, entretenimiento, y nuevas posibilidades de compras (Richard *et al.*, 2010). Por ejemplo, en España en el primer trimestre de 2013, el comercio electrónico alcanzó un volumen de negocio de 2.822,6 millones de euros, lo que supone un 15,1% más que en el mismo trimestre de 2012; con un total de 43,5 millones de operaciones (CMT, 2013).

Pero este extraordinario crecimiento en número de consumidores y ventas también viene acompañado de quejas debido a fallos en las compras online (Forbes *et al.*, 2005). A pesar del establecimiento de las ventas online como un modelo de negocio vital para las empresas hoy en día, el fallo en este tipo de ventas es aún inevitable (Kuo y Wu, 2012). Según el informe más reciente del Observatorio Nacional de las Telecomunicaciones y de la Sociedad de la Información, el 9,6% de los compradores online en España han tenido algún problema con su compra electrónica (ONTSI, 2013).

En este contexto las empresas se han esforzado en perfeccionar los sistemas de recuperación utilizados. Estos sistemas se caracterizan por incorporar elementos de justicia interpersonal (e.g. ofreciendo un trato amable y cordial al consumidor), de justicia procedimental (e.g. desarrollando procesos ágiles y flexibles) y de justicia distributiva (e.g. ofreciendo compensaciones o reembolsos). Resulta interesante analizar, en qué medida estos elementos no solo sirven para recuperar el fallo en el servicio cometido por la empresa, sino que pueden llegar a convertir a consumidores ocasionales de la empresa en consumidores fieles e incluso cambiar las percepciones del cliente relativas al fallo como puede ser la gravedad de dicho fallo.

El fallo en el servicio, puede tener diferentes orígenes. Por ejemplo, es posible que el fallo haya sido cometido por la empresa principal a la cual el consumidor contrató el servicio o bien el que fallo deba atribuirse a una empresa colaboradora de la principal (e.g. una empresa de mensajería que colabora en hacer llegar el producto al domicilio del consumidor). Este matiz del origen de la responsabilidad del fallo podría afectar a las percepciones del consumidor sobre el fallo e incluso podría condicionar otros aspectos como la satisfacción del consumidor con el proceso de compra y su relación con la empresa principal.

El objetivo de este trabajo es analizar cómo varía la influencia ejercida por la responsabilidad de la empresa principal a la que se ha contratado el servicio (según ésta sea una responsabilidad directa o indirecta al ser atribuida a un colaborador) sobre la satisfacción del consumidor y su percepción de responsabilidad y controlabilidad del fallo. De igual forma, se analiza la percepción de responsabilidad y controlabilidad que tiene el consumidor sobre una empresa colaboradora cuando el fallo se atribuye a la empresa principal. Por otra parte, estudiamos en qué medida los elementos de justicia interpersonal, procedimental y distributiva puedan reducir la percepción de la gravedad del fallo por parte del consumidor. Finalmente, se analiza el efecto moderador ejercido por la justicia interpersonal sobre la justicia procedimental y la justicia distributiva percibida por el cliente.

Para ello, se parte de las argumentaciones realizadas en la Teoría de la Atribución (Heider, 1958; Weiner, 1980) y la Teoría de la Equidad (Adams, 1963) y se utiliza la metodología de experimentación en un contexto de fallo de una compra online que involucra a dos compañías (la compañía principal a la que compra el consumidor a través de Internet y a la compañía colaboradora que se ocupa de hacer llegar dicho producto al domicilio del consumidor).

## 2. Revisión de la literatura

### 2.1 Atribución del fallo

Por lo general, los consumidores responden a los fallos en el servicio de diversas maneras (Bonifield y Cole, 2007): atribuyendo la culpa por el fallo cometido, apelando a la justicia, mostrando respuestas emocionales, expresando las expectativas de recuperación, y mediante las intenciones de comportamiento post fallo. La atribución, en psicología se define como un proceso cognitivo,

mediante el cual un individuo, a través de su percepción, atribuye las causas y responsabilidades de un evento (Liu, 1998).

La Teoría de la Atribución (Heider, 1958; Weiner, 1980) es una de las teorías más utilizadas en el contexto de las investigaciones sobre fallos en los servicios. Esta teoría argumenta que los consumidores normalmente buscan explicaciones que permitan identificar las causas de los fallos (Bitner *et al.*, 1990; Folkes, 1984) y que en este proceso de búsqueda el consumidor intenta descubrir si la causa que provocó el fallo podía haber sido controlada por la empresa e identificar quién fue el responsable del fallo en el servicio (Weiner, 2000).

### **2.1.1 Responsabilidad del fallo**

Ante un fallo en el servicio, una respuesta frecuente del consumidor es la identificación del responsable del fallo (Folkes, 1984; Weiner, 2000). El "locus" o la atribución de responsabilidad del fallo determinan las creencias acerca de quién debe resolver los problemas. En concreto, los problemas derivados de las acciones de los consumidores deben ser resueltos por los consumidores, mientras que los problemas derivados de las acciones de las empresas deben ser resueltos por las empresas (Folkes, 1988). Por tanto, si el consumidor está convencido de que el fallo es culpa del proveedor del servicio, éste pensará que merece una compensación por el mismo, que podría consistir en una sustitución, reembolso, disculpa o alguna combinación de estos (Harris *et al.*, 2006).

Saber quién es considerado como responsable en una situación de fallo y recuperación del servicio es muy importante para la resolución del conflicto (Ok *et al.*, 2005). Todo consumidor implicado en un fallo suele hacer una atribución de responsabilidades en sus encuentros con los proveedores (Susskind, 2004), e independientemente de la exactitud de las inferencias que éste haga, su comportamiento posterior con cada proveedor se verá notablemente condicionado por la responsabilidad que le haya sido atribuida (Swanson y Hsu, 2010).

### **2.1.2 Controlabilidad del fallo**

La Atribución de controlabilidad es el grado en que la causa del fallo está sujeta a la voluntad del proveedor del servicio cuando el resultado "podría haber sido de otra manera" (Weiner, 2000), es decir, el grado en que el consumidor cree que la organización pudo haber evitado la causa que originó el fallo.

La percepción del consumidor con respecto al grado de control de la compañía sobre el fallo es una variable psicológica importante que puede afectar la respuesta con el proceso de recuperación del servicio (Betts *et al.*, 2011). El consumidor experimenta insatisfacción cuando percibe que la empresa podía haber controlado el evento que provocó el fallo (Casado y Más, 2002). De este modo, es importante recurrir a la dimensión de la prevención de la Teoría del Enfoque Regulatorio (Higgins, 1997). Esta teoría afirma que, en una situación negativa los individuos se sienten prevenidos por la amenaza de la pérdida y tratan de evitarla. Por ejemplo, un consumidor que lee foros sobre las opiniones y calificaciones que se le brindan a un vendedor en páginas como Amazon y E-bay. Si observa comentarios sobre fallos atribuidos a ese vendedor, intentará evitar realizar esa misma compra.

De esta manera, la percepción que tiene el usuario respecto al control de la empresa sobre el fallo es un factor clave en el proceso de recuperación del servicio. Si el evento que provocó el fallo en la prestación del servicio se percibe como algo fuera del control de la empresa, los clientes podrían ser más propensos a justificar el inconveniente y por lo tanto, puede que disminuyan sus expectativas con respecto al resultado de la recuperación. Por ejemplo, cuando una compañía aérea cancela un vuelo debido a las condiciones climáticas, es probable que los clientes sean más comprensivos que si la cancelación se produce con buen tiempo y no existe una causa externa que permita justificarla (Betts *et al.*, 2011).

### **2.2 Gravedad del fallo**

La gravedad del fallo se refiere a la intensidad del problema que percibe un consumidor cuando se presenta un inconveniente en la prestación del servicio (Weun *et al.*, 2004). La percepción de gravedad del fallo puede variar de un consumidor a otro (Craighead *et al.*, 2004) por lo que los fallos

pueden ser percibidos como pequeñas molestias o incluso hasta agravios mayores (McQuilken y Robertson, 2011).

La gravedad del fallo del servicio es una cuestión clave a la que debe prestarse una gran atención en todo estudio de fallo y recuperación (Webster y Sundaram, 1998). En esta línea, Singh y Wilkes (1996), argumentan que la intensidad con la que se verá afectada negativamente la relación entre el cliente y el proveedor del servicio, será mayor cuanto más importante es la intensidad de ese fallo en el servicio. Estos mismos autores afirman que los clientes son más propensos a involucrarse en comportamientos negativos (e. g. intención de no revisita, WOM negativo) a medida que aumenta la gravedad del fallo.

La gravedad del fallo también puede tener una gran influencia en las percepciones del consumidor, ya que condiciona las expectativas de dicho consumidor respecto al tipo de solución que deberían ofrecerle en el proceso de recuperación del servicio (Betts *et al.*, 2011). Es por esta razón que, un fallo muy grave tiene una probabilidad alta de acarrear reacciones negativas respecto al resultado del proceso de recuperación, ya que por lo general en este caso es difícil que el consumidor perciba que la solución es equivalente al valor de la pérdida sufrida originalmente (Levesque y McDougall, 2000).

### **3. Formulación de hipótesis**

#### ***Satisfacción***

Los fallos se presentan como consecuencia de que las expectativas de los consumidores no han sido satisfechas. Ante una situación de fallo en el servicio, una de las primeras reacciones del consumidor será la atribución de dicho fallo para delimitar responsabilidades. Este proceso consiste en encontrar explicaciones racionales para justificar el incidente que produjo el fallo (Folkes, 1984) y en identificar el responsable de dicho fallo. El resultado de este proceso de atribución podría ser que la responsabilidad recayera directamente en la empresa principal que ha sido contratada para prestar el servicio (Folkes, 1988; Maxham y Netemeyer, 2002). Pero también es posible que esta empresa principal tan sólo tenga una responsabilidad indirecta porque la responsabilidad del fallo sea atribuida a una empresa colaboradora de la empresa principal (e.g una empresa de mensajería que debe entregar el producto comprado a través de Internet en la página Web de la empresa que vende el producto). En esta línea, autores como Holloway y Beatty (2003) argumentan que los problemas en la entrega del producto comprado es uno de los fallos más frecuentes en las ventas online.

En la literatura ha sido ampliamente constatada la insatisfacción del consumidor cuando la responsabilidad es atribuida directamente a la empresa que presta el servicio (Folkes, 1988; Maxham y Netemeyer, 2002; Wirtz y Mattila, 2004; Hess, 2008; Shi *et al.*, 2011). Sin embargo, parece razonable pensar que si la responsabilidad no se atribuye directamente a la empresa que presta el servicio (venta online), sino que su responsabilidad es indirecta (ya que recae en una empresa colaboradora) la insatisfacción del consumidor con la empresa que presta el servicio podría ser menor, pues al fin y al cabo el fallo no es una responsabilidad directa suya. Basándonos en los argumentos expuestos se propone la siguiente hipótesis:

*H1) El efecto negativo del fallo en la satisfacción del consumidor con la empresa que presta el servicio será menor si la responsabilidad del fallo es atribuida a la empresa colaboradora.*

#### ***Responsabilidad y Controlabilidad del fallo***

Cuando el consumidor identifica un fallo en el servicio que recibe, una de las primeras reacciones es intentar averiguar cuáles fueron las razones que lo provocaron (Bitner *et al.*, 1990). Para conseguirlo, se hace dos preguntas ¿Quién es el responsable? ¿Pudo haber evitado el fallo? (Weiner, 2000). Las percepciones del consumidor, con respecto a la habilidad de la organización para evitar el fallo, dependen en gran medida de si efectivamente el proveedor pudo haber hecho algo de otra manera y por lo tanto haber evitado el incidente (Weiner, 1980).

Si el consumidor percibe que la organización pudo haber prevenido el fallo, sus reacciones tienden a ser más negativas. La incapacidad para prevenir fallos controlables es vista por el consumidor como un signo de un trato inadecuado o falta de habilidad para corregirlo (Poon *et al.*, 2004). Por el

contrario, el hecho de no tener claro quién es el responsable del fallo, mitigará los efectos que éste puede causar sobre el comportamiento del consumidor (Yen *et al.*, 2004). En una línea similar, Maxham y Netemeyer (2002) argumentan que los clientes son más indulgentes si perciben que la empresa tenía poco control sobre la ocurrencia del fallo; mientras que son menos tolerantes cuando sienten que este fallo era razonablemente previsible y podría haberse evitado fácilmente (Folkes, 1984).

Por tanto, parece razonable plantear que el consumidor percibe que la responsabilidad que tiene la empresa que presta el servicio será menor si el fallo no es atribuido directamente a esta empresa sino a la empresa colaboradora (e.g. la empresa de mensajería que hace llegar el pedido al cliente). A partir de estos razonamientos, se plantean las siguientes hipótesis:

*H2a) Cuando se presenta un fallo en el servicio, el consumidor percibe que la responsabilidad de la empresa que presta el servicio será menor si el fallo es cometido por la empresa colaboradora.*

De igual forma, podría ser interesante analizar en qué medida varía la responsabilidad que el consumidor percibe que tiene la empresa colaboradora, según el fallo haya sido cometido por ella misma o por la empresa que presta el servicio, para poder comparar ambas situaciones y ver si la atribución de responsabilidades es más exigente con la empresa que presta el servicio (empresa contratada por el consumidor) que con la empresa colaboradora que no fue contratada directamente por el consumidor.

*H2b) Cuando se presenta un fallo en el servicio, el consumidor percibe que la responsabilidad de la empresa colaboradora será menor si el fallo es cometido por la empresa que presta el servicio.*

Utilizando los mismos argumentos podría ser interesante analizar cómo varía la controlabilidad percibida del consumidor en ambas situaciones. En la misma línea que en el caso anterior, parece razonable plantear que la percepción de controlabilidad del fallo que tiene el consumidor con respecto a la empresa que presta el servicio será menor, si el fallo no es atribuido directamente a dicha empresa sino a la empresa colaboradora (e.g. la empresa de mensajería que hace llegar el pedido al cliente). En este caso, la entrega del servicio está fuertemente influenciada por factores ajenos al control de la organización (Vázquez-Casielles *et al.*, 2007). A partir de estos razonamientos, se plantean la siguiente hipótesis:

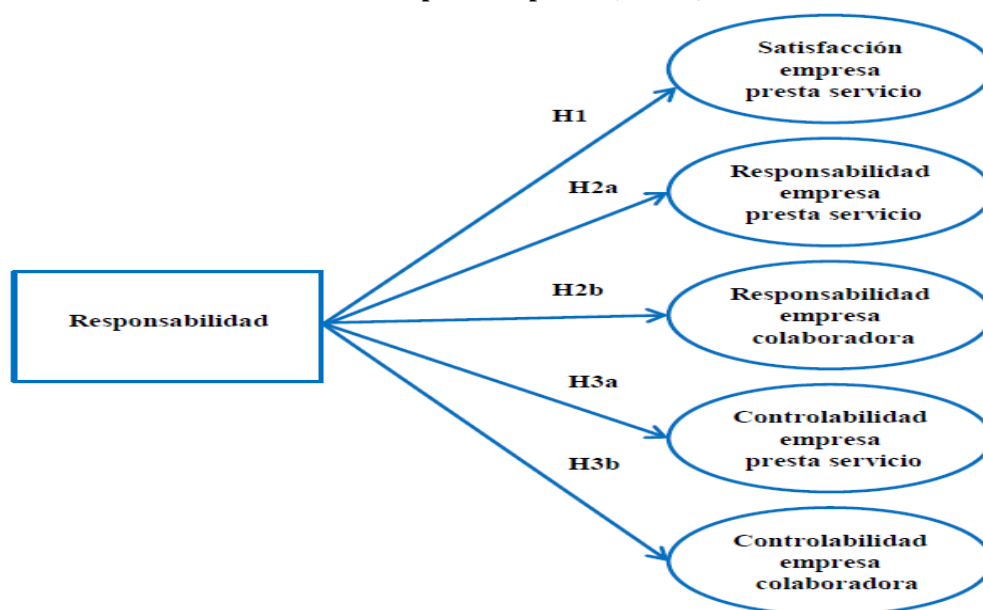

*H3a) Cuando se presenta un fallo en el servicio, el consumidor percibe que la controlabilidad de la empresa que presta el servicio será menor si el fallo es cometido por una empresa colaboradora.*

De la misma forma, parece interesante analizar la controlabilidad asignada a la empresa colaboradora, según el fallo haya sido cometido por ella misma o por la empresa principal a la que contrató el servicio para poder comparar ambas situaciones. De esta forma se plantea la siguiente hipótesis.

*H3b) Cuando se presenta un fallo en el servicio, el consumidor percibe que la controlabilidad de la empresa colaboradora será menor si el fallo es cometido por la empresa que presta el servicio.*

La figura 1 presenta la primera parte del modelo conceptual propuesto. En ella se plantea, por una parte, la influencia ejercida por la atribución de la responsabilidad del fallo sobre la satisfacción del consumidor con respecto a la empresa que presta el servicio; y por otra parte, la influencia ejercida por la atribución de la responsabilidad del fallo sobre la responsabilidad percibida y la controlabilidad percibida tanto de la empresa que presta el servicio como de la empresa colaboradora.

Figura 1  
**Modelo Conceptual Propuesto (Parte I)**

### ***Gravedad del fallo***

La gravedad del fallo se define como la percepción de la intensidad de un problema surgido durante la prestación del servicio: cuanto más intenso o grave sea el fallo, mayor será la sensación de pérdida que tiene el consumidor (Weun *et al.*, 2004). La Teoría de la Equidad (Adams, 1963) plantea que es importante que exista un equilibrio en los intercambios que se llevan a cabo entre dos o más individuos. Cuando se produce un fallo, se pierde el equilibrio en la relación entre el consumidor y el proveedor (Weun *et al.*, 2004). Al evaluar la recuperación del servicio, los consumidores valoran la relación existente en ese momento entre lo invertido y lo obtenido, a través de la relación, y dónde se encuentra en cada momento el punto de equilibrio (Smith *et al.*, 1999). Si lo invertido es más importante que lo obtenido, el consumidor podría percibir que el fallo es más grave.

Los fallos que el consumidor percibe que son más graves, y que por tanto le acarrearán más pérdidas, exigen que la ganancia ofrecida en la recuperación del servicio sea mayor para alcanzar el equilibrio en la relación (Smith *et al.*, 1999). Por esta razón, la Teoría de la Equidad sugiere que cuando el fallo que se produce es muy grave, se requiere que el proveedor reaccione ofreciendo un servicio de recuperación capaz de compensar la magnitud de dicho fallo (Webster y Sundaram, 1998). Así, parece razonable argumentar que cuanto más importante sea el fallo, más completa debe ser la compensación que se ofrezca al consumidor, por ejemplo, incluyendo adecuados elementos de justicia interpersonal, procedimental y distributiva. Dicho de otra forma, parece razonable suponer que la percepción de gravedad del fallo podrá verse parcialmente mitigada si el sistema de recuperación incluye elementos de justicia interpersonal, procedimental y distributiva. Por tanto, de acuerdo a estos argumentos, se plantean las siguientes hipótesis:

*H4) La percepción de gravedad del fallo será menor si el sistema de recuperación del servicio cuenta con elementos de justicia interpersonal*

*H5) La percepción de gravedad del fallo será menor si el sistema de recuperación del servicio cuenta con elementos de justicia procedimental*

*H6) La percepción de gravedad del fallo será menor si el sistema de recuperación del servicio cuenta con elementos de justicia distributiva*

Un aspecto sumamente importante al establecer las estrategias de recuperación, es ser conscientes de que durante la recuperación del servicio, los consumidores no consideran solamente el “resultado” (lo que reciben) sino también la “forma” (cómo lo reciben). Los consumidores evalúan la “forma” muy subjetivamente, basándose sobre todo en las interacciones con los empleados (Parasuraman *et al.*,

1985). Por tanto, los procesos de recuperación que atienden el aspecto interpersonal, tienen más probabilidades de obtener evaluaciones positivas por parte del consumidor que los procesos que atienden únicamente el resultado de la recuperación (De Ruyter y De Wetzels, 1998).

La Teoría de la Justicia (Folger y Cropanzano, 1998) sugiere que contemplar acciones de justicia interpersonal es crucial en situaciones de recuperación del servicio. Aun cuando los procedimientos sean justos, los consumidores pueden percibir que el tratamiento interpersonal que han recibido en el proceso no lo ha sido (Erdogan, 2002). De hecho, algunos consumidores utilizan de manera prioritaria para evaluar el servicio aspectos como el trato cordial y la capacidad de respuesta de los empleados (Laguna y Palacios, 2009).

De acuerdo a estos argumentos, sería razonable plantear que las estrategias de recuperación procedimental (e.g. ofrecer una respuesta rápida para comunicarle al cliente cómo se está resolviendo el fallo) y estrategias de recuperación distributivas (e.g. ofrecer algún regalo o un descuento especial) podrían obtener mejores resultados si se complementan con estrategias de recuperación interpersonal (e.g. envío de un mensaje amable para transmitir la idea de que se está haciendo el máximo esfuerzo por resolver el fallo en la mayor brevedad posible, se pidan disculpas y se ofrezca una explicación clara sobre la razón del fallo). Es decir, que la influencia de las estrategias de recuperación procedimental y distributiva sobre la percepción de gravedad del fallo podría verse multiplicada si además el sistema de recuperación contempla elementos de justicia interpersonal.

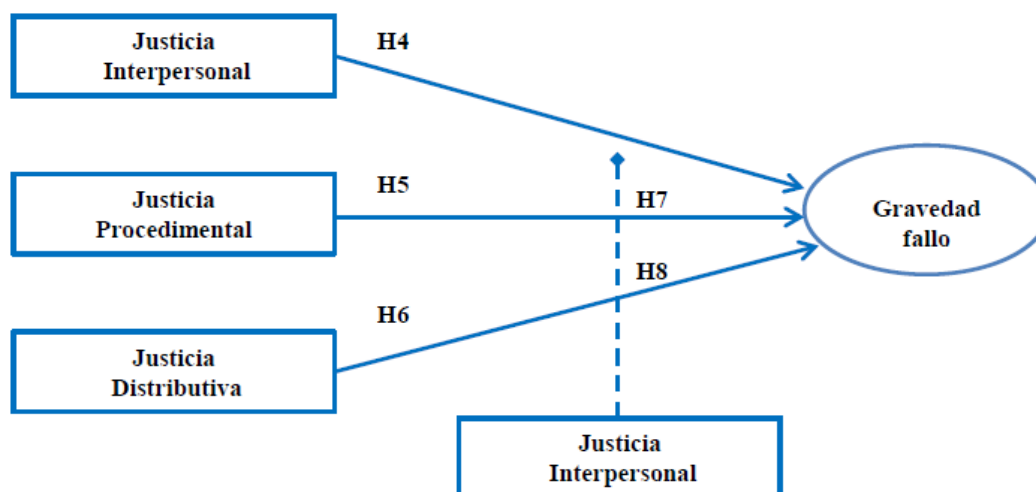

A partir de los razonamientos anteriormente expuestos, se proponen las siguientes hipótesis:

*H7) El efecto positivo de la justicia procedimental sobre la percepción de gravedad del fallo será mayor si el sistema de recuperación cuenta con elementos de justicia interpersonal*

*H8) El efecto positivo de la justicia distributiva sobre la percepción de gravedad del fallo será mayor si el sistema de recuperación cuenta con elementos de justicia interpersonal*

La figura 2 presenta la segunda parte del modelo conceptual propuesto. En él se plantea la existencia de una relación entre la justicia interpersonal, la justicia procedimental y la justicia distributiva con la percepción de la gravedad del fallo, así como el efecto moderador que la justicia interpersonal tiene en la influencia que ejercen la justicia procedimental y la justicia distributiva sobre la percepción de la gravedad del fallo.

Figura 2  
Modelo Conceptual Propuesto (Parte II)

#### 4. Metodología

Para el contraste de las hipótesis de investigación la metodología aplicada ha sido un diseño experimental de dieciséis escenarios. Los sujetos fueron asignados aleatoriamente a un escenario de dieciséis posibles, dentro de un diseño entre-sujetos de 2 x 2 x 2 x 2 condiciones. Para la obtención de una muestra representativa se contrató una empresa de Investigación de Mercados (NetQuest). La

muestra obtenida fue de 494 personas, cuya media de edad fue de 43 años, de los cuales el 51% eran mujeres.

Con el fin de que estuvieran más identificados con el escenario planteado, la condición exigida para poder participar en el estudio fue que hubieran sufrido alguna vez un fallo al realizar una compra en Internet. Al preguntar sobre un servicio que han utilizado (Smith y Bolton, 1998) los consumidores se sienten más identificados e involucrados con el escenario que se les presenta, por lo que, se obtienen mejores resultados con esta muestra. Si la obtención de la muestra no contara con este filtro, se correría el riesgo de incluir en el estudio personas que nunca hubieran realizado una compra online, por lo que su identificación con los escenarios del experimento sería menor, y por ende, la muestra de menor calidad.

Son varias las razones que permiten justificar el uso de la metodología de experimentación con varios escenarios en el estudio de la recuperación del servicio. En primer lugar, este método minimiza los sesgos de información que podrían presentarse cuando se le pide a un consumidor que recuerde experiencias pasadas concretas (Smith *et al.*, 1999). En segundo lugar, como Smith y Bolton (1998) indican, los escenarios pueden ser efectivamente manipulados, lo cual permite mejorar la variabilidad en las respuestas de los consumidores con respecto a la recuperación del servicio en el aspecto concreto que se está analizando. En tercer lugar, el uso de escenarios reduce los problemas relacionados con las diferencias individuales en las respuestas y las circunstancias personales al contexto de la investigación (Bateson y Hui, 1992). Es decir, esta metodología confiere validez interna y permite obtener resultados estadísticos más concluyentes mediante la manipulación de las variables independientes, y la reducción de ruido aleatorio en las variables dependientes, ya que utiliza el mismo entorno estandarizado para todos los sujetos (Churchill, 1995). Finalmente, la metodología de experimentación ha demostrado tener la capacidad de involucrar a los participantes en situaciones concretas, diseñadas por el investigador y que suelen darse en la vida real (Bateson y Hui, 1992).

Para llevar a cabo el experimento, tomamos como referencia una situación de compra a través de Internet en la que se produce un fallo. Este caso no resulta especialmente extraño, pues el 11% de los compradores online no están satisfechos con las páginas Web que visitaron (Harris *et al.*, 2006) y más de un 65% de los usuarios que compran a través de Internet han sufrido algún fallo en alguna ocasión (Wu, 2013). Tal y como hemos señalado anteriormente, destaca que entre los problemas más frecuentes en las ventas online, se encuentran los fallos en la entrega del producto comprado (Holloway y Beatty, 2003).

#### **4.1. Diseño del experimento**

Para el contraste de las hipótesis de investigación se ha diseñado un experimento 2 x 2 x 2 x 2 (Responsable del fallo: empresa que presta el servicio vs empresa colaboradora / justicia interpersonal vs no justicia interpersonal / justicia procedimental vs no justicia procedimental / justicia distributiva vs no justicia distributiva). Se ha planteado un escenario en el cual el consumidor compra una Tablet en una página Web, y al cumplirse el plazo de entrega, el paquete aún no ha llegado. Para solucionar el problema, el encuestado se sitúa en uno de 16 posibles escenarios (2 x 2 x 2 x 2) respecto a la atribución del fallo y las tres dimensiones de justicia manipuladas de la forma siguiente:

1) La atribución del fallo se manipula en dos niveles, según el fallo sea responsabilidad de la empresa principal a la que se ha contratado el servicio (A: BuyExperience) o sea responsabilidad de la empresa colaboradora (B: Transportering):

*A: Mediante un mail informan que el problema ocasionado se ha presentado debido a un mal registro del pedido como resultado de un fallo en el sistema informático*

*B: Mediante un mail informan que el problema ocasionado ha sido debido a un error al teclear el código postal del envío por parte de la empresa que colabora con ellos en las labores de mensajería*

2) La justicia interpersonal se manipula en dos niveles (A y B), según haya o no elementos de justicia interpersonal:

*A: Como respuesta a la consulta del comprador, responde el mail el gerente de la empresa, quien de una manera muy amable pide disculpas y explica la razón del inconveniente. En el mail aparece el logo de la empresa y todos los datos de contacto del gerente*

*B: Como respuesta a la consulta del comprador, llega un mail que nadie firma, escrito con un tono cortante y nada amable, y que en ningún momento se disculpa por el fallo cometido*

3) La justicia procedimental se manipula en dos niveles (A y B), según haya o no elementos de justicia procedimental:

*A: A primera hora del día siguiente llega un mail de la empresa, en el que se le informa al cliente que su paquete será entregado entre los primeros del día, y que en unos minutos le llamarán para preguntarle a qué hora y en qué lugar quiere que le entreguen el pedido*

*B: Hasta el día siguiente por la tarde no llega un mail de la empresa, en el que se le informa al cliente que no saben con certeza el día ni la hora en que llegará el paquete, que si quiere esa información que se ponga en contacto con la empresa de mensajería*

4) La justicia distributiva se manipula en dos niveles (A y B), según haya o no elementos de justicia distributiva:

*A: Al día siguiente llega un mail de la empresa, en el que se le informa al cliente que como compensación por lo sucedido le envían un código promocional, que podrá cambiar por 35 euros en compras en la página Web*

*B: Al día siguiente llega un mail de la empresa, en el que se le informa al cliente que es imposible ofrecerle algún tipo de compensación*

Después de llevar a cabo la descripción de los escenarios se les pidió a los individuos que valorasen en una escala tipo Likert del 1 al 7 su satisfacción, percepción de la gravedad del fallo, y su percepción acerca del grado de responsabilidad y control sobre el fallo que tenían ambas empresas. También se pidió que valorasen su percepción con respecto al grado de realismo o credibilidad del escenario planteado. La distribución de la muestra por escenarios se presenta en la tabla 1.

Tabla 1  
**Distribución de la muestra (por escenarios)**

Justicia			Responsable fallo		N
Interpersonal	Procedimental	Distributiva	Empresa principal contratada para el servicio BuyExperience	Empresa colaboradora Transportering	
No	No	No	38	32	70
No	No	Sí	28	19	47
No	Sí	No	46	24	70
No	Sí	Sí	25	28	53
Sí	No	No	33	32	65
Sí	No	Sí	39	25	64
Sí	Sí	No	30	28	58
Sí	Sí	Sí	32	35	67
			<b>271</b>	<b>223</b>	<b>494</b>

#### 4.2. Validación escalas de medida

Para llevar a cabo el proceso de validación de las escalas de medida se realizaron diferentes pruebas y contrastes que se describen a continuación. En primer lugar, se efectuó un análisis de la validez de contenido de las escalas propuestas. Posteriormente, se llevó a cabo el análisis exploratorio y confirmatorio. Finalmente, se valoró el grado de fiabilidad y el nivel de validez de cada constructo, en términos de validez convergente y discriminante (Gerbing y Anderson, 1988).

Las escalas utilizadas para medir los diferentes constructos incluidos en el análisis se obtuvieron a través de una exhaustiva revisión de la literatura especializada, y se adaptaron al escenario de compra online considerado en esta investigación. En concreto, la escala de la satisfacción fue adaptada de Varela-Neira *et al.* (2008), la percepción de gravedad del fallo fue adaptada de Weun *et al.* (2004), la responsabilidad del fallo (empresa que presta el servicio y empresa colaboradora) fue adaptada de Maxham y Netemeyer (2002), la controlabilidad del fallo (empresa que presta el servicio y empresa colaboradora) de Xie y Heung (2012) y el realismo o credibilidad del escenario fue adaptada de Collie *et al.* (2002).

Para valorar la fiabilidad y dimensionalidad de las escalas, se utilizó el método del Alpha de Cronbach considerando como valor mínimo 0,7 (Nunnally, 1978). Todas las escalas superaron este mínimo: satisfacción (0,984), gravedad del fallo (0,954), responsabilidad del fallo (empresa que presta el servicio) (0,969), responsabilidad del fallo (empresa colaboradora) (0,972), controlabilidad del fallo (empresa que presta el servicio) (0,934), controlabilidad del fallo (empresa colaboradora) (0,972), realismo del escenario (0,819).

## 5. Resultados

### 5.1 Chequeo de la manipulación

El análisis de las variables en el chequeo de la manipulación demostró que las manipulaciones en las variables independientes fueron percibidas por los encuestados como se esperaba. En este caso, las variables analizadas fueron Responsable del fallo (empresa que presta el servicio o empresa colaboradora); Escenario Justicia Interpersonal: sin Justicia Interpersonal o con Justicia Interpersonal; Escenario Justicia Procedimental: sin Justicia Procedimental o con Justicia Procedimental; Escenario Justicia Distributiva: sin Justicia Distributiva o con Justicia Distributiva.

Además, como paso previo a la realización del estudio principal se había realizado un pretest con 81 personas para comprobar que tanto los escenarios planteados como las escalas propuestas recogían lo que se quería analizar. Este análisis fue realizado siguiendo el criterio propuesto por Blodgett *et al.*, (1997), Harris *et al.*, (2006) y Shi *et al.*, (2011). Los resultados obtenidos permiten constatar que los participantes en este estudio percibieron los escenarios como realistas (media de 5,99 sobre 7).

### 5.2 Contraste de hipótesis

Con el fin de contrastar las hipótesis, se llevó a cabo un análisis multivariante de la varianza (MANOVA) con las seis variables dependientes (satisfacción, gravedad del fallo, responsabilidad del fallo de la empresa que presta el servicio (BuyExperience), responsabilidad del fallo de la empresa colaboradora (Transportering), controlabilidad del fallo de la empresa que presta el servicio (BuyExperience) y controlabilidad del fallo de la empresa colaboradora (Transportering)) con respecto al responsable del fallo y los tres tipos de justicias, como las variables independientes. Los resultados del MANOVA muestran efectos multivariantes significativos para el responsable del fallo (Wilks's  $\lambda = 0,844$ ;  $F = 14,622$ ;  $p = 0,000$ ), la justicia interpersonal (Wilks's  $\lambda = 0,736$ ;  $F = 28,281$ ;  $p = 0,000$ ), la justicia procedimental (Wilks's  $\lambda = 0,897$ ;  $F = 9,044$ ;  $p = 0,000$ ) y la justicia distributiva (Wilks's  $\lambda = 0,905$ ;  $F = 8,307$ ;  $p = 0,000$ ). A continuación, se realizaron ANOVAs univariantes para probar los efectos específicos.

En la tabla 2 se recoge la influencia ejercida por el responsable del fallo sobre la satisfacción, la responsabilidad del fallo y la controlabilidad del fallo. En cuanto a la satisfacción (H1), cabría indicar que los resultados se encuentran en la dirección que argumenta la hipótesis. Es decir, que el efecto negativo del fallo en la satisfacción del consumidor con la empresa que presta el servicio será menor si la responsabilidad del fallo es atribuida a una empresa colaboradora, aunque las diferencias encontradas no son significativas.

Sin embargo, sí se confirma la H2a que indica que cuando se presenta un fallo en el servicio, el consumidor percibe que la responsabilidad que tiene la empresa que presta el servicio será menor si el fallo es cometido por la empresa colaboradora, y la H2b, que indica que el consumidor percibe que la responsabilidad que tiene la empresa colaboradora será menor si el fallo es cometido por la empresa que presta el servicio. Los resultados son significativos en ambos casos.

Tabla 2  
Influencia del responsable del fallo

Variable	Responsable del fallo				F	p-valor
	BE (BuyExperience) N = 271		TR (Transportering) N = 223			
	Media	Desv.	Media	Desv.		
Satisfacción	2,36	1,68	2,55	1,74	1,427	0,233
Responsabilidad percibida de (BE)	5,54	1,73	4,58	1,93	33,881	0,000
Responsabilidad percibida de (TR)	3,14	1,77	4,19	1,81	41,01	0,000
Controlabilidad percibida de (BE)	5,60	1,50	5,60	1,57	0,003	0,960
Controlabilidad percibida de (TR)	4,03	2,11	5,33	1,71	53,897	0,000

En relación a este aspecto resulta interesante destacar, no solo la significatividad de ambas hipótesis, sino también el hecho de que en ambos casos la responsabilidad percibida de la empresa que presta el servicio es claramente mayor (responsabilidad percibida empresa que presta el servicio 5,54 y responsabilidad percibida empresa colaboradora 4,58) que la que se percibe que tiene la empresa colaboradora (responsabilidad percibida empresa que presta el servicio 3,14 y responsabilidad percibida empresa colaboradora 4,19).

Respecto a la controlabilidad percibida del fallo, al igual que en el caso anterior cabría destacar que en ambas situaciones la controlabilidad que percibe el consumidor que tiene la empresa que presta el servicio es mayor (empresa que presta el servicio 5,60 y empresa colaboradora 5,60) que la que percibe que tiene la empresa colaboradora (empresa que presta el servicio 4,03 y empresa colaboradora 5,33). Sin embargo, aquí las diferencias resultan significativas para el caso de la empresa colaboradora, pero no lo son para el caso de la empresa principal a la que se contrata el servicio. Es decir, cuando se presenta un fallo en el servicio, la responsabilidad que percibe el consumidor que tiene la empresa colaboradora será menor si el fallo es cometido por la empresa que presta el servicio (H3b). Sin embargo, la controlabilidad que percibe el consumidor que tiene la empresa que presta el servicio no es menor si el fallo es cometido por una empresa colaboradora. Este resultado presenta un gran interés y nos indica que el consumidor considera que la empresa que presta el servicio tiene la misma capacidad para evitar el fallo tanto si dicho fallo es responsabilidad suya o es responsabilidad de la empresa colaboradora. En definitiva, el consumidor considera que los fallos de la empresa colaboradora están bajo el control de la empresa que presta el servicio. En la Tabla 3 se muestra el contraste de las hipótesis H1, H2a, H2b, H3a y H3b.

Tabla 3  
Resultado del contraste de hipótesis (primera parte)

H	Var. Dependiente	Var. Independiente	F	p-valor	Contraste hipótesis
H1	Satisfacción	Responsable fallo	1,427	0,233	✗
H2a	Responsabilidad percibida BE	Responsable fallo	33,881	0,000	✓
H2b	Responsabilidad percibida TR	Responsable fallo	41,01	0,000	✓
H3a	Controlabilidad percibida BE	Responsable fallo	0,003	0,960	✗
H3b	Controlabilidad percibida TR	Responsable fallo	53,897	0,000	✓

Centrando la atención en la influencia ejercida por los elementos de justicia interpersonal, justicia procedimental y justicia distributiva que incorpora el sistema de recuperación de un fallo en el servicio sobre la percepción de la gravedad del fallo por parte del consumidor cabría destacar lo siguiente (ver tabla 4). La presencia de elementos de justicia interpersonal, justicia procedimental y justicia distributiva ejerce un efecto significativo sobre la percepción de gravedad del fallo que tiene el consumidor. Por tanto, los resultados del análisis indican que debe confirmarse la hipótesis 4 (F=9,862; p=0,002), la hipótesis 5 (F=8,876; p=0,003) y la hipótesis 6 (F=4,430; p=0,036).

Tabla 4  
**Influencia de la justicia interpersonal, procedimental y distributiva**

Variable: GRAVEDAD FALLO									
Justicia Interpersonal		F	Justicia Procedimental		F	Justicia Distributiva		F	
(Sin)	(Con)	9,862	(Sin)	(Con)	8,676	(Sin)	(Con)	4,43	
N = 240	N = 254		N = 246	N = 248		N = 263	N = 231		
Media	Desv.	P-valor	Media	Desv.	P-valor	Media	Desv.	P-valor	
4,92	2,11	0,002	4,97	1,79	0,003	4,89	1,91	0,036	
			4,42	1,68		4,52	1,86		

Finalmente, al analizar la moderación de la justicia interpersonal sobre los efectos ejercidos por la justicia procedimental y distributiva sobre la percepción de gravedad del fallo cabría destacar lo siguiente. Los resultados mostrados en la tabla 5 y en el gráfico 1 permiten constatar que durante el proceso de recuperación del servicio, el efecto moderador de la justicia interpersonal sobre la influencia ejercida por la justicia procedimental sobre la percepción de gravedad del fallo resulta significativo ( $F= 3,672$ ;  $p=0,056$ ) lo cual permite confirmar la hipótesis 7. Es decir, la percepción de gravedad del fallo puede verse reducida significativamente si el proceso de recuperación incorpora una adecuada justicia procedimental en combinación con una adecuada justicia interpersonal. Sin embargo, el efecto moderador de la justicia interpersonal sobre la influencia ejercida por la justicia distributiva sobre la percepción de gravedad del fallo no resulta significativo ( $F= 0,074$ ;  $p=0,786$ ) y por tanto la hipótesis 8 no se puede confirmar.

Tabla 5  
**Resultado del contraste de la hipótesis (segunda parte)**

**Moderación de la Justicia Interpersonal sobre la Justicia Procedimental en la percepción de la gravedad del fallo**

## 6. Conclusiones e implicaciones para la gestión

Utilizando la metodología de experimentación en un contexto de fallo de una compra online y tomando como referencia la Teoría de la Atribución y la Teoría de la Equidad, hemos analizado dos aspectos que tienen un claro interés para la investigación especializada en la materia y la gestión empresarial. En primer lugar, se ha analizado cómo varía la influencia ejercida por la responsabilidad de la empresa (ya sea de la empresa que presta el servicio o de la empresa colaboradora) sobre la satisfacción del consumidor y su percepción de responsabilidad y controlabilidad. De igual forma y con la finalidad de tener un punto de comparación, también se ha analizado la percepción de responsabilidad y controlabilidad que tiene el consumidor sobre una empresa colaboradora cuando el fallo se atribuye a la empresa que presta el servicio. En segundo lugar, se ha contrastado la influencia ejercida por los elementos de justicia interpersonal, justicia procedimental y justicia distributiva que incorpora el sistema de recuperación de un fallo en el servicio sobre la percepción de la gravedad del fallo por parte del consumidor. Adicionalmente, se ha analizado el efecto moderador de la justicia interpersonal en la influencia que ejercen la justicia procedimental y la justicia distributiva sobre la percepción de la gravedad del fallo.

El desarrollo de estos análisis nos ha permitido encontrar una serie de resultados reveladores, que detallamos a continuación. En cuanto a la responsabilidad del fallo (según ésta sea directa: empresa que presta el servicio; o indirecta: empresa colaboradora) y su influencia en las percepciones del cliente (satisfacción, responsabilidad y controlabilidad) cabría hacer referencia a los siguientes aspectos. En primer lugar, destacaríamos que el nivel de satisfacción del consumidor ante el fallo fue bajo en ambos casos y algo menor en el caso de que la responsabilidad le fuera atribuida directamente a la compañía que presta el servicio. Sin embargo, no existen diferencias significativas entre las dos situaciones. Es decir, el hecho de que la responsabilidad no fuera atribuida directamente a la compañía contratada no reduce la insatisfacción del cliente. Esto no resulta del todo extraño pues, al fin y al cabo, el perjuicio sufrido por éste (la no disponibilidad del producto comprado) es el mismo para los dos casos.

Respecto a la atribución de responsabilidades a sendas compañías, cabría destacar que se han encontrado diferencias significativas en las responsabilidades atribuidas en ambos casos, en función de si la responsabilidad del fallo fue atribuida a la empresa que presta el servicio o a la empresa colaboradora. En las dos situaciones, la responsabilidad que percibe el consumidor que tiene la empresa correspondiente (empresa que presta el servicio o empresa colaboradora) es menor si el responsable del fallo ha sido la otra empresa. No obstante, resulta especialmente interesante constatar que la percepción de la responsabilidad que tiene la empresa que presta el servicio es mayor en ambos casos que la responsabilidad asignada a la empresa colaboradora.

Acerca de la controlabilidad, cabría decir que una vez que un fallo se ha producido, además de identificar quién es el responsable, el consumidor también reflexiona sobre si ese fallo se podía haber evitado y quien podría haberlo hecho, es decir, qué empresa tiene bajo su control la posible ocurrencia del fallo. Los resultados de este análisis nos indican que para los dos casos la controlabilidad asignada a la empresa que presta el servicio fue mayor que la controlabilidad atribuida a la empresa colaboradora. No obstante, la controlabilidad de la empresa colaboradora sí presenta diferencias significativas pues cuando la responsabilidad es de la empresa que presta el servicio, la controlabilidad de la empresa colaboradora es claramente inferior. Sin embargo, resulta especialmente interesante constatar que la controlabilidad de la empresa que presta el servicio no se reduce si la responsabilidad recae sobre la empresa colaboradora. Esto permite reflejar que el consumidor considera que la empresa que presta el servicio debe controlar no sólo sus propios errores sino también los que pudieran ser cometidos por la empresa colaboradora.

Los resultados del presente trabajo también han permitido confirmar que los sistemas de recuperación del servicio también pueden ser capaces de cambiar la percepción del consumidor en relación a la gravedad que tenía el fallo que cometió la empresa. En concreto, se ha comprobado que los elementos de justicia interpersonal, justicia procedimental y justicia distributiva son capaces de que el consumidor perciba que el fallo de servicio que sufrió fue menos grave. De esta forma, se ha demostrado que un consumidor que percibe que se le ha brindado un buen trato (justicia

interpersonal) tiene una percepción de gravedad del fallo menor (4,42) que un consumidor al que se le ha tratado de una manera grosera y no se le ha pedido una disculpa adecuadamente (4,92). De manera similar, un consumidor que percibe que se le han aplicado mejores procesos en la resolución del fallo (justicia procedimental) tiene una percepción de gravedad del fallo menor (4,47) que un consumidor para el que el tiempo de respuesta y la información sobre la resolución del fallo no han sido las más adecuadas (4,97). La misma tendencia se cumple para la justicia distributiva: un consumidor que ha recibido una determinada compensación (justicia distributiva) tiene una menor percepción de gravedad del fallo (4,52) que un comprador al cual no se le ofrece ninguna compensación (4,89).

De igual forma, cabría destacar que se ha puesto de manifiesto el papel moderador de la justicia interpersonal (e.g. una comunicación amable y cortés con el cliente) sobre el efecto que ejerce la justicia procedimental (e.g. un proceso que permite una respuesta rápida ante el fallo) en la percepción de gravedad del fallo por parte del consumidor. Sin embargo, no se ha podido probar la existencia de un efecto moderador de la justicia interpersonal sobre la justicia distributiva.

El presente trabajo contribuye al avance de esta interesante línea de investigación, con las siguientes aportaciones:

- *Atribución del fallo*: la literatura ha aplicado la Teoría de la Atribución utilizando el concepto de “locus” con únicamente dos opciones: “locus externo” para atribuir el fallo al proveedor del servicio y “locus interno” para atribuir el fallo al propio consumidor. El presente estudio presenta una propuesta en la cual, el consumidor tiene una opción distinta de atribución: atribuir el fallo a uno de dos (o a los dos) proveedores que brindan un servicio de manera conjunta (empresa principal contratada por el consumidor o empresa colaboradora).
- *Recuperación servicio ofrecido por más de un proveedor*: en los últimos años la literatura ha estudiado ampliamente diversas facetas de la recuperación del servicio. Sin embargo, en casi todas las investigaciones se explotan escenarios donde solamente un proveedor está implicado en la prestación del servicio. En este estudio se destaca la necesidad de profundizar en la investigación en contextos en los cuales el servicio sea ofrecido por más de un proveedor. De esta manera, se puede contar con más información que podría ser sumamente valiosa en el sector de los servicios, tanto desde la perspectiva del consumidor como del proveedor. Desde el punto de vista del consumidor, esta información nos permite determinar cómo cambia su comportamiento ante este escenario, es decir, si le es indiferente quién cometió el fallo, o si por el contrario, dependiendo de qué empresa cometa el fallo muestra un mayor nivel de satisfacción, así como de atribución de responsabilidad y controlabilidad. Desde el punto de vista del proveedor, es importante estar atento a la reacciones de sus clientes, y de esta manera tomar una decisión mejor fundamentada sobre quiénes pueden ser sus *partners* al proveer el servicio.
- *Gravedad del fallo*: A pesar de que ha sido reconocido que la percepción de la gravedad del fallo tiene una influencia importante sobre la evaluación de la recuperación (Smith *et al.*, 1999; Levesque y McDougall, 2000), ha sido muy limitada la investigación que ha abarcado el estudio de la gravedad del fallo como un factor a tener en cuenta al analizar la respuesta de un consumidor ante los fallos (Hess, 2008). Por ello, en este estudio se ha incluido esta variable, y se ha hecho desde un punto de vista muy innovador: estudiando su variación como resultado de la influencia de las distintas justicias. El estudio de esta variable permite tener una comprensión más amplia de lo que un consumidor percibe como justo o injusto, al vincularlo con su noción de lo que entiende como un fallo grave o no grave.

Asimismo, los resultados del presente trabajo pretenden proveer de algunas claves en la gestión del servicio, de modo que los compradores tengan la percepción de que a pesar del fallo, han sido tratados de manera justa, se les ha solucionado rápidamente el problema y han sido recompensados de alguna forma. En primer lugar, se debe contar con estrategias de recuperación que contemplen aspectos de justicia interpersonal (e.g. una respuesta amable), justicia procedimental (e.g. procesos rápidos y flexibles), y justicia distributiva (e.g. regalos, descuentos, participación en sorteos en la misma página Web), con el fin de conseguir que el consumidor disculpe el fallo ocasionado y continúe haciendo compras en el mismo sitio online.

En segundo lugar, se debe utilizar la página Web como un medio de comunicación en dos vías, en lugar de un canal solamente para proveer información. Se podría habilitar una zona de “incidencias” para que el comprador pueda trasladar al vendedor cualquier situación relacionada con la transacción, por ejemplo, si el paquete no ha llegado a tiempo, si el objeto ha llegado en mal estado (pantalla de la Tablet rayada), si llegó el producto con características distintas a la solicitada (Tablet negra en lugar de blanca). De esta manera, se desestimula al consumidor a quejarse por otros medios, ya que se le está proveyendo de un medio -el cual es familiar al comprador, ya que estaba registrado en la página Web- para que comunique su insatisfacción directamente al vendedor.

Posteriormente, el proveedor debe entender que no basta solamente con obtener la queja del consumidor, se debe responder de forma rápida. Mediante un correo electrónico o un mensaje de texto (enviado de inmediato una vez conocida la incidencia) se le debe comunicar al usuario que la empresa ya tiene conocimiento de la situación, que lo va a solucionar a la mayor brevedad posible, y que pronto se pondrán en contacto con más información. Este simple mensaje puede tranquilizar al comprador, y suponer la diferencia entre un consumidor paciente y otro desesperado que da difusión a su insatisfacción y a al fallo de la empresa a través de las redes sociales o por cualquier otro medio.

Finalmente, si en el servicio participan más proveedores, y se produjera algún inconveniente, se debe valorar la posibilidad de “compartir” el fallo. De esta manera, la culpabilidad se “diluye”, de modo que el consumidor podría suponer que el 100% de la culpa no es exclusiva de una sola empresa, y por lo tanto podría mostrarse, al menos por una ocasión, un poco más tolerante hacia el fallo.

## **7. Limitaciones y futuras líneas de investigación**

En cuanto a las limitaciones del trabajo, el análisis se ha desarrollado con una muestra homogénea en cuanto a la experiencia de compra online, es decir, personas que han hecho alguna compra para un consumo personal. Sería interesante replicar el estudio con otra muestra de consumidores muy experimentados en la compra de productos en la red y otra de consumidores claramente ocasionales para determinar si la frecuencia de compra presenta diferencias significativas en relación a los aspectos aquí estudiados.

De igual forma, sería interesante plantear otros escenarios utilizando la gravedad del fallo como variable de manipulación en función de si este fallo es más o menos grave. Por ejemplo, podría plantearse un fallo leve cuando el paquete se retrasa un par de horas y comparar los resultados obtenidos con un fallo más grave, cuando el paquete se atrasa dos días, y con un fallo muy grave cuando el paquete nunca llega y hay que volver a realizar la transacción.

## **RESUMEN**

*La crisis financiera desatada en 2007 en los EE.UU. ha provocado que el sistema financiero español se encuentre inmerso en un profundo proceso de reestructuración. Este hecho ha obligado a muchas entidades a acometer procesos de fusión en los que deben decidir entre perder o mantener su identidad de marca regional.*

*Con el objetivo de responder a este dilema, se pretende analizar la importancia concedida por los clientes al atributo origen en la elección de una entidad financiera mediante el análisis de sus preferencias. Los resultados guiarán la toma de decisiones relativa a la gestión de marca en el sector financiero. Entre los principales resultados destacan la alta importancia concedida por los encuestados al origen de la entidad, la preferencia por las entidades financieras regionales frente a las nacionales y a las extranjeras y la existencia de tres segmentos de clientes diferentes en función de su estructura de preferencias.*

## **Palabras clave:**

Región de origen, Sector Financiero, Preferencias, Análisis Conjunto.

## 1. Introducción

La crisis financiera desatada en 2007 en los EE.UU. con las denominadas hipotecas “subprime” se extendió a todo el sistema financiero internacional y derivó en una crisis económica que azotó con mayor fuerza a las economías occidentales más endeudadas, como es el caso de los países del sur de Europa, España incluida. Desde entonces, el sistema financiero español está inmerso en un proceso de reestructuración necesario por la falta de liquidez en los mercados internacionales y por la caída de los precios de los activos inmobiliarios, muy presentes en los balances de las entidades financieras españolas. En algunos casos esta reestructuración ha conllevado políticas de ampliación de capital, pero en otros casos ha sido necesario acometer procesos de integración entre dos o más entidades financieras.

El número de entidades financieras en el mercado español ha ido reduciéndose progresivamente, de forma que en 2012 el sistema financiero estaba formado por 277 entidades, de las cuales, un 28,5% eran bancos nacionales, un 31,4% eran divisiones de bancos extranjeros y el restante 40% eran entidades de la denominada Economía Social, es decir cajas de ahorro y cooperativas de crédito, que suelen tener un tamaño muy reducido y un ámbito geográfico de actuación centrado principalmente en una región del país.

La reestructuración financiera ha afectado fundamentalmente a este grupo de entidades financieras, pues además de poseer un menor nivel de solvencia, disponen de menores posibilidades para el saneamiento de sus cuentas debido a que, por su forma jurídica, tienen limitadas las ampliaciones de capital. Según explican Miralles y Daza (2011), las razones que justifican que la reestructuración del sector financiero esté centrada en las cajas de ahorro y cooperativas de crédito se resumen en las siguientes:

- Gran parte del sector financiero y, en mayor medida las cajas de ahorro, se encuentra sobredimensionado, de forma que con la caída del volumen de negocio y la reducción de los márgenes en sus operaciones han visto reducida drásticamente su rentabilidad.
- El sector de la construcción y el elevado endeudamiento han sido los pilares en los que se ha basado la estrategia de expansión y, por lo tanto, en ellos residen las causas del exceso de capacidad del sector de las cajas de ahorro. El deterioro de valor de los activos inmobiliarios que las entidades financieras mantienen en sus balances ante la inexistencia de mercado, el incremento de la morosidad por la quiebra de muchas empresas inmobiliarias y las dificultades para encontrar financiación en los mercados mayoristas han influido de manera negativa en los resultados de explotación de dichas entidades.
- El problema de las cajas de ahorro surge especialmente por la dificultad de incrementar sus recursos propios mediante ampliaciones de capital. La emisión de cuotas participativas para incrementar el capital de las cajas de ahorro no es una opción atractiva para los inversores debido a que éstas no tienen derecho de voto.

Ante esta situación, algunas entidades han optado por acometer procesos de fusiones que han dado lugar a una nueva entidad que, en la mayoría de los casos, perdía su vínculo a una región. Otras, sin embargo, han optado por crear los denominados “Sistemas Institucionales de Protección” (SIP), es decir, un acuerdo contractual de responsabilidad conjunta entre varias entidades, de tal manera que los miembros del SIP respondan en términos de solvencia y liquidez ante cualquier dificultad de uno de los miembros que lo conforman. En este segundo caso, todas las entidades que entran a formar parte del proceso de integración mantienen su forma jurídica y, por consiguiente, pueden mantener su identidad de marca regional o usar una nueva marca única para todo el mercado nacional.

La realidad es que estos continuos cambios y procesos de integración de las cajas de ahorros y cooperativas de crédito están provocando que muchas de estas entidades pierdan total o parcialmente su identidad de marca regional. Por tanto y aunque sea de forma implícita, detrás de la decisión financiera de integrarse con otras entidades competidoras existe una decisión de marketing: mantener o eliminar las marcas de origen. Esta investigación pretende responder a este dilema analizando la importancia concedida por los clientes de las entidades financieras al origen regional de las mismas.

Los resultados pretenden servir de directrices útiles para los directivos de las entidades financieras en lo que respecta a la gestión de sus marcas.

El objetivo principal de este trabajo es analizar la estructura de preferencias de los clientes en la elección de una entidad financiera para evaluar la importancia que otorgan a distintos atributos a la hora de seleccionar a su entidad habitual, entre ellos el origen de la misma. Hasta donde alcanza nuestro conocimiento, no existen estudios dedicados al efecto del origen en este sector, salvo el llevado a cabo por Bigné y Sánchez (2002). Estos autores analizaron la preferencia de consumidores de 4 países (Alemania, España, Francia, y Reino Unido) para 6 categorías de productos, una de ellas, los bancos, y demostraron que los consumidores de todos los países tenían preferencias hacia las entidades financieras propias de su país frente a las extranjeras. La novedad de nuestro estudio radica en analizar el efecto región de origen, en lugar del efecto país de origen.

El trabajo se estructura de la siguiente forma. En el próximo apartado se desarrolla el marco conceptual sobre el Efecto Lugar de Origen, para posteriormente explicar el diseño y los objetivos de la investigación. A continuación, se muestran los resultados de la encuesta realizada y se finaliza mencionando las principales conclusiones e implicaciones del estudio.

## **2. El Efecto Lugar de Origen**

El efecto lugar de origen se define como un *“conjunto de fortalezas y debilidades vinculadas al lugar de origen que incorporan o sustraen el valor suministrado por una marca o servicio al fabricante y/o a sus clientes”* (Papadopoulos y Heslop, 2003) y ha sido ampliamente estudiado en la investigación académica (Ahmed y d’Astous, 2008). Este efecto del origen se puede manifestar de distintas formas, principalmente en la calidad percibida del producto por parte del consumidor (Han y Terpstra, 1988; Ahmed y d’Astous, 1992, 1996, 2001 y 2007; Verlegh et al., 2005; Veale y Quester, 2009), en sus actitudes y preferencias (Bigné y Cuenca, 2000; Van Ittersum et al., 2003; Font et al., 2011 y Gracia et al., 2011) o en sus intenciones de compra (González y Villanueva, 2000; Cerviño et al., 2005; Montesinos y Currat, 2007; Auger et al., 2010 y Godey et al., 2012). En la mayoría de los casos que se ha medido de varias formas, se concluye que el efecto lugar de origen se atenúa a medida que se pasa a fases más avanzadas del proceso de decisión de compra, es decir, es mayor cuando se mide en términos de percepciones de calidad, algo menor cuando se miden actitudes y menor cuando se evalúa en términos de intenciones de compra (Agrawal y Kamakura, 1999; Verlegh y Steenkamp, 1999; Peterson y Jolibert, 2005).

La mayoría de estos estudios sobre el origen se han centrado en analizar el efecto país de origen y sus variables explicativas. A título de ejemplo, se pueden citar como estudios recientes en esta materia los de Godey et al. (2012), Claret et al. (2012), Lee et al. (2013) o Lagerkvist et al. (2014), entre otros. Sin embargo, existe aún escasez de estudios sobre las variables que explican el efecto origen en el ámbito regional. Podemos citar como principal referente el estudio de Van Ittersum et al (2003) sobre patatas y cerveza en regiones de Holanda. De forma indirecta, también se pueden mencionar los trabajos que en el ámbito del marketing agroalimentario analizan las valoraciones y preferencias de los consumidores por las *“denominaciones de origen protegidas”* propias de determinadas regiones (por ejemplo, Gil y Sánchez, 1997; Monjardino y Ventura, 2001; Fotopoulos y Krystallis, 2003; Bernabéu y Tendero, 2005; Tendero y Bernabéu, 2005; Martínez-Carrasco et al., 2006; Hersleth et al., 2012; Caldas y Rebelo, 2013).

La revisión de la literatura también pone de manifiesto la escasez de investigaciones sobre el efecto lugar de origen en el sector servicios. Los estudios se han centrado en productos industriales (por ejemplo, Ahmed y d’Astous, 1995; Edwards et al., 2007 o Chen et al., 2011), y sobre todo bienes de consumo (Baldauf et al., 2009; Veale y Quester, 2009; Jiménez y San Martín, 2010; Font et al., 2011; Lee y Lockshin, 2011; Gázquez et al., 2012; Claret et al., 2012; Godey et al., 2012 o Lagerkvist et al., 2014).

Existen evidencias de la existencia de algunas variables que explican o moderan el efecto país de origen, como por ejemplo, la imagen del país, la familiaridad con un lugar y con sus productos, la familiaridad con la categoría de producto, algunas características socio-demográficas del individuo y

algunos aspectos de su personalidad, como la animosidad hacia un país determinado o el nivel de etnocentrismo.

La imagen se refiere a aquella representación mental que poseen los individuos acerca de un determinado lugar, ya sea en relación con aspectos históricos, políticos, culturales, económicos, geográficos o humanos, o en relación con una combinación de todos ellos. Puede afirmarse que la mayoría de los trabajos han encontrado una relación positiva entre la imagen de un lugar y el comportamiento de compra de los individuos hacia sus productos. Por una parte, algunos autores han demostrado la existencia de percepciones positivas y de una preferencia general de los consumidores por los productos procedentes de países desarrollados (Cordell, 1992; Srinivasan et al., 2004; Ahmed y d'Astous, 2001, 2007 y 2008). Otros trabajos, por su parte, confirman que ante percepciones positivas de un lugar, los consumidores muestran percepciones positivas y preferencia por sus productos (Roth y Romeo, 1992; Johansson et al., 1994; González y Villanueva, 2000; Verlegh et al., 2005; Montesinos y Currás, 2007; Lee y Lockshin, 2011 y Lee et al., 2013).

La familiaridad o nivel de conocimiento es otra de las variables moderadoras del Efecto que ha sido ampliamente estudiada en la literatura. Concretamente, son dos tipos de familiaridades las que han sido analizadas en la mayoría de estudios: la familiaridad con la categoría de producto (por ejemplo, Maheswaran, 1994; Bigné y Sánchez, 2002; Inch y McBride, 2004 o Jiménez y San Martín, 2010) y la familiaridad con un lugar y con sus productos (Roth y Romeo, 1992; González y Villanueva, 2000; Bigné y Sánchez, 2002; Ahmed y d'Astous, 2001, 2007 y 2008; Lee y Lockshin, 2011; o Gázquez et al., 2012). En ambos casos, los resultados obtenidos en los diferentes trabajos han sido contradictorios y aún existen lagunas respecto al papel de estas dos variables en el comportamiento de los individuos hacia el origen de los productos.

El etnocentrismo del consumidor se puede definir como “aquella creencia de que un producto derivado de tu grupo étnico o cultural es inherentemente superior a productos similares de otros grupos culturales o étnicos” (Myers, 1995). Las conclusiones respecto al papel de esta variable en el efecto lugar de origen son claras, pues la mayor parte de los estudios coinciden en afirmar la existencia de una relación negativa entre el nivel de etnocentrismo de los consumidores y las percepciones, actitudes e intención de compra de los mismos hacia los productos foráneos (Shimp y Sharma, 1987; González y Villanueva, 2000; Klein et al., 1998; Moon y Jain, 2002). Y, por otra parte, suele existir una relación positiva entre el nivel de etnocentrismo de los consumidores y las percepciones, actitudes e intención de compra de los mismos hacia los productos locales (Shimp y Sharma, 1987; Luque et al., 2004; Dmitrovic et al., 2009).

Las variables sociodemográficas también han sido ampliamente estudiadas en el contexto del comportamiento de los consumidores hacia los productos con origen. Sin embargo, los resultados obtenidos hasta el momento no revelan conclusiones claras. Autores como Inch y McBride (2004), Srinivasan et al. (2004), Samiee et al. (2005) o Ahmed y d'Astous (2001, 2007 y 2008) han analizado variables sociodemográficas como la edad, el sexo, los ingresos, el nivel de educación, el estado civil o el número de hijos, obteniendo conclusiones en diferentes direcciones y sin llegar a un consenso sobre su influencia en las valoraciones y en el comportamiento de los individuos.

### **3. Objetivos y diseño de la investigación**

El objetivo de este trabajo es analizar la estructura de preferencias de los clientes para conocer qué criterios o atributos tienen en cuenta en la elección de su entidad financiera habitual, entre ellos su vinculación con la región del cliente. De esta forma podremos evaluar si, en el proceso de reestructuración que se está viviendo en España (fusiones vs SIPs), es interesante desde el punto de vista comercial para la entidad financiera resultante mantener las marcas regionales previas al proceso de integración.

Este objetivo general se concreta en dos. En primer lugar, pretendemos conocer la importancia relativa que los clientes conceden al origen de la entidad financiera con respecto a otras características de la misma. En segundo lugar, pretendemos conocer las utilidades estimadas para cada una de las opciones de origen de una entidad financiera, de forma que se conozca si se prefiere o no una entidad regional, a una nacional o a una internacional.

Como se ha indicado anteriormente, en la revisión de la literatura no se han encontrado estudios previos que analicen la temática planteada en esta investigación. En el estudio de Devlin y Gerrard (2005) se analizan los principales criterios de elección de una entidad financiera, aunque no incluyen el origen como uno de los atributos analizados. Por todo ello, las hipótesis de trabajo se han basado en los resultados de una encuesta exploratoria previa y en los resultados de algunos estudios previos en el mismo entorno geográfico, pero en el sector agroalimentario. Por ejemplo, los estudios de Martínez-Carrasco et al. (2006) o Monjardino y Ventura (2001) ponen de manifiesto como los consumidores españoles y portugueses conceden una importancia relativa al origen de los alimentos superior a la de otros atributos, incluido en algunos casos el precio. Además, aunque hay excepciones (como por ejemplo, Martínez-Carrasco et al., 2006), la mayoría de los estudios sobre el origen en España ponen de manifiesto la preferencia del consumidor por el producto regional, frente a lo nacional y lo internacional (Bernabéu y Tendero, 2005; Gil y Sánchez, 1997) o para las denominaciones de origen de la región (Fotopoulos y Krystallis, 2003; Tendero y Bernabéu, 2005; Chocarro et al., 2009; Font et al., 2011; Claret et al., 2012; Realiani et al., 2013). En el caso del estudio citado de Bigné y Sánchez (2002), referido a los bancos, solo se concluía la preferencia por las entidades nacionales frente a las entidades internacionales, pues no se contemplaba el efecto región de origen.

Por esa razón, a priori, consideramos las dos siguientes hipótesis:

*Ha: El origen de la entidad financiera es un atributo que tiene mayor importancia relativa en la formación de las preferencias del cliente que otros atributos directamente relacionados con el servicio que les presta; en concreto: el trato de los empleados, la localización de las oficinas, las actividades de inversión social y los servicios de banca electrónica.*

*Hb: El origen regional de la entidad financiera será preferido al origen nacional y al origen extranjero.*

Por otro lado, pretendemos identificar la existencia de segmentos de compradores claramente diferenciados según sus preferencias a la hora de seleccionar su entidad financiera habitual y, en caso de que existan, se pretende describir el perfil de los individuos que los componen.

Para alcanzar los objetivos establecidos se ha utilizado la técnica del Conjoint Analysis a través de una encuesta dirigida a clientes de entidades financieras residentes en la región de Extremadura (suroeste de España). El trabajo de campo para la recogida de información se realizó desde febrero a junio de 2012 y se obtuvo una muestra de 427 personas (tabla 1). Esta técnica fue usada por primera vez en el campo del marketing a mediados de los años 70 (Green y Wind, 1975; Green y Srinivasan, 1978), desde entonces, su uso se ha extendido ampliamente, siendo el marketing agroalimentario el campo en el que se usa más frecuentemente. En los últimos años ha sido usada para evaluar la importancia del origen (Bernabéu & Tendero, 2005; Schunettler et al., 2008; Mesías et al., 2009; Font et al., 2011), pero especialmente ha sido usada para evaluar la preferencia por alimentos funcionales (Ares et al., 2008, 2009, 2010; Hailu et al., 2009; Johansen et al., 2010) y por alimentos modificados genéticamente (Carneiro et al., 2005; O'Connor et al., 2006; Cox et al., 2008). En el ámbito del marketing financiero, se ha utilizado para evaluar las preferencias por distintos tipos de tarjetas de crédito y otros productos financieros (Gómez Arias, 1996; Kara et al., 1996, 1994; Clark-Murphy y Soutar, 2004; Mankila, 2004; Baheri et al., 2011; Mishra y Bisht, 2013), pero no para la selección de entidades financieras.

**TABLA 1**  
**Ficha técnica del estudio**

<b>Población</b>	Clientes de entidades financieras mayores de 18 años
<b>Muestra</b>	427 clientes
<b>Ámbito geográfico</b>	Regional (Extremadura, España)
<b>Tipo de muestreo</b>	No probabilístico por cuotas (sexo y residencia)
<b>Tipo de encuesta</b>	Personal, auto-administrada
<b>Trabajo de campo</b>	<b>Febrero-junio, 2012</b>

Previamente al diseño del cuestionario final se procedió a seleccionar los atributos a introducir en el estudio. Para ello se realizó una breve encuesta a 40 clientes de entidades financieras que permitiese conocer aquellos aspectos que valoran a la hora de elegir a las mismas. Los atributos escogidos para el estudio final fueron los más valorados por los encuestados en este pre-test. Tan sólo hubo una excepción. A pesar de incluir en el pre-test atributos relativos a las condiciones financieras ofrecidas por las entidades, este atributo no fue incluido en el estudio. En el cuestionario final se especificaba que la decisión entre una y otra entidad financiera estaría basada en la igualdad en las condiciones financieras y, por tanto, la decisión recaería sobre el resto de atributos a valorar. Esta decisión se justifica por la pérdida de información muy valiosa para el objetivo del estudio que supondría la inclusión de este atributo claramente determinante de la elección de una entidad financiera.

Teniendo presente que las condiciones financieras son un aspecto fundamental a la hora de elegir cualquier entidad por parte del cliente, es necesario recordar que el objetivo específico de este estudio es valorar la importancia relativa del origen respecto a otros atributos. Lo que se pretende en este estudio es averiguar si existe la posibilidad de que las entidades financieras regionales, generalmente más pequeñas y con menos recursos financieros, puedan contrarrestar la (supuesta) mayor solidez financiera y mejores condiciones de las grandes entidades nacionales e internacionales a través de otros atributos como el trato al cliente, la inversión social en las regiones o el origen regional de la entidad. Se trata de dar respuesta a preguntas como: ¿es importante para el cliente que la entidad pertenezca a su región? ¿Debe la entidad financiera regional mantener su marca y potenciar la comunicación en ese aspecto?

Los atributos elegidos finalmente para el estudio fueron: el origen de la entidad, el trato de los empleados, la localización de las oficinas, los servicios on-line ofrecidos y las actividades sociales que la entidad realiza en la región del encuestado. Respecto al origen, se incluyeron en el estudio tres posibles opciones: entidad regional, nacional o extranjera. Por lo que se refiere al trato de los empleados, las opciones eran un trato correcto (le atienden de forma educada y profesional) o un trato cercano y personalizado (Le atienden de forma educada y profesional, pero además existe una relación más personal, el empleado le conoce y se interesa por cómo se encuentra). El tercer atributo, la localización de las oficinas de la entidad financiera, podía presentarse en dos niveles diferentes: oficinas cercanas o lejanas al hogar o al lugar de trabajo del encuestado. Respecto a los servicios on-line, los ejemplos de entidades financieras que se le presentaban a los encuestados podían disponer de una web básica (donde sólo se permite realizar operaciones financieras básicas, como consultas de saldo o transferencias) o una web completa (permitiendo todo tipo de operaciones financieras, incluidas las relativas a contratación y cancelación de productos financieros). Finalmente, el atributo “actividades sociales que la entidad realiza en su región” (definido como patrocinio y promoción de eventos deportivos o culturales, apoyo a personas discapacitadas, apoyo a proyectos empresariales, etc.) podía presentarse en dos niveles: pocas y bastantes.

Para llevar a cabo el Análisis Conjunto se ha trabajado con el método de perfil completo. Según este método, al entrevistado se le presenta un único conjunto de estímulos para ser evaluados, estando formado cada uno de estos estímulos por información sobre los 5 atributos incluidos en el estudio. El número de estímulos a utilizar en el método de perfil completo depende del número de atributos y niveles considerados. En nuestro estudio, el número de estímulos posibles eran 48. Sin embargo, presentar tantos estímulos al entrevistado generaría una sobrecarga de información que influiría negativamente en la calidad de respuesta. Para evitar este problema se ha procedido a realizar un *diseño ortogonal* que redujo las combinaciones a sólo 8. La reducción de todas las combinaciones posibles se realiza de tal forma que la información recogida en dicho subgrupo dará lugar a un resultado semejante al que se alcanzaría utilizando todos los estímulos. De esta forma, se puede garantizar la presencia de todos los atributos y sus correspondientes niveles con igual intensidad en los estímulos obtenidos con este diseño, no sesgándose hacia ningún nivel.

Las valoraciones de los compradores hacia las 8 entidades financieras fueron obtenidas mediante entrevistas personales, en las cuales los encuestados debían valorar cada estímulo en una escala

métrica de 1 a 9 según su preferencia (1=seguro que no la elegiría; 9= seguro que la elegiría). Para estimar los parámetros del modelo planteado, el programa SPSS emplea la regresión múltiple por mínimos cuadrados ordinarios.

Además de las preguntas relativas a los 8 tipos de entidades financieras, el cuestionario utilizado incluía preguntas relativas a variables que la literatura ha identificado como antecedentes o moderadoras del efecto lugar de origen, en concreto la familiaridad con la categoría de producto (funcionamiento de los productos financieros), la familiaridad con los productos del lugar (nivel de conocimiento de las entidades financieras de la región), el nivel de etnocentrismo y, como variables sociodemográficas, el sexo, el nivel de estudios y el nivel de ingresos.

La familiaridad de los clientes con la categoría de producto se midió a través de cuatro preguntas que permitían evaluar el conocimiento de los encuestados sobre el funcionamiento de los productos financieros. Los consumidores tenían la posibilidad de marcar una de las tres opciones disponibles: “verdadero”, “falso” o “no sabe”. Este sistema permitió dividir a los encuestados en dos grupos: experto y bajo nivel de conocimiento. Para que un consumidor fuera considerado experto en la categoría de producto debía acertar al menos tres preguntas de las cuatro realizadas en el cuestionario (61,8%). Se consideró que este sistema era más adecuado para evaluar el conocimiento real de los consumidores sobre los productos que el uso de una pregunta de autoevaluación (Ahmed y d’Astous, 1999).

Para medir la familiaridad con los productos de su región se usó una pregunta abierta en la que se pedía al encuestado que enumerasen tantas entidades financieras de su región como recordase en ese momento (notoriedad espontánea). Aquellos encuestados que nombrasen cuatro o más entidades serían considerados clientes altamente familiarizados con el sector financiero regional (28,8%).

Finalmente, para medir el nivel de etnocentrismo de los individuos se usó la escala CETSCALE, creada por Shimp y Sharma (1987). Esta escala de medida ha sido ampliamente validada en diferentes países y en diversos contextos y situaciones, aunque en algunas ocasiones se han utilizado versiones reducidas de la misma (Olsen et al., 1993; Samiee et al., 1994; Marín y Bigné, 1998; Klein et al., 1998; Watson y Wright, 2000; Moon y Jain, 2002; Srinivasan et al., 2004; Dmitrovic et al., 2009; Díaz et al., 2011). Está compuesta por 17 ítems medidos mediante escala de Likert de 7 puntos de forma que el valor mínimo de la escala para un individuo serían 17 puntos, mientras que el valor máximo de etnocentrismo se situaría en 119 puntos. En el caso de esta investigación, los ítems de la escala han sido adaptados para referirse al ámbito regional, pues la escala original es de aplicación a países. La muestra se dividió en tres grupos: bajo nivel de etnocentrismo si obtuvieron una puntuación inferior o igual a 44 puntos (35% de la muestra), nivel medio de etnocentrismo si obtuvieron una puntuación comprendida entre los 45 y los 82 puntos (53% de la muestra) y alto nivel de etnocentrismo si superaron los 82 puntos (12% de la muestra).

#### **4. Resultados**

Mediante las puntuaciones otorgadas por los entrevistados a las 8 entidades financieras propuestas se estimaron las utilidades concedidas a cada uno de los niveles de los atributos considerados en el modelo (tabla 2) y, por consiguiente, la importancia relativa de cada uno de los atributos. Según el valor obtenido para la Tau de Kendall se puede decir que el modelo ajusta correctamente.

En primer lugar, los resultados ponen de manifiesto que, para el conjunto de la muestra, la entidad financiera preferida sería una entidad regional, con un trato cercado por parte de los empleados, con oficinas localizadas cerca de la casa o el lugar de trabajo del cliente, que disponga de una Web en la que se puedan realizar una amplia gama de gestiones financieras y que invierta en bastantes actividades sociales dentro de la región. El perfil de esta entidad financiera “ideal” se ajusta a lo esperado, salvo en el caso del origen, en el que existía incertidumbre acerca de las preferencias de los clientes antes de comenzar este estudio y que supone una información relevante para los gestores de las entidades financieras regionales.

TABLA 2  
**Estimación de utilidades para los niveles de los atributos**

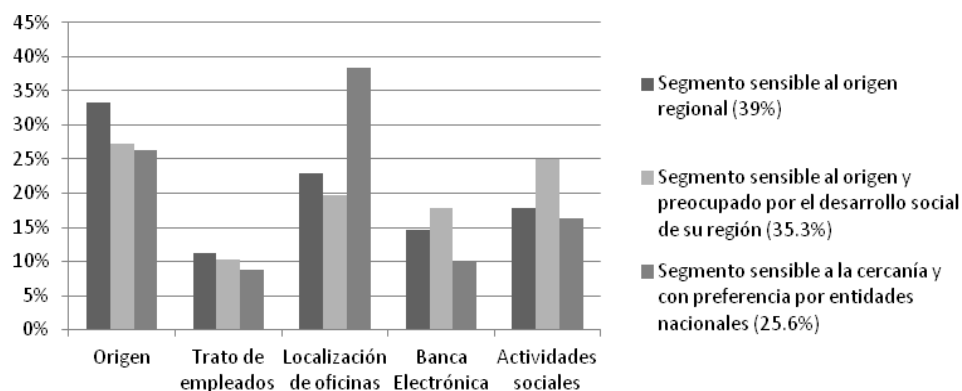

Atributos	Niveles	Estimated utility	Standard error	Relative importance
<b>Origen</b>	Regional	0,58	0,14	29,37%
	Nacional	0,29	0,17	
	Extranjera	-0,87	0,17	
<b>Trato empleados</b>	Correcto	-0,15	0,11	10,25%
	Cercano	0,15	0,11	
<b>Localización oficinas</b>	Cercanas a casa o lugar de trabajo	0,83	0,11	25,72%
	Lejanas a casa o lugar de trabajo	-0,83	0,11	
<b>Banca electrónica</b>	Todo tipo de operaciones financieras	0,38	0,11	14,66%
	Sólo operaciones financieras básicas	-0,38	0,11	
<b>Actividades Sociales</b>	Bastantes	0,66	0,11	20,00%
	Pocas	-0,66	0,11	
<b>(Constante)</b>		5,09	0,11	

R de Pearson= 0,999; Tau de Kendall= 1,000

Con relación a la importancia relativa de cada atributo en la formación de las preferencias del cliente, el atributo más importante para el conjunto de la muestra es el origen de la entidad financiera, con un peso relativo del 29,4%. Este atributo es seguido de cerca en importancia por la localización de las oficinas, con un 25,7%, y posteriormente por las actividades sociales realizadas por la entidad en la región del encuestado (20%), las características de la banca electrónica de la entidad (14,7%) y, en último lugar, por el trato de los empleados (10,25%). Por tanto, estos resultados nos permiten corroborar la hipótesis H<sub>a</sub>, puesto que el origen, en igualdad de condiciones financieras, es el atributo más importante para los consumidores en la formación de sus preferencias, por delante del resto de atributos. Y al observar las utilidades estimadas para cada nivel de los atributos se observa que también se corrobora la hipótesis H<sub>b</sub>, puesto que el origen regional de la entidad financiera es preferido al nacional, y este al extranjero.

Una vez analizadas las preferencias para el conjunto de la muestra de cliente se realizó una segmentación según los scores o puntuaciones otorgadas a los diferentes estímulos presentados a los encuestados. Para ello se realizó un análisis cluster K-medias que permitiese identificar segmentos con estructuras de preferencias claramente diferentes. Tras realizar las pruebas oportunas, la opción más adecuada fue considerar K=3. Cada uno de estos tres grupos realiza sus elecciones de entidades financieras de forma distinta y no conceden el mismo valor al origen regional. En la figura 1 se recoge una comparativa de la importancia relativa de los atributos del modelo entre los tres segmentos y, por otra parte, en la tabla 3 se indican las utilidades estimadas para cada uno de ellos.

FIGURA 1  
Importancia relativa según segmentos

Si analizamos detenidamente la información para cada segmento, se extraen los siguientes resultados:

- **Segmento 1:** se trata de un grupo de consumidores especialmente sensibles al origen de la entidad. Contiene algo más de un 39% del total de la muestra. Para ellos, el origen es el principal atributo diferenciador en una entidad financiera con un peso relativo del 33% en la formación de sus preferencias. Como se puede observar en la tabla 3, y tal y como ocurría con el global de la muestra, este segmento prefiere en primer lugar las entidades regionales, algo que, tratándose del grupo de consumidores más sensible a este atributo, es un dato relevante para la gestión de estas entidades. Por detrás de las entidades regionales, muestran preferencia por las nacionales y por último, muestran una preferencia negativa hacia las extranjeras. Por tal razón puede denominarse como “segmento sensible al origen regional de la entidad financiera”.

- **Segmento 2:** se trata de un segmento sensible al origen y preocupado por el desarrollo social de su región. Está compuesto por el 35% de la muestra; sus integrantes se caracterizan por otorgar una mayor importancia al origen en relación con el resto de atributos. Sin embargo, esa importancia es menor que en el caso del primer segmento (27% vs 33%) y además esta importancia es muy similar a la concedida a la vinculación de la entidad financiera con la región a través de actividades sociales (25%). Por lo que respecta a las utilidades de cada nivel, los consumidores pertenecientes a este segmento también muestran una mayor preferencia por las entidades regionales, por delante de las nacionales y de las extranjeras, con una utilidad negativa.

- **Segmento 3:** Está formado por un 25,6% de la muestra y se caracteriza por otorgar una fuerte importancia relativa (38,3%) a la localización de las oficinas, muy por encima del resto de atributos. Es el primer caso en el que el origen pasa a ser el segundo atributo en importancia, con un 26,3% de peso relativo. Se puede definir a este segmento como especialmente sensible a la localización de las oficinas de la entidad. Además, este grupo difiere del resto, al preferir las entidades nacionales por encima de las entidades regionales y de entidades extranjeras. Por otro lado, el compromiso con el desarrollo social de la región se trata de una característica secundaria en la formación de las preferencias de los individuos de este segmento. El peso relativo de dicho atributo es el más bajo en comparación con el resto de segmentos (solo un 16,4%).

Estos resultados ponen de manifiesto que se corroboran la hipótesis  $H_a$  y la hipótesis  $H_b$  para dos de los tres segmentos.

TABLA 3  
Estimación de las utilidades, según segmentos

		Sensibles al origen regional (39,1%)	Sensibles al origen y preocupado por el desarrollo social (35,3%)	Sensibles a la cercanía y con preferencia por entidades nacionales (25,6%)
<b>Origen</b>	Regional	0,62	0,77	0,27
	Nacional	0,32	0,02	0,62
	Extranjera	-0,94	-0,79	-0,89
<b>Trato empleados</b>	Correcto	-0,17	-0,19	-0,06
	Cercano	0,17	0,19	0,06
<b>Localización oficinas</b>	Cercanas a casa o lugar de trabajo	0,56	0,61	1,56
	Lejanas a casa o lugar de trabajo	-0,56	-0,61	-1,56
<b>Banca electrónica</b>	Todo tipo de operaciones financieras	0,38	0,60	0,08
	Sólo operaciones financieras básicas	-0,38	-0,60	-0,08
<b>Actividades Sociales</b>	Bastantes	0,44	0,93	0,62
	Pocas	-0,44	-0,93	-0,62
<b>(Constante)</b>		6,07	4,71	4,13

1. R de Pearson= 0,999; Tau de Kendall= 1,000
2. R de Pearson= 0,997; Tau de Kendall= 0,929
3. R de Pearson= 0,994; Tau de Kendall= 1,000

Tras analizar las preferencias de los tres segmentos, se realizaron los correspondientes test de chi-cuadrado para conocer el perfil de los integrantes de cada uno de ellos. Sin embargo, se extrajeron resultados poco aclaratorios, puesto que ninguno de los tres segmentos mostraba diferencias significativas en lo referente a las variables:

- Familiaridad o conocimiento del sistema financiero, en la línea de estudios como Bigné y Sánchez (2002) o Srinivasan et al. (2004), y al contrario de otros estudios que sí encontraron influencia de esta variable, como Maheswaran (1994) o Jiménez y San Martín (2010).
- Familiaridad con las entidades financieras regionales, en la línea de estudios como Roth y Romeo (1992), y en contra de numerosos estudios que ponen de manifiesto la importancia de esta variable en la importancia concedida al origen, como Johansson (1989), González y Villanueva (2000), Jaffe y Nebenzahl (2001), Bigné y Sánchez (2002), Ahmed y d'Astous (2001, 2007 y 2008), Lee y Lockshin (2011) o Gázquez et al. (2012).
- Algunas variables sociodemográficas como sexo, estudios o ingresos, en la línea de otros estudios como Ahmed y d'Astous (2001 y 2008) o Srinivasan et al. (2004).
- Nivel de etnocentrismo, en la línea de Srinivasan et al. (2004) y Jiménez y San Martín (2008), y al contrario de numerosos estudios que sí han identificado una fuerte influencia de esta variable, como Shimp y Sharma (1987), Klein et al. (1998), Watson y Wright (2000), González y Villanueva (2000), Moon y Jain (2002), Del Río et al. (2003), Luque et al. (2004), Samiee et al. (2005) o Dmitrovic et al. (2009). Todos estos análisis resultaron no significativos.

La edad fue la única variable para la que se obtuvieron diferencias significativas al 10% entre los tres segmentos, tal y como indica el valor de la Chi-cuadrado recogido en la tabla 4. Se puede concluir que el segmento sensible al origen regional de la entidad está formado por un grupo de consumidores principalmente joven, ya que casi la mitad de sus integrantes son menores de 35 años. Por su parte, el segmento sensible al origen y preocupado por el desarrollo social de su región lo constituye un grupo que contiene un amplio número de personas de entre 46 y 55 años (30,2% del total de sus integrantes). Además, más de la mitad de los encuestados mayores de 65 años se encuentran en este segmento, por lo que se puede concluir que se trata del segmento de mayor edad. Y por último, el tercer segmento, o clientes que prefieren entidades nacionales y cercanas, está formado principalmente por personas jóvenes menores de 35 años (38% de sus integrantes) y de edades comprendidas entre los 46 y 55 años (29,6% de sus integrantes).

**TABLA 4**  
**Perfil de los segmentos según edades**

		Menor de 35	Entre 35 y 45	Entre 46 y 55	Entre 56 y 65	Mayor de 65	Total
<b>Sensibles al origen regional</b>	según segmento	49,09%	20,61%	21,82%	6,67%	1,82%	100%
	según edad	47,93%	37,36%	31,86%	35,48%	16,67%	39,10%
<b>Segmento sensible al origen y preocupados por el desarrollo social de su región</b>	según segmento	31,54%	23,49%	30,20%	8,05%	6,71%	100%
	según edad	27,81%	38,46%	39,82%	38,71%	55,56%	35,31%
<b>Segmento sensible a la cercanía y con preferencia por entidades nacionales</b>	según segmento	37,96%	20,37%	29,63%	7,41%	4,63%	100%
	según edad	24,26%	24,18%	28,32%	25,81%	27,78	25,59%
<b>Total</b>	según segmento	40,05%	21,56%	26,78%	7,35%	4,27%	100%
	según edad	100%	100%	100%	100%	100%	100%

Estos resultados son similares a los de algunos autores como Ahmed y d'Ástous (2001), quienes encontraron relación significativa entre el origen de los productos y la edad, pero no para variables como la educación o los ingresos. Sin embargo, la dirección de la relación demostrada por estos autores no se corresponde con los resultados de este estudio, pues aseguraban que a menor edad, menores eran los prejuicios sobre los productos extranjeros. Inch y McBride (2004), por su parte, también encontraron un efecto moderador de la edad en el Efecto Lugar de Origen, aunque con resultados algo contradictorios. El resultado obtenido se puede justificar alegando que, en los tiempos de crisis económica y altas tasas de desempleo, los jóvenes están valorando más lo local y lo regional como forma de apostar por su futuro.

## **5. Conclusiones e implicaciones para la gestión**

El efecto lugar de origen ha sido ampliamente estudiado, pero no es un efecto universal porque varía geográficamente y según las categorías de producto (Johansson, 1989). Además, en la mayoría de los casos, los estudios se han centrado en el ámbito del efecto país de origen en bienes de consumo, siendo muy escasos los estudios en el ámbito de las regiones y de los servicios. Estas razones justifican la realización de este estudio, que ha pretendido cubrir parcialmente el vacío existente en el estudio del efecto lugar de origen en el sector financiero.

Los resultados del estudio sirven para confirmar la importancia del origen con respecto a otros atributos como elemento que el cliente utiliza para decantarse por su entidad financiera habitual, siempre y cuando las condiciones financieras sean similares. Además, se confirma un efecto región de origen positivo, puesto que existe una preferencia del cliente medio por las entidades regionales, frente a las nacionales y las extranjeras.

En un estudio de este tipo es importante resaltar el valor de la transferencia del conocimiento al sector empresarial. En el caso que nos ocupa, la crisis económica y financiera internacional ha tenido un relevante impacto negativo en España, obligando a una reestructuración del sistema financiero español. La mayoría de las cajas de ahorro y cooperativas de crédito, que suponen más de la mitad del sector y suelen tener un ámbito de actuación regional, se han visto obligadas a acometer procesos de integración entre ellas para mejorar su solvencia y competitividad. Este proceso se podía plantear a través de fusiones y absorciones o a través de una figura específica conocida como SIP. En el primer caso, la decisión suele conllevar la creación de un banco y la pérdida de la vinculación con la región de origen de las entidades integradas. En el segundo caso, esta pérdida no se produce necesariamente. Desde el punto de vista del marketing y la gestión de marca, las entidades financieras regionales que están en procesos de integraciones con otros competidores deben plantearse mantener su marca regional y potenciar la comunicación en ese aspecto, o si por el contrario, deben apostar por una marca única, común para todas las regiones donde compitan. Los resultados de nuestro estudio justifican la elección de la primera opción como estrategia de marca.

Además, el estudio realizado nos permite identificar la existencia de tres segmentos de clientes diferentes en función de su estructura de preferencias. Concretamente, se detecta la existencia de un segmento sensible al origen regional de la entidad, otro sensible al origen y preocupado por el desarrollo social de su región y un tercero especialmente sensible a la localización de las oficinas de la entidad. El mercado potencial de las entidades financieras regionales lo constituyen los dos primeros. Las características de estos segmentos también permiten plantear a los responsables de marketing de las entidades financieras la posibilidad de usar el compromiso y la vinculación con la región como medios para acceder a ellos y diferenciarse y posicionarse frente a la competencia.

A pesar de los resultados obtenidos hay que resaltar las limitaciones del estudio por cuanto que los mismos no se pueden extrapolar directamente a otros ámbitos geográficos, como hemos dicho el efecto lugar de origen no es universal. El comportamiento de los clientes y consumidores hacia los productos locales, regionales y nacionales puede variar considerablemente según las características políticas e históricas de cada región o país y variables como el etnocentrismo, el sentimiento regionalista o la reputación otorgada a su lugar de origen. Además, como se ha recogido en la literatura previa, el efecto lugar de origen varía de una categoría de producto a otra.

Sin embargo, creemos que este trabajo también abre nuevas alternativas para investigaciones futuras, tales como analizar si el efecto región origen en el sector financiero es similar para otras regiones y como evaluar el efecto lugar de origen en otros tipos de servicios no financieros.

*Universitat Jaume I*

## RESUMEN

*El objetivo del trabajo es enriquecer la investigación centrada en el marketing interno al analizar su incidencia en la satisfacción de los clientes a partir del papel mediador de la actitud y desempeño de los empleados, si bien diferenciando esta incidencia según la experiencia laboral de los trabajadores.*

*Para ello, se hace uso de una metodología diádica, con 244 díadas (relacionando las respuestas de cada empleado con las respuestas medias de tres de sus pacientes) en el servicio de consultas externas de cinco hospitales valencianos. El análisis se realiza a través de modelos de ecuaciones estructurales (EQS 6.1).*

*Los resultados corroboran la mayoría de las relaciones causales propuestas en el modelo. Además, se demuestran diferencias significativas en algunas relaciones en función de la experiencia laboral del trabajador. Precisamente, una de las principales contribuciones del trabajo es su análisis de las consecuencias de la OMI en distintos segmentos de empleados.*

## Palabras clave:

*Marketing interno, orientación al mercado interno, respuesta afectiva del empleado, calidad del servicio, satisfacción del paciente.*

## 1. Introducción

La relación demostrada entre la calidad percibida y la satisfacción del cliente y su lealtad explica el esfuerzo empresarial por mejorar la percepción que los clientes hacen de la calidad del servicio ofrecido. Esta relación se vuelve aún más importante en el caso de las empresas de servicios, por la variabilidad en la calidad ofrecida al depender de la interacción que se produce entre los empleados y sus clientes (Gunawardane, 2011). En consecuencia, las empresas de servicios dependen de sus trabajadores para lograr un servicio de calidad en tales encuentros (Cheung y To, 2010).

A nivel académico, la literatura centrada en el marketing interno ha analizado el modo en que la relación dirigente-trabajador puede gestionarse para mejorar el resultado en el mercado externo (Gounaris, 2006). Siguiendo a Ahmed and Rafiq (2003, p. 1180), el término marketing interno puede definirse como “una filosofía que centra su atención en la satisfacción del cliente y en la productividad organizativa a través de la atención continua y la mejora de los trabajos que los empleados realizan y del ambiente en el que los llevan a cabo”. Por lo tanto, las aportaciones que tratan el marketing interno pueden contribuir a enriquecer la llamada “linkage literature”, centrada en la relación entre la gestión interna y los resultados externos organizativos (Hartline y Ferrell, 1996).

En este sentido, el presente trabajo desea contribuir a esta línea de investigación al considerar, por vez primera, el papel mediador que la respuesta afectiva de los empleados puede tener sobre la relación entre la gestión interna (marketing interno) y el resultado externo organizativo (calidad del servicio percibida por el cliente y su satisfacción). Para tal fin, a partir de distintos trabajos (Gounaris et al., 2010; Lings y Greenley, 2010), utilizamos la Orientación al Mercado Interno (OMI) para representar y definir el concepto marketing interno.

La justificación teórica de las relaciones propuestas se basa en principios teóricos como la teoría de intercambio social (Homans, 1958), la teoría del contrato psicológico (Robinson, 1996) y la teoría de la equidad (Adams, 1963). Para ello, se hace uso de una metodología diádica, al relacionar respuestas de los empleados y de sus clientes, lo que supone dar respuesta a las limitaciones mostradas por diversos trabajos (Akroush et al., 2013; Lings y Greenley, 2010) centrados en la relación gestión interna – resultados externos organizativos sin contemplar la formación de díadas.

Además, con la excepción del reciente trabajo de Huang y Rundle-Thiele (2014), la literatura centrada en el marketing interno no ha analizado, a través del análisis multigrupo, la posible existencia de diferencias significativas en las consecuencias de la aplicación del marketing interno en su organización. De hecho, creemos que esta investigación es la primera que analiza la posible influencia que la experiencia laboral puede tener en el papel antecedente del marketing interno sobre la actitud y desempeño del trabajador.

Los resultados de la investigación pretenden ser de utilidad a las empresas de servicios, al ofrecer, a través de la Orientación al Mercado Interno, una herramienta de planificación, gestión y control de la aproximación directiva a los empleados. Además, se prueba la necesaria adopción de políticas y acciones diferenciadas según las necesidades y exigencias que los segmentos de trabajadores identificados muestran.

Finalmente, la investigación se centra en el sector sanitario, en el que los centros hospitalarios muestran una tendencia creciente a orientarse a los pacientes (Chen y Lin, 2013), lo que les exige una atención a los empleados a través de una filosofía marketing (marketing interno). Esta orientación a los trabajadores es muy necesaria en los servicios sanitarios debido al decisivo papel que juegan los profesionales para garantizar la calidad del servicio. En este sentido, diversos trabajos defienden que los empleados sanitarios tienen un mayor riesgo de sufrir desgaste emocional en el trabajo (Laranjeira, 2011; Lim et al., 2010), lo que lleva a justificar el tratamiento que este trabajo hace de la posible incidencia positiva que el marketing interno puede tener en la actitud y desempeño laboral de estos trabajadores.

El trabajo se estructura con el análisis, en primer lugar, de la literatura centrada en el marketing interno y la presentación de los principios teóricos que justifican las relaciones planteadas. Posteriormente, se menciona la metodología seguida y los resultados más destacados de la investigación. Finalmente, se argumentan las principales implicaciones, limitaciones del estudio y se sugieren futuras líneas de investigación.

## **2. Revisión de la literatura e hipótesis de la investigación**

### **2.1. Marketing interno y la Orientación al Mercado Interno (OMI)**

Desde su inicio académico, la falta de acuerdo sobre la naturaleza conceptual del término ha dificultado el desarrollo del marketing interno. A pesar de ello, siguiendo a Gounaris et al. (2010), treinta años de investigación han llevado a los siguientes acuerdos: (1) los principios para aplicar el marketing internamente son análogos a los principios a aplicarlo externamente; (2) el desarrollo del marketing interno ayuda a que los empleados alcancen sus necesidades laborales; y (3) el ámbito de aplicación del marketing interno es también externo ya que tiene como objetivo lograr la satisfacción del cliente a través de la satisfacción del empleado.

Recientes trabajos han desarrollado y validado distintos instrumentos para medir el marketing interno, destacando sobremanera la Orientación al Mercado Interno (OMI) de Lings y Greenley (2005). Este constructo representa que el marketing interno se refleja a través de la generación y comunicación de información sobre las exigencias y necesidades de los empleados, así como el diseño e implementación de las respuestas adecuadas a dichas exigencias y necesidades.

Siguiendo esta definición, Gounaris (2008a, b) trata la OMI como un constructo jerárquico y multidimensional, siendo la generación interna de información, la comunicación y la respuesta a dicha información sus principales dimensiones. Estas dimensiones están constituidas por un total de diez subdimensiones (ver tabla en el anexo). El presente trabajo utiliza este constructo, al considerar que por su riqueza y variedad de dimensiones y subdimensiones es el que mejor representa conceptual y operativamente la naturaleza del marketing interno.

### **2.2. Referencias teóricas**

La teoría del intercambio social defiende la existencia de dos tipos de relaciones de intercambio entre individuos y/o entidades: económicas y sociales (Homans, 1958). El intercambio social se basa en la confianza y cumplimiento de las obligaciones de cada partícipe (Rousseau, 1990). Además, la teoría de la equidad justifica que la respuesta de cada parte se basa en la valoración de la equidad de la relación (Adams, 1963). En el contexto organizativo, siguiendo a Settoon et al. (1996), las actuaciones organizativas y/o de sus dirigentes beneficiosas para los empleados contribuyen al establecimiento de relaciones de intercambio de gran calidad, que crean en los trabajadores la obligación de responder de manera positiva, beneficiosa para la organización.

La presente investigación, siguiendo los resultados de distintas aportaciones en los últimos años (Alexandrov et al., 2007; Chen et al., 2009; Paulin et al., 2006), considera que los empleados muestran una respuesta afectiva hacia su trabajo coherente con la valoración que hacen de su relación de intercambio social con su organización y dirigentes. El estado afectivo o actitud<sup>1</sup> de los empleados incide en su comportamiento durante el desempeño laboral. El modelo planteado se basa en esta secuencia, en la que la valoración que los trabajadores hacen de la OMI de su organización puede influir en su respuesta afectiva (satisfacción laboral, confianza en la benevolencia y honestidad de sus dirigentes, y su compromiso organizativo). Esta respuesta afectiva, en consecuencia, puede determinar su comportamiento laboral, y con ello la calidad del servicio percibido por el cliente y su nivel de satisfacción.

A pesar de las numerosas aportaciones que configuran la llamada “linkage literature”, centradas en analizar la relación entre la gestión interna y los resultados externos organizativos, el presente estudio creemos que es el primero que analiza la relación entre la gestión interna

---

<sup>1</sup> Emociones, talante y actitud son elementos que forman parte de una categoría general de procesos mentales que puede designarse como afecto (Bagozzi et al., 1999).

(marketing interno, a través de la OMI), la respuesta afectiva de los empleados (satisfacción laboral, confianza en la honestidad y benevolencia de los dirigentes, y compromiso organizativo) y los resultados externos de la empresa (calidad del servicio percibida y satisfacción del cliente).

### **2.3. La influencia de la IMO en la respuesta afectiva de los empleados**

La relación que los empleados tienen con su organización les permite evaluar el grado de orientación que su empresa tiene hacia la fuerza laboral, lo que puede incidir en que los trabajadores tengan una respuesta afectiva coherente con dicha valoración. Distintos estudios han representado esta respuesta a través de la satisfacción laboral (Alexandrov et al., 2007; Paulin et al., 2006); la confianza de los empleados en la empresa y los dirigentes que la representan (Chen et al., 2009; Garbarino y Johnson, 1999); y su compromiso afectivo (Babakus et al., 2003; Paulin et al., 2006). Ahora bien, una de las contribuciones del estudio es que, por vez primera, analiza en el mismo modelo la influencia que el marketing interno, representado por la OMI, tiene sobre estas tres respuestas afectivas, y la posible relación causal entre ellas. Por tal motivo, nuestra investigación responde a la necesidad manifestada en la literatura (Kaur et al., 2009) de investigar más sobre las posibles consecuencias de la OMI.

La satisfacción del empleado se ha definido tradicionalmente como el estado afectivo resultado de la evaluación que éste hace de su trabajo (Hartline y Ferrell, 1996), en concreto de lo recibido comparado con lo deseado alcanzar en su relación laboral (Locke, 1969). La satisfacción laboral puede estar influida por la valoración que el empleado hace del grado de atención (IMO) que la organización muestra hacia sus trabajadores.

Diversas contribuciones, centradas en el sector hotelero (Gounaris, 2006, 2008a) y financiero (Tortosa et al., 2009, 2010; Ferdous y Polansky, 2014), demuestran esta relación. Consideramos oportuno tratar de corroborar esta relación en el servicio sanitario, donde los empleados tienen una gran responsabilidad en el cumplimiento eficiente de su trabajo, al ser un servicio de vital importancia para la ciudadanía. Esta responsabilidad supone una mayor presión que puede incidir en el estado afectivo de los trabajadores (Fiabane et al., 2013). Por tal motivo planteamos la siguiente hipótesis:

H<sub>1</sub>: La OMI tiene una influencia directa, positiva y significativa en la satisfacción laboral del empleado.

La confianza puede considerarse una reacción afectiva favorable explicada a través de dos dimensiones (Kumar et al., 1995, p. 349): (1) la confianza en la benevolencia, o el interés que la otra parte demuestra en el bienestar de la persona que confía; y (2) la confianza en la honestidad (credibilidad), o fe de aquellos que confían en las acciones y comentarios de la otra parte de la relación. La presente investigación sigue esta delimitación conceptual de la confianza, definiéndola como la respuesta afectiva del trabajador a la honestidad y benevolencia demostrada por la organización y los dirigentes que la representan.

Hasta el momento la investigación centrada en el marketing interno no ha analizado la posible influencia que la OMI puede tener en la confianza de los trabajadores. Sin embargo, aproximaciones teóricas como la teoría del intercambio social (Homans, 1958) o la teoría del contrato psicológico (Robinson, 1996) justifican que la evaluación positiva que los empleados pueden hacer del apoyo organizativo y de sus dirigentes puede influir en la mayor confianza de los trabajadores. Por este motivo, consideramos las siguientes hipótesis:

H<sub>2a</sub>: La OMI tiene una influencia directa, positiva y significativa en la confianza de los empleados sobre la honestidad de la organización y sus dirigentes.

H<sub>2b</sub>: La OMI tiene una influencia directa, positiva y significativa en la confianza de los empleados sobre la benevolencia de la organización y sus dirigentes.

A partir de distintos trabajos (Paulin et al., 2006; Whitener, 2001), definimos el compromiso organizativo como el estado afectivo de adhesión del trabajador hacia su organización. Esta actitud también se ha descrito como la unión de la identidad del empleado con la identidad de su

empresa. En definitiva, la definición adoptada en el trabajo es la conocida en la literatura por compromiso organizativo afectivo.

Precisamente, uno de los objetivos del marketing interno es asegurar que los empleados sientan que la dirección se preocupa por ellos y por alcanzar sus necesidades. El marketing interno puede, por lo tanto, incidir en el compromiso organizativo del trabajador (Awwad y Agti, 2011; Paulin et al., 2006). Así, dos trabajos centrados en la IMO, en el sector bancario (Kaur et al., 2009) y en el servicio de transporte marítimo de pasajeros (Lings et al., 2008), han corroborado esta relación positiva. Tal y como hemos mencionado con anterioridad, debido a las características del servicio sanitario, consideramos relevante replicar la posible influencia de la OMI sobre el compromiso organizativo en este sector. Proponemos como hipótesis:

H<sub>3</sub>: La OMI tiene una influencia directa, positiva y significativa en el compromiso organizativo afectivo del empleado.

El presente estudio también plantea como hipótesis las relaciones causales ente las variables representativas de la respuesta afectiva del empleado. La naturaleza conceptual de cada una de ellas justifica tales relaciones. De hecho, distintos trabajos han corroborado la influencia directa que la satisfacción laboral puede tener en la confianza del trabajador (Daley y Vasu, 1998; Williams, 2005) o en el compromiso afectivo (Alexandrov et al., 2007; Chen et al., 2009; Yousef, 2002), y la incidencia que la confianza de los empleados puede tener sobre su compromiso afectivo (Alder et al., 2006; Doucet et al., 2008). En este línea, proponemos como hipótesis:

H<sub>4a</sub>: La satisfacción laboral del empleado tiene una influencia directa, positiva y significativa en su confianza sobre la honestidad de la organización y sus dirigentes.

H<sub>4b</sub>: La satisfacción laboral del empleado tiene una influencia directa, positiva y significativa en su confianza sobre la benevolencia de la organización y sus dirigentes.

H<sub>5</sub>: La satisfacción laboral del empleado tiene una influencia directa, positiva y significativa en su compromiso organizativo afectivo.

H<sub>6a</sub>: La confianza del empleado sobre la honestidad de la organización y sus dirigentes tiene una influencia directa, positiva y significativa en su compromiso organizativo afectivo.

H<sub>6b</sub>: La confianza del empleado sobre la benevolencia de la organización y sus dirigentes tiene una influencia directa, positiva y significativa en su compromiso organizativo afectivo.

#### ***2.4. La relación entre la respuesta afectiva de los empleados y su desempeño laboral***

Para analizar la incidencia que la respuesta afectiva de los empleados puede tener en su actuación en el trabajo consideramos que la calidad del servicio ofrecida por éstos, tal y como valoran sus clientes, es representativa del desempeño laboral.

La respuesta afectiva de los trabajadores puede determinar su interacción con los clientes (Babakus et al., 2003). De hecho, la relación entre la satisfacción laboral y el desempeño de los trabajadores ha sido corroborada empíricamente (Hartline and Ferrell, 1996; Yoon et al., 2001; Malhotra y Mukherjee, 2004), lo que nos lleva a plantear la siguiente hipótesis:

H<sub>7</sub>: La satisfacción laboral del empleado tiene una influencia directa, positiva y significativa en la calidad del servicio percibida por el cliente.

La literatura centrada en el marketing de relaciones defiende que la confianza puede influir en el comportamiento del trabajador (Konovsky y Pugh, 1994). Algunos estudios han corroborado el papel antecedente que la confianza del empleado en la organización y sus dirigentes puede tener en la calidad del servicio (Aryee et al., 2002; Podsakoff et al., 1990). De nuevo, estimamos relevante replicar esta relación, a través de una metodología diádica, en un sector donde la confianza del empleado deviene clave ante la exigencia que recae en su labor. Por lo que proponemos como hipótesis:

H<sub>8a</sub>: La confianza del empleado sobre la honestidad de la organización y sus dirigentes tiene una influencia directa, positiva y significativa en la calidad del servicio percibida por el cliente.

H<sub>8b</sub>: La confianza del empleado sobre la benevolencia de la organización y sus dirigentes tiene una influencia directa, positiva y significativa en la calidad del servicio percibida por el cliente.

Meyer y Herscovich (2001) defienden que el compromiso afectivo es el deseo a continuar una acción o comportamiento en aras a lograr un objetivo. En el contexto organizativo, el objetivo del deseo del empleado puede ser seguir en la empresa donde trabaja y la acción su eficiente desempeño laboral. El compromiso afectivo puede incidir favorablemente en acometer un desempeño de mayor calidad (Jiang et al., 2009; Meyer et al., 2002), por tal motivo mostramos como hipótesis:

H<sub>9</sub>: El compromiso afectivo del empleado tiene una influencia directa, positiva y significativa en la calidad del servicio percibida por el cliente.

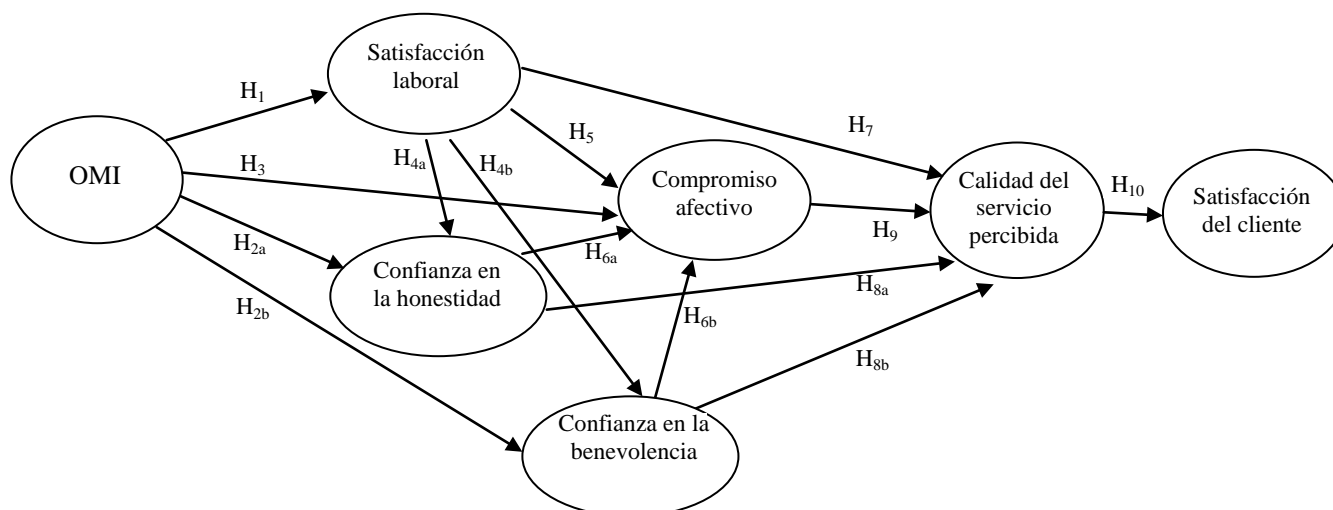

Finalmente, el estudio defiende que la calidad del servicio percibido es fruto de un proceso de evaluación de distintas transacciones que a lo largo del tiempo ha recibido el cliente del mismo trabajador. Si la valoración global es positiva, el cliente tiene una respuesta afectiva en forma de satisfacción por el servicio recibido. Diversos estudios (Boshoff y Gray, 2004; Mohr y Bitner, 1995) corroboran esta relación, lo que justifica su planteamiento en forma de hipótesis:

H<sub>10</sub>: La calidad del servicio percibida por el cliente tiene una influencia directa, positiva y significativa en su satisfacción.

La figura 1 muestra el modelo de la investigación con las hipótesis propuestas.

FIGURA 1

**Modelo de la investigación**

Además, en la presente investigación valoramos la posible existencia de diferencias significativas en las relaciones propuestas en el modelo a partir de la experiencia laboral de los trabajadores. La consideración de la experiencia laboral como criterio para formar submuestras de empleados se justifica por el desgaste emocional que, según corroboran diversos trabajos (Laranjeira, 2011; Lim et al., 2010), tienen los empleados sanitarios con mayor experiencia en el ejercicio de su trabajo.

### **3. Metodología**

#### **3.1. *Ámbito del estudio***

La investigación se centra en el sector sanitario, en concreto en el servicio de consultas externas de cinco hospitales en la Comunidad Valenciana. Los cinco hospitales, tres públicos y dos privados, son de similar tamaño (mediano) y ofrecen parecidos servicios sanitarios. Analizamos el servicio de consultas externas porque facilita la formación de díadas y permite alcanzar los objetivos planteados por la investigación.

La elección del sector sanitario se debe al elevado nivel de contacto personal existente entre los empleados y sus paciente (Curry et al., 1986). De hecho, la actuación de los trabajadores influye en gran medida en la percepción que el paciente tiene de la calidad del servicio recibida. Todo ello explica la creciente atención que en general los dirigentes hospitalarios dan al servicio prestado y al logro de la satisfacción del paciente (Paulin et al., 2006). Además, la presión externa (pacientes, sociedad en general) e interna (carga de trabajo, recortes presupuestarios) que sufren los profesionales sanitarios puede llevar a un mayor desgaste afectivo respecto a otros profesionales (Fiabane et al., 2013), lo que refuerza el interés directivo por implementar actuaciones que mejoren la actitud y desempeño de los trabajadores.

#### **3.2. *Recogida de datos***

Debido al análisis que el estudio pretende realizar de las percepciones de empleados y de sus pacientes fue necesario diseñar una investigación con dos muestras, confeccionándose dos tipos de cuestionario. El primero para medir la valoración que los trabajadores hacen de la OMI y de sus respuestas afectivas. El segundo para medir la calidad del servicio percibida por los pacientes y su nivel de satisfacción.

Las escalas utilizadas (ver tabla en el anexo) se basaron en trabajos previos. La OMI (constructo multijerárquico de tres niveles y multidimensional con tres dimensiones y diez subdimensiones) se adaptó al sector sanitario tomando como referencia el trabajo de Gounaris (2006, 2008a, b); la satisfacción laboral se basó en los trabajos de Churchill et al. (1974) y Oliver (1980); la confianza en la honestidad y en la benevolencia en la aportación de Ganesan (1994) y Kumar et al. (1995); el compromiso organizativo afectivo en el trabajo de Allen y Mayer (1990); la calidad del servicio percibida (constructo multijerárquico de tres niveles y multidimensional con tres dimensiones y nueve subdimensiones) en el trabajo de Brady y Cronin (2001); y la satisfacción laboral en la aportación de Bloemer y Odekerken-Schroder (2002).

La muestra de los empleados estaba formada por 244 individuos y la de los pacientes por 732. Los cuestionarios fueron revisados por un grupo de seis empleados y seis pacientes de hospitales distintos a los investigados, con el fin de asegurar la comprensión de los enunciados. Ambos cuestionarios estaban formados por preguntas cerradas con ítems medidos en una escala likert de 5 puntos (donde el 1 representaba totalmente en desacuerdo y el 5 totalmente de acuerdo).

A través de la codificación de los cuestionario fue posible identificar y unir los cuestionarios de cada profesional con el de sus tres pacientes encuestados. Estos pacientes recibieron el servicio del mismo profesional al menos en tres ocasiones durante el mismo año. Se aseguró la confidencialidad en la comunicación de los resultados, a pesar de la codificación, con el fin de lograr mayor franqueza en las respuestas.

La tasa de repuesta de la muestra de empleados fue del 60% (244 de 411 trabajadores del servicio de consultas externas). La muestra estaba formada por 132 hombres (54%) y 112 mujeres (46%), con 162 facultativos y 82 diplomados y auxiliares de enfermería. La media de experiencia laboral no superaba los diez años (punto de corte para formar las dos submuestras, 141 trabajadores con menos de diez años de experiencia laboral y 103 empleados con más de diez años). La muestra de pacientes consistió en 392 mujeres (53%) y 340 hombres (47%), con una media de edad de 42 años.

En definitiva, la unidad de análisis de la investigación fue la relación empleado-pacientes. Para contrastar las hipótesis se formaron 244 díadas, con las respuestas de cada empleado y la media de las respuestas de los tres pacientes que éste había atendido. Esta agregación está justificada en trabajos previos (George y Bettenhausen, 1990; Yoon y Suh, 2003). Ahora bien, fue necesario asegurar que las respuestas de los tres pacientes por trabajador sobre la calidad del servicio y el grado de satisfacción eran razonablemente estables. Los estimadores para medir el grado de acuerdo dentro de cada grupo (interrater agreement, intraclass correlation (1) e intraclass correlation (2)) fueron superiores a los valores recomendados (>0.7, >0.12 y >0.6, respectivamente), lo que justifica la agregación de los datos en la relación empleado-pacientes.

#### 4. Resultados

El presente estudio utilizó modelos de ecuaciones estructurales, con el programa EQS 6.1, para el tratamiento estadístico de los resultados. La estimación del modelo se llevó a cabo en dos etapas (Anderson y Gerbing, 1988). En primer lugar, se acometió un análisis factorial confirmatorio para validar las escalas, y posteriormente se contrastaron las relaciones causales.

En la primera etapa, el análisis factorial confirmatorio permitió evaluar la dimensionalidad, fiabilidad y validez (convergente y divergente) de los constructos (ver tabla en el anexo del documento). En el caso de los multijerárquicos, la variable latente se formaba de manera sumativa con los ítems o indicadores. Se confirmó la bondad del ajuste del modelo (p-value=0.060; RMSEA=0.020; CFI=0.99; GFI=0.99; AGFI=0.99), con todos los indicadores por encima de los valores de corte recomendados. Las cargas factoriales fueron superiores a 0.5 y los t-test significativos ( $t > 1.96$ ) para todos los ítems de las variables latentes, por lo que se corroboró la validez convergente. La fiabilidad compuesta se utilizó para medir la fiabilidad de las escalas, todas ellas por encima del umbral mínimo exigido de 0.7. Finalmente, la validez divergente también quedó demostrada, la raíz cuadrada de la varianza media extraída ( $AVE^{1/2}$ ) de cada variable fue mayor que la correlación entre las distintas variables.

Posteriormente, se estimó el modelo estructural para analizar las relaciones planteadas (tabla 1). Los indicadores estadísticos corroboraron la bondad del ajuste (p-value=0.380; RMSEA=0.017; CFI=0.99; GFI=0.99; AGFI=0.98).

TABLA 1  
Relaciones causales

Efectos directos	Pesos (valores estandarizados)	t-Test
H <sub>1</sub> : OMI → Satisfacción laboral	0.81 (*)	21.51
H <sub>2a</sub> : OMI → Confianza en la honestidad	0.43 (*)	7.93
H <sub>2b</sub> : OMI → Confianza en la benevolencia	0.53 (*)	7.95
H <sub>3</sub> : OMI → Compromiso afectivo	n.s.	n.s.
H <sub>4a</sub> : Satisfacción laboral → Confianza en la honestidad	0.53 (*)	9.98
H <sub>4b</sub> : Satisfacción laboral → Confianza en la benevolencia	0.42 (*)	6.51
H <sub>5</sub> : Satisfacción laboral → Compromiso afectivo	0.40 (*)	4.35
H <sub>6a</sub> : Confianza en la honestidad → Compromiso afectivo	0.25 (*)	5.18
H <sub>6b</sub> : Confianza en la benevolencia → Compromiso afectivo	0.28 (*)	5.18
H <sub>7</sub> : Satisfacción laboral → Calidad del servicio percibida	0.08 (*)	5.74
H <sub>8a</sub> : Confianza en la honestidad → Calidad del servicio percibida	0.09 (*)	5.74
H <sub>8b</sub> : Confianza en la benevolencia → Calidad del servicio percibida	0.10 (*)	5.74
H <sub>9</sub> : Compromiso afectivo → Calidad del servicio percibida	0.10 (*)	5.74
H <sub>10</sub> : Calidad del servicio percibida → Satisfacción del cliente	0.93 (*)	49.49
Indicadores de la bondad del ajuste del modelo estructural	Chi-cuadrado= 11.79, g.l = 11, p-value = 0.38, CFI = 0.99, GFI = 0.99, AGFI = 0.98, RMSEA = 0.017	

(\*) Significativo  $p \leq 0.05$

n.s. = no significativo

El análisis de los resultados del modelo verifica el papel antecedente de la OMI sobre la satisfacción laboral (H<sub>1</sub>) y sobre la confianza en la honestidad (H<sub>2a</sub>) y en la benevolencia (H<sub>2b</sub>),

sin embargo no se corrobora su influencia directa sobre el compromiso afectivo ( $H_3$ ). Además, se demuestran las hipótesis que relacionan entre sí las respuestas afectivas del empleado ( $H_{4a}$ ,  $H_{4b}$ ,  $H_5$ ,  $H_{6a}$ ,  $H_{6b}$ ) y las que analizan la influencia de estos afectos sobre la calidad del servicio percibida por el paciente ( $H_7$ ,  $H_8$ ,  $H_9$ ). Finalmente, también se prueba la incidencia que la calidad del servicio percibida ejerce sobre la satisfacción del paciente ( $H_{10}$ ).

A través del análisis multigrupo se evaluó la existencia de diferencias significativas en los resultados de las dos muestras de empleados, según la experiencia laboral (tabla 3). La invarianza de las cargas factoriales fue corroborada ( $\Delta\chi^2=41.34$ ;  $\Delta df=31$ ;  $p=0.101>0.05$ ), por lo que el mismo modelo podría aplicarse a cada una de las dos submuestras. Para corroborar si existen diferencias significativas en las relaciones causales de las dos submuestras se analiza la existencia de invarianza estructural (tabla 2). La diferencia de la chi-cuadrado muestra la existencia de diferencias entre ambas submuestras ( $\Delta\chi^2= 25.83$ ;  $\Delta df=13$ ;  $p=0.018<0.05$ ). En concreto, las diferencias significativas se dan en la influencia que la OMI tiene sobre los dos constructos representativos de la confianza (mayor en los empleados con más experiencia) y en la influencia que la satisfacción laboral tiene sobre estas dos variables de la confianza (mayor entre los trabajadores con menor experiencia).

## 5. Conclusiones

Las organizaciones de servicios buscan mejorar su posición competitiva a través de adaptar su respuesta a las necesidades de los clientes, lo que les lleva a estimar como factor clave el papel de los trabajadores. Precisamente la adopción de una filosofía marketing en la gestión directiva de los empleados facilita que éstos tengan la actitud y comportamiento necesario para ofrecer un servicio de calidad y con ello satisfacer a los clientes. En este sentido, la presente investigación siguiendo aportaciones previas en la literatura representa esta filosofía a través de la OMI.

En el contexto académico nuestro estudio contribuye a enriquecer la llamada “linkage literature” al corroborar, a través de un metodología diádica, el papel mediador que la satisfacción laboral y la confianza del empleado tienen en la relación entre la gestión interna (OMI) y los resultados externos organizativos (calidad del servicio percibida y satisfacción del paciente). Para tal fin, el estudio toma referentes teóricos como la teoría del intercambio social o la teoría de la equidad. Cabe destacar que es la vez primera que se analiza y corrobora el papel mediador de la confianza en la literatura centrada en el marketing interno. Un contexto de dificultades

económicas y de creciente exigencia interna y externa como el actual hace más necesaria la construcción de relaciones sinceras y próximas entre los dirigentes y sus empleados, relaciones que fomenten la confianza del trabajador, y con ello su mayor compromiso organizativo y mejor desempeño en el trabajo.

Precisamente, a través del análisis multigrupo en función de la experiencia laboral, se demuestra la existencia de diferencias significativas en la influencia que la OMI y la satisfacción laboral tienen sobre las dos dimensiones representativas de la confianza del trabajador. En concreto, la adopción de una filosofía marketing en la gestión con los trabajadores tiene una incidencia significativamente mayor en la confianza entre aquellos empleados con mayor experiencia laboral. En cambio, la satisfacción laboral tiene un efecto significativamente mayor en las dos dimensiones de la confianza entre los trabajadores con menor experiencia. Estos resultados parecen denotar que la confianza de los empleados más experimentados, con más elementos de juicio debido a los años vividos en la organización, están más influidos por el grado de aproximación a la fuerza laboral que demuestran los dirigentes. En cambio, los empleados con menor experiencia y con menos elementos para enjuiciar la labor de los dirigentes basan su confianza en la satisfacción que supone su trabajo.

La investigación también revela que la satisfacción laboral juega un papel destacado como respuesta afectiva del empleado, la OMI ejerce una mayor influencia sobre ella y también es la que tiene un mayor efecto sobre el resto de afectos del trabajador. Es por ello necesario que los dirigentes sean conscientes de lo importante que supone alcanzar las necesidades y exigencias de los trabajadores para lograr su satisfacción y con ello favorecer la mejora en los resultados organizativos internos y externos.

Tan sólo una de las relaciones propuestas no se corrobora, la que describe la influencia directa y significativa de la OMI sobre el compromiso afectivo. Una posible interpretación de este resultado es que la OMI tiene un efecto directo sobre aquellas respuestas afectivas, satisfacción y confianza, que surgen en un horizonte temporal más corto que el compromiso afectivo, que de hecho está influido por estos dos afectos.

Entre las recomendaciones a realizar a las empresas del estudio podemos destacar que deberían adoptar plenamente la filosofía marketing en su gestión con los empleados, con el fin de crear un clima interno de excelencia que reporte mayores resultados en el ámbito externo. Una aproximación a los trabajadores que les permita una mayor integración entre las funciones organizativas. De hecho, las tradicionales barreras entre los distintos departamentos tenderían a desaparecer. En un sentido más práctico, sin la presencia de un instrumento válido para la aplicación del marketing interno resulta difícil que las organizaciones puedan acometer con éxito una aproximación a los empleados. La literatura ha mostrado que la OMI puede ser una representación válida del marketing interno, al facilitar la comprensión directiva de las necesidades de los trabajadores, desarrollar la comunicación bidireccional y favorecer la respuesta adaptada a tales necesidades. Los dirigentes pueden definir las estrategias y tácticas más adecuadas para la implementación de soluciones proactivas.

En este sentido, una vez valoradas las necesidades y sugerencias de los empleados es posible identificar diferentes segmentos o colectivos de empleados con distintas problemáticas, lo que permite adaptar las decisiones y actuaciones más pertinentes para cada colectivo. En el caso de los hospitales analizados, OMI tiene más influencia sobre la confianza de los empleados más experimentados.

Una de las principales limitaciones del estudio es haberse centrado únicamente en el sector sanitario de una misma zona geográfica. Además, se hace uso de datos basados en las percepciones de profesionales y pacientes lo que puede conllevar no tener una visión completamente ajustada de la realidad investigada. No se analizan las posibles diferencias significativas en las relaciones causales por criterios como el género de los empleados, categoría profesional o tipo de hospital (público o privado). Finalmente, el estudio no desarrolla un análisis longitudinal de los resultados.

Entre las posibles líneas de investigación destacamos la posibilidad de generalizar el modelo a más hospitales, otros servicios y sectores de la economía; identificar los posibles antecedentes de la OMI; o incorporar otras variables para medir el resultado externo (objetivas y subjetivas).

## RESUMEN

*En el contexto minorista en general las aportaciones miden la lealtad desde la perspectiva actitudinal y son escasos los trabajos que analizan el comportamiento de repetición de compra. Nuestro objetivo es investigar la formación de este tipo de conducta estudiando el efecto directo de la satisfacción, el compromiso, el valor percibido y la conducta de boca-oreja y el efecto moderador del tipo de producto comprado en estas relaciones. A partir de una muestra de 820 sujetos que han comprado en diferentes establecimientos, aplicamos una regresión logística ordinal y concluimos que la satisfacción no influye en la conducta de repetición y que en productos de compra frecuente la satisfacción tiene un efecto menor en la repetición. Se presentan implicaciones interesantes para la gestión empresarial y futuras líneas de investigación para avanzar en la compleja relación entre la satisfacción y la lealtad.*

## Palabras clave:

Repetición de compra, lealtad, satisfacción, compromiso, valor, boca-oreja, regresión logística ordinal.

## 1. Introducción

El comercio minorista es un sector altamente competitivo en el que la lucha por aumentar la cuota del cliente es un reto importante para conseguir ingresos y beneficios (Hernant *et al.*, 2007). Por ello, la retención de clientes y la repetición de compras se convierten en factores claves para crear lealtad y, consecuentemente, para mejorar la rentabilidad de la tienda (Martos y González, 2009). Especialmente en este contexto de la distribución comercial minorista, la conducta de repetición ha recibido especial atención (Pan y Zinkhan, 2006; Teller y Gittenberger, 2011), ya que el grado en que los clientes vuelven a visitar el establecimiento puede marcar la diferencia entre el éxito y el fracaso de la empresa (Grace y O’Cass, 2005).

La repetición de compra es una de las dimensiones de la lealtad que puede ser abordada desde las perspectiva conductual (Zeithaml *et al.*, 1996) o actitudinal (Lovelock y Wirtz, 2007) o ambas (Doherty y Nelson, 2008). La mayoría de los estudios empíricos en el contexto minorista que analizan la relación entre la satisfacción y la repetición de compra se encuentran en la óptica actitudinal y miden la intención de repetición en vez de la conducta de repetición (p.e. Pappas *et al.*, 2014). Sin embargo, pueden existir diferencias importantes (Morwitz *et al.*, 1997; Mittal y Kamakura, 2001; Seiders *et al.*, 2005). Del mismo modo, otras variables que la literatura ha considerado como antecedentes de la lealtad, como son el compromiso (p.e. Cerri, 2012) y el valor percibido (p.e. Nezakati *et al.*, 2014), también se han estudiado midiendo su efecto sobre las intenciones de repetición de compra en la tienda. Igualmente existen evidencias empíricas que muestran que la conducta de boca-oreja, aunque teóricamente es una de las dimensiones de la lealtad (Zeithaml *et al.*, 1996), contribuye en las intenciones de repetición (p.e. Hutter y Hoffmann, 2014).

Adicionalmente, en el cuerpo teórico se han propuesto diferentes variables que pueden ejercer un efecto moderador sobre la repetición de compra en los comercios minoristas (p.e. Pan y Zinkhan, 2006). Entre ellas se encuentran factores asociados al contexto de compra como el tipo de producto comprado, sin embargo, los estudios sobre esta variable son escasos y a veces contradictorios (p.e. Seiders *et al.*, 2005).

Ante estas limitaciones empíricas sobre el estudio de la conducta de repetición, nuestro objetivo es analizar la formación de dicha conducta en la distribución comercial minorista investigando la contribución directa que tienen la satisfacción, el compromiso, el valor percibido y la conducta de boca-oreja, así como el efecto moderador que ejerce en estas relaciones el tipo de producto según la frecuencia de compra.

Para abordar este estudio, empleamos la metodología de la regresión logística ordinal ya que partimos de una variable dependiente categórica ordinal. Esto es, trataremos de analizar si las estimaciones de las variables explicativas anteriores son significativas sobre la conducta de repetición a partir de la inversa del logaritmo de la razón de probabilidad, entendida como el ratio entre la probabilidad acumulada hasta cierta categoría de la variable dependiente y la probabilidad de mayores valores de dicha categoría (Hosmer y Lemeshow, 2000). Esta metodología es una extensión del modelo lineal general para datos categóricos con carácter ordinal. Los modelos de regresión logística, y especialmente la regresión logística ordinal, resultan adecuados para el análisis de satisfacción sobre la conducta de repetición, ya que generalmente la información proviene de encuestas donde se emplean escalas de medida ordinal (Eboli y Mazzulla, 2009).

## 2. Revisión teórica

### 2.1. La lealtad a la tienda y la conducta de repetición

La lealtad del cliente puede referirse a un producto, una marca, un fabricante o una tienda. Además, es un constructo multidimensional que se ha definido y medido de diferentes formas en la literatura de marketing (Oliver, 1999). Desde la perspectiva conductual, la lealtad se manifiesta a través del comportamiento de repetición de compra a lo largo del tiempo (Buttle y Burton, 2002), el nivel de gasto realizado (Knox y Denison, 2000) o las recomendaciones a

otros (Zeithaml *et al.*, 1996). Desde la óptica afectiva o actitudinal, se refiere a las preferencias y predisposiciones favorables de los clientes hacia el establecimiento (Gremler y Brown, 1996), el compromiso de seguir comprando a lo largo del tiempo (Lovelock y Wirtz, 2007) o la promesa de realizar compras futuras (Berné, 1997). Recogiendo ambos enfoques, la lealtad implica además de la repetición de compra un cierto compromiso o vínculo emocional (Doherty y Nelson, 2008).

En el contexto del comercio minorista, diferentes aportaciones ponen de manifiesto la ambigüedad del término lealtad hacia un establecimiento y destacan la importancia de la conducta de repetición de compra a la hora de definir y medir el concepto. Por ejemplo, Bloemer y de Ruyter (1998: 500) definen la lealtad como una “*respuesta en forma de comportamiento (repetición de visita), expresada a lo largo del tiempo, hacia una tienda entre un conjunto de ellas*”. En el trabajo de Rhee y Bell (2002) realizado en tiendas de alimentación, los autores señalan que los consumidores fieles, aunque visiten varios establecimientos, suelen ser clientes habituales de uno que lo consideran como principal para cubrir sus necesidades de alimentación. Knox y Denison (2000) afirman que los clientes más leales son los que gastan más dinero en la tienda.

Más recientemente, desde el punto de vista práctico también se destaca que la repetición de compra de los clientes es un factor clave para medir la rentabilidad del establecimiento. En esta línea, el estudio de Bellini *et al.* (2011) realizado a gerentes de tiendas revela que la mayoría de ellos sigue utilizando medidas conductuales, como el porcentaje de gasto, frecuencia de visita o gasto medio para conocer la lealtad de sus clientes. Además, la forma de medir la conducta de lealtad es diferente en función de la relación contractual entre el comprador y vendedor (Kumar *et al.*, 2013). En contextos donde existe un contrato formal (p.e. telecomunicaciones o servicios financieros), se puede utilizar la tasa de deserción de clientes para medir la lealtad. Sin embargo, no es posible esta medida en contextos no contractuales como es el caso del comercio minorista, donde la lealtad se puede medir fácilmente a partir de la frecuencia de compra o nivel de gasto en la tienda (Reinartz y Kumar, 2000).

La revisión de la literatura revela que es más sencillo encontrar investigaciones que abordan el estudio de la lealtad desde el punto de vista actitudinal que desde la perspectiva conductual (p.e. Pan y Zinkhan, 2006; Teller y Gittenberger, 2011). Teniendo en cuenta esta diferencia de interés y la importancia que tiene la conducta de repetición de compra para la gestión empresarial del comercio minorista, nos centramos en estudiar la contribución directa que tienen en dicha conducta la satisfacción, el compromiso, el valor percibido y el boca-oreja, así como el efecto moderador que ejerce en estas relaciones el tipo de producto comprado.

## **2.2. La satisfacción con la tienda**

Uno de los antecedentes de la lealtad más importantes y más investigados en la literatura es la satisfacción. Este constructo se ha definido principalmente a partir de dos enfoques: el carácter específico o acumulativo de la transacción (Boulding *et al.*, 1993) y la naturaleza cognitiva y/o afectiva (Oliver, 1997).

Respecto al primer enfoque, la satisfacción con un servicio hace referencia a un conjunto de experiencias acumuladas (Jones y Suh, 2000), por lo que en el ámbito del comercio minorista el consumidor evalúa la capacidad del establecimiento de entregar de manera continuada los beneficios que busca. Así pues, consideramos que la satisfacción en nuestro contexto es la evaluación global que realiza el cliente del conjunto de experiencias de compra en la tienda (Anderson *et al.*, 1994). Respecto al segundo enfoque, la definición clásica de Oliver (1997) utiliza un planteamiento puramente cognitivo al conceptualizar la satisfacción como un juicio sobre el grado de cumplimiento o desempeño de un producto o servicio. Aunque otros autores consideran que la satisfacción es una respuesta más afectiva al tener un gran componente emocional (Lovelock y Wirtz, 1997; Giese y Cote, 2000), la teoría de la desconfirmación de expectativas ha sido la de mayor aceptación en la literatura (Oliver, 1980). Siguiendo otros estudios aplicados en el contexto minorista (p.e. Helgesen *et al.*, 2010), nos suscribimos a este

enfoque en este trabajo y consideramos que el cliente evalúa el grado de cumplimiento de las expectativas que tenía sobre la tienda (Bloemer, 2002).

Numerosas investigaciones recientes confirman el efecto directo que tienen los juicios de satisfacción de los clientes de comercios minoristas en las diferentes dimensiones de la lealtad. En esta línea, la mayoría de las aportaciones ofrece evidencias empíricas sobre la influencia positiva de la satisfacción en las intenciones de repetir la compra y de recomendar la tienda a otros (p.e. Walsh *et al.*, 2008; Binninger, 2008; Vesel y Zabkar, 2009; Helgesen *et al.*, 2010; Nettet *et al.*, 2011; Teller y Gittenberger, 2011; Pappas *et al.*, 2014). Por ejemplo, Teller y Gittenberger (2011) encuentran que la satisfacción con la tienda influye positivamente en la intención de repetición y dicha intención aumenta la conducta de repetición. Sin embargo, son más escasos los trabajos que estudian el efecto directo sobre la lealtad desde el punto de vista puramente conductual, es decir, sobre el comportamiento de repetición de compra. Por ejemplo, Mägi (2003) encuentra un efecto positivo de la satisfacción con la tienda en la conducta de repetición de compra expresada a través de la cuota de gasto y la cuota de visitas. También el trabajo de Cortiñas *et al.* (2010) revela que la satisfacción del cliente aumenta la frecuencia de asistencia al establecimiento. Y Akbar (2013) confirma que la satisfacción aumenta el grado en que el cliente desarrolla una conducta repetitiva. En la línea de estos resultados, planteamos la primera hipótesis de investigación:

*H<sub>1</sub>: La satisfacción del cliente con la tienda está positivamente relacionada con su conducta de repetición.*

La relación entre la satisfacción y la lealtad parece una cuestión obvia, sin embargo, hoy en día todavía es un tema de interés y de debate el análisis de la eficacia de la satisfacción para predecir la lealtad del cliente (Kumar *et al.*, 2013). En esta línea, una de las principales debilidades del vínculo satisfacción-lealtad es la asunción de que la lealtad se expresa y se mide en términos de intenciones de recompra en vez de conducta de recompra (Williams *et al.*, 2011). Diversos trabajos han puesto de manifiesto la limitada influencia que tiene la satisfacción en la conducta e intenciones de repetición de compra (p.e. Szymanski y Henard, 2001; Verhoef, 2003). Un alto grado de satisfacción no siempre conduce a la lealtad (Mittal y Lassar, 1998), por lo que son importantes otras variables que explican mejor estas respuestas (p.e. Agustín y Singh, 2005), como las que se explican a continuación.

### **2.3. El compromiso con la tienda**

Entre las variables que mejoran la estimación de las respuestas de lealtad, el compromiso ha sido un elemento de gran interés en el ámbito del comercio minorista (p.e. Walz *et al.*, 2012). En general las definiciones de compromiso coinciden en señalar que se trata de un deseo continuado del cliente de seguir con la relación con la tienda y una voluntad de realizar esfuerzo para mantener esa relación (Morgan y Hunt, 1994). Se considera que este compromiso es un proceso necesario para que el consumidor se convierta en un cliente fiel, es decir, es una forma de proteger al establecimiento de la pérdida de clientes. Bajo este mismo planteamiento, Oliver (1997) entiende que la lealtad es un profundo compromiso de volver a comprar que causa una conducta de compra repetitiva a pesar de la influencia de los esfuerzos comerciales de la competencia. También Bloemer y de Ruyter (1998) señalan que la lealtad expresada a través de una conducta de repetición depende de un proceso psicológico de evaluación que se deriva del compromiso. Este compromiso se convierte en un factor motivador de las conductas de lealtad (Dean, 2007).

En la literatura el compromiso se puede entender desde diferentes perspectivas: afectiva, de continuidad y normativa (Bansal *et al.*, 2004). El compromiso de tipo afectivo se refiere al sentido de pertenencia e implicación del consumidor con el proveedor del servicio desde el punto de vista emocional. El compromiso de continuidad es la obligación que siente el consumidor de continuar con la relación con el proveedor como consecuencias de los costes sociales o económicos y de la escasez de alternativas. Y el compromiso normativo procede de la obligación contractual que tiene el cliente con el proveedor. Generalmente es aceptado que el

compromiso de carácter afectivo es el que mayor efecto tiene sobre la lealtad (Dimitriades, 2006), y este es el enfoque que asumimos en este trabajo.

A nivel empírico, se pueden encontrar evidencias del efecto positivo que tiene el compromiso sobre las intenciones de repetición (p.e. Wang *et al.*, 2006) y sobre la lealtad actitudinal (p.e. Cerri, 2012). Sin embargo, son menos las que se refieren al efecto sobre la conducta de repetición. Por ejemplo, los resultados de Carpenter (2008) indican que el compromiso que refleja la lealtad actitudinal aumenta el porcentaje de compras que realiza el cliente en relación con la compra en otras tiendas. Walz *et al.* (2012) revelan que el compromiso tiene un efecto positivo y directo sobre la conducta de repetición exclusiva hacia el establecimiento. Por tanto, consideramos que el compromiso que sienta el cliente con la tienda va a favorecer su conducta de repetición de compra, formulando así la segunda hipótesis:

*H<sub>2</sub>: El compromiso del cliente con la tienda está positivamente relacionado con su conducta de repetición.*

#### **2.4. El valor percibido del cliente**

El valor percibido también aporta fundamentos sólidos para explicar la lealtad (Holbrook, 1999). Siguiendo la definición de Zeithaml (1988), es aceptado que el valor es una evaluación global que realiza el consumidor en un intercambio sobre la relación entre lo conseguido (resultados y beneficios deseados) y lo invertido (dinero, tiempo y esfuerzo). En la literatura se han destacado diferentes dimensiones del constructo. Por ejemplo, Sweeney y Soutar (2001) desarrollan una escala de medición del valor percibido denominada PERVAL formada por dos dimensiones: la utilidad derivada de la percepción del cliente sobre la capacidad que tiene el producto de reducir los costes a corto y largo plazo o el tiempo y esfuerzo, y la utilidad derivada de la calidad percibida y el rendimiento esperado del producto. Según Gallarza *et al.* (2011), el valor contiene dos dimensiones: la económica que está unida a la percepción del precio y es conocida como el valor transaccional, y la psicológica que incluye los elementos emocionales o cognitivos que afectan a la decisión de compra. También se ha diferenciado entre el valor utilitario y hedónico (Babin *et al.*, 1994) e incluso se ha estudiado el valor desde la perspectiva experiencial (Holbrook y Hirschman 1982). Tradicionalmente, el valor económico se ha considerado como el principal componente del valor percibido del consumidor (Sullivan *et al.*, 2012), por lo que retenemos esta dimensión en nuestro trabajo para analizar su efecto sobre el comportamiento de repetición.

En la clásica cadena de relaciones “calidad-valor-lealtad” (Parasuraman y Grewal, 2000) ya se pone de manifiesto la influencia que ejerce el valor percibido sobre la lealtad. Así pues, el valor ayuda a comprender diferentes facetas del comportamiento del consumidor anteriores y posteriores a la compra, entre las que se encuentra el comportamiento de repetición (Nison, 1992). En el contexto minorista, existen evidencias empíricas del efecto positivo que tiene el valor percibido en las intenciones de recompra (Cronin *et al.*, 2000; Grace y O’Cass, 2005; Chaudhuri y Ligas, 2009; Cho y Rutherford, 2011; Reynolds *et al.*, 2012; Nezakati *et al.*, 2014) y son más limitados los trabajos que confirman la influencia del valor sobre el comportamiento de repetición. En esta línea, Carpenter (2008) confirma que el valor influye en el porcentaje de compras del cliente, aunque a través de la satisfacción. Considerando estas aportaciones, entendemos que el valor percibido del consumidor va a tener un efecto positivo y directo en la conducta de repetición de compra, por lo que formulamos la siguiente hipótesis:

*H<sub>3</sub>: El valor que percibe el cliente de la tienda está positivamente relacionado con su conducta de repetición.*

#### **2.5. La conducta de boca-oreja**

Los comentarios boca-oreja son una de las dimensiones más relevantes y reconocidas de la literatura sobre lealtad (Carl, 2006). Aunque su estudio tiene su origen en la década de los 60, en los últimos años la investigación académica ha crecido notablemente (WOMMA). Diversas cuestiones sobre la naturaleza de esta conducta son destacables. En primer lugar, las definiciones coinciden en señalar que se trata de una comunicación entre consumidores acerca

de un producto, servicio o empresa y que el emisor de la información es un individuo independiente (Harrison-Walker, 2001; Litvin *et al.*, 2008). Por tanto, el boca-oreja excluye la comunicación formal de los clientes a las empresas (en forma de quejas o sugerencias) y de las empresas a los clientes (mediante las acciones de promoción) (Mazzarol *et al.*, 2007). Además, al ser una conducta, directa, personal y ajena a la empresa, el mensaje es más real y creíble, por lo que su efecto en las decisiones de compra de otros consumidores es mucho mayor al de publicidad o promoción (Sen, 2008). En segundo lugar, el boca-oreja es tanto un antecedente como una consecuencia de la evaluación que realizan los consumidores de una experiencia de compra (Godes y Mayzlin, 2004): en la etapa precompra los individuos pueden buscar información a través del boca-oreja de otros para reducir el riesgo y en la postcompra desarrollan esta conducta para ayudar, vengarse, desahogarse o reducir la disonancia cognitiva (Halstead, 2002).

Partiendo de estas cuestiones conceptuales compartidas, algunos trabajos sugieren que no siempre esta conducta es un componente de la lealtad (Sweeney *et al.*, 2012). En este sentido, en ocasiones no existe consenso sobre si el boca-oreja es una recomendación activa que realiza el consumidor (Gremler y Brown, 1999), si son comentarios extremadamente positivos o negativos relativos a experiencias vividas, originales y memorables (Anderson, 1998) o si es una combinación de ambos elementos (Maxham y Netemeyer, 2002). Teniendo en cuenta el concepto de lealtad (Zeithaml *et al.*, 1996), sólo el boca-oreja en forma de recomendación o de intención de recomendar se podría considerar como una dimensión de la lealtad. Siguiendo el enfoque conductual que estamos adoptando en este trabajo, abordamos el estudio de la conducta de boca-oreja y consideramos que contiene dos dimensiones: la acción y el contenido (Gelbrich, 2011). La acción se refiere al grado en que los consumidores hablan positivamente de un producto o empresa y/o lo recomiendan y el contenido representa el grado en que el consumidor habla de las ventajas.

Empíricamente, la conducta de boca-oreja ha sido analizada por lo general como un componente de la lealtad considerando que es una consecuencia de la satisfacción y otros constructos afines (p.e. Nasset *et al.*, 2011). Sin embargo, nuestra intención se centra en el efecto del boca-oreja sobre la conducta de repetición. Esta relación ha sido escasamente investigada en el contexto del comercio minorista y las evidencias empíricas encontradas se centran en las intenciones de repetición. Así, Sivadas y Baker-Prewitt (2000) revelan que las recomendaciones que los clientes hacen de una tienda están relacionadas con el hecho de volver a visitarla. Los resultados de Gauri *et al.* (2008) indican que el boca-oreja positivo tiene más influencia en las intenciones de repetición de compras en tiendas online. En el trabajo de Cho y Rutherford (2011) se confirma que las recomendaciones sobre el establecimiento y su personal aumentan la intención de repetir la compra. Y Hutter y Hoffmann (2014) también encuentran que la intención de boca-oreja de los consumidores influye positivamente en la intención de compra en la tienda. De acuerdo con estos resultados, suponemos que cuantas más recomendaciones haga el cliente mayor será el grado de repetición de compra ya que los individuos tienden a desarrollar conductas coherentes con lo que han contado a otros, estableciendo así la siguiente hipótesis:

*H<sub>4</sub>: El boca-oreja que realiza el cliente sobre la tienda está positivamente relacionado con su conducta de repetición.*

## **2.6. Efecto moderador del tipo de producto en la conducta de repetición**

Aunque el efecto de la satisfacción sobre la lealtad parece obvia, esta relación depende en gran parte del tipo de sector, del tipo de clientes estudiado, de la naturaleza de las variables dependientes e independientes empleadas y de las variables mediadoras y/o moderadoras que se consideren (Kumar *et al.*, 2013).

Partiendo de esta variabilidad y centrándonos en la dimensión de la repetición de compra de la lealtad, en la literatura se han considerado diversas variables que pueden ejercer un efecto moderador, desde las relacionadas con el contexto de compra (p.e. tipo de producto, tienda, grado de competencia, etc.) (Pan y Zinkhan, 2006; Seiders *et al.*, 2005), las relativas a consumidor (p.e. perfil sociodemográfico, nivel de implicación, tiempo de relación, etc.)

(Homburg y Giering, 2001; Mittal y Kamakura, 2001; Seiders *et al.*, 2005) hasta variables metodológicas (p.e. tipo de muestra, escalas, técnicas, etc.) (Pan y Zinkhan, 2006).

En general, estos trabajos estudian el efecto moderador de las variables sobre las intenciones de repetición de compra y no sobre la conducta. Además, algunas variables pueden moderar la relación entre la satisfacción y la conducta de repetición pero no moderar la relación entre la satisfacción y la intención de repetición (Seiders *et al.*, 2005). Matizando esta diferencia, la revisión de la literatura muestra que son escasos los trabajos que abordan el efecto moderador de variables relacionadas con el contexto de compra en la relación entre la satisfacción y la conducta de repetición (Kumar *et al.*, 2013). Dentro de este tipo de variables, el tipo de producto según la frecuencia de compra puede tener un efecto moderador relevante en la conducta de repetición. Sin embargo, la investigación sobre esta variable es bastante limitada, algunas evidencias empíricas son contradictorias y la mayoría hacen referencia a las intenciones de repetición y no a la conducta.

Por ejemplo, según Chandon *et al.* (2005), las intenciones de repetición de bienes de conveniencia son diferentes a las de bienes duraderos. La investigación de Pan y Zinkhan (2006), aunque no analiza el efecto directo de la satisfacción, revela que aspectos como la calidad de servicio y la calidad del producto influyen más en las intenciones de repetición de bienes de especialidad que en las de bienes de conveniencia, ya que en éstos últimos es más probable que se compre por inercia y se ignoren estos aspectos. En esta línea, Kaltcheva y Weitz (2006) concluyen que el efecto de los sentimientos sobre las conductas es mayor en compras de carácter hedónico que en compras de tipo utilitario. Por el contrario, Seiders *et al.* (2005) demuestran que en los productos de compra cómoda que requieren poco tiempo y esfuerzo, la satisfacción influye más en la conducta de repetición.

De acuerdo con estos resultados, consideramos que los determinantes propuestos van a influir de forma diferente en la conducta de repetición en función de la frecuencia de compra del producto. Concretamente, suponemos que en productos de compra frecuente, donde el consumidor actúa más por inercia o por hábito, el efecto de los determinantes en la repetición va a ser menor que en productos de compra esporádica, ya que en este último caso el consumidor realiza cierta evaluación de su experiencia en la tienda, tiene en cuenta su relación con el establecimiento y considera variables de carácter más hedónico. A partir de esta reflexión, formulamos la última hipótesis de la investigación:

*H<sub>5</sub>: El efecto de la satisfacción (H<sub>5a</sub>), el compromiso (H<sub>5b</sub>), el valor percibido (H<sub>5c</sub>) y el boca-oreja (H<sub>5d</sub>) sobre la conducta de repetición es menor en productos de compra frecuente que en productos de compra esporádica.*

### **3. Metodología**

#### ***3.1. Diseño del cuestionario y trabajo de campo***

Se ha desarrollado una investigación de carácter cuantitativo en el contexto de experiencias de compras realizadas en comercios minoristas de alimentación, textil, hogar y productos de electrónica. La distribución de entrevistas se realizó a partir de la selección de una serie de enseñas representativas de distintos formatos de tiendas ubicadas en una ciudad española y su área metropolitana.

El cuestionario definitivo resultante después de realizar la prueba piloto está compuesto por un conjunto de escalas cuidadosamente seleccionadas de la literatura más reciente y adaptadas a nuestro contexto (véase Tabla 1). La escala de conducta de repetición de compra se adaptó de la escala de lealtad conductual de los trabajos de Willems y Swinnen (2011) y Demoulin y Zidda (2009) basados en Osman (1993), seleccionando el ítem relativo a la frecuencia de visita a la tienda (utilizando una medida ordinal desde 1-casi nunca hasta 7-casi siempre). En el resto de escalas se emplearon medidas de tipo Likert también de 7 puntuaciones. La escala de satisfacción, de carácter cognitivo, se midió a partir de la escala empleada en el trabajo de Nettet *et al.* (2011) basada en el trabajo de Fornell (1992). El compromiso se midió con la

escala utilizada por Willems y Swinnen (2011) que fue elaborada a partir de las investigaciones de Morgan y Hunt (1994) y Bloemer y De Ruyter (1998). La medición del valor percibido se adaptó de la escala de Sweeney y Soutar (2001). Por último, la conducta de boca-oreja se ha medido siguiendo el enfoque de Gelbrich (2011) que diferencia la dimensión acción y la dimensión contenido.

TABLA 1  
Escalas de medida

<b>Conducta de repetición</b> Adaptada de Willems y Swinnen (2011) y Demoulin y Zidda (2009)	– ¿Con qué frecuencia visita esta tienda?	
<b>Satisfacción</b> Adaptada de Nettet <i>et al.</i> (2011)	– En general, ¿cuál es su nivel de satisfacción con esta tienda? – Considerando lo que espera de tiendas de este tipo, valore su satisfacción con esta tienda	
<b>Compromiso</b> Adaptada de Willems y Swinnen (2011)	– Me siento comprometido con esta tienda – Tengo una relación cercana con esta tienda	
<b>Valor percibido</b> Adaptada de Sweeney y Soutar (2001)	– En esta tienda los productos tienen un precio razonable – En esta tienda los productos ofrecen valor por dinero – En esta tienda los productos son buenos por el precio que valen	
<b>Boca-oreja</b> Adaptada de Gelbrich (2011)	Acción	– Recomiendo esta tienda a mis amigos o familiares – Si mis amigos o familiares me piden consejo, les digo que vayan a esta tienda – Animo a mis amigos o familiares a que compren productos en esta tienda
	Contenido	– Cuento a otras personas las ventajas que tiene esta tienda – Cuento a otras personas que esta tienda es mejor que otras – Cuento que en esta tienda me tratan mejor que en otras tiendas

Se utilizaron encuestas *ad-hoc* personales interceptando a los compradores a la salida de los establecimientos, de lunes a sábado y en horarios de mañana y tarde. Se utilizó un muestreo dirigido y se consiguió recoger un total de 820 cuestionarios válidos (36.5% procedentes de establecimientos de alimentación, 22% de textil, 22% de electrónica, y 19.5% de hogar). Las principales características sociodemográficas de la muestra son: el 62.8% son mujeres, con edad media de 40.6 años ( $\pm$  14.8 años), el 54.1% afirman estar trabajando, mientras que el 48.7% tiene, al menos, formación universitaria.

### 3.2. Análisis de la fiabilidad y validez de las escalas de medida

Se analizó la fiabilidad y validez de las escalas de medida correspondientes a los constructos satisfacción, compromiso, valor percibido y boca-oreja mediante la estimación de un modelo de medida de primer orden utilizando máxima verosimilitud robusta ( $\chi^2_{\text{Sat-Ben}}=246.91$  (g.l=59) (p-valor=0.000); RMSEA=0.068; CFI=0.976; GFI=0.948; AGFI=0.911). Las escalas alcanzaron niveles satisfactorios de fiabilidad ( $\alpha$  de Cronbach superiores a 0.7) y consistencia interna (fiabilidad compuesta superior a 0.7 y varianza extraída superior a 0.5) (Tabla 2).

TABLA 2  
Estadísticos descriptivos, índices de fiabilidad y correlaciones de las escalas de medida

	Media	D.T.	$\alpha$	$\rho$	AVE	1	2	3	4
1. Satisfacción	5.31	1.27	0.927	0.926	0.863	0.929 <sup>1</sup>			
2. Compromiso	2.58	1.79	0.962	0.962	0.927	0.452	0.963		
3. Valor percibido	5.11	1.20	0.918	0.901	0.752	0.555	0.374	0.867	
4. Boca-oreja	4.18	1.54	0.952	0.949	0.759	0.637	0.570	0.477	0.871

<sup>1</sup> Los elementos de la diagonal principal representan la raíz cuadrada del AVE

Además, las escalas de medida están dotadas de validez: (1) convergente al corroborar que todas las cargas factoriales resultaron significativas al 99% (t-estadístico>2.58) (Steenkamp y Van Trijp, 1991); y (2) discriminante, ya que la correlación lineal entre cada par de escalas es inferior a la raíz cuadrada del AVE de las escalas implicadas (véase Tabla 2). Profundizando en

esta validez, la prueba de diferencias de  $\chi^2=82.09$  (g.l.=6) es significativa al 99% (p-valor=0.000) (Anderson y Gerbing, 1988).

Como todos los indicadores resultaron satisfactorios optamos por usar las puntuaciones factoriales de los constructos analizados como variables independientes para explicar la conducta de repetición en el comercio minorista.

### 3.3. Regresión Logística Ordinal

El primer objetivo del trabajo es analizar la influencia de una serie de variables específicas sobre la conducta de repetición. Esta variable dependiente Y, entendida como “¿Con qué frecuencia visita esta tienda?” se ha medido mediante una escala ordinal desde 1: “casi nunca” hasta 7: “casi siempre”. Al no tratarse de una variable continua no es posible aplicar la estimación de un modelo de regresión por mínimos cuadrados ordinarios. Además, las categorías de la variable admiten ordenación, por lo que es recomendable aplicar un modelo de regresión logística ordinal frente a otros análisis que tratan la variable dependiente como nominal (McCullagh, 1980).

Mediante un modelo de regresión logística ordinal pretendemos estimar los efectos de la satisfacción, el compromiso, el valor percibido y el boca-oreja – variables independientes medidas como las puntuaciones factoriales resultantes de la estimación del modelo de medida – sobre la conducta de repetición. Específicamente para nuestro estudio, el modelo logístico ordinal, utilizando como función de enlace la función<sup>2</sup> Logit, estimará el efecto de las variables independientes sobre el logaritmo de la probabilidad de que la variable dependiente Y asume valores bajos frente a valores altos (Cainarca y Sgobbi, 2005). La relación entre el logaritmo de la razón de la probabilidad con las cuatro variables independientes queda especificada como sigue:

$$\ln\left(\frac{\text{Pr ob}(Y \leq j|X)}{\text{Pr ob}(Y > j|X)}\right) = \alpha_j - \sum_{i=1}^4 \beta_i X_i ; \text{ para } j=1,\dots,6 \quad (1)$$

donde  $\alpha_j$  es el intercepto o valor umbral de la ecuación de la razón u odds de probabilidad para la categoría  $j$  de la variable conducta de repetición que indica que la variable Y toma valores bajos frente a valores altos cuando se anulan todas las variables independientes. La última categoría (conducta de repetición = “casi siempre”) no se asocia a ningún odds, ya que el cociente expresado en la parte izquierda de la expresión (1) es igual a 1 al tratarse de la probabilidad acumulada hasta la mayor categoría. Por ello, el modelo expresado en (1) se denomina como modelo logit acumulado, ya que trata de predecir el logaritmo de las probabilidad acumuladas de la variable dependiente en función de las variables independientes (Homer y Lemeshow, 2000).  $\beta_i$  son los coeficientes que representan los cambios que se producen en el logaritmo de la razón de probabilidad por incremento unitario de la variable independiente  $X_i$ . Por tanto, valores positivos de  $\beta_i$  se corresponden con probabilidad más altas de que la variable dependiente Y asuma valores altos, y viceversa. También señalar que en este tipo de modelización se asume que los coeficientes  $\beta_i$  de la ecuación (1) asociados a las variables explicativas son independientes de las categorías de la variable dependiente, por lo que sólo existe una estimación por variable explicativa. Es decir, la relación entre la satisfacción, el compromiso, el valor percibido y el boca-oreja con la conducta de repetición es independiente de las siete categorías de esta variable ordinal, entendiéndose que los cambios que se producen en las variables explicativas provocan la misma variación en la razón de probabilidad acumulada de todas las categorías (McCullagh, 1980).

Por otra parte, para valorar si el tipo de producto comprado modera los efectos anteriores de la satisfacción, el compromiso, el valor percibido y el boca-oreja sobre el logaritmo del odds de probabilidad de la conducta de repetición ( $H_5$ ), seguimos la metodología diseñada por Cohen *et*

<sup>2</sup> McCullagh (1980) argumenta la idoneidad de esta función enlace para relacionar las variables explicativas con la razón de probabilidad cuando la distribución de la variable dependiente es uniforme a lo largo de sus siete categorías como en nuestro caso (1: 12.3%; 2: 19.3%; 3: 19.3%; 4: 12.8%; 5: 17.9%; 6: 10.1; 7: 8.5%).

al. (2003). Planteamos la estimación de la expresión (1) añadiendo la variable dicotómica sector (1: alimentación; 2: no alimentación)<sup>3</sup>, que denominados modelo 2, y el efecto de interacción del sector en la relación de las cuatro variables independientes sobre la conducta de repetición.

#### 4. Resultados

En este apartado presentamos las estimaciones de los diferentes modelos de regresión logística ordinal planteadas en el anterior epígrafe. La Tabla 3 muestra las estimaciones de los coeficientes así como los índices de ajuste para cada uno de los modelos<sup>4</sup>.

TABLA 3

Si atendemos a las estimaciones del modelo 1, los resultados indican que existe un efecto significativo y positivo del compromiso, el valor percibido y el boca-oreja sobre el logaritmo del odds de probabilidad de la conducta de repetición. Esto es, los coeficientes estimados positivos indican que, por incremento unitario de cada una de estas variables, permaneciendo el resto constante, aumenta la probabilidad acumulada de la razón de probabilidad, o dicho en otras palabras, aumenta la probabilidad de que la conducta de repetición tome valores mayores. Estos resultados nos permiten contrastar de manera afirmativa las hipótesis H<sub>2</sub>, H<sub>3</sub> y H<sub>4</sub>. Sin embargo, la satisfacción no ejerce un efecto significativo sobre la conducta de repetición, por lo que no podemos confirmar el cumplimiento de la hipótesis H<sub>1</sub>. Respecto al ajuste del modelo 1, los índices permiten concluir que es adecuado ya que el contraste global, basado en el

<sup>3</sup> Consideramos que el sector de alimentación agrupa comercios minoristas que comercializan productos de compra frecuente y el sector de no alimentación incluye el resto de establecimientos de la muestra (textil, hogar y productos de electrónica) en los que se venden productos de compra más esporádica.

<sup>4</sup> Antes de estimar los modelos se comprobó que existía correlación no paramétrica entre las variables independientes con la conducta de repetición.

estadístico ratio de  $\chi^2$ , conduce a rechazar la hipótesis nula sobre la falta de influencia conjunta de las variables independientes. También la aceptación de la hipótesis nula soportada por el estadístico  $\chi^2$  de Pearson indica que el modelo ajusta correctamente. Por último, señalar que podemos asumir que sólo existe un coeficiente asociado a cada variable explicativa independientemente de la categoría de la variable conducta de repetición, ya que se acepta la hipótesis nula del test de líneas paralelas ( $\chi^2$  (gl=20)=4.46; p-valor=0.841).

Tras valorar el efecto directo de las variables explicativas, se estimó el modelo 2 para analizar el efecto moderador del sector. En primer lugar, los resultados indican que al introducir la variable dicotómica sector, sigue existiendo un efecto significativo del compromiso, el valor percibido y el boca-oreja sobre la variable dependiente. Además, el sector alimentación incide de manera significativa sobre el logaritmo del odds ratio de la conducta de repetición (0.717\*\*\*), es decir, los clientes que hayan comprado en un establecimiento de alimentación presentarán niveles más altos de conducta de repetición que aquéllos que lo hayan hecho en otro tipo de establecimientos.

Al introducir el efecto de interacción del sector varían en gran medida los resultados. Esto es, el efecto directo de la satisfacción y del compromiso sobre el ratio de la probabilidad de la conducta de repetición es significativo, mientras que las relaciones entre valor percibido y boca-oreja con el odds de probabilidad no son significativas. En relación al efecto de interacción del sector, indicar que esta variable modera de manera significativa la relación entre la satisfacción y la razón de probabilidad de conducta de repetición (-0.409\*\*). El coeficiente negativo indica que entre los clientes que han acudido a un centro de alimentación, al aumentar su nivel de satisfacción disminuye la probabilidad de obtener niveles altos de conducta de repetición. Por tanto, en productos de compra frecuente, a mayor satisfacción es menos probable que la repetición sea mayor, lo que nos permite contrastar de manera afirmativa la hipótesis  $H_{5a}$ . Por otra parte, también existe un efecto moderador significativo al 90% entre el boca-oreja y la conducta de repetición (0.304\*). En esta situación, entre los clientes que han realizado sus compras en el sector de la alimentación, al aumentar el boca-oreja aumenta la probabilidad de alcanzar niveles altos de conducta de repetición. No podemos contrastar que exista efecto moderador del sector en la relación entre el compromiso y el valor percibido sobre la conducta de repetición.

Por último, indicar que los índices de ajuste son adecuados siguiendo las explicaciones realizadas para el modelo 1 y los valores presentes en la Tabla 3, y que de nuevo se asume la igualdad de coeficientes asociados a las variables independientes según el test de líneas paralelas.

## 5. Conclusiones

La literatura sobre la lealtad en el comercio minorista ha prestado mayor atención al componente actitudinal y la mayoría de las evidencias empíricas se basan en medidas relacionadas con las intenciones, preferencias, promesas o probabilidades de desarrollar un conducta (p.e. Lovelock y Wirtz, 2007). En este trabajo hemos abordado el estudio de la lealtad desde la perspectiva conductual centrándonos en la conducta de repetición de compra para comprobar si las relaciones se encuentran en la misma línea. Para ello analizamos, por una parte, la contribución que tiene la satisfacción, el compromiso, el valor percibido y el boca-oreja en la conducta de repetición y, por otra parte, el papel moderador que ejerce en estos efectos el tipo de producto comprado según su frecuencia de compra.

En primer lugar, los resultados muestran que la satisfacción no ejerce un efecto significativo sobre la repetición de compra. Ante esta ausencia de relación entre la satisfacción y la conducta de repetición nos sumamos al debate sobre el complejo vínculo satisfacción-lealtad (Kumar *et al.*, 2013). La mayoría de investigaciones en el contexto minorista confirman el efecto de la satisfacción sobre las intenciones de volver a comprar y/o de recomendar (p.e. Nettet *et al.*, 2011), sin embargo, nuestros resultados indican que esta influencia no se cumple en el caso de la conducta de repetición. Así como la satisfacción es un claro antecedente de la intención, no parece existir la misma relación con la conducta real. En este sentido, diferentes autores han

afirmado que la satisfacción es una vía pobre para predecir la retención efectiva del clientes (p.e. Martínez-Ribes *et al.*, 1999; Verhoef, 2003; Seiders *et al.*, 2005).

En segundo lugar, el grado de compromiso, el valor percibido y la conducta de boca-oreja sí que influyen de forma positiva en la conducta de repetición de compra. Resultados en la misma línea se han encontrado en investigaciones previas que han estudiado también estas relaciones. Cuando los clientes se sienten más comprometidos con la tienda porque tienen cierto vínculo afectivo (p.e. Carpenter, 2008; Walz *et al.*, 2012), perciben mayor valor en relación al precio pagado (p.e. Carpenter, 2008; Nezakati *et al.*, 2014) y realizan más comentarios boca-oreja hablando positivamente de la tienda (p.e. Hutter y Hoffmann, 2014), van a visitar con más frecuencia el establecimiento.

Por último, el tipo de producto se ha revelado como una variable que modera únicamente la relación entre la satisfacción y la conducta de repetición. Concretamente, según los resultados, en productos de compra frecuente la satisfacción influye negativamente en la conducta de repetición. Existen evidencias anteriores del menor efecto que tiene la satisfacción en la repetición de compra de productos de conveniencia (p.e. Pan y Zinkhan, 2006; Kaltcheva y Weitz, 2006) y nuestros resultados confirman esta menor influencia, pues a mayor satisfacción es más probable que la conducta de repetición sea baja. Una posible explicación de este hallazgo es que al tratarse de compras basadas en el hábito donde tienen poca importancia los factores emocionales y hedónicos, la repetición de compras en la tienda no viene condicionada por la satisfacción sino por factores más relacionados con la comodidad, la cercanía o los precios.

Desde el punto de vista empresarial estudiar la conducta de repetición es una cuestión fundamental para identificar a los clientes que efectúan más compras y centrar en ellos los esfuerzos de marketing de forma diferente respecto a los clientes que manifiesten otras conductas de lealtad. En este sentido, las acciones deberían estar encaminadas a aumentar el compromiso afectivo (p.e. mayor personalización del servicio o mejor atención de los empleados) y la percepción de valor (p.e. ofrecer incentivos económicos y mejorar la relación calidad-precio). Del mismo modo, crear experiencias satisfactorias e inesperadas para el cliente (p.e. tratamiento adecuado de las quejas o actividades de animación en el punto de venta) estimularía la conducta de boca-oreja favoreciendo así no sólo la captación de nuevos clientes sino también una mayor frecuencia de visitas. Respecto a la diferente conducta de repetición según la frecuencia de compra, los establecimientos deben diseñar sus estrategias teniendo en consideración los criterios que utilizan los clientes para seleccionar la tienda en función del tipo de producto, ya sean criterios más emocionales o más utilitarios.

Por último, para avanzar en esta línea de investigación, proponemos aplicar el mismo análisis midiendo la conducta de repetición con una escala de intervalos de porcentaje de compras (p.e. Willems y Swinnen, 2011) con el fin de analizar el comportamiento real de compras y observar si existen diferencias respecto a la medida basada en la frecuencia de compra. También sería interesante estudiar el efecto moderador de otras variables relacionadas con el contexto de compra como el formato de tienda (autoservicio *versus* atención personalizada o cadenas de tiendas *versus* tiendas independientes).

## ABSTRACT

*The adoption of a market orientation in innovative service organizations implies that strategies must be designed according to the needs of the different targets. Focusing on the higher education context, this study aims to examine the existence of unobserved heterogeneity in the graduate market through a model of perceived economic value as segmentation tool. Through a PLS-SEM approach, future analyses will try to validate this model, and to identify and profile graduates segments that are different in terms of the intensity and significance of the relationships between perceived economic value, satisfaction, perceived image and identification with the institution. We expect that these potential findings suggest adapted actions to develop or improve long-term relationships with graduates.*

## Keywords:

Perceived economic value, identification, image, heterogeneity, higher education

## 1. Introduction

Given that higher education institutions are competing aggressively for potential students by differentiating their service offerings constantly, a key aim for marketers in this sector is determining how the service they provide is perceived, consumed or enacted (Durvasula et al., 2011). The measurement of people's perceptions of university services remains a major challenge because of the abstract qualities of the service concept in education. In this regard, a critical issue in the evaluation of a university's services is the analysis of perceived value. The importance of this topic is threefold. First, the analysis and assessment of perceived value allow service providers to actively contribute to people's experiences and value creation (Grönroos and Ravald, 2011), which are core factors for institutions to create or maintain a competitive advantage based on organizational distinctiveness (Payne et al., 2008). Second, this analysis also helps to explain the relationship between universities and their main targets (Alves, 2011; Woodall et al., 2012). Third, while students share similar socio-demographic factors (e.g., gender, age, grade point average), not all students with similar characteristics have the same expectations and perceptions (e.g., Angulo et al., 2010); therefore, the analysis of perceptual variables, such as perceived value, is important to identify distinct groups of students, which would allow educational institutions to design differentiated strategies and actions.

A principal dimension for value creation and for building relationships in the service domain is the perceived economic value, which is defined in terms of efficiency and excellence (Holbrook, 1999). Higher education institutions constantly aim for greater efficiency and improved excellence; that is, they try to be competitive in the market by enhancing the perceived economic value of their service offerings. Despite the importance of this type of value for universities, only a small number of studies have analyzed economic aspects of perceived value in the educational context (e.g., Brown and Mazzarol, 2009), which clearly limits the understanding of this phenomenon and the extent to which it may help explain other related factors. This study examines the economic dimension of perceived value in the higher education domain through a model that also comprises satisfaction, perceived image and organizational identification as outcome variables. These outcomes are usually paired with a strategic differentiation in the educational context (e.g., Mael and Ashforth, 1992), and they serve as indicators of a successful marketing strategy. Therefore, the first objective of the current work is to analyze whether perceived economic value determines satisfaction and how this effect accounts for perceived differentiation evaluated in terms of perceived image and organizational identification, using a sample of graduates.

As discussed above, in practice, we cannot assume that people's evaluations and judgments are similar and, consequently, that individuals exhibit similar perceptions of specific phenomena. In the case of higher education, it seems reasonable to believe that the perception of economic value and its impact on other perceptual variables may vary from one group of individuals to another. The evaluation of this potential heterogeneity is thus crucial for universities to compete in the marketplace because it could allow them to adopt effective segmentation and positioning strategies to enhance institutional distinctiveness. Thus, the second objective of this study is to investigate the existence of unobserved heterogeneity within the analyzed sample using the proposed perceived economic value-based model.

## 2. Background

Consistent with their role of creating economically valuable, skilled human resources, higher education institutions are engaged in providing superior services that encourage an ongoing relationship with students. Accordingly, such concepts as the perceived value of services, satisfaction, perceived institutional image or organizational identification are central factors in understanding the overall perception and evaluative judgment of students and graduates of these institutions.

Perceived value has emerged as a crucial tool for the analysis of consumer behavior (Holbrook 1999; Zeithaml 1988). Students and graduates are increasingly demonstrating customer-like behavior and are now demanding even more "value" from institutions (Woodall et al., 2012). Cognitive definitions, whereby value is posited as a trade-off between benefits and sacrifices, have traditionally been prevalent among marketers (Zeithaml 1988). Those conceptualizations have been criticized as being simplistic and narrow (Mathwick et al., 2001). As a consequence, extant research has argued for

considering a concept in which all the components are integrated under a multidimensional structure, reflecting the cognitive-affective nature of value (e.g., Holbrook, 1999; Ryu et al., 2010). In the higher education domain, most of the definitions are focused on the trade-off approach (Alves, 2011). However, some studies in this context have analyzed the students' perceived value from a multidimensional perspective (e.g., Ledden et al. 2007).

Based on the traditional prevalence of the utilitarian elements of value, such as quality or price, this research examines the economic component of value, which is defined in terms of efficiency — the overall balance of benefits and costs, including the consideration of monetary cost, time, and effort — and excellence — the reactive appreciation of the potential of an object or experience to accomplish a goal or to perform a function, which has similar connotations to the concept of quality — (Holbrook, 1999). Holbrook's conceptualization of economic value has been applied in several works (e.g., Mathwick et al., 2001) and has also been implicitly reflected in recent empirical studies (e.g. Munnukka and Järvi, 2012). To evaluate the economic component of perceived value in higher education, it is necessary to understand the key aspects that compose a university's service offerings. Prior studies stress that the quality of the lecturer-student relationship, the physical plant or facilities, the administrative services, and the training and the outcome of the lecture, are the most influential services or service-related facets of students' evaluative judgments (e.g., Douglas et al., 2006; Hill et al., 2003). Drawing on this classification and Holbrook's (1999) conceptualization of perceived economic value, three dimensions of the concept are delineated in this study: (1) the quality of the student-professor interaction, (2) the economic value of university facilities and services, and (3) the economic value of the academic training.

### 3. Conceptual model

In this study, the authors propose a conceptual model focused on the analysis of the perceived economic value as a multidimensional variable and its contribution to several key outcome variables, using graduates as the unit of analysis. In particular, the model posits a direct influence of perceived economic value on satisfaction with the university. It also suggests the direct effects of satisfaction on perceived image and identification, which are supposed to be linked as well (see Figure 1).

FIGURE 1  
Conceptual model based on graduate's perceptions and judgments

Perceived value is conceived as a source for understanding the fundamental role of satisfaction in developing long-term relationships with customers (Wang et al., 2004). Although the distinction — and the link — between value and satisfaction is somewhat critical due to the natural affinity between both concepts (Woodruff and Gardial, 1996), there is a growing recognition that satisfaction is positively influenced by perceived value (e.g., Sakthivel and Raju, 2006). In the particular context of education, authors such as Brown and Mazzarol (2009) argued that value has a significant influence on students' satisfaction. Accordingly, it seems logical to believe that graduates' perceived economic value has a positive effect on satisfaction with the higher institution (H<sub>1</sub>).

Regarding organizational identification, Dutton et al. (1994) argued that when the individual's self-concept has the same attributes that he or she perceives in the organization's identity, a cognitive connection occurs that is defined as company identification. Several social identification researchers have shown that satisfaction with an educational institution's contributions to the accomplishment of the individual's goal influences alumni identification (e.g., Mael and Asforth, 1992). Identification occurs when an individual is influenced to establish or maintain a satisfying relationship with the

organization (see O'Reilly and Chatman, 1986). Therefore, the more satisfied a person is with an organization's offerings, the greater his/her organizational identification (H2).

Prior studies have highlighted the importance of the perceived image of the institution in the educational context (Landrum et al., 1998; Nguyen and Leblanc, 2001). Since some authors stated that customer satisfaction influences corporate image (Hu et al., 2009), we argue that graduates' satisfaction with a university has a positive effect on graduates' perceived image of the university (H3). Indeed, image is viewed as a cumulative construct updated each time the customer experiences the service. Moreover, like Bhattacharya et al. (1995) pointed out, it is expected that graduates are likely to identify strongly with their university not only if they are satisfied with the benefits the institution offers them but also when they perceive the university to have a good external image. According to previous studies (Ahearne et al., 2005) it is expected that an organization with a better image is likely to foster individuals' identification with the organization (H4).

Even if graduates had similar interactions with their university, they can have different perceptions and judgments of these exchanges, which could cause differences in the behaviour of the global model proposed. This potential heterogeneity leads us to define the second objective of this research, which is exploring the extent to which the relationships suggested in the model hold true in different sub-populations using a segmentation technique. Thus, unanticipated patterns in predicting satisfaction, image and identification can be uncovered.

#### **4. Methodology and expected contributions of the study**

We will conduct an empirical research based on Partial Least Squares (PLS) method to test the above model. For our purpose, we initially assembled a questionnaire utilizing measurement items that were sourced from the existing literature and adapted to the educational context. After a qualitative research with a group of faculty members, we administered the preliminary draft questionnaire to a pilot test group of graduates, generating the final questionnaire for the main survey study. Simple random sampling was used to select a sample of 500 graduates from a database provided by the university. The database contained contact information of graduates who obtained the degree from this university two or three years before the research fieldwork was carried out. A market research company performed the data collection using a CATI system to administer each survey. To develop the survey instrument, we used multi-item scales sourced from existing literature and adapted to the context of this study. In particular, the three proposed dimensions of perceived economic value were considered formative components (MacKenzie et al., 2011) and were measured by adapting existing scales (Holbrook, 1999; Ledden et al., 2007). Graduate satisfaction, university image and graduate-university identification were measured adapting previous measures (scales of Fornell, 1992; Nguyen and LeBlanc, 2001; and Mael and Ashforth, 1992; respectively). All items were measured on an 11-point Likert scale in which 0 was "strongly disagree" and 10 was "strongly agree."

To develop our empirical study, we will use the SmartPLS 2.0 (Ringle *et al.*, 2005) software application. We will examine the reliability and validity of the scales of the model and, in a second phase, we will test the proposed relationships in the inner path model, looking for statistically significant levels for explaining the latent endogenous variable. Finally, the FIMIX-PLS module of SmartPLS 2.0 will be applied to graduate segmentation based on the estimated scores for latent variables.

Regarding the expected contributions, the use of a model based on perceptual variables as a segmentation criterion provides a different and more innovative view than does the use of socio-demographic variables in prior segmentation studies in the field of education. If results are as expected, they could help practitioners better understand alumni's rationale for maintaining long-lasting relationships and respond accordingly. In particular, the validation of the proposed model could provide an additional insight about the factors that promote organizational identification in the higher education domain. Uncovering heterogeneity in the graduate's market may also help understand the differences among groups regarding perceptual factors involved in the evaluation of university services and their interrelationships. This type of analysis is critical for universities to reach an enhanced market orientation and create and/or add value for graduates, so it is hoped that this study

can provide a useful tool for higher education institutions to segment and to improve their strategic positioning.

## ABSTRACT

*Firms had been using offshored and/or outsourced call centers to provide assistance to their customers as a way of gaining efficiency and reduce costs. However, the loss of customers associated to this service has forced companies such as Telefónica to bring their business back. Traditionally, call center studies focused on service quality. However, this study goes one step back and put the focus on fluency, a key aspect of the interaction. The aim of this research is to analyze the role of fluency during the interaction in a voice-to-voice service encounter. With two samples of 180 and 176 service customers who had contacted a call center, we reach our goals of (1) developing a scale to measure call fluency and (2) measuring the direct effect that call fluency places on anger, interaction satisfaction, and call aversion, as well as its indirect effect on trust and satisfaction with the company.*

## KEYWORDS:

Fluency, call centers, interaction satisfaction, anger, trust , satisfaction with the company

## 1. Introduction

Call centers have existed for a long time now. They have gained attention and popularity since economic and competitive pressures have led firms to search for cost-efficient after-sales service (CSO Insights, 2007). Consequently, many organizations started using call centers as a point of contact with the customers, resulting in a rapidly growing industry (Anton, 2000). Call centers offer companies the possibility to fulfill customers' increasing expectations and demands as well as to standardize their processes to enable employee training and consistent responses to customers' inquiries (Frenkel et al. 1998).

Nowadays, the role of call centers is usually to provide the main, if not the only, customer interface for after-sales service, information, complaint resolution, reservations, and a point of contact for customers to engage with their service provider (Whiting and Donthu, 2006). However, companies have been facing the loss of customers due to call centers poor service. In this sense, in 2012 Telefónica, Orange and Jazztel, after numerous complaints, opened new call centers in Spain to get closer to their customers and improve their service. This is in line with Bharadwaj and Roggeveen's (2008) results. They prove that customers' evaluations are more favorable if both customer and agent are based in the same country. Despite the implications for company success, research on call center encounters from the customers' perspective is very limited. In this paper, we try to fill this gap. Our goal is two-fold. First, we develop a second-order scale to measure fluency during customer-employee interactions in call centers. Second, we integrate the scale into a model that identifies the key factors contributing to caller satisfaction with the company.

## 2. Theoretical background

The concept of processing fluency, i.e. the subjective experience of ease with which people process information, has been shown to influence people's judgments across a broad range of social dimensions (Alter and Oppenheimer 2009). According to processing fluency accounts, stimuli that can be easily processed are generally evaluated in positive terms and inspire favorable attitudes (Reber et al. 2004). Processing fluency is hedonically marked, i.e., fluent processing is experienced as positive (Reber et al. 2004). The general assumption holds that this positive affect is subsequently attributed to the stimulus at hand, inducing positive evaluations.

In our context, we assume that fluency may play an essential role during the interactions between customer and employee in call centers. Thus, we define "interaction fluency" as the degree to which the firm's multiple interfaces facilitate flowing, effortless, and accurate interactions with customers. In that vein, technology applications have been applied to call centers with the purpose of facilitating the interaction with customers (Cassab and MacLachlan, 2006). However, those interactions may not always be successful. Indeed, the ease with which the caller can understand and process the words spoken by the employee on the other end of the line could have an impact on the consumer's evaluation of the experience with the call center. One of the central concepts of such evaluation is customer satisfaction. Since call centers deal with a diverse array of issues ranging from complaint resolution to order taking, call centers have become a critical touch point for managing satisfaction (Dawson, 1998). Consequently, the favorable or unfavorable perceptions of fluency should become apparent in terms of satisfaction with the call:

**H1:** fluency will positively influence interaction satisfaction

Furthermore, fluency should also affect the caller's future intentions. Thus, an easily processed conversation (high fluency) would derive in a higher intention to contact the call center again when needed. However, if the information received from the employee turned out to be difficult to follow and process (low fluency), the customer will avoid contacting the call center in the future. Therefore, we predict:

**H2:** fluency will negatively influence call aversion

In addition to call satisfaction and call aversion, perceived fluency may also induce an emotional reaction on the consumer. The perception that interaction fluency is low will lead the customer to

attribute the lack of fluency to the unskilled employee –external attribution of blame-, which, in turn, facilitates the elicitation of anger (Folkes et al. 1987). On the contrary, the perception that interaction fluency is high would contribute to a reduction in anger. Therefore, we predict that:

**H3:** fluency will negatively influence anger

Literature has demonstrated that anger occurs frequently in call center interactions, as customers are often unfriendly to employees (e.g., Grandey et al., 2004). They generally expect the service to work perfectly and become angry and frustrated when problems arise. The inverse relationship between negative emotions and satisfaction is well grounded in the literature (Phillips and Baumgartner, 2002) so we predict that it will also hold during customer-employee interactions in call centers:

**H4:** anger will negatively influence interaction satisfaction

Call centers, even if they are run by an external firm (settled in South America or India, for example), are sometimes the only point of contact between the customer and the main firm (settled in the USA or Europe). It means that the image of the main company from the customer's eyes can either be demolished or enhanced depending on the evaluation of the interactions with the call center (Whiting and Donthu, 2009). Dissatisfied customers are more likely to spend less, switch to competitors, and spread negative word of mouth when they find troubles with the call centers. Consequently, it should be expected that low call satisfaction will be transmitted to the evaluation of the main company in terms of both satisfaction and trust:

**H5:** interaction satisfaction will positively influence satisfaction with the company

**H6:** interaction satisfaction will positively influence trust in the company

Finally, trust has been proved to be an antecedent of both satisfaction and customers' future intentions (Jarvenpaa et al. 2000; Manganari et al. 2012). Therefore, we predict that:

**H7:** trust will positively influence satisfaction with the company

**H8:** trust will negatively influence call aversion

### 3. Methodology

To develop a reliable, valid scale of call fluency, we follow the process recommended by Churchill (1979) and Gerbing and Anderson (1988). Through a review of the relevant literature, an initial item pool consisting of 16 items was elaborated. Eight personal interviews were carried out with people of different ages and gender who had recently had an experience with a call center service. They provided detailed information about that experience and made comments on the preliminary scale items. As a result, some of them were modified and 5 new items were generated. Then, four marketing expert judges were given the definition of call fluency and were instructed to evaluate the previous 21 items and rate them as "not representative", "somewhat representative" or "very representative". Items with 75% or more agreement as belonging to call fluency were thus retained for further analysis. Based on the judges' evaluation, 5 items were removed and 16 remained.

**First study.**- We ran a pretest of the items with a convenience sample. An electronic questionnaire was elaborated. Its link was sent by e-mail to different contact lists. We managed to collect 180 complete questionnaires of customers from companies pertaining to sectors such as telecommunications, electricity, or insurance, among others, who had called the company and interacted with the call center service. The respondents' average age was 45.63 years old, and 51.1% of them were males.

Call fluency scale consisted of 5-point multi-item Likert questions, ranging from "1=totally disagree" to "5=totally agree". In this questionnaire no additional variables were measured. A confirmatory factor analysis (CFA) using LISREL 8.80 was conducted to assess measurement reliability, and convergent validity. A model with 4 dimensions was tested<sup>1</sup>. Examination of standardized residuals and modification indices suggested that the model could be significantly improved by removing 6

---

<sup>1</sup> Alternative models were compared.

items from the original scale. Although the overall chi-square statistic was significant ( $\chi^2=52.61$   $df=29$   $p=0.0047$ ), the observed normed  $\chi^2$  ( $\chi^2/df$ ) for this model was 1.81, which is smaller than 3 as recommended by Fornell and Larcker (1981). The remaining indices show a good fit (NFI= 0.97, NNFI=0.97, CFI= 0.98, SRMR= 0.043, RMSEA= 0.067, GFI=0.94). Reliability was confirmed with composite reliability index higher than the recommended level of .60 (Bagozzi and Yi 1988) whereas average variance extracted was higher than the recommended level of .50 (Hair et al. 1998). Convergent validity was assessed by verifying the significance of the t values associated with the parameter estimates. All t values were positive and significant.

**Second study.**- We collected a second dataset with the assistance of a marketing research firm. The sample was drawn as a Random Digit Dial telephone survey, using a Computer Assisted Telephone Interview (CATI) format. After its depuration, a sample of 176 usable questionnaires remained. The respondents had an average age of 44.7 years old; the majority were females (65.9%), and 41.5% had university education.

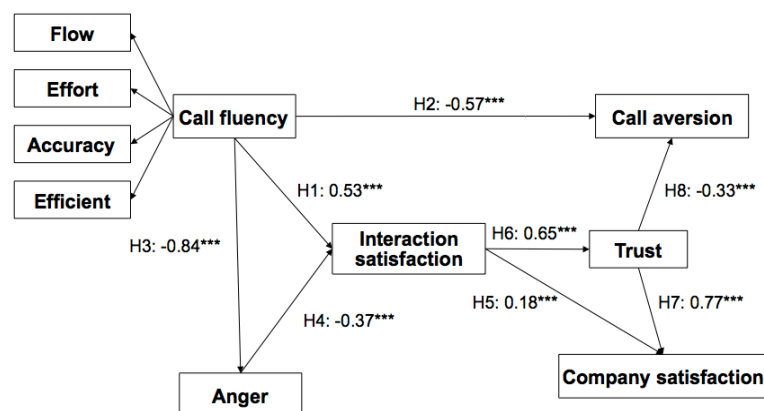

In this questionnaire, besides call fluency, all the variables from our theoretical model were included. All the scales consisted of 5-point multi-item Likert questions, ranging from “1=totally disagree” to “5=totally agree”. Anger was measured using three items adapted from Bougie et al. (2003). Trust was measured using three items adapted from Ranaweera and Prabhu (2003). Call aversion and interaction satisfaction were measured with items adapted from de Ruyter and Wetzels (2000). Finally, a three-item satisfaction measure developed by Cronin et al. (2000) was used.

Then, a CFA using LISREL 8.80 was conducted to assess measurement reliability, convergent and discriminant validity. The previous model with 4 dimensions was tested. The indices show a good fit (NFI= 0.96, NNFI=0.97, CFI= 0.98, SRMR= 0.046, RMSEA= 0.073, GFI=0.94). Again, reliability and convergent validity of the measures were confirmed. Discriminant validity was successfully tested by comparing the average variance extracted by each construct with the shared variance between the construct and the other variables (Fornell and Larcker 1981).

#### 4. Results

The hypothesized relationships were estimated via LISREL 8.80. The results indicated a good fit between the model and the observed data ( $\chi^2=462.49$   $df=263$   $p< .00$ , NFI= 0.96, NNFI=.98, CFI=.98, RMSR=.052; RMSEA=.066, GFI=.83). As shown in Figure 1, all hypotheses were supported.

**Figure 1**  
Empirical findings

The model explained 70.1%, 75.4%, 63.21%, 42.1% and 81.9% of the variance in anger, call satisfaction, call aversion, trust, and company satisfaction, respectively<sup>2</sup>.

<sup>2</sup> We compared the superiority of this model with two alternative models (more and less restricted).

## 5. Discussion and managerial implications

This research demonstrates that fluency is a key factor in determining customer satisfaction when interacting with call centers. After confirming the second-order structure of fluency and developing a valid and reliable scale for its measurement, the results show that fluency affects customer anger, interaction satisfaction and call aversion directly whereas it has an indirect impact on trust and satisfaction with the main company. These findings entail relevant implications for companies as they identify courses of action to improve their after-sales service. Thus, they should train their employees to engage in fluent conversations with the customers. Facilitating customers' processing of information through an efficient, accurate and effortless conversation would result in favorable emotional responses as well as higher satisfaction.

## RESUMEN

*CETSCALE (Consumer ethnocentrism tendencies scale), la escala desarrollada por Shimp y Sharma en 1987 para estudiar el comportamiento etnocentrista del consumidor cumplía recientemente 25 años de existencia. Su utilización durante todo este tiempo ha abarcado numerosas aplicaciones en una gran variedad de países, lo que le ha conferido un carácter universal. No obstante, el carácter unidimensional de la escala no se ha mantenido de forma uniforme en el conjunto de la literatura, un aspecto que ha podido venir condicionado por su aplicación en contextos geográficos diferente, por utilizar tipos de muestras distintas o por las diferentes versiones de la escala que han sido utilizadas. Con el objetivo de encontrar una respuesta a esta falta de homogeneidad en la unidimensionalidad de la escala, en este trabajo realizamos un meta-análisis a partir de una amplia selección de trabajos que han aplicado CETSCALE. Los resultados de las estimaciones realizadas considerando tanto efectos directos como moderadores nos aportan evidencia sobre los aspectos que pueden influir en la no unidimensionalidad de la escala y que se concreta en la versión de la escala utilizada junto a que haya sido aplicada en determinados ámbitos geográficos.*

## Palabras clave:

Etnocentrismo, CETSCALE, unidimensionalidad, meta-análisis

## 1. Introducción

En 2012 se cumplían veinticinco años de aplicación de CETSCALE, la escala diseñada por Shimp y Sharma en 1987 para representar las creencias de los consumidores norteamericanos acerca de la idoneidad de adquirir productos extranjeros, y que ha sido utilizada de forma preferente en la literatura para estudiar el etnocentrismo. Según Shimp y Sharma (1987), el etnocentrismo del consumidor se centra en la responsabilidad y moralidad de comprar productos fabricados en el extranjero frente a la lealtad de los consumidores hacia los productos fabricados en su país. Por tanto, para un consumidor etnocéntrico, importar productos de otros países no es adecuado, ya que no es patriótico, y va en detrimento de la economía y el empleo doméstico (Yagci, 2001; Supphellen y Gronhaug, 2003). Como consecuencia de ello, los consumidores etnocéntricos evalúan de un modo diferente los productos fabricados en su país y los fabricados en otras naciones (Huddleston et al., 2000), sobrestimando los atributos y calidad global de los productos domésticos, y subestimando los de los productos extranjeros (Sharma et al., 1995).

Aunque su aplicación original se centró en consumidores de Estados Unidos, posteriormente ha sido validada a nivel internacional por múltiples trabajos (e.g. Netemeyer et al., 1991; Duvarsula et al., 1997; Luque et al., 2000; Supphellen y Rittenburg, 2001; Orth y Firbasova, 2003; Kwak et al., 2006; Nadiri y Tümer, 2010).

Sin embargo, a medida que los parámetros inicialmente propuestos para la aplicación de CETSCALE (ámbito geográfico, tipo de muestra o versión de la escala) han ido variando en los diferentes estudios a lo largo de los últimos años, en un intento de contrastar la aplicabilidad de la escala en otros ámbitos geográficos diferentes y con tipologías de muestras distintas, los resultados han variado sustancialmente, sobre todo por no mantenerse la unidimensionalidad de la escala. De hecho, son múltiples los trabajos que aparecen en la literatura desarrollados en diferentes contextos culturales que cuestionan la existencia de una única dimensión (e.g., Marcoux et al., 1997 [Polonia]; Mavondo y Tan (1999) [Malasia]; Supphellen y Gronhaug (2003) [Rusia]; Douglas y Nijssen (2003) [Holanda]; Bawa (2004) [India]; Saffu y Walker (2005) [Rusia]; Khan y Rizvi (2008) [India]; Wei et al. (2009) [China]). Estos trabajos obtienen dos o, en muchos casos, tres y hasta cuatro dimensiones diferentes que explican el comportamiento etnocéntrico del individuo dentro de un contexto cultural geográfico específico.

Con el objetivo de conocer qué aspectos de los utilizados en las aplicaciones empíricas desarrolladas hasta ahora en la literatura son los que condicionan el carácter unidimensional de CETSCALE, en este trabajo se desarrolla un meta-análisis que nos permita aportar evidencia empírica respecto al comportamiento no unidimensional de la escala. Para ello, utilizaremos como variables de referencia el ámbito geográfico del estudio, el tipo de muestra utilizado y la versión de la escala empleada.

Este trabajo ha sido estructurado en cuatro apartados adicionales. El apartado segundo se dedica a analizar brevemente el comportamiento no unidimensional de CETSCALE en la literatura. En un tercer apartado se analiza la influencia sobre la unidimensionalidad de la escala de los tres factores anteriormente mencionados (ámbito geográfico, tipo de muestra y versión de la escala). A continuación, en un cuarto apartado se describe la metodología del estudio, detallando las diferentes etapas llevadas a cabo para realizar el meta-análisis. Por último, se plantean las conclusiones del trabajo.

## 2. CETSCALE, ¿una escala unidimensional?

Al estudiar en la literatura el comportamiento unidimensional de CETSCALE, encontramos que existen una mayoría de trabajos que confirman esta propiedad de la escala. Estos estudios abarcan países muy diferentes como EE.UU. (e.g., Durvasula et al., 1997; Mittelstaedt et al., 2004; Yoo y Donthu, 2005), Corea del Sur (e.g., Sharma et al., 1995; Kwak et al., 2006), España (Luque et al., 2000), Rusia (Supphellen y Gronhaug, 2003), Turquía (e.g., Kucukerimoglou, 1999; Kaynak y Kara, 2002), China (e.g., Pereira et al., 2002; Qing et al., 2012), Malta (Caruana y Magri, 1996), Islandia (Bandyopadhyay, 2012), Israel (Shoham y Brencic, 2003) o Chipre (e.g., Nadiri y Tümer, 2010).

Sin embargo, numerosos trabajos que sugieren el carácter multidimensional de la escala proceden igualmente de contextos geográficos muy diversos, si bien la mayoría de ellos han sido desarrollados en países asiáticos. Es el caso de China (Wei et al., 2009; Hsu y Nien, 2008), Malasia (Mavondo y Tan, 1999; Ramayah et al., 2011) o India (Bawa, 2004; Khan y Rizvi, 2008). Únicamente en el caso de Rusia (Saffu y Walker, 2005), Holanda (Douglas y Nijssen, 2003) Polonia (Marcoux et al., 1997) y Alemania (Jiménez et al., 2014) nos encontramos con países europeos en los que no se ha confirmado la unidimensionalidad de la escala.

De todos estos estudios cabe destacar el trabajo de Yu y Albaun (2002) que analiza el etnocentrismo del individuo de Hong Kong en dos momentos diferentes del tiempo: hasta julio de 1997 (bajo soberanía

británica) y desde esa fecha (bajo soberanía china). Para ello, utiliza dos escalas diferentes de CETSCALE, la completa de 17 ítems y la versión reducida de 10 ítems. En el primero de los casos (utilizando la escala completa), los resultados confirman la multidimensionalidad de la escala, obteniendo 4 factores antes del cambio de soberanía, y 2 factores después del 1 de julio. Utilizando la escala reducida de 10 ítems, Yu y Albaun (2002) obtienen, igualmente, 2 factores antes del cambio de soberanía. Sin embargo, bajo soberanía China, sí que obtienen un único factor que explica el 62% de la varianza total de la escala.

En relación a la no unidimensionalidad, son mayoritarios los trabajos que indican la existencia de dos dimensiones dentro de la escala. En esta línea se sitúan los trabajos de Yu y Albaun (2002) (en dos de los cuatro análisis que estos autores desarrollan), Douglas y Nijssen (2003), Saffu y Walker (2005), Chryssochoidis et al. (2007), Hsu y Nien (2008), Wei et al. (2009), Ramayah et al. (2011) y Jiménez et al. (2014). En la mayor parte de estos estudios, las dos dimensiones identificadas representan dos perspectivas diferentes del comportamiento etnocéntrico: por una parte, el etnocentrismo del individuo representado en una aversión hacia los productos extranjeros y, por otra, el etnocentrismo del individuo representado por la propensión y defensa de los productos propios o domésticos. Chryssochoidis et al. (2007) y Ramayah et al. (2011) denominan ambas dimensiones como “etnocentrismo duro” y “etnocentrismo suave”, respectivamente. Por su parte, Hsu y Nien (2008) las denominan “proteccionismo” y “patriotismo defensivo”.

Respecto a los trabajos que identifican tres factores encontramos los trabajos de Marcoux et al. (1997), Mavondo y Tan (1999) y Bawa (2004) (en dos de las tres muestras que analizan). Para Mavondo y Tan (1999), CETSCALE es un constructo complejo de segundo-orden que cuenta con tres componentes que reflejan: (1) la animosidad hacia los extranjeros y sus productos; (2) el deseo de la “preservación propia” del grupo a través del desarrollo de acciones económicas, y (3) la obligación moral de apoyar a los productos domésticos. Marcoux et al. (1997) señalan que, de los tres factores, el que representa las tendencias proteccionistas del individuo es el más importante. Por el contrario, el patriotismo es la dimensión que explica en menor medida el comportamiento etnocéntrico del individuo.

Finalmente, Yu y Albaun (2002) (en el caso de la escala completa de 17 ítems entre ciudadanos de Hong Kong aún bajo soberanía británica), Bawa (2004) (en el caso de la muestra de estudiantes universitarios), y Khan y Rizvi (2008), obtienen 4 factores diferentes. Para Khan y Rizvi (2008), la importancia de cada una de las cuatro dimensiones es similar, lo que refleja que CETSCALE es una escala de dimensionalidad cuestionable cuando es analizada fuera del contexto norteamericano.

### **3. Factores que influyen en la no unidimensionalidad de CETSCALE.**

Son diferentes los argumentos utilizados para justificar los resultados obtenidos por los trabajos que apoyan la multidimensionalidad de CETSCALE, y que se encuentran alejados de los planteamientos de Shimp y Sharma (1987). Diversos autores (e.g., Marcoux et al., 1997; Supphellen y Rittenburg, 2001; Bawa, 2004), argumentan que estos resultados responden, principalmente, a las características sociodemográficas de la muestra utilizada, ya que las diferencias de edad y de nivel de educación pueden dar lugar a diferencias en la dimensionalidad de la escala. Este aspecto, sin embargo, parece no confirmarse en la revisión de la literatura que hemos realizado, dado que tanto en trabajos que confirman la unidimensionalidad de CETSCALE como los que no la apoyan, utilizan indistintamente muestras de estudiantes como de población en general. Otro de los argumentos utilizados se relaciona con la versión de CETSCALE que cada estudio utiliza, tal y como se demuestra en el trabajo de Yu y Albaun (2002), anteriormente comentado. Si bien es cierto que de forma mayoritaria CETSCALE se ha aplicado utilizando los 17 ítems originalmente propuestos por Shimp y Sharma (1987), en la literatura se han planteado diferentes adaptaciones con un número de ítems considerablemente menor. Así, son múltiples los trabajos que utilizan la escala reducida de 10 ítems propuesta en el propio trabajo original de Shimp y Sharma (1987), y que concluyen que la escala no es unidimensional. Es el caso de los trabajos de Douglas y Nijssen (2003) y Hsu y Nien (2008). Sin embargo, existen también trabajos que utilizan la misma escala reducida y que sí obtienen un único factor subyacente (e.g., Balbanis y Diamantopoulos, 2004; Mittelstaedt et al., 2004), lo que nos hace dudar acerca de si la utilización de la escala reducida de Shimp y Sharma puede provocar la obtención de resultados multidimensionales.

Por todo ello, y ante la divergencia de planteamientos encontrados en la literatura, en este trabajo hemos optamos por seleccionar tres aspectos que nos parecen más vinculantes o más significativos a la hora de analizar el carácter multidimensional de la escala: ámbito geográfico de aplicación, tipo de muestra utilizado y versión de la escala empleada en cada estudio, a partir de los cuales podamos justificar este comportamiento tan heterogéneo.

### 3.1. *Ámbito geográfico de aplicación de CETSCALE*

Durante estos veinticinco años CETSCALE ha sido aplicada en ámbitos geográficos muy diversos que abarca los cinco continentes. Repasando algunos de los países en los que se ha aplicado la escala, cabe señalar en primer lugar *EE.UU.*, donde por primera vez se aplicó a partir del trabajo original de Shimp y Sharma (1987). No obstante, en años posteriores se ha vuelto a repetir este tipo de análisis con los trabajos de Netemeyer et al. (1991), Duvarsula et al. (1997), Pullman et al. (1997) o Lee et al. (2003). Dentro del continente americano, CETSCALE también se ha aplicado en *Canadá* (Bruning, 1997; Saffu y Walker, 2005) y *México* (Witkowski, 1998; Clarke III, 2001), no teniendo constancia de trabajos en países de Sudamérica.

Europa ha sido también un escenario ideal para la aplicación de CETSCALE. Así, la literatura recoge aplicaciones en *Alemania* (Evanschitzky et al., 2008; Jiménez et al., 2014), *Bélgica* (Steenkamp y Baumgartner, 1995), *Chipre* (Nadiri y Tümer, 2010), *Eslovenia* (Reardon et al., 2005), *Eslovaquia* (Saffu et al., 2010), *España* (Luque et al., 2000; Jiménez y San Martín, 2010), *Francia* (Netemeyer et al., 1991; Javalgi et al., 2005), *Grecia* (Steenkamp y Baumgartner, 1995; Chrysochoidis et al., 2007), *Holanda* (Douglas y Nijssen, 2003), *Polonia* (Good y Huddleston, 1995; Marcoux et al., 1997; Lindquist et al., 2001; Supphellen y Rittenburg, 2001), *Reino Unido* (Steenkamp y Baumgartner, 1995; Balbanis y Diamantopoulos, 2004), *Rusia* (e.g., Supphellen y Gronhaug, 2003; Saffu y Walker, 2005; Thelen et al., 2006) o *Turquía* (e.g., Kaynak y Kara, 2002; Altintas y Tokol, 2007; Erdogan y Uzkurt, 2010) entre otros.

El continente asiático ha sido el área geográfica donde en los últimos años ha tenido lugar un mayor número de estudios, sobre todo en China e India. Repasando brevemente algunos de estos trabajos publicados en los años más recientes, para el caso de *China* encontramos entre otros el de Wang y Chen (2004), Liu et al. (2007), Wong et al. (2008), Chang y Cheng (2011) o Qing et al. (2012), mientras que para la *India*, podemos destacar los trabajos de Bawa, (2004), Kwak et al., (2006) o Khan y Rizvi, (2008). También son numerosos los estudios desarrollados en *Malasia* (e.g., Yeong et al., 2007; Othman et al., 2008; Teo et al., 2011), o *Corea* (Sharma et al., 1995; Kwak et al., 2006), encontrando también en la literatura otros trabajos en países como *Indonesia* (Hamin y Elliot, 2006), *Israel* (Shoham y Brencic, 2003), *Japón* (Netemeyer et al., 1991) o *Jordania* (Al Ganideh y Al Tae, 2012).

Por último, en Oceanía encontramos varios trabajos desarrollados en *Australia* (Philp y Brown, 2003; Poon et al., 2010; Josiassen et al., 2011) y *Nueva Zelanda* (Watson y Wright, 2000; Shergill et al., 2010), mientras que en el continente africano apenas encontramos referencias, destacando los recientes trabajos realizados en *Etiopía* (Mangnale et al., 2011), *Mauricio* (Ramsaran, 2010) o *Túnez* (Ben Mrad et al., 2011).

Por tanto, CETSCALE ha tenido una proyección internacional muy importante siendo un referente indiscutible a la hora de analizar el sentimiento etnocéntrico del consumidor. Aunque en muchos de estos trabajos se ha reproducido el carácter unidimensional de la escala, el hecho de que también haya un número representativo de los mismos que ofrecen unos resultados discrepantes nos lleva a plantear como hipótesis si esta falta de unanimidad responde al hecho en sí del ámbito geográfico de estudio.

En base a ello, planteamos una primera hipótesis en nuestro trabajo:

**H<sub>1</sub>: El ámbito geográfico de estudio tiene una influencia directa sobre la unidimensionalidad de la escala**

### 3.2. *Tipología de la muestra*

El trabajo original desarrollado por Shimp y Sharma (1987) utilizaba una muestra en la que se entremezclaban estudiantes universitarios y población en general. Tomando como referencia esa tipología de muestra, la práctica totalidad de estudios desarrollados con posterioridad han respetado en mayor o menor medida ese patrón, utilizando uno de esos perfiles muestrales o combinándolos. Así, encontramos en la literatura trabajos que utilizan solamente como muestra a la población en general (e.g., Mavondo y Tan, 1999; Luque et al., 2000; Kaynak y Kara, 2002; Balbanis y Diamantopoulos, 2004; Nadiri y Tümer, 2010; Qing et al., 2012), otros, que solamente utilizan a estudiantes universitarios (e.g., Duvarsula et al., 1997; Mittelstaadt et al., 2004; Saffu y Walker, 2005; Khan y Rizvi, 2008), o bien trabajos que utilizan una combinación de ambas muestras (e.g., Supphellen y Gronhaug, 2003; Kwak et al., 2006). De la misma manera que ocurría en el caso del ámbito geográfico de estudio, también encontramos trabajos donde la unidimensionalidad de la escala se ve alterada dependiendo del tipo de muestra utilizada, lo que nos lleva a plantear una segunda hipótesis en nuestro trabajo que intente reflejar si esta falta de unanimidad es una consecuencia directa de la selección de muestra. En base a ello planteamos la siguiente hipótesis:

**H<sub>2</sub>: El tipo de muestra utilizada tiene una influencia directa sobre la unidimensionalidad de la escala**

### 3.3. Versión de CETSCALE

Uno de los aspectos más singulares que encontramos al revisar la literatura es sin duda el referente a las versiones utilizadas de CETSCALE. Aunque en el trabajo original de Shimp y Sharma (1987) se proponía una escala de 17 ítems, estos autores también ofrecían la posibilidad de utilizar una escala reducida<sup>1</sup> de 10 ítems. Si bien la escala de 17 ítems ha sido la más utilizada en la mayoría de trabajos, en la literatura también podemos encontrar numerosos trabajos en los que se utiliza la escala reducida (e.g. Yu y Albaum, 2002; Douglas y Nijssen<sup>2</sup>, 2003; Balabanis y Diamantopoulos, 2004; Mittelstaedt et al.; 2004; Thelen et al., 2006; Hsu y Nien, 2008). El uso de estas escalas “reducidas” es una práctica muy habitual como señalan Li y He (2013), dada la alta correlación interna que existe entre los ítems de una escala cuando estos, como es el caso de CETSCALE, son muy numerosos, siendo además un procedimiento eficaz y fiable como señalan Steenkamp y Baumgartner (1995).

El hecho de que Shimp y Sharma propusieran esta doble versión de CETSCALE abrió la puerta a que en la literatura se propusieran otras versiones alternativas. Así, mientras que en unos casos suponía solamente modificar los ítems de la versión reducida (e.g., Supphellen y Rittenburg, 2001), en otros casos implicaba una escala con un número de ítems diferentes (e.g., Marcoux et al., 1997; Bawa, 2004). En cualquier caso, aquellos autores que deciden no utilizar la escala completa o la reducida de Shimp y Sharma (1987), llevan a cabo una selección de *ítems* que parece responder a la necesidad de adaptación de la escala al contexto geográfico y socio-cultural específico del análisis.

Respecto a los trabajos que utilizan escalas reducidas distintas a la propuesta por Shimp y Sharma, encontramos entre otros el de Marcoux et al. (1997), que utiliza una escala de 14 ítems (elimina los ítems 3, 4 y 5), el de Bawa, que también utiliza una escala de 14 ítems, si bien elimina los ítems 2, 4 y 12, Supphellen y Rittenburg (2001) que utiliza una escala de 10 ítems pero parcialmente distintos a los de la escala original reducida, o Supphellen y Gronhaug (2003) que utilizan una escala de 11 ítems. A la vista de la disparidad de los resultados obtenidos en los diferentes trabajos según se utilicen una u otra versión de CETSCALE, consideramos necesario plantear una tercera hipótesis en nuestro trabajo que intente reflejar si esta falta de unanimidad en la unidimensionalidad de la escala es una consecuencia del tipo de escala utilizada. En base a ello planteamos la siguiente hipótesis:

***H<sub>3</sub>: La versión de la escala utilizada tiene una influencia directa sobre la unidimensionalidad de la escala***

## 4. Metodología

### 4.1. Selección de estudios

La realización de un meta-análisis supone necesariamente desarrollar las mismas seis fases que se requieren para llevar a cabo cualquier estudio empírico. En este sentido, una vez formulado el problema objeto de este trabajo (1ª fase), el siguiente paso consistiría en hacer una búsqueda y selección de estudios empíricos que hayan contemplado la aplicación de CETSCALE (2ª fase), así como una codificación de las características de los mismos (3ª fase). En este sentido, en la Tabla 1 se recogen 46 estudios seleccionados procedentes de 32 trabajos publicados en la literatura. La no coincidencia se debe a que en algunos casos, un mismo trabajo incluye ámbitos geográficos de aplicación distintos.

Una 4ª fase del meta-análisis supone la determinación del tamaño del efecto, es decir, un índice estadístico que permita poner en la misma métrica los resultados de los distintos estudios. Esta necesidad de homogeneizar la unidad de medida de los resultados se debe al hecho de que los diferentes estudios pueden analizar sus resultados de formas muy diversas, como por ejemplo, a través de medias, desviaciones típicas, o pruebas estadísticas diferentes como las pruebas t de diferencias entre medias, las pruebas F de ANOVA o las pruebas Chi-cuadrado de Pearson, entre otras (Sánchez, 2010; Sánchez y Botella, 2010).

En nuestro caso podemos considerar que el número de factores obtenidos al realizar el Análisis factorial de la escala es una medida que permite homogeneizar los resultados de los diferentes trabajos y, por ello, podríamos considerarlo como el tamaño del efecto de cada estudio. Por su parte, respecto a las variables que presumiblemente pueden moderar el tamaño del efecto, es decir, pueden alterar la unidimensionalidad de la escala, tal y como hemos analizados en los apartados anterior, utilizaremos el ámbito geográfico de aplicación, la tipología de la muestra y la versión de la escala utilizada.

<sup>1</sup> Shimp y Sharma (1987, p.283, nota al pie de página 4; *ítems* 2,4,5,6,7,8,11,13,16,17 de la escala original de 17 ítems)

<sup>2</sup> Estos autores añaden, a la escala reducida de 10 *ítems*, un *ítem* adicional relacionado con la compra de productos foráneos cuando no existe disponibilidad doméstica

<sup>c</sup> N° de factores en el caso de no ser unidimensional

A partir de los estudios seleccionados en la Tabla 1, podemos llevar a cabo un primer análisis descriptivo sobre los mismos que nos oriente sobre el probable resultado de las hipótesis anteriormente planteadas. En este sentido, en la Tabla 2 podemos observar el número de estudios (en %) en los que la escala presenta un comportamiento unidimensional, considerando las tres variables analizadas (ámbito geográfico, tipo de muestra y versión de la escala) y los diferentes niveles contemplados en cada uno de los casos.

TABLA 2  
Unidimensionalidad de la escala según tipo de variable (%)

	TOTAL (%)	SI-UNI	%	NO-UNI	%
<b>Escala 17 ítems original (ESC17)</b>	33 - (71,7%)	25	75,8	8	24,2
<b>Escala 10 ítems original (ESC10)</b>	6 - (13,0%)	3	50,0	3	50,0
<b>Otras escalas (OTESC)</b>	7 - (15,2%)	2	28,6	5	71,4
	46 - (100%)	<b>30</b>	<b>65,2</b>	<b>16</b>	<b>34,8</b>
<b>Población general (POB)</b>	24 - (52,2%)	13	54,2	11	45,8
<b>Estudiantes (ESTU)</b>	16 - (34,8%)	11	68,8	5	31,3
<b>Pob. gral y estudiantes (POB/ESTU)</b>	6 - (13,0%)	6	100,0	0	0,0
	46 - (100%)	<b>30</b>	<b>65,2</b>	<b>16</b>	<b>34,8</b>
<b>Continente americano (AME)</b>	7 - (15,2%)	7	100,0	0	0,0
<b>Continente europeo (EUR)</b>	18 - (39,1%)	13	72,2	5	27,8
<b>Continente asiático (ASI)</b>	21 - (45,7%)	10	47,6	11	52,4
	46 - (100%)	<b>30</b>	<b>65,2</b>	<b>16</b>	<b>34,8</b>

Como podemos observar en la Tabla 2, en lo que respecta a la versión de CETSCALE utilizada, cuando se trata de la escala de 17-ítems, en un 75,8% de los casos esta es unidimensional; sin embargo, este porcentaje desciende hasta el 28,6% cuando se utilizan otras versiones distintas a las dos propuestas por Shimp y Sharma (1987), mientras que en el caso de la escala reducida de 10 ítems, el porcentaje es el mismo para ambas situaciones (50%).

Si consideramos el tipo de muestra utilizada, se observa que para el caso de la población en general la escala es unidimensional solamente en el 54,2% de los casos; si es una muestra de estudiante alcanza el 68,8% y, finalmente, si es una combinación de ambas, consigue el 100%. Por último, en relación al ámbito geográfico, en los estudios realizados en el continente americano la escala es unidimensional en el 100% de los casos; cuanto se trata de estudios realizados en Europa, este porcentaje baja hasta el 72,2%, mientras que si se refiere a países del área asiática, la escala es unidimensional solamente en un 47,6% de los casos.

A continuación, en la Tabla 3 llevamos a cabo un análisis similar, considerando combinaciones 2 a 2 de los diferentes niveles de las tres variables analizadas.

TABLA 3  
Unidimensionalidad de la escala combinando variables (%)

	ESC17	ESC10	OTESC
<b>POB</b>	75,0	100,0	<b>27,3</b>
<b>ESTU</b>	60,0	100,0	57,1
<b>POB/ESTU</b>	100,0	100,0	100,0
	POB	EST	POB/ESTU
<b>AME</b>	100,0	100,0	100,0
<b>EUR</b>	75,0	60,0	100,0
<b>ASI</b>	<b>27,3</b>	57,1	100,0
	ESC17	ESC10	OTESC
<b>AME</b>	100,0	100,0	0,0
<b>EUR</b>	76,9	100,0	50,0
<b>ASI</b>	64,3	<b>25,0</b>	0,0

Como podemos observar, son tres las combinaciones en las que la unidimensionalidad de la escala alcanza unos porcentajes más reducidos: en primer lugar, sería el caso en el que se utilizan otras escalas distintas a las propuestas por Shimp y Sharma (1987) y, además, se considera como muestra a la población en general (27,3%), si bien sólo representa a tres casos de los 46 seleccionados; en segundo lugar, estarían aquellos estudios que se llevan a cabo en el continente asiático y también se utiliza como muestra a la población en general (27,3%), una combinación que se repite en 11 de los estudios seleccionados; por último, lo completarían aquellos trabajos que también se llevan a cabo en el continente asiático y que utilizan la escala reducida de 10 ítems (25%), pero que sólo se reproduce en cuatro de los estudios.

Estos resultados nos permiten a su vez plantear una nueva hipótesis referente a la existencia de efectos moderadores entre las diferentes variables independientes, de manera que el carácter unidimensional de la escala pueda venir condicionado no sólo por el efecto directo de cada una de ellas (p.ej: un ámbito geográfico determinado, o el uso de la escala de 10 ítems), sino también por el efecto conjunto entre algunas

de ellas. En base a ello, y a la representatividad de las combinaciones anteriores, planteamos una nueva hipótesis:

***H<sub>4</sub>. La realización del estudio en el continente asiático si se utiliza a la población general influye negativamente en la unidimensionalidad de la escala***

#### ***4.2. Especificación del modelo***

A partir de los planteamientos anteriores, y siguiendo con el proceso secuencial del meta-análisis, a continuación especificamos el modelo que posteriormente estimaremos (5ª fase). Dado el carácter categórico de la variable dependiente (unidimensional / multidimensional), hemos estimado un modelo de regresión logístico. Igualmente, el carácter categórico de las variables independientes ha motivado la inclusión de n-1 (siendo n igual al número de categorías en cada caso) variables ficticias para cada una de ellas.

Inicialmente vamos a considerar un modelo que incluya únicamente efectos directos (hipótesis H<sub>1</sub>, H<sub>2</sub> y H<sub>3</sub>), y, posteriormente, desarrollaremos un segundo modelo que incluya los efectos moderadores (hipótesis H<sub>4</sub>).

##### ***4.2.1. Modelo de efectos directos***

Para el caso de regresiones con variables dummy en las que, como en este caso, existen más de dos categorías en cada caso, la decisión respecto a qué variables incluir y cuáles dejar como categoría de referencia puede responder a diferentes criterios como señala (Hardy, 1993). Entre estos criterios estaría la consideración de categorías de referencia que estén bien delimitadas, la inclusión como variables de categorías que presenten un mayor número de casos o que conteniendo un número reducido sean muy representativa, en cuyo caso habría que utilizar como categoría de referencia una de las más numerosas.

En base a estos criterios especificaremos el siguiente modelo:

$$F_t = \beta_0 + \beta_1 ESC17_t + \beta_2 ESC10_t + \beta_3 POB_t + \beta_4 ESTU_t + \beta_5 AME_t + \beta_6 ASI_t + e_t \quad [1]$$

donde:

$F_t$  = Variable dummy que toma el valor 1 si la escala es unidimensional (un único factor obtenido en el Análisis Factorial) y 0 si no lo es.

$ESC17_t$  = Variable dummy que toma el valor 1 si la escala utilizada es la original de 17 ítems y 0 en el resto de casos.

$ESC10_t$  = Variable dummy que toma el valor 1 si la escala utilizada es la original reducida de 10 ítems y 0 en el resto de casos.

$POB_t$  = Variable dummy que toma el valor 1 si la muestra utilizada ha sido sólo población en general y 0 en el resto de los casos.

$ESTU_t$  = Variable f dummy que toma el valor 1 si la muestra utilizada ha sido sólo estudiantes y 0 en el resto de los casos.

$AME_t$  = Variable dummy que toma el valor 1 el estudio se ha realizado en el continente americano y 0 en el resto de los casos.

$ASI_t$  = Variable dummy ficticia que toma el valor 1 el estudio se ha realizado en el continente asiático y 0 en el resto de los casos.

$e_t$  = Término de error.

Según señala Hair *et al.* (1999), en la mayoría de los casos de regresión múltiple, se tiene un número posible de variables independientes entre las cuales elegir para incluirlas en la ecuación de regresión. A veces el conjunto de variables independientes puede estar muy definido, como a priori es en este caso, y el modelo de regresión se usa esencialmente en una aproximación confirmatoria. En otros casos, el investigador puede desear elegir entre el conjunto de variables independientes para conseguir el “mejor” modelo de regresión a través de una aproximación secuencial. No obstante, en el procedimiento de búsqueda secuencial el investigador debe ser consciente de dos posibles inconvenientes: 1) en primer lugar, la multicolinealidad entre variables independientes puede tener un impacto sustancial sobre la especificación final del modelo, por lo que habrá que examinar las correlaciones directas de todas las variables independientes potenciales; 2) en segundo lugar, se deberán emplear umbrales muy conservadores (por ejemplo, 0,01 o 0,05) al añadir o

destruir las variables en los test de significación múltiple que se realizan en el proceso de estimación del modelo.

En este caso, muchas de las variables inicialmente consideradas son eliminadas bien por presentar altas correlaciones con otras variables independientes (existencia de multicolinealidad) como ocurre, por ejemplo, entre las variables POB y ESTU (-0,763) (ver Tabla 4) o bien, por no ser significativas las correlaciones con la variable dependiente, como ocurre con las variables ESC10, POB y ESTU, tal y como podemos observar en la Tabla 5.

TABLA 4  
Correlación Pearson entre variables independientes

Variable	ECS17	ESC10	POB	ESTU	AME	ASI
ESC17	1					
ESC10	-0,675	1				
POB	-0,118	0,242	1			
ESTU	0,053	-0,147	-0,763	1		
AME	0,131	0,016	-0,321	0,199	1	
ASI	-0,103	0,163	0,004	-0,028	-0,388	1

TABLA 5  
Correlación entre la variable dependiente y las independientes

Variable	Índice de correlación (Pearson)	Signif.
ESC17	0,353	0,008*
ESC10	-0,124	0,206
POB	-0,242	0,052
ESTU	0,054	0,360
AME	0,309	0,018*
ASI	-0,339	0,011*

El hecho de que las variables POB y ESTU no sean significativas y, por tanto, queden excluidas del modelo, nos permite obtener un primer resultado de nuestro estudio, dado que la hipótesis  $H_2$ , con la que se pretendía contrastar si el tipo de muestra utilizada tenía una influencia directa sobre la unidimensionalidad de la escala, no va a ser aceptada.

Por tanto, la especificación del modelo [1] inicialmente propuesto cambia sustancialmente, quedando reducido al siguiente modelo final:

$$F_t = \beta_0 + \beta_1 ESC17_t + \beta_6 ASI_t + e_t \quad [2]$$

A continuación, la Tabla 6 muestra los parámetros estimados del modelo de regresión logística utilizando el *Método paso a paso hacia delante de Wald* (SPSS.21).

TABLA 6  
Parámetros estimados en el modelo de regresión final

Variable	$\beta$	Signif.
ESC17	1,844	0,001
ASI	-1,381	0,030
Chi-cuadrado	14,607	0,001
R <sup>2</sup> Nagelkerke	0,363	

Los resultados obtenidos de la regresión logística nos permiten aceptar tanto la hipótesis  $H_1$  como la  $H_3$  planteadas anteriormente, ya que al ser significativas las variables ASI y ESC17, podemos afirmar que tanto el ámbito geográfico de estudio como el tipo de escala utilizada ejercen una influencia directa sobre unidimensionalidad de CETSCALE.

Respecto a la interpretación que podemos dar a los parámetros estimados, comentar que para el caso de ESC17, significaría que la utilización de la escala completa incrementa en un 184,4% la probabilidad de que la escala sea unidimensional en relación a la utilización de otras escalas distintas a las planteadas por Shimp y Sharma. Por su parte, en el caso de la variable ASI, el hecho de que el estudio se haya desarrollado en un país asiático reduce en un 138,1% la probabilidad de que la escala sea unidimensional respecto a si el estudio se hace en el continente europeo (categoría de referencia).

#### 4.2.2. Modelo de efectos moderadores

A la hora de incorporar los efectos moderadores que nos permitan contrastar la hipótesis  $H_4$  necesitamos como paso previo, conocer el carácter moderador puro o cuasimoderador de cada una de las variables. A partir de la significatividad de los coeficientes de correlación calculados, podemos caracterizar las variables  $ESC17_t$ ,  $AME_t$  y  $ASI_t$  como cuasimoderadoras (pueden tener efectos directos y moderadores) mientras que las variables  $ESC10_t$ ,  $POB_t$ , y  $ESTU_t$ , carecerían de efecto directo y sólo tendría, en su caso, un efecto moderador.

Por tanto, en nuestro caso podríamos incorporar al modelo la siguiente variable adicional con la que contrastar  $H_4$ :  $ASI_t \times POB_t$

La nueva especificación del modelo [3] que incluye los efectos moderadores será finalmente la siguiente:

$$F_t = \beta_0 + \beta_1 ESC17_t + \beta_2 ASI_t + \beta_3 ASI_t \times POB_t + e_t \quad [3]$$

Al realizar una segunda regresión logística utilizando de nuevo el *Método paso a paso hacia delante de Wald*, obtenemos los resultados que recoge la Tabla 7.

TABLA 7  
Parámetros estimados en el modelo de regresión final

Variable	$\beta$	Signif.
ESC17	1,632	0,001
ASIXPOB	-2,025	0,012
Chi-cuadrado	16,927	0,000
R <sup>2</sup> Nagelkerke	0,410	

Como ocurría en el modelo [2] de nuevo en la estimación del modelo [3] se mantiene la significatividad de la variable  $ESC17$ , ofreciendo unos resultados muy similares a los comentados anteriormente. En cambio, la variable  $ASI$ , al no ser significativa, deja de tener un efecto directo para presentar un efecto condicionado. Esto significa que cuando el estudio se realiza en el continente asiático, si se utiliza como tipo de muestra a la población en general se reduce en un 202,50% la probabilidad de que la escala sea unidimensional. Estos resultados nos llevan a aceptar la hipótesis  $H_4$ , pero en cambio, nos obliga a reconsiderar la aceptación inicial de la hipótesis  $H_3$ , que tras la estimación del modelo con efectos moderadores resulta no aceptada.

## 6. Conclusiones

CETSCALE es, sin lugar a dudas, la escala más utilizada en la literatura para analizar el comportamiento etnocentrista del consumidor. Además, es una escala que ha sido validada en numerosos trabajos en los que ha prevalecido tanto su consistencia interna como su unidimensionalidad. El hecho de que en los últimos años hayan surgido en la literatura algunos trabajos que cuestionan su carácter unidimensional y, con ello, su universalidad, viene a sugerir que CETSCALE se comporta de diferente manera cuando se examina fuera de Estados Unidos, el ámbito geográfico para el que fue diseñada. Por esta razón, Thelen et al. (2006) alertan a los investigadores de la trampa que puede suponer dar por hecho que las escalas desarrolladas en un país o cultura puedan aplicarse a otros países o culturas diferentes.

El meta-análisis realizado en este trabajo, y para el que hemos considerado como variables de estudio la versión de la escala utilizada, el ámbito geográfico y la tipología de la muestra, nos ha permitido determinar algunos factores que condicionan los resultados unidimensionales de la escala. Sin duda, el aspecto más significativo de los resultados obtenidos ha estado en el hecho de que de una forma directa o indirecta todas las variables analizadas tienen una influencia en la unidimensionalidad de CETSCALE.

En este sentido, resulta importante destacar que, por lo que se refiere a la versión de la escala, siempre que se utilice la escala original de 17 ítems planteada por Shimp y Sharma (1987), existirá una mayor probabilidad de que la escala sea unidimensional, lo que le da preferencia sobre el resto de escalas planteadas en la literatura, incluida la propia escala reducida de Shimp y Sharma. Por otro lado, y en lo que se refiere al ámbito geográfico, si el estudio se realiza en un país asiático se reduce de una forma importante la probabilidad de que la escala presente un comportamiento unidimensional si a ello se le añade el hecho de utilizar como muestra a la población general. De nuevo, este resultado viene a alertar de la probable no unidimensionalidad de la escala si el estudio se realiza en ámbitos geográficos distintos al continente americano o europeo. Respecto a otros argumentos planteados en la literatura y que condicionan un comportamiento no unidimensional de la escala a las características socio-demográficas de la población (e.g.

Marcoux et al., 1997; Supphellen y Rittenburg, 2001; Bawa, 2004), destacar que no resultan avalados por los resultados de este estudio al carecer el tipo de muestra utilizado de un efecto directo y, además, negativo, sobre la unidimensionalidad (no aceptación de la  $H_2$ ), limitándose a un efecto moderador y en un ámbito geográfico muy concreto.

## RESUMEN

*Desde la perspectiva del marketing, la clave del éxito de las organizaciones en el mercado descansa en sus habilidades para atraer y retener a sus clientes, mediante la creación, entrega y comunicación de un valor añadido superior. En un contexto de crisis, las empresas orientadas al consumidor han de lograr esos objetivos, reduciendo costes en todos los eslabones del sistema de distribución. La gestión de stocks es una función esencial de la organización que es vital para el desarrollo del proceso de comercialización*

*En el presente trabajo se determinan las políticas óptimas de sistemas de inventarios, considerando múltiples artículos y demandas dependientes del tiempo con patrones potenciales. En primer lugar, se asume que no existen roturas y, a continuación, se admite la presencia de roturas recuperables, obteniendo periodos de gestión y cantidades económicas de pedido que minimizan los costes totales. Finalmente, se presentan ejemplos numéricos que ilustran los modelos analizados.*

## Palabras clave:

*Sistemas de Inventario, Demanda Dependiente del Tiempo, Patrón Potencial, Roturas Recuperables, Período Óptimo de Gestión, Cantidad Económica de Pedido.*

## 1. Introducción

Como es sabido, la economía mundial se encuentra inmersa en un acelerado proceso de transformación. El entorno global se ha convertido en un medio dinámico, extremadamente competitivo y cargado de incertidumbre, en el cual no existen puntos de referencia estables y donde la evolución de los acontecimientos económicos condiciona la adopción de decisiones. La etapa que se desarrolla en la actualidad se caracteriza por la necesidad de afrontar numerosos desafíos en materia de gestión empresarial, existiendo un consenso generalizado en cuanto a que en un contexto de profunda crisis, las organizaciones han de ahorrar con el objetivo de generar ventajas competitivas sostenibles en el tiempo que garanticen su supervivencia.

En el ámbito del marketing se están consolidando algunas de esas tendencias. Así, por una parte, parece reafirmarse el protagonismo de los aspectos financieros y los costes empresariales en el seno de las organizaciones, y por otra, se están desarrollando nuevos métodos y modelos de gestión en el marco de la logística (Lambert et al., 1998; Ballou, 2004; Martínez y Maraver, 2009; Anaya Tejero, 2011) y la distribución comercial (Díez de Castro, 1997; Casares y Rebollo, 2005; Soret Los Santos, 2006; Miquel Peris et al., 2008), orientados a proporcionar eficacia y eficiencia para la consecución de los objetivos, logrando una mejor asignación de los recursos disponibles (Parra Guerrero, 2005).

La mayor parte de los autores coinciden al concebir el marketing como un sistema global de actividades, que incluye un conjunto de procesos mediante los cuales se identifican las necesidades de los consumidores para poder satisfacerlas de la mejor manera posible, promoviendo el intercambio de productos y/o servicios de valor, a cambio de una utilidad o beneficio para la empresa u organización (Cruz Roche, 1991; Martín Armario, 1993; Miquel Peris et al., 1995; Vázquez y Trespalacios, 2002; Kotler et al., 2000; Rufin, 2010). En relación con ello, la distribución comercial minorista es una de las materias que mayor tratamiento ha recibido en la literatura de la gestión empresarial y el marketing, como consecuencia de su importancia estratégica en la eficacia y eficiencia de cualquier sistema económico (Díez de Castro, 1997), así como por la estrecha relación que mantiene con otras áreas de decisión de la empresa. Lógicamente, los esfuerzos de marketing realizados por las organizaciones resultarán ineficaces si, en última instancia, los productos que comercializan no se encuentran a disposición del consumidor (Kotler et al., 2000). De ahí que, la distribución, como instrumento que relaciona la producción con el consumo, tenga como misión principal entregar el producto al cliente final en la cantidad demandada, en el momento en que lo necesite, en el lugar que desee o pueda adquirirlo, y todo ello con el mínimo coste posible (Díez de Castro, 1997; Miquel Peris, 2008).

La adecuada gestión y control de los inventarios ha sido siempre un capítulo estratégico de gran relevancia en la ciencia empresarial, ya que la mayor parte de los autores coinciden en que es una de las áreas de decisión que ofrece mayores posibilidades para conseguir una reducción de los costes (Waters, 1992; Cuatrecasas, 1999; Ballou, 2004; Parra Guerrero, 2005). Su consideración como una inmovilización financiera los convierte en un referente económico determinante para las organizaciones, ya que esas inversiones representan una gran proporción de sus activos y, por tanto, los gastos derivados de mantener productos en stock tienen un protagonismo esencial dentro de los costes empresariales. Desde esa perspectiva, como sostiene Parra Guerrero (2005), ahora más que nunca, se ha de procurar la protección del beneficio empresarial mediante mecanismos distintos del incremento de las ventas y de los ingresos. Tal es así, que probablemente la palabra clave hoy en la gestión empresarial sea la productividad más que el crecimiento, configurándose el control de stocks como una de las parcelas de actividad de la empresa que ofrece mayores posibilidades de reducción en los costes, sin merma en la eficacia.

En el presente trabajo nos proponemos determinar las políticas óptimas de gestión de inventario para varios productos, considerando dos posibles escenarios diferentes. En primer lugar analizamos el modelo de gestión de stocks cuando no se permite la existencia de roturas y, posteriormente, estudiamos el modelo que asume que existen roturas recuperables, teniendo en

cuenta que las mismas pueden ser atendidas con la llegada de la siguiente reposición, es decir, los clientes estarían dispuestos a esperar al suministro de nueva mercancía para satisfacer sus necesidades. En ambos supuestos, formularemos la función de coste total, que engloba los costes relacionados con el mantenimiento, la rotura y la reposición del inventario, determinando cuándo se deberá reponer el stock junto con la cantidad óptima que minimiza su coste total de gestión.

## **2. Los modelos de gestión de inventarios en el ámbito del marketing y la distribución comercial**

La Teoría de Inventarios proporciona un cuerpo de conocimientos que permiten modelar y analizar las operaciones relativas a la gestión de los productos para cubrir las necesidades de los consumidores. Los inventarios se definen como aquellos bienes almacenados, que poseen valor económico y están listos para ser utilizados por los consumidores. Si se considera a los stocks como bienes económicos, éstos tienen su razón de ser en la utilidad que reportan, pues permiten disponer de los artículos atendiendo a los requerimientos del cliente (Parra Guerrero, 2005). Este término se refiere tanto a acumulaciones de materias primas que esperan ser utilizadas en la producción de artículos, componentes, productos semiterminados o almacenados temporalmente durante el proceso de producción como a productos terminados que intervienen en diferentes puntos a lo largo del canal logístico de la empresa (Zermati, 2004; Parra Guerrero, 2005), variando en cantidad con el tiempo, en respuesta al proceso de demanda que los reduce y el proceso de abastecimiento que los eleva.

La gestión, administración y control de los inventarios se deriva de la importancia que tienen las existencias para la empresa, siendo esta actividad un elemento básico en su cadena de valor, y constituyendo uno de los aspectos más complejos para cualquier organización (Cuatrecasas, 1999). El objetivo fundamental consiste en mantener un nivel de stock que permita, a un mínimo costo, proporcionar un máximo nivel de satisfacción a los clientes, asegurando la disposición de los productos en las mejores condiciones para cubrir sus necesidades (Díez de Castro, 1997; Zermati, 2004; Anaya Tejero, 2011).

### **2.1. Políticas óptimas de gestión de stocks y servicio al cliente**

Por tanto, las técnicas de gestión de stocks tienen entre sus principales fines conciliar la minimización de los costes de almacenamiento de los productos, con la adecuada distribución comercial de los artículos para hacerlos llegar al cliente, sin que éste tenga que incurrir en tiempos de espera, o logrando que este tiempo sea el mínimo posible, permitiendo maximizar las ventas y los beneficios (Christopher, 1994; Lambert et al., 1998; Anaya Tejero, 2011). De acuerdo con García Sabater et al. (2005), la gestión de inventarios pretende maximizar la rentabilidad de la compañía, minimizando el costo de capital inmovilizado en el stock y al mismo tiempo satisfaciendo los requerimientos de servicio al cliente. Por ello, su eficiente administración se ha convertido en un factor crítico de la cadena de suministro para lograr los objetivos de gestión de la organización.

El mantenimiento de inventarios es una actividad económica necesaria e imprescindible para atender la demanda actual y futura de los clientes. Si no se atendieran los pedidos realizados por algún cliente en un tiempo prudencial, éste podría dejar de adquirir ciertos productos a la empresa para solicitárselos a la competencia. Además, si no se dispone de un stock adecuado de artículos en el inventario con la finalidad de satisfacer la demanda, se perderían los ingresos correspondientes derivados de las ventas por no tener capacidad de suministrar los productos solicitados. Por tanto, los inventarios permiten atender las peticiones de los clientes, cubriendo las demandas de los productos y suavizando la diferencia que separa la oferta productiva de la demanda en el tiempo.

Podemos hablar de tres tipos de costos generales relacionados con la gestión de los inventarios: el costo de mantener almacenados los artículos, el costo derivado de la falta de existencias y el costo relativo a la reposición de los productos. En el primero de ellos, se recogen todos aquellos

gastos que tienen que ver con el almacenamiento y mantenimiento de los artículos, incluyendo aquí también el costo de oportunidad de realizar otras inversiones alternativas. En el segundo de los costes se recoge la cuantía económica no obtenida debido a la rotura ocasionada cuando los clientes demandan un producto, y el mismo no es suministrado debido a la falta de stock o existencias. Por último, en el tercer costo se aglutinan todos los gastos relacionados con el pedido o la reposición de los productos para cubrir la demanda de los clientes.

En la actualidad, la complejidad de los problemas y la imprecisión de las situaciones ha hecho necesario introducir esquemas matemáticos más flexibles y adecuados al entorno empresarial contemporáneo (Sarabia, 1996). En ocasiones, para la resolución de esos problemas en los sistemas u organizaciones, se utiliza una metodología que se apoya en el proceso de modelización (Rios, 1995), como representación simplificada de algún sistema real (Prawda, 1991), de forma que se pueda trabajar en un marco apropiado que permita buscar las mejores soluciones posibles a los dilemas planteados. Aunque sea menos completo que el sistema al cual sustituye, y a pesar de las dificultades que se pueden originar al representar problemas reales a través del recurso a los modelos, existen múltiples razones positivas para su utilización, entre las cuales destaca el poder entender mejor las condiciones y el entorno que rodea al sistema cuando éste es muy complejo.

Desde los primeros modelos de Harris (1913) y Wilson (1934) hasta nuestros días, han aparecido, en la literatura especializada, un gran número de trabajos de control de inventarios que intentan representar las diferentes casuísticas que se presentan en los sistemas de gestión de stocks. El problema fundamental de la gestión de stocks se centra en determinar cuál debe ser la cantidad que se debe mantener en el almacén para garantizar la satisfacción del cliente, así como el establecimiento de la inversión máxima en existencias, considerando que cuanto mayor sea la cantidad de elementos almacenados, menor será el riesgo de rotura de stocks y mayores serán los costes en los que se incurrirá (Anaya Tejero, 2011), incluyendo el coste de oportunidad derivado de la inmovilización de recursos financieros materializados en existencias.

Desde ese punto de vista, el nivel mínimo de existencias en almacén ha de renovarse al ritmo condicionado por la demanda de los clientes (Zermati, 2004; García Sabater et al., 2005). La decisión que se debe adoptar se centra en decidir entre tener altos niveles de stock, que proporcionarán altos niveles de servicio a los clientes, o tener bajos niveles de stock, que generarán menores costes (Zipkin, 2000;). En ese sentido, las desventajas de poseer bajos niveles de stocks se traducen en que los pedidos no pueden satisfacerse de manera íntegra, lo cual podría llevar a una pérdida, tanto de clientes reales como potenciales. Por su parte, mantener elevados niveles de inventario puede suponer importantes desventajas debido a que el capital almacenado podría estar invertido en otros activos más productivos, a lo que habría que añadir el riesgo de deterioro de los productos, de obsolescencia o de caducidad.

Con respecto a la pregunta sobre la cantidad a pedir, hay diferentes respuestas posibles (Naddor, 1966; Waters, 1992; Rambaux, 1998; Zipkin, 2000; Zermati, 2004). Para determinar la cantidad adecuada que se debería solicitar se ha de calcular el tamaño del lote óptimo, analizando los costes relacionados con el inventario. También, se debe especificar el momento idóneo para ejecutar las órdenes de reposición. La repercusión de esas decisiones sobre los costes de mantenimiento supondrá que a mayor pedido de cierto artículo, mayores serán dichos costes. Por otro lado, realizar un gran número de pedidos en pequeñas cantidades generará un volumen medio más bajo de stocks, pero unos costes de reposición y entrega mayores.

En un entorno económico caracterizado por un exceso de oferta sobre la demanda, en el que las exigencias de los consumidores son cada vez mayores, el mundo empresarial está destinando un gran número de recursos y esfuerzos para atraer, retener y fidelizar al cliente con el fin de mantener relaciones positivas a largo plazo (Kotler et al., 2000), ya que es mucho más fácil conservarlo que ganar un nuevo cliente. En ese sentido, cuando hay rotura de stocks o escasez es complicado que los consumidores esperen por la llegada de la siguiente reposición, ya que algunos de ellos adquirirán sus productos a la competencia, siendo probable que la empresa los pierda como clientes, afectando, además, negativamente a su imagen.

## ***2.2. Los modelos de inventario deterministas con demanda variable en el tiempo y patrón potencial***

Tradicionalmente, en el análisis de los sistemas deterministas se asume que la demanda de los productos es uniforme a lo largo del ciclo del inventario. Sin embargo, en este trabajo estudiaremos un sistema de inventario, considerando varios artículos, donde las demandas de los mismos no son uniformes, sino que pueden variar con el tiempo. Esas demandas de los clientes recogen o modelan situaciones que reflejan la posibilidad de que el tamaño de la cantidad solicitada al comienzo del ciclo de inventario sea grande y luego vaya disminuyendo a lo largo del resto del periodo, o también permiten representar la situación contraria, esto es, la demanda es inicialmente pequeña y va aumentando progresivamente durante el transcurso del periodo de programación.

El patrón de demanda potencial se asume como una función útil para mostrar la evolución del nivel de inventario y modelar la demanda de los consumidores, suponiendo que la misma depende del período del ciclo de pedido y varía con el tiempo (Naddor (1966), Datta y Pal (1988), Lee y Wu (2002), y Dye (2004)). De esa manera, bajo ese patrón se considera no sólo la posibilidad de que la tasa de demanda sea constante durante el ciclo de inventario, sino también se permite caracterizar otras situaciones que reflejan los momentos en los cuales los clientes requieren sus productos.

A la hora de mostrar la aplicabilidad práctica del patrón potencial en los análisis de los modelos de gestión de inventarios, en primer lugar se han de identificar las demandas de productos que reflejan estos supuestos.

En la vida real hay situaciones donde la demanda de un artículo es mayor al comienzo del período de programación. Se pueden dar en el caso de los bienes preparados, tales como panes, helados, dulces, comidas cocinadas listas para su venta, etc., ya que los consumidores quieren productos alimenticios que estén recién hechos. Este tipo de demanda también se puede dar con productos perecederos como el pescado, la carne fresca, las frutas, las verduras, los yogures, etc., porque las ventas se reducen cuando se acerca su fecha de caducidad. Además, la demanda de nuevos productos con un alto componente tecnológico es mayor al principio que al final del período. Por ejemplo, los bienes tales como ordenadores, teléfonos móviles, videojuegos, etc. son más demandados cuando aparecen en el mercado por primera vez, debido a la innovación que representan y a las nuevas aplicaciones, utilidades y servicios que ofrecen.

Sin embargo, al contrario, hay productos donde la demanda es mayor al final del ciclo de inventario. Esta situación se da para artículos como la gasolina, cuya demanda se incrementa cuando el producto escasea. También, hay bienes indispensables para el hogar que pueden entrar dentro de esta categoría, tales como el aceite, la harina, el café, el azúcar, el agua, la leche, etc. Así, se producen aumentos en sus demandas cuando la cantidad en inventario exhibida en los puntos de venta comienza a disminuir debido a su uso diario. Otros ejemplos, adaptados a la oferta de servicios, incluyen la demanda de entradas en los teatros, cines, espectáculos musicales, eventos deportivos, etc., la cual suele ser más alta al final del período, esto es, cuando el evento está a punto de tener lugar.

Por último, hay otros productos en los que la demanda se mantiene más o menos estable a una tasa uniforme a lo largo del período de programación. Los artículos que pueden reflejar ese comportamiento pueden ser, por ejemplo, los aparatos eléctricos, los materiales de construcción, los suministros, los artículos vendidos en una ferretería, los productos de decoración, muebles, artículos para el hogar, productos de limpieza, utensilios de cocina y electrodomésticos, complementos, etc. En general, la demanda de estos productos suele ser constante y no depende de una parte específica del ciclo del inventario.

En la literatura sobre los modelos de inventario, existen diversos trabajos en los cuales se asume que la demanda varía con el tiempo y sigue un patrón potencial. Así, Goel y Aggarwal (1981) formularon un sistema de nivel de inventario con patrón de demanda potencial para artículos con cierto porcentaje de deterioro. Datta y Pal (1988) presentaron un modelo de inventario con patrón de demanda potencial, pero considerando tasa variable de deterioro. Lee y Wu (2002)

estudiaron un modelo de inventario para artículos con posibilidad de deterioro, roturas y patrón de demanda potencial. Dye (2004) amplió el modelo de Lee y Wu contemplando una proporción de roturas que se satisfacen con retraso, la cual es proporcional al tiempo. Recientemente, Rajeswari y Vanjikkodi (2011) estudiaron un modelo de inventario con patrón de demanda potencial, asumiendo deterioro y permitiendo que la rotura no satisfecha se cubra parcialmente en función del tiempo de espera.

En esos trabajos que hemos citado en el párrafo anterior, la demanda sigue un patrón potencial y el período de programación o la duración de cada ciclo de inventario se considera siempre fija. Al ser constante dicho período, el costo total promedio por unidad de tiempo es una función dependiente de una sola variable: el nivel inicial de stock. Sin embargo, en el presente trabajo, el ciclo de reposición no está dado ni está preestablecido y es también una variable de decisión del problema de inventario. Además, en los trabajos previamente citados sólo se considera un producto y se determina la reposición óptima de ese artículo. Sin embargo, en este trabajo se estudia un sistema de inventario para múltiples productos, desarrollándose la política óptima conjunta de inventario.

### 3. Hipótesis y notación

Los fundamentos en los que se basan los sistemas de inventarios que analizaremos en el presente trabajo son los siguientes:

- El sistema de inventario considera  $N$  artículos diferentes. Por tanto, para cada uno de los artículos deberá determinarse la cantidad que se debe pedir para reponer el inventario y cada cuanto tiempo se debe reponer el mismo.
- Los períodos de programación o gestión  $T_i$ , con  $i = 1, 2, \dots, N$ , representan las duraciones de los ciclos de inventario de los artículos. Son variables de decisión del sistema.
- Al inicio de cada período de programación se repone el inventario de cada artículo hasta el nivel de stock inicial  $S_i$  con  $i = 1, 2, \dots, N$ . Dichos niveles de stock obtenidos después de la reposiciones son también variables de decisión del sistema.
- El inventario debe ser repuesto cuando el nivel de stock sea igual o inferior a  $s_i$  unidades, con  $i = 1, 2, \dots, N$  ( $s_i$  representa el punto de pedido o de reposición). La cantidad  $-s_i$  representa el número de roturas o unidades de demanda a cubrir del artículo  $i$ -ésimo al final del ciclo de inventario.
- El coste de mantener en stock una unidad del artículo  $i$ -ésimo es denotado por  $h_i$ , con  $i = 1, 2, \dots, N$ . Dichos costes  $h_i$  son constantes y difieren según el artículo considerado.
- El coste de realizar un pedido para reponer el inventario es  $A$ . Dicha cantidad es constante e independiente del número de artículos diferentes solicitados en el pedido y de la cantidad solicitada para cada artículo.
- El coste unitario de incurrir en escasez del artículo  $i$ -ésimo debido a la falta de existencias en el inventario es  $w_i$ , con  $i = 1, 2, \dots, N$ . Dichos costos son valores constantes y pueden ser diferentes, dependiendo del tipo de artículo.
- La reposición de los artículos se considera instantánea.
- El tiempo de retardo de los artículos es un periodo insignificante, por lo que se considera nulo.
- Los tamaños del lote o cantidad a reponer de cada artículo son denotados por  $Q_i$ , con  $i = 1, 2, \dots, N$ . Dichas cantidades son valores desconocidos y deben ser determinadas de forma que se minimice el coste total del inventario por periodo de programación. Si las roturas no están permitidas, entonces  $Q_i = S_i$ . En el caso en que haya rotura y la demanda sea diferida en el tiempo, esto es, la rotura se satisface posteriormente a la llegada de la siguiente reposición, entonces  $Q_i$  es la suma del nivel inicial de stock ( $S_i$ ) más el número total de pedidos pendientes en el ciclo de inventario ( $Q_i = S_i - s_i$ ).

- Para el  $i$ -ésimo artículo ( $i = 1, 2, \dots, N$ ), sea  $d_i$  la demanda total durante el tiempo de programación  $T_i$ , y sea  $r_i$  la demanda promedio por período, es decir,  $r_i = d_i / T_i$ . Esa demanda promedio por período es determinista, pero la forma en que las cantidades son sacadas del inventario depende del momento en que son retiradas. Así, la demanda  $D(t)$  acumulada hasta el momento  $t$  ( $0 \leq t \leq T$ ) varía con el tiempo y se supone que es

$$D_i(t) = d_i \left( \frac{t}{T_i} \right)^{\frac{1}{n_i}} \quad (1)$$

donde  $n_i$  es el índice de patrón de demanda del artículo  $i$ -ésimo, con  $0 < n_i < \infty$ . La tasa de demanda en el tiempo  $t$  ( $0 \leq t \leq T$ ) para el  $i$ -ésimo artículo ( $i=1,2,\dots,N$ ) es

$$\frac{d_i t^{\frac{1-n_i}{n_i}}}{n_i T_i^{\frac{1}{n_i}}} = \frac{r_i}{n_i} \left( \frac{t}{T_i} \right)^{\frac{1-n_i}{n_i}} \quad (2)$$

Esta expresión de la demanda de los artículos se conoce como patrón de demanda potencial (ver Naddor (1966), Datta y Pal (1988), Lee y Wu (2002)). En la Figura 1, se muestran diversos patrones de demanda potencial.

FIGURA 1  
Patrones de demanda potencial

Así, para cualquier artículo  $i$ , si el índice del patrón de demanda  $n_i > 1$ , significa que una porción mayor de la demanda se produce al comienzo del período. Cuando dicho índice es  $n_i = 1$ , la demanda sigue un patrón uniforme de forma que está igualmente repartida a lo largo del período. Finalmente, cuando  $n_i < 1$ , una parte mayor de la demanda de dicho artículo se produce al final del período.

#### 4. Formulación y resolución de los problemas de gestión de inventario

Teniendo en cuenta los supuestos del sistema de inventario, la cantidad de stock almacenada para el  $i$ -ésimo artículo  $I_i(t)$  en el tiempo  $t$ , para  $0 \leq t \leq T$ , viene dada por el nivel inicial menos la demanda acumulada hasta el instante  $t$ , esto es,

$$I_i(t) = S_i - d_i n_i \sqrt[n_i]{\frac{t}{T_i}} \quad (3)$$

El nivel de inventario  $I_i(t)$  es una función decreciente, continua y diferenciable en el intervalo  $[0, T]$ . Al comienzo del período de programación hay  $I_i(0) = S_i$  unidades en stock y, posteriormente, el nivel de stock se va reduciendo con el tiempo.

Al final del período, el inventario es repuesto instantáneamente hasta el nivel  $S_i$  y, por tanto, comienza un nuevo ciclo de inventario.

En los apartados siguientes estudiaremos las políticas óptimas de inventario tanto para el sistema cuando no se admiten roturas, como para el sistema de inventario en el cual las roturas están permitidas y se recuperan con la llegada de la siguiente reposición.

#### 4.1. Sistema de inventario con patrones de demanda potencial, sin permitir la existencia de roturas

Comenzamos analizando el sistema de inventario con patrón de demanda potencial en el que las roturas de stocks no se permiten. En este caso, el nivel inicial de stock  $S_i$  al comienzo del ciclo de inventario  $T_i$  es igual a la demanda total  $d_i$  durante ese periodo  $T_i$ . Por lo tanto, la cantidad media  $I_1(S_i)$  mantenida en inventario para el artículo  $i$ , con  $i = 1, 2, \dots, N$ , es

$$I_1(S_i) = \frac{1}{T_i} \int_0^{T_i} I_1(t) dt = \frac{1}{T_i} \int_0^{T_i} (S_i - S_i \sqrt{t/T_i}) dt = \frac{S_i}{n_i + 1} \quad (4)$$

Como no hay roturas, el nivel de stock inicial  $S_i$  es igual a la demanda total  $d_i$ , y dicha demanda es igual a la cantidad  $r_i T_i$ . Por tanto, de (4) obtenemos que la cantidad media del artículo  $i$ -ésimo mantenida en stock es

$$I_1(T_i) = \frac{r_i T_i}{n_i + 1} \quad (5)$$

Antes de proceder con el desarrollo de la ecuación del costo total para este sistema de inventario, veamos que en una política óptima de inventario todos los periodos de programación  $T_i$  deben ser iguales.

En efecto, suponiendo que no lo fueran, habría un artículo  $k$  el cual tendría el menor ciclo  $T_k$  de inventario de entre todos los ciclos de inventario. Consideremos ahora otro artículo  $j$  con  $T_j > T_k$ . Para ese artículo  $j$  tendremos que la cantidad media en inventario es  $I_1(S_j)$ . Ahora bien, si reducimos el periodo de programación del artículo  $j$  al mismo periodo de programación del artículo  $k$ , entonces obviamente de (5) la cantidad media mantenida en inventario se reducirá y, por tanto, el coste de mantenimiento disminuirá. Además como el coste de reposición es independiente de los artículos solicitados, dicho coste seguirá siendo el mismo aún cuando se soliciten al mismo tiempo las reposiciones de los artículos  $j$  y  $k$ . En consecuencia, como el coste de mantenimiento disminuye y el coste de reposición se mantiene, tendremos que el coste total de reposición de los artículos  $j$  y  $k$  se reducirá. Repitiendo el proceso para el resto de los artículos, si disminuimos los periodos de gestión y los hacemos iguales al del artículo  $k$ , obtendremos una reducción del coste total relacionado con la gestión del inventario.

Por tanto, la política eficiente de inventario requerirá que todos los ciclos de inventario de los artículos coincidan. A partir de ahora llamaremos  $T$  a ese periodo común de gestión o ciclo de inventario de los artículos, esto es,  $T_i = T$ , para todo  $i = 1, 2, \dots, N$ .

Como consecuencia de tener en cuenta que los periodos de programación deben ser iguales, la cantidad media  $I_1(T_i)$  mantenida en inventario para el artículo  $i$  es

$$I_1(T_i) = \frac{r_i T}{n_i + 1} \quad (6)$$

Y el número de reposiciones por unidad de tiempo es  $R(T) = R(T_i) = 1/T_i = 1/T$ . Además, la rotura promedio en inventario es igual a cero debido a que no existen roturas en este sistema.

El costo total de mantenimiento por unidad de tiempo es la suma de los costes de mantenimiento de los  $N$  artículos, esto es

$$C_1(T) = \sum_{i=1}^N C_1(T_i) = \sum_{i=1}^N h_i \frac{S_i}{n_i + 1} = \sum_{i=1}^N h_i \frac{r_i T}{n_i + 1} \quad (7)$$

Además, el costo de rotura es cero y el costo de reposición por unidad de tiempo es  $C_3(T) = AR(T) = A/T$ . Así, el costo total  $C(T)$  por unidad de tiempo es la suma de estos costos y viene dado por la expresión

$$C(T) = C_1(T) + C_3(T) = \sum_{i=1}^N h_i \frac{r_i T}{n_i + 1} + A \frac{1}{T} \quad (8)$$

Para determinar el nivel óptimo que minimiza la función de coste  $C(T)$ , calculamos la derivada de dicha función:

$$C'(T) = \sum_{i=1}^N h_i \frac{r_i}{n_i + 1} - \frac{A}{T^2} \quad (9)$$

Resolviendo la ecuación  $C'(T) = 0$ , encontramos la solución óptima  $T_0$ . Por tanto, el periodo de gestión óptimo es

$$T_0 = \sqrt{\frac{A}{\sum_{i=1}^N h_i \frac{r_i}{n_i + 1}}} \quad (10)$$

Además, el nivel de stock óptimo para el artículo  $i$ -ésimo al inicio del periodo es

$$S_i^0 = r_i T_0 = r_i \sqrt{\frac{A}{\sum_{i=1}^N h_i \frac{r_i}{n_i + 1}}} \quad (11)$$

Obsérvese que las cantidades óptimas  $Q_i^0$  ( $i = 1, 2, \dots, N$ ) que se deben pedir para reponer el inventario coinciden con los niveles de stock  $S_i^0$  al comienzo del ciclo del inventario, ya que en este sistema no se permiten roturas.

Sustituyendo  $T_0$  en  $C(T)$  podemos obtener el costo mínimo total por unidad de tiempo, el cual es

$$C_0 = \sqrt{4A \sum_{i=1}^N h_i \frac{r_i}{n_i + 1}} \quad (12)$$

Nótese que el periodo de programación  $T_0$  es un punto mínimo, ya que la segunda derivada de  $C(T)$  es siempre positiva

$$C''(T) = \frac{2A}{T^3} > 0 \quad (13)$$

#### 4.1.1. Casos Particulares

- En el caso especial de que los patrones de demanda de los artículos sean uniformes, esto es,  $n_i = 1$ , para todo  $i = 1, 2, \dots, N$ , la política de inventario obtenida coincide con la política óptima para un sistema de inventario con varios artículos, demandas constantes y roturas no permitidas (ver Naddor (1966)).
- Por otro lado, si consideramos que  $N = 1$ , esto es, trabajamos con un solo artículo, las formulas (10), (11) y (12) que determinan la política óptima son equivalentes a las formulas de la política óptima del sistema de inventario sin permitir roturas y con patrón de demanda potencial (ver Sicilia y otros (2012)).
- Por último, si consideramos ambas situaciones simultáneamente, es decir,  $N = 1$  y  $n_i = 1$ , entonces la política óptima obtenida equivale a la clásica cantidad económica de pedido (EOQ) ya que trabajamos con un solo artículo y la demanda es uniforme (ver Hillier y Lieberman (2006)).

#### 4.2. Sistema de inventario con patrones de demanda potencial y roturas

A continuación analizaremos el sistema de inventario con varios artículos que siguen patrones de demanda potencial y donde existe la posibilidad de roturas. Dichas roturas se recuperan y los artículos solicitados se suministran cuando se recibe la siguiente reposición.

Para permitir que en el sistema haya un periodo de stock y otro de rotura asumiremos que  $0 \leq S_i \leq r_i T_i$ , para todo  $i = 1, 2, \dots, N$ . Nótese que si asumiéramos que  $S_i \leq 0$  para algún artículo  $i$ , entonces en el ciclo del inventario de ese artículo sólo habría roturas. También si considerásemos que  $S_i \geq r_i T_i$ , entonces nunca habría roturas y siempre habría stock en el inventario.

Definimos  $\tau_i$  como el instante de tiempo en el cual el nivel de inventario del artículo  $i$ -ésimo se hace cero. Al principio del ciclo del inventario hay stock suficiente porque se han repuesto los artículos, pero a medida que transcurre el tiempo y por efecto de la demanda, el inventario va decreciendo hasta entrar en rotura. Luego se mantiene en rotura hasta que termine el ciclo del inventario y se añada nueva reposición al inventario.

Por tanto, para cada artículo  $i$ , con  $i = 1, 2, \dots, N$ , en este sistema debemos calcular la cantidad media mantenida en el inventario  $I_1(S_i, T_i)$  y la cantidad media de rotura  $I_2(S_i, T_i)$ . Ambas cantidades dependen de las variables nivel de stock inicial  $S_i$  y periodo de programación  $T_i$ .

La cantidad promedio del artículo  $i$ -ésimo que se mantiene en el inventario  $I_1(S_i, T_i)$  es:

$$I_1(S_i, T_i) = \frac{1}{T_i} \int_0^{\tau_i} I_1(t) dt = \frac{1}{T_i} \int_0^{\tau_i} (S_i - r_i T_i \sqrt[n_i]{t/T_i}) dt = \frac{S_i}{n_i + 1} \left( \frac{S_i}{r_i T_i} \right)^{n_i} \quad (14)$$

La rotura promedio en inventario  $I_2(S_i, T_i)$  para dicho artículo  $i$ -ésimo es

$$I_2(S_i, T_i) = \frac{-1}{T_i} \int_{\tau_i}^T I_2(t) dt = \frac{-1}{T_i} \int_{\tau_i}^T (S_i - r_i T_i \sqrt[n_i]{t/T_i}) dt = \frac{n_i r_i T_i}{n_i + 1} + \frac{S_i}{n_i + 1} \left( \frac{S_i}{r_i T_i} \right)^{n_i} - S_i \quad (15)$$

Teniendo en cuenta que el costo mínimo para el artículo  $i$ -ésimo se obtiene (ver Sicilia y otros (2012)) cuando se cumple la condición

$$S_i = r_i T_i \sqrt[n_i]{\frac{w_i}{h_i + w_i}} \quad (16)$$

tendremos que

$$I_1(S_i, T_i) = \frac{S_i}{n_i + 1} \left( \frac{S_i}{r_i T_i} \right)^{n_i} = \frac{w_i}{(h_i + w_i)} \frac{r_i T_i}{(n_i + 1)} \sqrt[n_i]{\frac{w_i}{h_i + w_i}} \quad (17)$$

y

$$\begin{aligned} I_2(S_i, T_i) &= \frac{n_i r_i T_i}{n_i + 1} + \frac{S_i}{n_i + 1} \left( \frac{S_i}{r_i T_i} \right)^{n_i} - S_i = \\ &= \frac{n_i r_i T_i}{n_i + 1} + \frac{r_i T_i}{n_i + 1} \sqrt[n_i]{\frac{w_i}{h_i + w_i}} \frac{w_i}{h_i + w_i} - r_i T_i \sqrt[n_i]{\frac{w_i}{h_i + w_i}} \end{aligned} \quad (18)$$

Nótese que las cantidades expuestas en (17) y (18) son siempre valores positivos.

Ahora puede probarse un resultado similar al sistema sin rotura estudiado en el apartado anterior. Así, podemos afirmar que en la política óptima de inventario los periodos de programación  $T_i$  deben coincidir. En efecto, si no fuera así, habrá un artículo  $k$  con menor ciclo  $T_k$  de inventario de entre todos los ciclos de inventario. Elijamos ahora otro artículo  $j$  con

$T_j > T_k$ . Para ese artículo  $j$  tendremos que la cantidad media en inventario es  $I_1(S_j, T_j)$  y la rotura media es  $I_2(S_j, T_j)$ . Ahora bien, si reducimos el periodo de programación del artículo  $j$  al mismo periodo de programación del artículo  $k$ , entonces obviamente de (17) la cantidad media mantenida en inventario  $I_1(S_j, T_j)$  se reducirá y de (18) la rotura media  $I_2(S_j, T_j)$  también disminuirá.

En consecuencia, se reducen tanto el coste de mantenimiento como el coste de rotura. Ahora bien, como el coste de reposición es independiente de los artículos diferentes solicitados, si se solicitan al mismo tiempo las reposiciones de los artículos  $j$  y  $k$ , el coste de reposición seguirá siendo el mismo. Por tanto, como disminuyen los costes de mantenimiento y rotura, manteniéndose constante el coste de reposición, tendremos que el coste total de la gestión del inventario correspondiente a los artículos  $j$  y  $k$  se reducirá. Repitiendo el proceso para el resto de los artículos, si se reducen los periodos de gestión de los artículos haciéndolos iguales al del artículo  $k$ , se consigue una reducción del coste total relativo a la gestión del inventario. En consecuencia, la política óptima de inventario requerirá que todos los ciclos de inventario de los artículos coincidan.

A partir de ahora llamaremos  $T$  a ese periodo común de gestión o ciclo de inventario de los artículos, esto es,  $T_i = T$ , para todo  $i = 1, 2, \dots, N$ .

A continuación, podemos plantear la función de coste total  $C(S_1, \dots, S_N, T)$  relacionada con la gestión de los inventarios. Obviamente, dicha función de coste será la suma de los costes de mantenimiento y de rotura de todos los artículos, junto con el coste de reponer los stocks. Así, tendremos

$$\begin{aligned} C(S_1, \dots, S_N, T) &= C_1(S_1, \dots, S_N, T) + C_2(S_1, \dots, S_N, T) + C_3(T) = \\ &= \sum_{i=1}^N h_i I_1(S_i, T) + \sum_{i=1}^N w_i I_2(S_i, T) + A \frac{1}{T} = \\ &= \sum_{i=1}^N h_i \frac{S_i}{n_i + 1} \left( \frac{S_i}{r_i T} \right)^{n_i} + \sum_{i=1}^N w_i \left[ \frac{n_i r_i T}{n_i + 1} + \frac{S_i}{n_i + 1} \left( \frac{S_i}{r_i T} \right)^{n_i} - S_i \right] + A \frac{1}{T} \quad (19) \end{aligned}$$

Calculando las derivadas parciales respecto a  $S_i$  y  $T$ , tenemos:

$$\frac{\partial C}{\partial S_i} = h_i \left( \frac{S_i}{r_i T} \right)^{n_i} + w_i \left[ \left( \frac{S_i}{r_i T} \right)^{n_i} - 1 \right], \quad i = 1, 2, \dots, N \quad (20)$$

$$\frac{\partial C}{\partial T} = \sum_{i=1}^N h_i \frac{S_i}{n_i + 1} \left( \frac{S_i}{r_i} \right)^{n_i} \left( \frac{-n_i}{T^{n_i+1}} \right) + \sum_{i=1}^N w_i \left[ \frac{n_i r_i}{n_i + 1} + \frac{S_i}{n_i + 1} \left( \frac{S_i}{r_i} \right)^{n_i} \left( \frac{-n_i}{T^{n_i+1}} \right) \right] - \frac{A}{T^2} \quad (21)$$

Igualando a cero estas derivadas parciales, se obtienen las ecuaciones a resolver para determinar la política óptima de inventario. Así, dichas ecuaciones serán:

$$S_i = r_i T^{n_i} \sqrt[n_i]{\frac{w_i}{h_i + w_i}} \quad (22)$$

$$\sum_{i=1}^N h_i \frac{S_i}{n_i + 1} \left( \frac{S_i}{r_i} \right)^{n_i} \left( \frac{-n_i}{T^{n_i+1}} \right) + \sum_{i=1}^N w_i \left[ \frac{n_i r_i}{n_i + 1} + \frac{S_i}{n_i + 1} \left( \frac{S_i}{r_i} \right)^{n_i} \left( \frac{-n_i}{T^{n_i+1}} \right) \right] - \frac{A}{T^2} = 0 \quad (23)$$

Sustituyendo los niveles de stocks dados en (22) en la ecuación (23), nos queda la siguiente ecuación

$$\sum_{i=1}^N (h_i + w_i) \frac{(-n_i) r_i^{n_i} \sqrt[n_i]{\frac{w_i}{h_i + w_i}}}{n_i + 1} \frac{w_i}{(h_i + w_i)} + \sum_{i=1}^N w_i \frac{n_i r_i}{n_i + 1} - \frac{A}{T^2} = 0 \quad (24)$$

Despejando  $T$  se obtiene el periodo de programación óptimo

$$T^* = \sqrt{\frac{A}{\sum_{i=1}^N \frac{w_i n_i r_i}{n_i + 1} \left[ 1 - \sqrt{\frac{w_i}{h_i + w_i}} \right]}} \quad (25)$$

Por tanto los niveles de stock de los artículos al comienzo del ciclo de inventario serán

$$S_i^* = r_i \sqrt{\frac{w_i}{h_i + w_i}} \sqrt{\frac{A}{\sum_{i=1}^N \frac{w_i n_i r_i}{n_i + 1} \left[ 1 - \sqrt{\frac{w_i}{h_i + w_i}} \right]}}, \quad i = 1, 2, \dots, N \quad (26)$$

Obsérvese que las soluciones propuestas cumplen que  $0 \leq S_i^* \leq r_i T^*$ , para todo  $i = 1, 2, \dots, N$  y por tanto están dentro de la región considerada.

Además puede comprobarse que el Hessiano  $H$  es siempre positivo. Por tanto, el punto  $(S_1^*, S_2^*, \dots, S_N^*, T^*)$  es un punto mínimo de la función  $C(S_1, S_2, \dots, S_N, T)$ .

El costo total mínimo relacionado con la gestión del sistema de inventario se obtiene sustituyendo (24) y (25) en la función de coste dada en (19).

Haciendo los cálculos correspondientes, obtenemos la expresión del costo mínimo

$$C^* = \sqrt{4A \sum_{i=1}^N \frac{w_i n_i r_i}{n_i + 1} \left[ 1 - \sqrt{\frac{w_i}{h_i + w_i}} \right]} \quad (27)$$

Las cantidades a pedir o tamaños de las reposiciones de los artículos serán

$$Q_i^* = r_i \sqrt{\frac{A}{\sum_{i=1}^N \frac{w_i n_i r_i}{n_i + 1} \left[ 1 - \sqrt{\frac{w_i}{h_i + w_i}} \right]}}, \quad i = 1, 2, \dots, N \quad (28)$$

y los puntos óptimos de pedido  $s_i^*$  se calculan como la diferencia entre los niveles iniciales  $S_i^*$  de stock y los tamaños  $Q_i^*$  de las reposiciones.

#### 4.2.1. Casos Particulares

- En el caso especial de que los patrones de demanda de los artículos sean uniformes, esto es,  $n_i = 1$ , para todo  $i = 1, 2, \dots, N$ , la política de inventario obtenida coincide con la política óptima para un sistema de inventario con varios artículos, demandas constantes, donde las roturas son permitidas y los clientes afectados están dispuestos a esperar a la siguiente reposición para recibir sus productos (ver Naddor (1966)).
- Por otro lado, si consideramos que  $N = 1$ , esto es, trabajamos con un solo artículo, las formulas (25), (26) y (27) que determinan la política óptima son equivalentes a las formulas de la política óptima del sistema de inventario donde se consideran roturas recuperables y las demandas siguen un patrón potencial (ver Sicilia y otros (2012)).
- Por último, si consideramos ambas situaciones simultáneamente, es decir,  $N = 1$  y  $n_i = 1$ , entonces la política óptima obtenida equivale a la política eficiente considerada para sistemas de inventario con reposición instantánea y roturas atendidas posteriormente con la llegada de la siguiente reposición de artículos, ya que trabajamos con un solo artículo y la demanda es uniforme (ver Hadley and Within (1968)).

#### 4.3. Resultados numéricos

En este apartado presentamos algunos resultados numéricos que nos sirven de complemento a los desarrollos teóricos expuestos en la sección anterior. Consideremos un sistema de inventario con  $N=5$  artículos. Las razones de demanda  $r_i$ , los costos unitarios de mantenimiento  $h_i$ , los costos unitarios de rotura  $w_i$ , y los índices de los patrones de demanda  $n_i$ , para los cinco artículos ( $i=1,2,3,4$  y  $5$ ) se muestran en la tabla 1.

TABLA 1

Parámetros de entrada de un sistema de inventario con N=5 artículos y coste de reposición A = 50 \$

	Razón de demanda $r_i$	Coste unitario de Mantenimiento $h_i$	Coste unitario de rotura $w_i$	Índice del patrón de demanda $n_i$
<b>Artículo 1</b>	1000 u./año	0.5 \$ / u. y t.	8 \$ / u. y t.	1.5
<b>Artículo 2</b>	80 u./año	2.0 \$ / u. y t.	10 \$ / u. y t.	0.2
<b>Artículo 3</b>	300 u./año	1.5 \$ / u. y t.	6 \$ / u. y t.	1
<b>Artículo 4</b>	40 u./año	3.0 \$ / u. y t.	15 \$ / u. y t.	2
<b>Artículo 5</b>	500 u./año	1.0 \$ / u. y t.	5 \$ / u. y t.	0.8

Presentamos a continuación las políticas de inventario óptimas para los dos sistemas considerados en el presente trabajo.

En el primer sistema de inventario las roturas no estaban permitidas. Así, las soluciones óptimas del problema de inventario siguen las fórmulas propuestas en (10), (11) y (12). En la tabla 2 se muestra la política óptima de inventario obtenida para este ejemplo. Nótese que en la política óptima de inventario, el coste de mantenimiento coincide con el coste de reposición.

TABLA 2

Política óptima para el sistema de inventario con varios artículos, demandas potenciales y roturas no permitidas, considerando los parámetros mostrados en la tabla 1.

	Nivel óptimo de stock inicial $S_i^0$	Periodo óptimo de gestión $T^0$	Longitud del ciclo del inventario (en días)	Tamaño de la reposición $Q_i^0$
<b>Artículo 1</b>	238,89410 u.	0,2388940912 años	87,19635 días	238,89410 u.
<b>Artículo 2</b>	19,11159 u.	0,2388940912 años	87,19635 días	19,11159 u.
<b>Artículo 3</b>	71,66823 u.	0,2388940912 años	87,19635 días	71,66823 u.
<b>Artículo 4</b>	9,55576 u.	0,2388940912 años	87,19635 días	9,55576 u.
<b>Artículo 5</b>	119,44705 u.	0,2388940912 años	87,19635 días	119,44705 u.
	<b>Coste de mantenimiento:</b> 209,29776767934 \$		<b>Coste de reposición:</b> 209,29776767934 \$	
	<b>Coste total mínimo por ciclo de inventario:</b> 418,59553535868 \$			

En el segundo sistema de inventario se permiten roturas o falta de stocks para atender la demanda, y se considera que las mismas se satisfacen con la llegada de la siguiente reposición. En esa situación la política eficiente de inventario se caracteriza por los valores óptimos recogidos en las fórmulas (25), (26), (27) y (28).

En la tabla 3 se expone la política de inventario que debería seguirse para minimizar el coste total de la gestión del inventario. Obsérvese que el periodo de gestión para todos los artículos es el mismo. Sin embargo, para este sistema de inventario las cantidades a pedir para reponer los stocks de productos son diferentes a los niveles iniciales de artículos. Ello significa que la política óptima permite la existencia de roturas, y que no se debe solicitar reponer los stocks hasta que los niveles de rotura de los productos no alcancen a los puntos óptimos de pedido, los cuales se recogen también en la citada tabla.

Ahora intervienen los tres costos generales en la gestión de los inventarios: costo de mantenimiento, costo de rotura o falta de existencias y costo de reposición. En la tabla 3 también se recogen las cuantías de dichos costos para este sistema de inventario con patrones potenciales de demanda. Nótese que en la solución óptima la suma del coste de mantenimiento y el coste de rotura coincide con el coste reposición.

TABLA 3

**Política óptima para el sistema de inventario con varios artículos, demandas potenciales y roturas recuperables, considerando los parámetros recogidos en la tabla 1.**

		<b>Costo de reposición:</b> 226,9551146312		
	<b>Costo total de gestión por ciclo de inventario:</b> 453,9102292624			

## 5. Conclusiones

Los modelos de gestión de stocks permiten mejorar la eficacia y eficiencia de las operaciones empresariales relacionadas con la comercialización y distribución de los productos. En el análisis desarrollado en este trabajo hemos profundizado en el diseño de diferentes sistemas de inventarios orientados a determinar políticas óptimas, con el propósito de adoptar decisiones encaminadas a minimizar los costes totales y proporcionar un adecuado nivel de satisfacción a los clientes, asegurando la disposición de bienes o materiales en las mejores condiciones para cubrir sus necesidades.

Hemos estudiado sistemas de inventario con múltiples artículos, modificando una de las hipótesis de los modelos clásicos EOQ y EPQ. Ahora la demanda no es constante y depende del tiempo. En concreto, se han desarrollado dos modelos de inventario con demanda variable en el tiempo, asumiendo un patrón potencial que intenta reflejar la concentración temporal de la demanda de los clientes a lo largo del período de programación. En ambos modelos hemos supuesto la existencia de un inventario de productos orientados a satisfacer la demanda que ha de ser reaprovisionado. Además, hemos considerado los costos asociados a las operaciones de almacenamiento y reposición, incluyendo también los relacionados con la rotura. En el primer escenario, hemos determinado la política óptima de inventario sin permitir la existencia de roturas, obteniendo el nivel óptimo de stock y el período de gestión óptimo. En un segundo escenario, hemos estudiado un sistema de gestión de stocks con presencia de roturas recuperables, donde los clientes están dispuestos a esperar a la llegada de la siguiente reposición para satisfacer sus demandas de artículos.

Los modelos presentados en este trabajo generalizan algunos sistemas de inventario estudiados por otros autores. Así, el modelo clásico de cantidad económica de pedido es un caso particular del modelo sin rotura (ver Hadley y Whitin (1963), Naddor (1966)). También, cuando se permiten las roturas y las demandas son diferidas en el tiempo, la solución óptima propuesta generaliza a la política óptima del sistema de inventario clásico donde la demanda pendiente es totalmente satisfecha con la llegada del siguiente pedido (ver Waters (1992), Mathur y Solow (1996) y Zipkin (2000)).

## RESUMEN

*La globalización ha provocado que el origen del producto se haya convertido en un atributo atractivo para la diferenciación de productos agroalimentarios. Por tal razón, la investigación sobre el efecto lugar de origen ha proliferado en las últimas décadas; aunque aún existen lagunas dentro de este campo de investigación, principalmente en lo referente al tópico región de origen y a la influencia de algunas variables moderadoras en dicho efecto.*

*A través de un modelo de ecuaciones estructurales, esta investigación pretende identificar las variables que explican y moderan la intención de compra de los vinos regionales. Los resultados ponen de manifiesto los efectos directos e indirectos que sobre dicha intención tienen la imagen de la región, la imagen de la región como productora de vino, la calidad percibida de los productos regionales y el etnocentrismo. Además se contrasta el papel moderador que ejerce la familiaridad con la categoría de producto.*

## Palabras clave:

Región de Origen, Vino, Intención de Compra, Familiaridad, Imagen, Calidad Percibida, Etnocentrismo

## 1. Introducción

La globalización y el consiguiente incremento del nivel de competencia han hecho que el origen o procedencia del producto se haya convertido en un atributo atractivo para la diferenciación de las marcas, especialmente en algunas categorías de productos agroalimentarios. Por tal razón, la investigación académica sobre el denominado efecto lugar de origen ha proliferado en las últimas décadas. Bilkey y Nes (1982) lo definen como “el grado en el que la procedencia de un producto afecta al comportamiento del consumidor en los procesos de compra”, definición similar a la establecida por Papadopoulos y Heslop (2003) al referirse al “un conjunto de fortalezas y debilidades vinculadas al lugar de origen que incorporan o sustraen el valor suministrado por una marca o servicio al fabricante y/o a sus clientes”. Este valor añadido puede proceder de los factores ambientales y humanos existentes en el lugar, y se suele manifestar de varias formas diferentes: a través de la calidad percibida del producto por parte del consumidor (Han y Terpstra, 1988; Ahmed y d’Astous, 1992, 1996, 2001 y 2007; Verlegh et al., 2005; Veale y Quester, 2009), a través de sus actitudes y preferencias (Bigné y Cuenca, 2000; Van Ittersum et al., 2003; Font i Furnols et al., 2011 y Gracia et al., 2011) o a través de sus intenciones de compra (González y Villanueva, 2000; Cerviño et al., 2005; Montesinos y Currat, 2007; Auger et al., 2010 y Godey et al., 2012).

Los resultados de diversos estudios ponen de manifiesto la existencia de algunas variables antecesoras y moderadoras del efecto lugar de origen, tales como las siguientes:

- La imagen de la región (Johansson et al., 1994; González y Villanueva, 2000; Verlegh et al., 2005; Montesinos y Currás, 2007; Ahmed y d’Astous, 2001; 2007 y 2008; Lee y Lockshin, 2011; Lee et al., 2013), que se refiere a aquella representación mental que poseen los individuos acerca de un determinado lugar, ya sea en relación con aspectos históricos, políticos, culturales, económicos, geográficos o humanos, o en relación con una combinación de todos ellos.
- La imagen de la región como productora de una determinada categoría de producto (Van Ittersum et al., 2003)
- La familiaridad o nivel de conocimiento con la categoría de producto (Maheswaran, 1994; Bigné y Sánchez, 2002; Inch y McBride, 2004; Huitzilín y San Martín, 2010).
- La familiaridad con un lugar y con sus productos (González y Villanueva, 2000; Bigné y Sánchez, 2002; Ahmed y d’Astous, 2001, 2007 y 2008; Lee y Lockshin, 2011; Gázquez et al., 2012).
- El etnocentrismo del consumidor (Shimp y Sharma, 1987; Sharma et al., 1995, Klein et al., 1998; González y Villanueva, 2000; Moon y Jain, 2002; Luque et al., 2004; Dmitrovic et al., 2009), entendido como “aquella creencia de que un producto derivado de tu grupo étnico o cultural es inherentemente superior a productos similares de otros grupos culturales o étnicos” (Myers, 1995).
- La animosidad del consumidor (Klein et al., 1998; González y Villanueva, 2000; Shimp et al., 2004; Huitzilín y San Martín, 2008 y 2010), es decir, “los sentimientos de antipatía hacia un país relacionados con eventos previos o continuos de tipo militar, político o económico, los cuales se reflejarán en el comportamiento de compra de los consumidores en los mercados internacionales” (Klein et al. 1998).
- Algunas variables sociodemográficas (Samiee et al., 2005; Ahmed y d’Astous, 2001, 2007 y 2008), como la edad, el sexo, los ingresos o el nivel de educación.

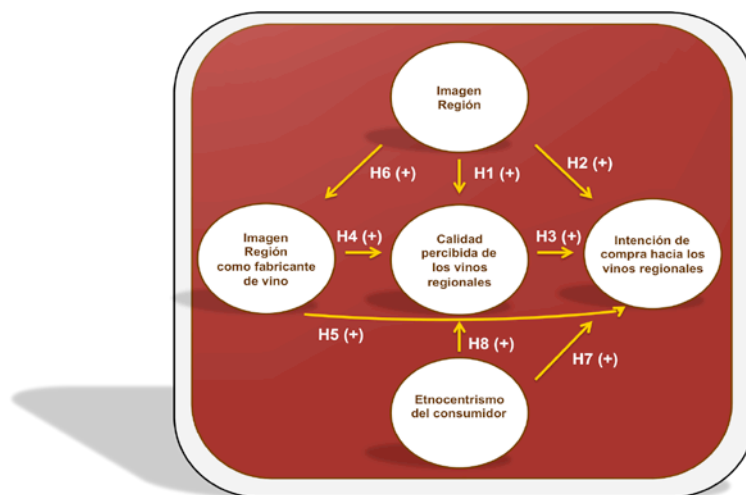

Tras una revisión de la literatura académica, se ha observado que la mayor parte de los estudios que tratan de conocer estas variables que influyen en la existencia de un efecto lugar de origen se han enfocado en el ámbito país (como ejemplo, Godey et al., 2012; Claret et al., 2012; Lee et al., 2013; Lagerkvist et al., 2014), quedando en un segundo plano el estudio del efecto región de origen (tal y como ponen de manifiesto Pharr, 2005, González y Villanueva, 2000, y De Francesco et al., 2012). Sin embargo, existen algunas categorías de productos, especialmente en el sector agroalimentario, donde las características diferenciadoras del producto son generadas por características propias de una región específica de un país. Esta es la razón del auge, especialmente en los países del sur de Europa, de las Denominaciones de Origen Protegidas (DOP) y de las Indicaciones Geográficas Protegidas (IGP) como marcas colectivas de calidad.

La homogeneidad y consistencia de las características de una región, mayores que para el caso de los países, permiten a estos productos transmitir una identidad propia basada en el “saber hacer” de sus gentes, en sus condiciones climatológicas y agrarias y en su tradición. De ese modo se otorga al producto una personalidad e identidad únicas que no se pueden imitar en otras regiones o países que no cuentan con todas esas características unidas al mismo tiempo. Esta circunstancia de los productos regionales hace que las investigaciones que centran su estudio en este tópico suelen tratar el constructo región de origen como un constructo multidimensional formado fundamentalmente por dos dimensiones: factores humanos y condiciones naturales (van Ittersum et al., 2003); a las que en ocasiones se le une una tercera dimensión: las materias primas (Dekhili y d’Hauteville, 2009).

## 2. Propuesta de un modelo sobre el efecto región de origen

A partir de la revisión de la literatura se ha diseñado el modelo estructural que parece en la figura 1, con el objetivo de estudiar el efecto región de origen en el mercado vitivinícola español. En concreto, se pretende conocer las variables que explican y moderan la intención de compra de los vinos regionales. El modelo propuesto plantea los efectos directos e indirectos que sobre dicha intención de compra tienen las siguientes variables antecedentes: la imagen de la región, la imagen de la región como productora de la categoría de producto, la calidad percibida de los productos regionales y el etnocentrismo del consumidor.

FIGURA 1  
Modelo para el estudio del Efecto Región de origen

Ahmed y d’Astous (1996, 2001 y 2007) han demostrado que las percepciones de calidad de los productos estaban influidas por las imágenes que los consumidores tienen de los países de origen de los productos. Resultados similares se han obtenido en otros trabajos, como los de González y Villanueva (2000), Srinivasan et al. (2004) o Verlegh et al. (2005). Por su parte, Van Ittersum et al. (2003), consiguen demostrar la influencia de la actitud de los consumidores hacia una región de origen en las percepciones de calidad, aunque sólo para una de las dos categorías de producto analizadas en su estudio. En el caso concreto del producto objeto de estudio en esta investigación, Lee y Lockshin (2011) también demuestran una fuerte influencia positiva de la imagen de Australia sobre las percepciones sobre los vinos procedentes de ese origen. Por todo lo citado anteriormente, se plantea la siguiente hipótesis:

*H<sub>1</sub>: A mejor imagen general de los consumidores sobre la región, mejores serán sus percepciones sobre la calidad de los productos originarios de dicha región.*

Además del mencionado efecto que la imagen general de un lugar tiene sobre las percepciones de calidad de los productos, varios estudios han demostrado que esta imagen también afecta a las intenciones de compra, es decir, que tiene una influencia directa y positiva sobre la variable final de nuestro modelo (Cordell, 1992; Roth y Romeo, 1992; Johansson et al., 1994; Van Ittersum et al.,

2003; Srinivasan et al., 2004; Verlegh et al., 2005; Ahmed y d'Astous, 2001; 2007 y 2008; Montesinos y Currat, 2007; Lee et al., 2013). Justificada a partir de estos resultados, planteamos la siguiente hipótesis:

*H<sub>2</sub>: A mejor imagen general de los consumidores sobre la región, mayores serán sus intenciones de compra hacia los productos originarios de dicha región.*

Otra de las conclusiones extraída de la revisión de la literatura permite afirmar que las percepciones de calidad de los productos de un determinado origen influyen de forma directa y positiva en las intenciones de compra o preferencias hacia los productos originarios de ese lugar (Erickson et al., 1984; Van Ittersum et al., 2003; González y Villanueva, 2000). Más recientemente, Lee y Lockshin (2011) demuestran en su estudio que las creencias de los consumidores sobre los vinos de un lugar se relacionan de forma positiva con su preferencia de compra. Por tal razón, se plantea la hipótesis:

*H<sub>3</sub>: A mejores percepciones de calidad de los consumidores hacia los productos de la región, mayores serán sus intenciones de compra hacia ellos.*

Como ya hemos mencionado anteriormente, existen varios estudios que analizan el papel de la imagen general de un lugar en el comportamiento de compra de los consumidores hacia sus productos. Sin embargo, Van Ittersum et al. (2003) aseguran que cuando el estudio se centra en una categoría de producto específica, el valor predictivo de esta variable no suele ser alto, por lo que afirman que también es necesario medir la imagen de la región como fabricante de dicha categoría de producto. En este sentido, son pocos los estudios que hasta el día de hoy han introducido esta variable, aun así establecemos la siguiente hipótesis:

*H<sub>4</sub>: A mejor imagen como fabricante de una categoría de producto específica que los consumidores posean sobre la región afectará, mejores serán sus percepciones de calidad hacia los productos de dicha región.*

Además, Van Ittersum et al. (2003) intentan demostrar que esta variable no tiene una influencia directa en la preferencia de los consumidores por los productos de esta región. Sin embargo, no pueden aceptar dicha hipótesis puesto que en una de las dos categorías estudiadas esta hipótesis no se confirma. Por ello, en este trabajo se plantea esta hipótesis:

*H<sub>5</sub>: A mejor imagen como fabricante de una categoría de producto específica que los consumidores posean sobre la región, mejores serán sus intenciones de compra hacia los productos regionales.*

Por otro lado, los citados autores consideran que la actitud o imagen general que tienen los consumidores hacia una región puede influir de forma directa en su imagen como fabricante de una categoría de producto específica. Por ello, en este estudio se trata de contrastar la hipótesis:

*H<sub>6</sub>: A mejor imagen general que los consumidores posean sobre la región, mejor será la imagen que éstos posean sobre la misma como fabricante de una categoría de producto específica.*

Finalmente, se ha incluido en el modelo la variable etnocentrismo del consumidor, pues según los resultados de diversos estudios el etnocentrismo está relacionado positivamente tanto con el comportamiento de compra doméstico, como con la percepción de calidad de los productos domésticos (por ejemplo, Luque et al., 2004 o Dmitrovic et al., 2009). Las hipótesis a contrastar son:

*H<sub>7</sub>: Las tendencias etnocentristas de los consumidores están directamente relacionadas de forma positiva con la intención de compra hacia los productos de su región (comportamiento de compra doméstico).*

*H<sub>8</sub>: Las tendencias etnocentristas de los consumidores están directamente relacionadas de forma positiva con las percepciones de calidad hacia los productos de su región.*

Además de analizar las relaciones entre las variables del modelo estructural, la investigación realizada también pretende conocer el papel moderador que la familiaridad con la categoría de producto puede desempeñar en algunas de las relaciones del modelo. Algunos de los estudios que han incluido esta variable son Maheswaran (1994), Bigné y Sánchez (2002), Inch y McBride (2004) o Srinivasan et al. (2004). Aunque los resultados obtenidos son contradictorios en cuanto a la existencia del efecto moderador y en cuanto a la dirección del mismo, nuestras hipótesis de trabajo han sido (figura 2):

H<sub>9</sub>: La familiaridad con la categoría de producto modera la relación entre la imagen de una región como fabricante la categoría de producto y la calidad percibida de los productos de esa región.

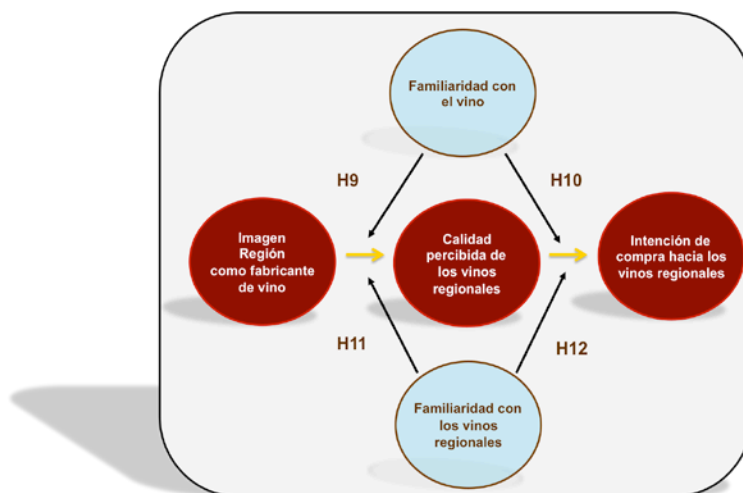

H<sub>10</sub>: La familiaridad con la categoría de producto modera la relación entre la calidad percibida de los productos de una región y la intención de compra hacia esos productos.

Al igual que la familiaridad con la categoría de producto, el nivel de conocimiento de los consumidores sobre un origen o sobre sus productos puede jugar un papel moderador en las relaciones entre las variables del modelo estructural, tal y como han puesto de manifiesto Johansson (1989), González y Villanueva (2000), Ahmed y d'Astous (2008), Lee y Lockshin (2011) o Gázquez et al. (2012). Por tal razón, las dos últimas hipótesis son (figura 2):

H<sub>11</sub>: La familiaridad con los productos de un origen modera la relación entre la imagen de una región como fabricante de una categoría de producto específica y la calidad percibida de los productos de esa región.

H<sub>12</sub>: La familiaridad con los productos de un origen modera la relación entre la calidad percibida de los productos de una región y la intención de compra hacia esos productos.

FIGURA 2  
Efecto moderador de la familiaridad

### 3. Diseño de la investigación

Para contrastar el modelo de relaciones propuesto se ha utilizado la técnica Partial Least Squares o Regresión por Mínimos Cuadrados Parciales (Chin, 1998), a través de la aplicación del software SmartPLS, y se ha realizado una encuesta dirigida a compradores habituales o esporádicos de vino en la región de Extremadura (España). La ficha técnica del estudio se recoge en la tabla 1. El procedimiento de muestreo ha sido el no probabilístico, por cuotas de sexo y provincia de residencia, tratando de conseguir una muestra representativa de la región. El tamaño muestral final fue de 427 individuos.

TABLA 1  
Ficha técnica del estudio

<b>Población</b>	Clientes de entidades financieras mayores de 18 años
<b>Muestra</b>	427 consumidores
<b>Ámbito geográfico</b>	Regional (Extremadura, España)
<b>Tipo de muestreo</b>	No probabilístico por cuotas (sexo y residencia)
<b>Tipo de encuesta</b>	Personal, auto-administrada
<b>Trabajo de campo</b>	Febrero-junio, 2012

El cuestionario incluía diversas preguntas para medir cada una de las variables del modelo. Para medir la imagen general que los individuos poseen sobre la región se ha adaptado la escala propuesta por González y Villanueva (2000) que considera 5 ítems para medir la imagen de un país: calidad de vida, riqueza, nivel tecnológico, nivel educativo y estabilidad política. Este último ítem se ha excluido al tratarse de un estudio sobre el efecto región de origen y considerarse que, en general, no es un elemento diferenciador entre regiones de un mismo país. A estos ítems se le han añadido tres más relativos al atractivo de la región como destino turístico, a la eficacia de la gestión política de la región y un ítem relativo a la imagen de la región en general. De esta forma, la escala final quedó constituida por los siete ítems que debían ser valorados por los encuestados mediante una escala de Likert de 7 puntos.

Para medir la imagen que los individuos poseen sobre la región como fabricante de vinos se ha tomado como referencia el trabajo de Van Ittersum et al. (2003). Según estos autores, la imagen de un país o región como productora de una categoría de producto está constituida por tres dimensiones: el factor humano, el factor climatológico y el factor naturaleza. Los ítems introducidos por los autores hacían referencia a la cualificación de la mano de obra existente en la región, a la cultura y la experiencia de sus habitantes, al clima de la misma, o al tipo de suelo, entre otros. Para el caso de este trabajo se han adaptado algunos de estos ítems al caso concreto del vino. La escala final que se ha utilizado está constituida por siete ítems.

La escala para medir la calidad percibida de los vinos regionales se ha basado en las escalas propuestas por González y Villanueva (2000) y por Klein et al. (1998). Las primeras utilizaban cuatro ítems, de los cuales se han utilizado tres en esta investigación; los referentes a la calidad en general, a la relación calidad-precio y al nivel de confianza que poseen los individuos respecto a la calidad de los vinos regionales. El ítem que no se ha tenido en cuenta hacía referencia al buen acabado de los productos, un aspecto que está asociado a otro tipo de productos industriales, pero no al vino.

La escala propuesta por Klein et al. (1998) incluía los ítems: mano de obra, nivel tecnológico, calidad, fiabilidad, diseño y valor en relación con el precio del producto. La mayoría de ellos no son de aplicación a un producto agroalimentario, pero sí se incluyó el ítem referente a la calidad del producto de la región en comparación al producido en otras regiones. De esta manera, la escala utilizada finalmente estuvo formada por cuatro ítems.

Para medir la intención de compra de los individuos hacia los productos regionales se han unido algunos ítems procedentes de las escalas propuestas por Olsen et al. (1993) y por Klein et al. (1998), eliminando aquellos que no eran de aplicación a un producto agroalimentario como el vino. Finalmente, la escala utilizada para medir la intención y el comportamiento de compra hacia los vinos regionales estuvo formada por cuatro ítems que los encuestados debían valorar según una escala de Likert de 7 puntos.

Para medir el nivel de etnocentrismo de los individuos se ha optado por utilizar la escala CETSCALE, creada por Shimp y Sharma (1987) y validada posteriormente en diferentes países y contextos (por ejemplo, Olsen et al., 1993; Samiee et al. 2005; Klein et al. 1998; Marín y Bigné 1998; González y Villanueva, 2000; Watson y Wright, 2000; Moon y Jain, 2002; Del Río et al., 2003; Luque et al., 2004; Srinivasan et al., 2004; Huitzilín y San Martín, 2008 y 2010; Dmitrovic et al., 2009; Díaz et al., 2011). Está compuesta por 17 ítems medidos mediante escala de Likert de 7 puntos de forma que el valor mínimo de la escala para un individuo serían 17 puntos, mientras que el valor máximo de etnocentrismo se situaría en 119 puntos. En el caso de esta investigación, los ítems de la escala han sido adaptados para referirse al ámbito regional, pues la escala original es de aplicación a países.

La familiaridad de los consumidores con la categoría de producto fue medida a través de cuatro preguntas sobre el proceso de elaboración y los tipos de vino, que permitían evaluar el conocimiento de los consumidores hacia el vino. Los consumidores tenían la posibilidad de marcar una de las tres opciones disponibles: “verdadero”, “falso” o “no sabe”. Este sistema permite dividir a los consumidores en dos grupos: alto y bajo nivel de conocimiento. Para que un consumidor fuera considerado experto en la categoría de producto debía acertar tres preguntas de las cuatro realizadas en el cuestionario. Se consideró que este sistema era más objetivo para evaluar el conocimiento real de

los consumidores sobre los productos que realizar una pregunta de autoevaluación (Ahmed y d'Astous, 1999).

Por último, para medir la familiaridad de los consumidores con los productos de su región se incluyó en el cuestionario una pregunta abierta, en la que se solicitaba a los encuestados que enumerasen las Denominaciones de Origen Protegidas de vino de la región que conociesen. Aquellos consumidores que conociesen la Denominación de Origen *Ribera del Guadiana* serían considerados consumidores con suficiente nivel de familiaridad con el vino extremeño.

#### 4. Resultados

El modelo de medida se ha analizado teniendo en cuenta la fiabilidad individual de los ítems y la validez discriminante de los constructos (Hulland, 1999). En primer lugar se han estimado las cargas de cada ítem respecto a su variable latente, aceptándose como válidos aquellos cuyas cargas tuvieran un valor igual o superior a 0,707, lo que indica que más del 50% de la varianza observada es explicada por el constructo (Carmines y Zeller, 1979). Inicialmente fueron varios los ítems que no alcanzaban este valor de referencia, por lo que se procedió a su eliminación del modelo para posteriormente volver a correrlo y detectar nuevos ítems a eliminar. Tras cuatro depuraciones, fueron eliminados 8 ítems de la escala de etnocentrismo, 4 de la escala de imagen regional, 1 de la escala de imagen de la región como productora y otro de la escala de medición de la calidad percibida (tabla 2).

Los índices relativos a la fiabilidad y la validez convergente (tabla 2), muestran resultados positivos, superando los valores críticos de aceptación. En concreto, el alfa de Cronbach de los cinco constructos presenta valores comprendidos entre 0,696 y 0,93, lo que es indicativo de una buena fiabilidad entre los indicadores de cada constructo. Todos, salvo la imagen Región de Origen, superan el valor de referencia de 0,7; aunque en este caso se encuentra en un valor muy cercano. Además, los índices de fiabilidad compuesta (IFC) de todos los constructos superan con creces el valor de referencia de 0,60 indicado por Bagozzi y Yi (1988). Por su parte, los valores de las medias de la varianza extraída (AVE) superan el valor de 0,5, garantizando de esta forma la validez convergente del modelo (Fornell y Larcker, 1981).

TABLA 2  
Evaluación del modelo de medida

Constructo	Cargas	Alfa de Cronbach	Fiabilidad Compuesta	AVE
<b>Imagen Región de Origen</b>		<b>0,696</b>	<b>0,831</b>	<b>0,622</b>
El nivel educativo de los habitantes de Extremadura es alto	<b>0,828</b>			
Extremadura posee un nivel de tecnología avanzado	<b>0,771</b>			
En general, la imagen que poseo sobre Extremadura es positiva	<b>0,765</b>			
<b>Imagen Región de Origen como productora de vino</b>		<b>0,903</b>	<b>0,925</b>	<b>0,674</b>
Extremadura cuenta con una amplia tradición en la producción de vino	<b>0,787</b>			
En Extremadura existe una profunda cultura vinícola	<b>0,756</b>			
Extremadura posee materias primas adecuadas para producir vino	<b>0,831</b>			
Extremadura posee un entorno natural adecuado para la producción de vinos	<b>0,889</b>			
El suelo y las tierras de Extremadura son idóneos para producir vino	<b>0,827</b>			
El clima extremeño es adecuado para la producción de vino	<b>0,830</b>			
<b>Calidad percibida hacia el vino regional</b>		<b>0,826</b>	<b>0,896</b>	<b>0,742</b>
La calidad de los vinos extremeños es alta	<b>0,843</b>			
La relación calidad-precio de los vinos extremeños es buena	<b>0,839</b>			
Los vinos extremeños son vinos de confianza	<b>0,900</b>			

EL EFECTO REGIÓN DE ORIGEN EN LA COMPRA DE VINOS

<b>Etnocentrismo del consumidor</b>	<b>0,930</b>	<b>0,941</b>	<b>0,640</b>
No es correcto comprar productos de fuera de Extremadura puesto que deja a los extremeños sin trabajo	<b>0,824</b>		
Un verdadero extremeño debería comprar siempre productos hechos en Extremadura	<b>0,830</b>		
Deberíamos comprar productos hechos en Extremadura en vez de permitir que otras regiones o países se enriquezcan a nuestra costa	<b>0,755</b>		
Debería haber muy pocos intercambios o compras de productos de fuera de Extremadura a menos que fuese necesario	<b>0,823</b>		
Los extremeños no deberían comprar productos fuera de Extremadura, porque daña a las empresas extremeñas y provoca desempleo	<b>0,824</b>		
Debería ponerse freno a todas las importaciones	<b>0,773</b>		
No debería permitirse a las empresas de fuera de Extremadura poner sus productos en nuestros mercados	<b>0,817</b>		
Sólo deberíamos comprar de otras regiones y países aquellos productos que no podamos obtener dentro de nuestra propia región	<b>0,742</b>		
Los consumidores extremeños que compran productos hechos en otras regiones o países son los responsables de poner a sus paisanos en el paro	<b>0,807</b>		
<b>Intención de compra hacia el vino regional</b>	<b>0,853</b>	<b>0,901</b>	<b>0,695</b>
Compraré prioritariamente en tiendas que hagan un esfuerzo especial por vender vinos producidos en Extremadura	<b>0,840</b>		
Estoy dispuesto a comprar vinos extremeños siempre que pueda	<b>0,877</b>		
Si dos vinos son similares en calidad, pero uno es de Extremadura y otro no, estaría dispuesto a pagar un 10% más por el extremeño	<b>0,735</b>		
Cuando compro vino, suelo optar por marcas extremeñas	<b>0,876</b>		

Por último, para evaluar la validez discriminante de los constructos se sugiere que ningún ítem presente cargas superiores en otros constructos distintos al que pretende medir (Barclay et al., 1995). De esta forma, un constructo tendrá validez discriminante cuando su AVE sea mayor que el cuadrado de las correlaciones de su constructo con los demás (Fornell y Larcker, 1981). Como se observa en la tabla 3, se constata la validez discriminante por lo que es posible proceder a la evaluación del modelo estructural.

TABLA 3

Nota: Los elementos de la diagonal muestran la raíz cuadrada de la varianza extraída media (AVE)

En la figura 3 se muestran los resultados de la estimación del modelo estructural. Las flechas indican relaciones causales y el número al lado de cada una de ellas representa su coeficiente estandarizado, figurando entre paréntesis el resultado de la multiplicación entre el coeficiente estandarizado y el coeficiente de correlación entre los dos constructos, expresado en porcentaje (Falk y Miller, 1992). Utilizando la técnica del muestreo “Bootstrap” con 500 sub-muestras se obtienen los valores del test-t

y se verifica la significación de las relaciones causales establecidas en el modelo. Todos los valores del test  $Q^2$  de Stoner Geisser muestran relevancia predictiva, al ser mayores que cero.

FIGURA 3  
Resultados del modelo estructural

\* $p < 0,05$ , \*\* $p < 0,01$ ; ns = no significativo – GoF = 0,196

La calidad percibida del vino regional (22,42%) es la variable que más contribuye a la explicación de la intención de compra, seguida por el etnocentrismo (10,23%) y, en menor medida, por la imagen de la región como fabricante de vino (8,39%) y por la imagen global de la región (2,65%). Si analizamos variable por variable, se observa la influencia de la imagen de la región como fabricante de vinos sobre la calidad percibida (28,15%) y también, aunque en menor medida, su influencia directa sobre la intención de compra hacia los mismos (8,39%). La imagen general de la región juega un papel importante en el modelo, pues a pesar de que los porcentajes son bajos, contribuye a la explicación de tres variables del modelo, la imagen de la región como fabricante de vinos (4,72%), la calidad percibida (3,18%) y la intención de compra (2,65%). Por último, el etnocentrismo del consumidor muestra influencia en las dos variables con las que se relaciona en el modelo, es decir, en la calidad percibida (7,43%) y en la intención de compra hacia los vinos regionales (10,23%). Por tanto, se confirman todas las hipótesis planteadas en el estudio.

El modelo muestra un aceptable nivel predictivo ( $R^2$ ), puesto que contribuye a explicar un 43,7% de la varianza de la intención de compra, un 38,8% de la calidad percibida y un 4,7% de la imagen de la región como fabricante de vinos. El ajuste global del modelo es moderado (Tenenhaus et al., 2005).

Tras el análisis global del modelo se ha realizado un análisis para conocer si la familiaridad moderaba dos relaciones del modelo: concretamente la relación entre *Imagen Región como fabricante de vino* y *Calidad Percibida de los vinos de esa región* y la relación entre esta última y la *Intención de Compra* hacia los vinos de la región. Para ello se dividió la muestra en dos subgrupos de consumidores: los que mostraban un alto nivel de conocimiento y los que mostraban un nivel de conocimiento bajo.

La técnica elegida para la comparación entre los mismos fue el análisis multigrupo propuesto por Chin (2000), el cual ha sido utilizado posteriormente por varios autores (Keil et al., 2000; Sánchez-Franco et al., 2009). En este procedimiento, se calcula un *t*-test de Student usando la ecuación 1. Esta ecuación deriva de una distribución *t* de Student con  $m+n-2$  grados de libertad, donde  $S_p$  (ecuación 2), es un estimador agrupado para la varianza de los errores estándar,  $m$  y  $n$  son los tamaños muestrales de cada uno de los grupos, y SE es el error estándar de cada coeficiente estandarizado del modelo estructural para cada grupo.

Ecuación 1: 
$$t = \frac{\beta_a - \beta_b}{S_p \sqrt{\frac{1}{m} + \frac{1}{n}}}$$

Ecuación 2: 
$$S_p = \sqrt{\frac{(m-1)^2}{m+n-2} SE_a^2 + \frac{(n-1)^2}{m+n-2} SE_b^2}$$

El efecto moderador de la familiaridad con la categoría de producto sólo se confirma para la relación existente entre la imagen de la región como fabricante de vino y la calidad percibida (tabla 3). Se acepta la hipótesis H<sub>9</sub> y se rechaza la H<sub>10</sub>. El valor negativo de las diferencias entre las cargas de los dos grupos indica que, para este caso, la relación entre estas dos variables es más intensa para el grupo con menor nivel de familiaridad con el vino. Es decir, que aquellos consumidores con un menor conocimiento de este producto muestran una relación más intensa entre la imagen que forman en su mente sobre la región como fabricante de un producto y la calidad percibida hacia el producto de esa región. Estos resultados coinciden con la teoría del Efecto Halo y Efecto Resumen (Han, 1989). Según definían Jaffe y Nebenzahl (2001) el Efecto Halo consistía en que “debido a la necesidad de evaluar los productos cuando se tiene información limitada sobre sus atributos, los consumidores utilizan las imágenes o estereotipos que poseen sobre los países de origen para formular actitudes hacia los mismos”. Según estos mismos autores, en el momento en que el consumidor gana familiaridad con los verdaderos atributos de una categoría de producto, la imagen del país pasa a ser un resumen o “summary” de los atributos relativos a las categorías de productos conocidas fabricadas en ese país. En el caso de nuestro estudio, los consumidores poco familiarizados con el vino tienden a formar las evaluaciones de calidad en base a la imagen que poseen de la región como fabricante de vino.

TABLA 3  
Efecto moderador de la familiaridad con el vino

	Sp	βa - βb	t
Imagen de la región como fabricante de vinos > Calidad Percibida de los vinos regionales	0,7055	-0,1435	-1,9548
Calidad Percibida de los vinos regionales > Intención de compra hacia los vinos regionales	0,8757	0,0482	0,5293

Para el caso de la segunda variable moderadora, la familiaridad con los vinos de la región, ocurre lo mismo (tabla 4). El efecto moderador tan sólo se confirma para la primera relación, confirmándose la hipótesis H<sub>11</sub> de este estudio y rechazándose H<sub>12</sub>. Además, los resultados vuelven a confirmar la teoría del Efecto Halo y Efecto Resumen defendida por Han (1989) y Jaffe y Nebenzahl (2001), pues los consumidores menos familiares con los vinos regionales muestran una relación más intensa entre la imagen de la región como productora de vinos y la calidad percibida hacia los mismos.

TABLA 4  
Efecto moderador de la familiaridad con los vinos regionales

	Sp	βa - βb	t
Imagen de la región como fabricante de vinos > Calidad Percibida de los vinos regionales	0,7643	-0,1745	-2,2718
Calidad Percibida de los vinos regionales > Intención de compra hacia los vinos regionales	0,7982	-0,0228	-0,2839

## 5. Conclusiones

Competir en el mercado agroalimentario es cada vez más complejo como consecuencia de una demanda cada vez más exigente y de la mayor competencia empresarial derivada de la liberalización de los mercados. Los pequeños productores regionales tienen que hacer frente hoy en día no solo a la competencia de otros productores nacionales, sino también a un creciente número de competidores

internacionales que penetran en el mercado nacional gracias, sobre todo, a la política de aprovisionamiento de las grandes cadenas de distribución minorista.

En este entorno, la industria agroalimentaria se ve forzada a buscar mecanismos que le permitan acceder a los canales de venta mediante la diferenciación de su oferta frente a los competidores, alcanzando a su vez unos exigentes requisitos de calidad y seguridad alimentaria. Sin embargo, acometer las estrategias y acciones de marketing necesarias para diferenciar sus marcas suele ser muy difícil y costoso para los pequeños productores regionales. Actuar de forma independiente no es del todo rentable, por lo que las opciones pasan por el asociacionismo entre industrias regionales para fomentar la demanda de los productos domésticos de calidad. Se trata, en definitiva, de hacer que el origen del producto sea un elemento clave en la decisión de compra de los consumidores y, por tanto, una fuente de ventaja competitiva para las empresas regionales.

Desde el punto de vista del marketing, una de las medidas asociativas más relevantes es la creación y potenciación de marcas de garantía que amparen de forma conjunta a los productos de todas las empresas asociadas. Las Denominaciones de Origen Protegidas y las marcas “alimentos de...” son dos ejemplos de estas marcas de garantía que combinan criterios de calidad y de lugar de procedencia en la selección de los productos autorizados a utilizarlas.

Las administraciones públicas europeas y, en particular, de las distintas regiones, consideran hoy en día que el apoyo a estas marcas debe ser un eje prioritario de sus políticas comerciales para proteger a su sector agroalimentario. Pero la eficacia de esta política dependerá del valor que los consumidores concedan a estas marcas. Por tanto para diseñar desde la administración pública unas estrategias de promoción óptimas es necesario responder a la pregunta clave: ¿Qué importancia tiene el origen regional en la decisión de compra de los alimentos (efecto lugar de origen)?

Para dar respuesta a esta pregunta, hemos contrastado un modelo de relaciones estructurales que expliquen la intención de compra de vinos regionales. Los resultados del modelo corroboran el efecto directo de la imagen general de la región y de la imagen de la región como productora de vinos sobre la intención de compra, así como sus efectos indirectos a través de la calidad percibida de los vinos regionales. Estos resultados aportan importantes implicaciones gerenciales para los decisores políticos. Por un lado, se confirma el valor de poner en práctica campañas de comunicación que persigan una mejora de la imagen de la región como marca. En otras palabras, se confirma que las marcas regionales colectivas no solo tienen valor como herramientas de promoción exterior, sino también como incentivo para el consumo interno de los productos regionales, especialmente de aquellos consumidores que se consideren más etnocentristas. Se comprueba que una mejora en la imagen general de la región tendrá efectos positivos en la venta de vinos regionales, por lo que la acción conjunta de la administración pública regional y de las empresas vitivinícolas de la región en materia de comunicación acarrearán efectos positivos en términos de comercialización de este producto en los mercados internos.

Algo similar ocurre con la variable imagen región como fabricante de vinos, la cual influye de forma directa sobre la calidad percibida y la intención de compra. Las campañas de concienciación a la sociedad regional sobre la cultura y tradición vitivinícola en la región, así como las posibles acciones de formación de personal cualificado y conservación medioambiental del suelo regional provocarán un aumento de la intención de compra hacia el vino con origen en dicha región.

Por otra parte, en la misma línea que otros estudios previos sobre esta materia (Shimp y Sharma, 1987; Luque et al., 2004; Dmitrovic et al., 2009), se corrobora la relación positiva del etnocentrismo del consumidor sobre la calidad percibida de los vinos y sobre la intención de compra, lo que también da pistas a los responsables de las políticas comerciales de las empresas y de los gobiernos regionales sobre cómo enfocar sus campañas de comunicación. Si el etnocentrismo influye positivamente en estas variables, la estrategia de comunicación puede ir encaminada al ensalzamiento del origen regional del producto, haciendo hincapié en el efecto positivo que tiene la decisión del consumidor de apostar por los productos regionales para apoyar y revitalizar la economía y el empleo en su entorno más cercano.

Otra de las conclusiones más relevantes de este estudio, por su aportación en una de sus lagunas más importantes de la teoría de marketing sobre el efecto origen, es la confirmación de un efecto

moderador por parte de la familiaridad en una de las relaciones del modelo. Como muestran los resultados, tanto la familiaridad relativa a la categoría de producto como la relativa a los productos de un origen, moderan la relación existente entre la imagen región como fabricante de vinos y la calidad percibida hacia los mismos. Además, los resultados son coherentes con la teoría del Efecto Halo y Efecto Resumen (Han, 1989). No se puede corroborar, sin embargo, el efecto moderador de la familiaridad en la relación entre la calidad percibida y la intención de compra hacia los vinos regionales.

## RESUMEN

*El propósito de este estudio es explorar la influencia del éxito deportivo sobre el efecto de la transmisión de imagen en el patrocinio deportivo. Se realizó un estudio cuantitativo en tres equipos de fútbol según su clasificación histórica, repercusión mediática y riqueza. El tratamiento de datos se realizó por medio del modelado de ecuaciones estructurales. Los resultados muestran que la transmisión de imagen se efectúa entre los equipos más laureados. El modelo de transmisión de imagen no funciona en el equipo con menos éxito deportivo. La principal conclusión conlleva replantear el funcionamiento del éxito del patrocinio en función de variables deportivas. Los gestores deportivos deben entonces reconsiderar la relación coste eficacia de la inversión en patrocinio en función de la entidad patrocinadora y el objetivo propuesto.*

## Palabras clave:

Patrocinio, transmisión imagen, deporte, congruencia, actitud

## **1. Introducción**

En las últimas décadas el patrocinio deportivo ha evolucionado considerablemente. Han aumentado las inversiones y el interés por el conocimiento de los beneficios y su eficacia. Desde el punto de vista empresarial como académico. Reuters (“Global sponsorship spending to rise 5.2 pct in 2011,” 2011) informa que el gasto mundial de patrocinio ascendió a 46,6 billones de dólares americanos en 2010, frente a sólo 2 billones de dólares en 1984 (Meenaghan, 1998). IEG (2013) estima que en 2013 el gasto global en patrocinio fue de 53.3 billones de dólares americanos lo que supuso un incremento del 75% desde 2005. El gasto por empresas norteamericanas en patrocinio se incrementó un 5.5% en el año 2013 en detrimento de otros gastos (O’Reilly y Lafrance Horning, 2013).

La principal razón para la inversión en patrocinio es obtener una respuesta de los consumidores (Meenaghan, 2001), tal como el mejoramiento de imagen y el aumento del conocimiento de la marca, lo que teóricamente conlleva un aumento de las ventas (Walliser, 2003). La evaluación de la eficacia de esta herramienta tiene dos propósitos. En primer lugar, proporcionar una medida de valor de un patrocinio determinado (medir su eficacia), y en segundo lugar, servir como propuesta para la venta y financiación de eventos y series deportivas (Crompton, 2004). Sin embargo, hasta ahora no se ha tratado de diferenciar la eficacia del patrocinio en función del tamaño del evento o la eficacia del patrocinio en equipos con diferentes niveles (deportivos o de seguidores). Esto es, las empresas que patrocinan los eventos o equipos deportivos no tienen conocimiento sobre la eficacia de patrocinar un gran evento o un pequeño evento, o un equipo deportivo de éxito o un equipo con peores resultados deportivos excepto el número de impactos.

Este artículo pretende contribuir a la literatura del patrocinio realizando una investigación exploratoria con el objetivo de conocer la eficacia del proceso de transmisión de imagen en función del rendimiento deportivo. Para tal fin se realiza un estudio cuantitativo en tres entidades deportivas de fútbol según el éxito deportivo, riqueza y número de seguidores. La hipótesis es que la transmisión de imagen en el patrocinio no funciona igual en entidades deportivas de gran éxito que en otras de menos éxito. Los resultados teóricos llenarán un hueco existente en la búsqueda de la comprensión del funcionamiento de la transmisión de imagen. En la práctica, los gestores comerciales podrán designar el gasto en patrocinio según el coste y eficacia esperada.

## **2. La transmisión de imagen**

El término transferencia de imagen describe la transferencia de asociaciones relacionadas con una marca o compañía desde el patrocinado al patrocinador (Gwinner, 1997). Se refiere a la asociación realizada por el consumidor del evento o equipo deportivo a la marca patrocinadora. El objetivo es evocar sentimientos y actitudes positivas hacia el patrocinador, vinculando estrechamente un evento que el consumidor valora altamente (Grohs y Reisinger, 2005).

En la literatura de marketing varios autores han hallado evidencias del concepto de transferencia de imágenes para eventos deportivos. En el caso de Stipp y Schiavone (1996), encontraron un efecto positivo y significativo en la influencia de las actitudes de los consumidores hacia los Juegos Olímpicos y la imagen de los patrocinadores del evento. De igual manera Grohs, Wagner, y Vsetecka (2004) comprobaron la transferencia de imagen de un evento deportivo de invierno a los patrocinadores de dicho evento.

En cuanto a la medición y evaluación de la eficacia de la transmisión de imagen, no existe un modelo global para medir la eficacia del patrocinio, ni tampoco una medición que permita expresar lo cuantificable que pueda ser la efectividad de la transmisión de imagen (Choi y Yoh, 2011).

Aquellos eventos que no abordan la eficacia del patrocinio a menudo prestan poca atención a los objetivos de los patrocinadores. Al contrario, las cifras de asistencia y las impresiones de medios son más importantes para el patrocinador (Stotlar, 2004).

También se ha manifestado que la falta de técnicas de medición adecuadas para medir la eficacia es el tema más debatido y el aspecto más difícil del proceso de patrocinio (Meng-Lewis, Thwaites, y Pillai, 2013). El desafío que predomina consiste en la evaluación estandarizada y los procedimientos del patrocinio en relación a la valoración de sus competencias. Además, la intangibilidad puede dificultar la medición por lo que la evaluación del patrocinio aún está algo distante para alcanzar un modelo general que explique la eficacia de la trasmisión de imagen.

La creación de una imagen positiva de una marca resulta ser el principal objetivo de las empresas que se asocian a la hora de participar en eventos sociales. La conexión de una marca con un evento patrocinado debe llevar a las personas y al patrocinado a una influencia positiva hacia la marca y al evento (Gwinner y Eaton, 1999). El patrocinio repercute positivamente en la percepción de las personas sobre la marca cuando esta se asocia con un evento (patrocinado). A través del patrocinio, la gente percibe una conexión adecuada entre el evento y la marca del patrocinador (Crimmins y Horn, 1996).

### **3. Construcción de hipótesis**

#### **3.1. Actitud hacia el patrocinador**

La actitud hacia el patrocinador se podría definir como la evaluación global de un consumidor hacia la organización patrocinadora de un evento (Keller, 2003). Meenaghan (2001) y Dees, Bennett y Villegas, (2008) entendieron este constructo como una disposición favorable hacia el patrocinador. La actitud ha sido una de las variables más usadas para medir la eficacia del patrocinio. Levin, Joiner, y Cameron (2001) adoptaron la variable para comprobar el efecto del tiempo de exposición y el recuerdo al patrocinio. Roy y Cornwell (2003) emplearon la misma medida para evaluar el efecto de la equidad de la marca en respuesta al evento patrocinado. Así mismo, otros autores también han examinado la actitud hacia el patrocinio como medida de la eficacia del patrocinio (Alexandris y Tsiotsou, 2012; Carrillat, 2005; Dees, Bennett, y Villegas, 2008; Kim et al., 2011; Koo, Quarterman, Jackson, y Suh, 2005).

Según Meenaghan (1983) las actividades o eventos están poseídos de atributos de personalidad particulares depositados en la mente del consumidor, y la actividad de patrocinio asocia una actividad o evento en particular con los productos o servicios de la empresa. Los individuos asocian a un promotor con una actividad patrocinada, las imágenes de la actividad se transfieren al patrocinador, es decir, la actitud que se tiene hacia el patrocinado se transfiere al patrocinador.

La estrecha vinculación se logra mediante la presentación del patrocinador de forma simultánea con el evento, que debería traducirse en un contagio de la imagen a la empresa patrocinadora (Grohs y Reisinger, 2005). Por lo tanto se concluye con la siguiente hipótesis:

H1: La actitud hacia el equipo (el patrocinado) ejerce una influencia positiva en la actitud hacia el patrocinador.

#### **3.2. Intención de compra**

De la revisión de la literatura se desprende la preeminencia de los planteamientos teóricos de Fishbein y Ajzen (Ajzen, 1991; Ajzen, 1981, 2001, 2008; Fishbein y Ajzen, 1975) a la hora de predecir la conducta humana. Según Ajzen (1991, 2001), las personas actúan de acuerdo con sus intenciones influidas por la percepción de control del comportamiento, las normas subjetivas y las actitudes hacia el comportamiento. Un gran número de estudios han apoyado con sus resultados la creencia de que las intenciones juegan un papel importante en la predisposición del comportamiento real.

Por consiguiente, la intención de compra puede ser un indicador apropiado de la eficacia del patrocinio, particularmente cuando un patrocinador participa en eventos deportivos dirigidos a los aficionados deportivos (Ko, Kim, Claussen, y Kim, 2008), pues su mera presencia puede influir en el individuo que visiona o participa en el evento y en su intención de comprar un producto del patrocinador (Dean, 2002; Pitts, 1998). Diversos estudios han demostrado que la actitud de los consumidores es un importante predictor de las intenciones de comportamiento

(Kim et al., 2011). Por otra parte, Meenaghan (2001) concluyó que las actitudes positivas hacia el patrocinador son antecedentes de las intenciones de compra de los consumidores, y así también de los comportamientos reales de compra.

H2: La actitud hacia el patrocinador influye positivamente en la intención de compra de productos del patrocinador.

### **3.3. Congruencia**

La congruencia es el concepto que mide el “ajuste” de la relación entre patrocinador y patrocinado según la percepción del consumidor. La congruencia relaciona al patrocinador con el evento, y ha sido motivo de estudio de la eficacia del patrocinio deportivo en los últimos años (Chao, 2011; Cornwell, Weeks, y Roy, 2005; Rifon, Choi, Trimble, y Li, 2004). Tal y como cita Chao (2011), son varios los autores que han estudiado la influencia de la congruencia sobre el recuerdo y el reconocimiento de marca (Crimmins y Horn, 1996; Rifon et al., 2004; Speed y Thompson, 2000; Wakefield, Becker-Olsen, y Cornwell, 2007). Para el consumidor, por lo tanto, será más fácil recordar al patrocinador cuando perciba una cierta relación lógica entre el patrocinador y el evento. Por lo tanto, es un factor muy importante que influye en el recuerdo y el conocimiento de los patrocinadores (Chao, 2011; Clark, Cornwell, y Pruitt, 2009; Cornwell et al., 2005). Esta variable es integradora de factores cognitivos como el recuerdo y el conocimiento.

Los estudios sobre la congruencia apoyan su capacidad para mejorar la transferencia de imágenes del evento al patrocinador (Gwinner, 1997), mejorando el recuerdo del patrocinador (Johan y Pham, 1999) y mejorando la actitud de los consumidores hacia el patrocinador (McDaniel, 1999).

El patrocinio congruente crea una mayor diferenciación del producto con el resto de productos del mercado (Amis y Slack, 1999) y puede llegar a aumentar la eficiencia de la promoción de ventas (Chandon, Wansink, y Laurent, 2000). En cambio, una incongruencia en el patrocinio conlleva que la transferencia de imágenes de los valores del evento hacia el patrocinador sea deficiente (Meenaghan, 2001).

Así pues, la evaluación de la congruencia y el ajuste entre el patrocinador y las características propias del evento pueden proporcionar información con respecto a la percepción del consumidor de las marcas patrocinadas y servir como medida de su eficacia.

Citando a Tribou (2011), la incongruencia en la relación de patrocinio puede conllevar dos escenarios. En primer lugar, si la incongruencia no es significativa, entonces el esfuerzo cognitivo llevado a cabo por el consumidor aumenta el impacto del patrocinio, pudiendo incluso llegar a perpetuarlo. El espectador tratará de asimilar el motivo de tal incongruencia, y de lograrlo, la transmisión de imagen persistirá más en el tiempo. En caso contrario, si la incongruencia es percibida como significativa, el patrocinador sufre el riesgo de ser rechazado, y por lo tanto no se efectuará la transmisión de imagen y no habrá retorno de la inversión.

H3: El ajuste percibido por parte del consumidor entre el patrocinador y el patrocinado tiene una influencia positiva en la actitud hacia el patrocinador.

## **4. Transferencia de imagen y éxito deportivo**

En el análisis de (Abreu Novais y Arcodia, 2013) se sugiere que el área del patrocinio deportivo ha seguido siempre la misma tendencia. La mayoría de los estudios se centran generalmente en grandes eventos multidisciplinarios que atraen a una gran cantidad de atención de los medios. Los autores señalan que es esencial un estudio de la transferencia de la imagen de marca en otros tipos de eventos (pequeños eventos unidisciplinarios) para comprender mejor el proceso y para evaluar si se produce en la misma forma que lo hace en los grandes eventos deportivos.

Se escogieron tres equipos deportivos pertenecientes a la categoría de fútbol (soccer) de la Asociación Nacional de Fútbol Profesional (ANFP) de Chile. Para la elección de las entidades deportivas se tuvo en cuenta la clasificación histórica y la repercusión social. En primer lugar,

se ordenaron los equipos por títulos conseguidos (nacionales, internacionales y de segunda categoría) y se calcularon las frecuencias. Se clasificaron como equipos ganadores, equipos competitivos y equipos supervivientes; más de diez títulos (tres equipos), de cuatro a diez títulos (siete equipos), y de uno a tres títulos (ocho equipos). Tres equipos resultaron distanciarse significativamente de la media (8,22) con más de 17 títulos (17, 22, y 44). El primer de ellos fue el Colo Colo. La Unión Española con diez títulos está situado aproximadamente sobre la media. Finalmente, el Ñublense con un título de segunda categoría cierra la elección.

Posteriormente se estableció una segunda clasificación en función del número de seguidores o hinchas que visitan los estadios de cada equipo. En una clasificación desde 1990 hasta el 2013 el Colo Colo ocupa el primer lugar con más de siete millones. La Unión Española se encuadra por debajo de la media y el Ñublense se encuentra en último lugar con menos de medio millón de visitantes.

Por último, se realizó un estudio de impacto de los equipos deportivos nacionales en las redes sociales (Twitter y Facebook son las redes sociales más frecuentadas en Chile). Al igual que en anteriores clasificaciones los resultados mostraron tres equipos con un mayor número de seguidores (más de 3.5 millones en Twitter). El Colo Colo entre ellos. Siete equipos con un número medio de 1.3 millones de seguidores. La Unión Española entre ellos. Y por último el Ñublense con menos de 0.4 millones de seguidores cerrando la lista.

Estos tres indicadores justifican la elección de los clubes en función del rendimiento deportivo y la repercusión social. Ambos índices coinciden.

## **5. Metodología**

### **5.1. Datos y muestra**

La muestra del equipo Colo-Colo es de 490 aficionados, del equipo Unión Española son 292 aficionados y de Ñublense son 200 aficionados. La aplicación de las encuestas contempla el desarrollo de la liga Chilena temporada 2013-2014, la cual se divide en dos semestres, campeonato de transición (primer semestre) y campeonato Petrobras apertura 2013-2014 (segundo semestre).

El periodo de encuestas comenzó en la última semana de octubre y terminó en diciembre del mismo año 2013. Por lo tanto las encuestas estuvieron repartidas en fases iniciales y finales del campeonato.

Para los tres equipos la muestra estuvo compuesta por un 75% de hombres con un rango de edad del 40% entre 31 y 40 años. El ingreso salarial estuvo muy distribuido con cinco rangos del 20% siendo el nivel más bajo el que mostraba un porcentaje inferior. El nivel educativo del 70% de la muestra fue superior al nivel medio o preuniversitario también para los tres equipos. La mitad de la muestra afirmó ser soltero. La muestra final es uniforme en cuanto a las variables sociodemográficas en función de los tres equipos.

### **5.2. Escalas de medida**

La escala para medir la actitud hacia el equipo de los individuos ha sido adaptada de Speed y Thompson (2000). Esta escala fue posteriormente utilizada por otros investigadores como por ejemplo, Martensen, Grønholdt, Bendtsen, y Jensen (2007) o Dhurup y Rabale (2012). ¿El equipo deportivo es muy importante para mí?. ¿Pienso en el equipo deportivo todo el tiempo?. ¿Veo los partidos del equipo deportivo siempre que puedo?.

Para la actitud hacia el patrocinador se ha traducido y adaptado escalas empleadas por autores en investigaciones anteriores como Dees et al. (2008), la cual previamente había sido adaptada de Quester y Thompson (2001), y usada en la investigación de Kutintara (2009). Preguntas utilizadas en la encuesta: en general los patrocinadores del equipo deportivo ¿me gustan?. En general los productos/servicios de los patrocinadores ¿son de calidad?. En general los productos/servicios de los patrocinadores ¿son mejores que los de otras marcas?. En general los patrocinadores del equipo deportivo ¿son marcas prestigiosas?

Para medir la intención de compra de los productos se adaptan las escalas de Smith, Graetz, y Westerbeek (2008), los cuales se basaron en los estudios previos de Speed y Thompson (2000) y empleada por Rodgers, (2004); Dees, Bennett, y Villegas (2008). Preguntas utilizadas en la encuesta: mi actitud general hacia la compra de productos/servicios de las empresas que patrocinan al equipo deportivo ¿es positiva?. ¿Usa productos/servicios de los patrocinadores del club?. ¿Probaría un producto o servicio nuevo de un patrocinador si lo veo en el evento?. ¿Prefiero los productos/servicios de un patrocinador del equipo a los de un no patrocinador?. ¿Estaría dispuesto a pagar más por una marca que apoya una causa que me importa?.

La congruencia ha sido medida mediante la adaptación de dos escalas en un ítem procedentes de Speed y Thompson (2000), y que posteriormente fue utilizada por Roy en el año (2011). Para evitar cualquier identificación con un determinado patrocinador específico, los ítems están redactados en referencia a los patrocinadores de forma genérica. ¿La imagen del equipo deportivo es congruente con sus patrocinadores?.

Para la medición de todas las variables se utiliza una escala Likert, muy de acuerdo/muy en desacuerdo de 1 a 7 puntos.

## **6. Resultados**

Se ha empleado el método de mínimos cuadrados parciales (PLS) en un modelo de ecuaciones estructurales (SEM). Para ello se empleó el paquete de software SmartPLS 2.0.M3 (Ringle, Wende, y Will, 2005) para evaluar tanto el modelo de medida como el modelo estructural.

Varias razones apoyan el uso de la técnica de PLS SEM en esta investigación. En primer lugar, PLS es una técnica SEM con base en el estudio de la varianza que se ha utilizado en la investigación previa (Hulland, 1999) y particularmente en el ámbito deportivo (Howat y Assaker, 2013).

En segundo lugar, ha sido recomendado el uso de PLS cuando el conocimiento teórico sobre un tema es escaso (Petter, Straub, y Rai, 2007). Este estudio examina la transmisión de imagen en equipos con heterogéneos éxitos deportivos y repercusión social. Abarca cuestiones de investigación que no han sido examinadas en la investigación previa, se revela el grado en que la teoría anterior es limitado y entonces la estimación PLS es adecuada.

Tercero, PLS funciona mejor con pequeñas muestras de datos como los empleados en este estudio en comparación con técnicas de SEM basados en la covarianza (Hulland, 1999). A pesar de su tamaño relativamente pequeño, la muestra supere el tamaño mínimo de la muestra necesario para garantizar un nivel adecuado de precisión y potencia estadística (Barclay, Higgins, y Thompson, 1995). Además, PLS es apropiado para esta investigación ya que puede manejar los constructos con solo unos pocos elementos indicadores, tan pocos como dos o incluso uno (Hair, Ringle, y Sarstedt, 2011).

### **6.1. Evaluación del modelo de medida**

En recomendación de Straub (1989) y Chin (2010), se sugiere probar el modelo de medida analizando la fiabilidad individual y de las escalas o consistencia interna, la validez convergente y discriminante.

Para evaluar la fiabilidad individual se procede a examinar las cargas o correlaciones simples de los indicadores sobre sus respectivas dimensiones. La carga estandarizada debe ser superior a 0,707 (Barclay et al., 1995). Este nivel mínimo en las correlaciones simples señala que más del 50% de la varianza del parámetro observado es compartida con la variable (Bollen, 1989). La tabla 1 muestra ciertos valores que no alcanzan el mínimo requerido, sin embargo, (Chin, 1998) señala que valores menores son aceptables para investigaciones exploratorias. No obstante, todas las cargas son significativas y próximas al valor esperado.

Para medir la fiabilidad de las escalas se utiliza la fiabilidad compuesta. Nunnally (2010) sugiere 0,7 como nivel mínimo para una fiabilidad aceptable. Todos los valores muestran valores superiores a los recomendados. Así también sucede para el alfa de Cronbach.

El procedimiento PLS, respecto a la validez convergente, nos permite evaluar el grado en que los ítems de una dimensión explican realmente la misma idea subyacente. Según Fornell y Larcker (1981) el valor de la varianza extraída (AVE) debería superar el valor 0,5. Todos los indicadores superan el umbral mínimo establecido.

TABLA 1  
Evaluación del modelo de medida

Modelo	Constructo	Alfa Cronbach	Fiabilidad compuesta	AVE	Cargas factoriales
Colo Colo	Act equipo	0.894	0.933	0.824	0.889*** - 0.925***
	Act patro	0.814	0.877	0.640	0.755*** - 0.821***
	Int comp	0.756	0.862	0.676	0.784*** - 0.876***
Union	Act equipo	0.813	0.866	0.686	0.677*** - 0.907***
	Act patro	0.800	0.867	0.621	0.692*** - 0.838***
	Int comp	0.802	0.871	0.629	0.745*** - 0.844***
Ñuble	Act equipo	0.886	0.927	0.810	0.879*** - 0.929***
	Act patro	0.814	0.874	0.636	0.753*** - 0.839***
	Int comp	0.826	0.899	0.757	0.598*** - 0.978***

Para evaluar la validez discriminante mediante PLS existen dos métodos: (a) comparar que la varianza media compartida entre un constructo y sus medidas es mayor que la varianza que dicho constructo comparte con los otros constructos del modelo (Barclay et al., 1995) y (b) evaluar que las correlaciones entre los constructos son más bajas que la raíz cuadrada de la AVE (Fornell y Larcker, 1981). Mediante ambos métodos se comprueba que ciertamente las escalas presentan validez discriminante (tabla 2 y 3).

### 6.2. Evaluación del modelo estructural

Para la evaluación del modelo estructural se recomienda comenzar por la evaluación del coeficiente de correlación múltiple al cuadrado ( $R^2$ ) (Castro, Carrión, y Salgueiro, 2007). Falk y Miller (1992) señalan que el valor recomendado debería ser superior a 0,1. Los índices mostrados en la tabla 4 superan los valores mínimos recomendados para estudios exploratorios.

### 6.3. Test de hipótesis

Se emplea la técnica de análisis bootstrap con 500 submuestras para estimar la significancia de los coeficientes estructurales (Chin, 1998). La tabla 4 muestra los resultados.

Según Chin (1998) los coeficientes path estandarizados se consideran significativos si adquieren cuanto menos un valor de 0,2, pero deberían alcanzar al menos un valor de 0,3 para ser económicamente significativos. En general, la evaluación indica un poder explicativo satisfactorio para el modelo estructural en los modelos Colo Colo y Unión Española. Sin embargo, para el modelo Ñublense no resulta significativa la relación o hipótesis H1 (Actitud hacia el equipo – Actitud hacia el patrocinador).

## 7. Conclusiones

### 7.1. Contribución teórica

Los objetivos del patrocinio deportivo han sido principalmente tres: mejorar la imagen de marca, aumentar las ventas y el reconocimiento (Grohs y Reisinger, 2014). Se ha demostrado que la imagen del patrocinado se transfiere al patrocinador en función de su ajuste percibido

(Gwinner y Eaton, 1999). Pero nunca antes se ha realizado un estudio sobre la influencia que el éxito deportivo tiene sobre la eficacia del patrocinio (Abreu Novais y Arcodia, 2013). Las entidades no disponen actualmente de información para valorar la eficacia del patrocinio en función del rendimiento deportivo. La necesidad del estudio es tanto académica como profesional.

Se presenta un modelo de transmisión de imagen para tres entidades deportivas de fútbol. Para la elección de los equipos se ha optado por clasificar el éxito o rendimiento deportivo como el resultado de la consecución de los campeonatos internacionales, de primera y segunda categoría. Adicionalmente, se clasificaron los equipos según su repercusión mediática. Para ello se tuvo en cuenta la hinchada o asistencia a los estadios y además, la repercusión social en las redes sociales. Las tres clasificaciones dieron resultados paritarios. Coincidió como el equipo más laureado el Colo Colo, que a su vez tenía mayor repercusión social e hinchada. Un segundo grupo de equipos tenían un éxito deportivo y repercusión social media, que se escogió como representante a la Unión Española. Por último, el Ñublense representa a los equipos con menos éxito deportivo, menor repercusión en redes sociales e hinchada.

En cuanto a las hipótesis, únicamente la H1 para el Ñublense resultó no significativa. La transmisión de imagen no funciona desde el equipo de fútbol hacia la marca patrocinadora.

La conclusión más relevante es que la actitud hacia el equipo deportivo (Ñublense) no influye en la actitud hacia el patrocinador. Sí afecta a la imagen del patrocinador en equipos más laureados y con mayor repercusión social. Pero la transmisión de imagen en esta competición deportiva particular no funciona en equipos de menor nivel deportivo. La explicación puede estar condicionada en varios sentidos. El concepto *basking in reflected glory* (BIRGing) fue propuesto por (Sloan, 1989). BIRGing es un autoreflejo cognitivo mediante el cual uno mismo siente el éxito de otro como suyo propio. El concepto tiene conexiones con la teoría de la identidad social (Abrams y Hogg, 2012). Es el conocimiento del individuo relativo a la pertenencia a ciertos grupos sociales y que tiene significado emocional y valor en la medida de su adhesión al grupo. Los equipos Colo Colo y Unión Española son ganadores y laureados. El sentido de pertenencia al grupo resulta positivo en la medida que el individuo necesita el éxito. Sin embargo, para equipos deportivos con escaso rendimiento deportivo, el concepto BIRGing no es aplicable. Los aficionados escasas veces pueden verse reflejados en el éxito. (Spinda, 2011) sugiere que los aficionados pueden escoger varios equipos, uno de ellos más ganador para dar más oportunidades a BIRGing. Entonces, si uno predice que su equipo favorito va a perder, hay menos probabilidad de identificarse con él por el miedo al fracaso. Esto apoya que una persona es más probable que participe en BIRGing si su imagen pública está altamente amenazada.

Diversos estudios han confirmado que la identificación con el equipo o evento influye positivamente en la actitud hacia el patrocinador. Pero según la teoría de la identidad social los individuos estarán menos identificados con el equipo perdedor. Entonces, no exteriorizan su actitud hacia el patrocinador. Por ejemplo, los aficionados del Ñublense no se identifican con con el equipo por el miedo a ser identificados a través de los patrocinadores como perdedores. Entonces dicha asociación patrocinado – patrocinador no sucede.

Por otra parte, la identificación con el patrocinador tiende a estar sesgada a favor de las marcas que ocupan un lugar destacado en el mercado (Pham y Johar, 2001). Las marcas con mayor valor apoyan a los equipos con mayor hinchada debido al coste del patrocinio. Aún así, el cuestionario fue construido con todas las marcas. Un nuevo estudio podría revelar la eficacia del patrocinio en función del valor de marca.

Por último, sería relevante conocer el motivo de asistencia y afición al equipo deportivo. Estas variables podría afectar a la actitud hacia el patrocinador y patrocinado. Según el estudio de las motivaciones de asistencia a los eventos deportivos (Alonso Dos Santos y Montoro Rios, 2014; Izzo et al., 2011; Kim y Trail, 2010) la socialización y la implicación con el deporte podrían ser las variables que explican que no se cumpla el proceso de transmisión de imagen en los equipos con menor éxito deportivo.

## 7.2. Implicaciones empresariales

La empresa debería establecer unos objetivos claros y definidos sobre el patrocinio para poder posteriormente medirlos. En Chile como en España por ejemplo, las empresas cuentan con beneficios fiscales por patrocinio deportivo. Si el objetivo del patrocinador es mejorar el valor o imagen de marca debería seleccionar equipos deportivos con mayor repercusión social y éxito deportivo. El patrocinador de Ñublense, Copelec Eléctrica, opera en situación de monopolio en la región de acción del equipo deportivo. Es decir, el gasto en patrocinio y la consecuente elección del patrocinado debe ser coherente con el objetivo del patrocinio. En este caso concreto, si el objetivo es reducir impuestos el objetivo del patrocinio es eficaz. Si el objetivo es aumentar la actitud hacia la marca no.

En segundo lugar, la congruencia efectivamente ha sido soportada como hipótesis para los tres modelos. La empresa patrocinadora, previamente a decidir si patrocinar un deporte, evento o equipo, deberá tener en cuenta el público objetivo al que quiere dirigirse, el mercado y los atributos asociados con el deporte, equipo o evento en particular. Se sugiere localizar patrocinados congruentes con el sector y región de actividad de la empresa. Así mismo con los valores intrínsecos de cada institución. En este sentido, las comunicaciones integradas de marketing pueden ayudar a establecer o fortalecer el vínculo entre el evento y el patrocinador (Grohs y Reisinger, 2014).

## 8. Limitaciones y futuras líneas de investigación

Aunque la transferencia de imágenes y la congruencia es un modelo válido para medir la eficacia del patrocinio (Abreu Novais y Arcodia, 2013; Grohs y Reisinger, 2005; Smith, 2004), el ajuste funcional entre patrocinado y patrocinador no necesariamente debe ser tomada en cuenta. Un patrocinador puede elegir un deporte cuya imagen no se corresponde con la percibida por los consumidores y, de hecho, asociar eficazmente la marca con el deporte como ha sucedido en diversos casos (tómese de ejemplo McDonald's con los Juegos Olímpicos o Carlsberg con la UEFA Champions League) a costa, eso sí, de un mayor esfuerzo y empleo de recursos.

La implicación con el deporte y con el equipo además de la identificación deben ser variables a incluir en posteriores investigaciones con el objetivo de esclarecer los motivos por los que la transmisión de la actitud no es producida en equipos de inferior nivel deportivo. Esto podría determinar como afectan tanto a la congruencia como al proceso de transmisión de imagen.

Sería interesante para posteriores trabajos valorar el motivo por el cual el individuo pertenece a un equipo u a otro según su nivel deportivo. Según investigaciones anteriores sobre motivación (Alonso Dos Santos y Montoro Rios, 2014) la conexión con el entorno y la socialización son importantes motivos de asistencia a los espectáculos deportivos de fútbol.

En general, este estudio contribuye significativamente a la comprensión de la medición de la eficacia del patrocinio. Sin embargo, investigaciones confirmatorias deberían llevarse a cabo en otras regiones, culturas y disciplinas deportivas para confirmar los resultados.

## RESUMEN

*This research analyzes the impact of trust and contracts on knowledge exchange between industrial buyers and suppliers and its effect on innovation. From a survey to 202 European machine tool firms acting as buyers and sellers, we propose and evaluate a structural equation model. Results confirm the complementary thesis, and show that firms that develop high levels of trust also make a more intensive use of contracts. Those firms with both high levels of trust and contracts develop more knowledge exchange routines and reinforce their innovation capability based on buyer-supplier interaction. These results, and mainly the fact that contracts and trust are used as complements, can be valid for managing interfirm governance mechanisms in other industries with similar characteristics (long term investments, high specificity, high level of investment) and in other regions with legal institutions that are similarly effective for regulating business activity.*

Trust; Contracts; Knowledge Exchange; Innovation; Machine tool industry

## 1. Introducción

Today, the idea that innovation has become vital for growth and survival is commonsense. Innovation involves the application of significant new technologies in order to find new market opportunities (Tushman and Nadler, 1986, cited by Li et al. 2009), bringing solutions to same or different problems.

Along with the problems or needs, knowledge is a necessary ingredient for innovation. Customers and suppliers are an important source for identifying problems and gaining knowledge to solve them, in other words, to innovate. This is particularly true in relationships among the members of the supply chain, or the marketing channel, where firms commonly offer complex products and services very closely tailored to other firms' circumstances (XXX & YYY 2010, 2013). In the case of relationships with suppliers, these can have an important positive influence on the buyer's innovative capacity and its ability to offer high quality and value-added products down the supply chain (Dyer and Nobeoka 2000, Bessant 2004, Wagner 2006). At the same time, collaboration relationships with customer firms can also be a source of creativity and new ideas, as well as an effective way of ensuring loyalty to the seller. In this context there is a need to configure and maintain long-term relationships (Anderson and Naurus 1990, Bidault and Castello 2009, Gila 2009, Grönroos 1983, Jap and Ganesan 2000, Noordevier et al. 1990) and to find mechanisms for there to be an effective diffusion of needs and knowledge among customers and suppliers.

Different studies have brought to light the positive relationship between *Knowledge sharing* and *Innovation performance* for the members of the supply chain (XXX & YYY, 2010, 2013, Li et al. 2009, Lin et al. 2012, Tsai 2009) pointing to the idea that firms that share more knowledge tend to benefit from more valuable innovations. However, sharing information can also bring risks, to the extent that it can lead to a loss of exclusive knowledge that is fundamental for the firm. Therefore, of particular importance are the means organizations dispose of in order to ensure that these actions of knowledge sharing do help them to gain competitive edge without turning against them. Contracts and trust are two well-known instruments of guarantee and control to this end (Williamson, 1985, Dyer and Singh, 1998), ensuring the transaction or interchange of knowledge in this case.

However, current research in the field has not reached a consensus either on which of these two mechanisms is more adequate for its use in the context of engendering innovation in the customer-supplier realm, *or* on how they have to be employed. Does increasing the degree of contract formalization delimiting firms' innovation compromise have an influence on innovation performance? Is it the same effect for an increase in trust? Are both trust and the use of contracts mutually exclusive with respect to the aim of improving innovation performance, or do they reinforce? How do they combine in their mediating role on the effect of knowledge sharing on innovation? These are the questions this study aims to respond, in the context of innovations from the customer-supplier relationships among European machine-tool manufacturers.

In order to accomplish our aim, we have gathered data from a sample of 202 European firms in the machine tool industry. In this industry, customers and providers are the main source of innovation (Carlsson, 1995; Chuma, 2001; Lissoni, 2001, Lissoni and Pagani, 2003; Chen, 2006; Otero, 2010), but those same buyers and suppliers are also a channel of potential knowledge spill-over to competitors (Chen, 2006; Chuma, 2001; Lissoni and Pagani, 2003; Otero, 2010; Wengel and Shapira, 2004). This makes this industry particularly interesting for the research of exchange governance mechanisms.

The paper is organized as follows. After this introduction, we set up the hypothesis based on a review of the literature on trust and contracts and their impact on knowledge exchange and innovation. In the third section, we explain the methodology followed in our study, and the main results of it. The fourth section presents our conclusions and looks at the theoretical and

practical implications of this research. We conclude by highlighting the limitations of the study and the areas that remain open for further research.

## **2. Literature framework**

### ***2.1. Knowledge-sharing routines and innovation***

Dyer and Singh (1998) define knowledge-sharing routines among firms as regular patterns of inter-firm relations that permit the transfer, recombination and creation of specialized knowledge. With regard to customer-supplier relationships, in buying or selling complex assets or services, both firms develop capabilities to absorb mutual knowledge. In this form of inter-organizational learning, a firm acquires the capacity to recognize and assimilate valid knowledge for its interests from its relationship partner (Dyer and Singh, 1998).

Partners in dyads with unique fine-grained information exchange may gain a competitive edge by elevating their cognitive capacities and information processing abilities from those of bounded rationality to expert rationality (Gulati and Sitch, 2007; Uzzi, 1997). As innovation is an uncertain process lacking reliable information about latent needs, suppliers can benefit from customer innovation knowledge to generate novel ideas early in the process (Bonner and Walker 2004; Noordhoff *et al.* 2011). Intense information and knowledge-sharing between buyers and suppliers increases the probability of discovering new ways to enhance performance (Dyer 1997) and can also be a key factor for process innovations (Lin 2007; MacDuffie and Helper 1997).

We may therefore infer that the fact of sharing and exploiting knowledge is linked to its necessary condition of transfer, requiring efforts to be made and resources to be dedicated — for example, smooth and easy communication, interlocutors who can be asked for or given information, access to technical information that can be given by the employees of the customer (supplier) to the supplier (customer), or the fact of using technical resources for communication that are compatible with the other party's. From these efforts to share information and gain knowledge, greater product innovation performance can be anticipated, as expressed in the following hypothesis:

H1: A high degree of knowledge-sharing effort in the customer-supplier relationship is positively related to greater product innovation performance.

### ***2.2. Trust, knowledge exchange and innovation performance***

The literature on business-to-business relationships highlights numerous ways in which trust enhances buyers and suppliers' levels of performance in exchange relationships. Considering the goal of our research, we are going to focus on the literature that links trust, knowledge exchange and innovation.

Trust between buyer and supplier can be defined as the expectation that the other part may be relied upon to fulfil its obligations, to behave predictably, and to act and negotiate fairly even when the possibility of opportunism is present (Zaheer, McEvily, and Perrone, 1998, p.143), irrespective of the ability to monitor or control the other party (Mayer *et al.* 1995; Joshi and Stump, 1999)

When buyers and suppliers have trust in one another, they are more willing to engage in open communications and share information (Jap, 1999; Morgan and Hunt, 1994; Villena *et al.*, 2011; Zaheer *et al.* 1998). Effective learning between partners is facilitated (Gulati, 1995; Lane *et al.* 2001; Selnes and Sallis, 2003) and innovation performance is enhanced (Wang *et al.* 2011)

Trust influences not only the extent of knowledge exchanged, but also the kind of knowledge transferred between parties. When buyers and suppliers believe they will not be harmed or put at risk by actions of the other party, they are more likely to share fine-grained tacit knowledge (Dyer and Singh, 1998; Uzzi, 1997) and even organization specific, proprietary and sensitive information (Uzzi, 1997; Zaheer et al. 1998; Carey et al, 2011; Selnes and Sallis, 2003). Trust can also help to evaluate and better understand the knowledge exchanged between buyers and suppliers (Lane et al. 2001), as “social relationship imbues information with veracity and meaning beyond its face value” (Uzzi, 1997).

In long term relationships, such as those between buyers and suppliers in our sample, uncertainty and risks in terms of the final results and the resources needed are high. Trust plays a critical role in the development of those long term relationships, covering expectations about what the other part will do in circumstances that are very difficult to cover in a written contract (Blomqvist et al, 2005). In addition, disagreements might occur in different moments of long term relationships. High levels of trust enable both parties to find joint problem-solving arrangements and work out problems “on the fly” (Uzzi, 1997); to have the freedom to disagree, find productive resolutions to disagreements and produce novel insights from shared ideas (Moorman et al., 1992; Morgan and Hunt, 1994).

As regards to business performance and innovativeness, it has been found that there is a strong positive relation between interorganizational trust and performance (Wang *et al.* 2011, Zaheer *et al.* 1998), suggesting that the former intervenes to smooth negotiation costs, reducing the transaction costs of interfirm exchange (Zaheer *et al.* 1998), and enhancing innovation (Molina-Morales *et al.* 2011). When environment uncertainty is high, it is trust instead of contracts, the governance mechanism that should be used to manage the supply chain relationship (Wang *et al.* 2011). However, it is more clear in cases of high partner behaviour uncertainty, than of environmental uncertainty, where the effect of trust on alliance performance is particularly positive (Krishnan, Martin and Noorderhaven (2006).

The role of trust acting either as an antecedent or as a mediation effect of knowledge exchange has been profusely studied in the Business-to-Business literature. However, previous research stressing on the mediation role of trust *from* knowledge exchange *to* innovation performance has been scarce. Trust as a resulting factor has been more commonly studied in the consumer research phenomena, such as the case of social word of mouth in e-commerce and social commerce (Hajli et al. 2013), in organization and human resource management (Van Zolingen et al. 2006), or among information technology R&D team members (Wang et al. 2006), to mention but a few examples.

Trust can develop from knowledge mutually gained in the relationship, exercised by means of “iterative cycles of dialogue” (Ballantyne 2004). In the supplier-manufacturer relationship, the establishment of embedded ties enables de creation of informal coordination mechanisms with the resulting elements of trust, commitment or joint problem solving (Huang and Chang, 2008).

In long-term buyer-seller relationships characterized by a high level of servicing, it is plausible to expect a non-recursive relation where not only trust enhances the exchange of knowledge, but also this variable acts positively on trust. Therefore, our hypotheses on trust as a variable that is positively linked to knowledge exchange and innovation performance, as described above, are as follows:

H2a. In a customer-supplier relationship, a greater presence of knowledge-sharing routines is positively associated with a higher degree of trust.

H2b. In a customer-supplier relationship, a greater presence of trust is associated with a higher degree of innovation performance.

The linkage of these two hypotheses allows us to account for the mediation effect (Baron and Kenny, 1986; Cheung, 2007; Hayes, 2013) of factor trust in the relation between knowledge sharing and innovation performance. Hence the following hypothesis:

H2c. The effect of knowledge-sharing routines on innovation performance is positively mediated by trust.

### ***2.3. Contracts, knowledge exchange and innovation performance***

Empirical evidence with respect to the sign of the linkages between the use of contracts, knowledge exchange and innovation has been not found conclusive. On the one hand, it has been argued that contracts help delineate the rights and obligations of buyers and suppliers and reduce the risk of opportunism. As a consequence, contracts can improve coordination and commitment of partners (Jap and Ganesan, 2000), enhance their cooperation (Sivadas and Dwyer, 2000), encourage the discussion and documentation of unspoken assumptions (Cannon et al., 2000), bring a level of transparency to information exchanges (Noordhoff et al. 2011), clarify expectations and obligations relating to innovation performance, enhancing buyer firms' innovation performance and cost improvement (Carey et al. 2011) and, as a consequence, facilitate knowledge transfer and improve innovation performance (Wang et al. 2011).

According to Noordhoff et al. (2011) contracts between firms often foresee and establish future communication activities completed at key points in the innovation process. This means that valuable information that may have been overlooked in a less formalized relationship is included and that information is more structured and refined when shared (Noordhoff et al. 2011). Formalization should also reduce trivial and repetitive informal flows of information that feed a sense of redundancy (Noordhoff et al. 2011).

Contracts also provide a way to manage conflict during knowledge transfer. Thus, the costs and risks associated with knowledge exchange and with collaborative innovation across the supply chain are reduced (Wang et al. 2011).

On the other hand, too-detailed and complex contracts between buyers and suppliers can be as harmful to the knowledge transfer process as too-little detailed ones (Wang et al., 2011). Over-detailed, explicit and complex contracts may provide little flexibility to both parties (Jap and Ganesan, 2000), hamper information exchange between the manufacturer and its suppliers in a limited area because of clear, contractual specification of what is and is not allowed (Wang et al. 2011) and limit the exchange of informal knowledge (Noordhoff et al. 2011). Furthermore, because explicit contracts signal to the supplier that the buyer does not trust it, the supplier is likely to be wary of the buyer, which results in lower levels of commitment (Jap and Ganesan, 2000) and lower levels of tacit knowledge exchange (Wang et al. 2011). Hence, the excessive use of contracts in a manufacturer–supplier relationship may hinder knowledge transfer and collaborative innovation (Wang et al. 2011).

Traditionally, previous studies like these here discussed have accounted for the causal link of the use of contracts on knowledge exchange. However, even the chronological relation between factors in order to infer causation does not stand very clearly in the case of relationships lasting for long time on a repetitive basis, or those entailing a selling operation of a complex product requiring a continuous revision of clauses and further corrections in a contract. Given these positive and negative effects cited by the literature, our hypotheses on the links between contracts and knowledge exchange are as follows:

H3a. A more intensive level of exchange of knowledge is linked to a greater use of contracts that set out the terms of the relationship between buyers and suppliers.

H3b. A more intensive level of exchange of knowledge is linked to a lower use of contracts that set out the terms of the relationship between buyers and suppliers.

H3c. The intensity in the use of contracts is linked to a greater presence of innovation performance.

H3d. The intensity in the use of contracts is linked to a lower presence of innovation performance.

Finally, as it was previously reasoned for the case of hypothesis H2c with respect to H2a and H2b, the study of a serially combined link of knowledge on the use of contracts and from these on innovation performance, is equivalent to a mediation role of the second in the relation between the two other factors. Therefore, our mediation effect hypotheses state as follows:

H3e. The effect of knowledge-sharing routines on innovation performance is positively mediated by trust.

H3f. The effect of knowledge-sharing routines on innovation performance is negatively mediated by trust.

#### ***2.4. Contracts and trust. Do they substitute or complement each other?***

The relation between trust and contracts has been viewed from two different perspectives: as substitutes or complements. A substitution view argues that trust reduces the need for formal contracts (Gulati, 1995; Ghoshal and Moran, 1996; Dyer and Singh, 1998; Uzzi, 1997; Zaheer et al., 1998; Adler, 2001; Wuyts and Geyskens, 2005; Yang et al. 2011). Proponents of the substitution point of view argue that firms should not apply trust and contracts simultaneously, since both strategies are costly in terms of time and effort (Wuyts and Geyskens, 2005) and it may be redundant to invest in two strategies that serve the same goal of reducing opportunistic behaviour (Dyer & Singh, 1998). Thus, when there are high levels of trust between buyers and suppliers it is unnecessary to specify or monitor contractual clauses (Dyer & Singh, 1998) and it is possible to reduce transaction costs by “replacing contracts with handshakes” (Adler, 2001). Also, it is argued that exchange partners mutually adjust their contractual obligations to changes in the external environment by means of “bilateral expectations of willingness to make adaptations”, rather than keeping them to original terms (Heide and John, 1992).

Some scholars even argue that contracts and trust are not only redundant, but counter-effective to each other. Trying to reduce opportunistic behaviour drafting too detailed contracts, with coercive terms, clauses and sanctions may be interpreted as a signal of distrust (Jap and Ganesan 2000). Ghoshal and Moran (1996) argue that formal control signals that parties are neither trusted nor trustworthy to behave appropriately without such controls, leading to distrust that breeds more distrust and “pathological spiralling relationships”. Similarly, high levels of trust and cooperation between buyers and suppliers can undermine the effectiveness of explicit contracts, because parties can be reluctant to severely enforced contractual details (Antia and Frazier 2001).

By comparison, many researchers propose a complementary effect of trust and contracts (Ring and van de Ben, 1994; Cannon et al, 2000; Poppo and Zenger, 2002; Luo, 2002; Reuer and Ariño, 2007; Liu et al. 2009; Carey et al. 2011). Because of their formal specification of a long-term commitment to exchange, and given that they reduce the risk of opportunistic behaviour and promote expectations that the other party will behave cooperatively, contracts contribute to trust development, and in a reverse complementary relation, trust enables the refinement of contracts (Poppo and Zenger, 2002). Secondly, it has been found that previous cooperation between parties, before forming a joint venture, not only breeds trust, but also bolsters contractual adaptability and contract completeness, nurturing cooperation between the same partners (Luo, 2002). When both contracts and trust are used jointly, relationship performance improves more significantly and opportunism is more effectively restrained than when used separately (Liu 2009). There is also empirical evidence showing that, by virtue of clarifying obligations and expectations of the parties, contractual agreements help ensure the continuity of the exchange when buyers and suppliers share relational norms (Cannon et al. 2000). Lastly, it has been found that contract enforcements help to ease movements of buyers into exchanges with new sellers, reducing the hazards of initiating new exchanges, particularly in situations of high environmental uncertainty about encountering the optimal exchange partners (Lazzarini et al. 2008)

The coexistence of empirical studies that support opposite hypotheses of the joint effect of contracts and trust is explained, to a great extent, by the fact that trust and contracts play different roles, and are not equally effective for regulating business activities in the different industries and regions where prior research has been conducted. For example, Yang *et al.* (2011) warn that the generalization of their results supporting the substitution view was not possible in their study, given that these are influenced by the Chinese culture and a rather ineffective legal system. Given that the sectorial and cultural context in which buyers and suppliers are embedded influence the effectiveness of trust and contracts as governing mechanisms, we consider that research to test the complementary or substitute views should focus on key regional industries.

In summary, there appear to be different but equally logical arguments for interpreting the seemingly contradictions that have been found in the joint effect of contracts and trust, namely the complexity of contractual provisions, as well as sectorial or regional factors. Therefore, in order to find out which of those two views prevail, we advance the two following hypotheses:

H4a. The intensity in the use of contracts is linked to a greater presence of trust.

H4b. The intensity in the use of contracts is linked to a lower presence of trust.

The proposed hypotheses are illustrated as follows:

FIGURE 1  
Conceptual framework

In addition to the formulated hypotheses, the illustrated model may point out to all the indirect effects (Hayes, 2013), with both mutual trust and the use of contracts intervening as mediators of the relation between the exchange of knowledge and innovation performance. Two of these indirect relations are set by hypotheses H<sub>2c</sub>, and H<sub>3e</sub> or H<sub>3f</sub> but also, the adjusted results (in table 5) consider explicitly the mediation effect of trust in the influence from contracts to innovation performance.

### 3. Empirical Study

#### 3.1. Definition of the population and sample selected

The empirical study was conducted on a sample group of European companies from the Division 28: “Manufacture of machinery and equipment not elsewhere classified”, groups 28.4

“Manufacture of metal forming machinery and machine tools”, and 28.9 “Manufacture of other special purpose machinery”, according to the list of codes from NACE Rev. 2 (2006)<sup>1</sup>.

The information was gathered by means of telephone interviews with sales, production or management representatives. These were conducted between May and July 2010 by an external firm hired for the purpose. The sampling framework consisted of a list of companies from the two aforementioned sub-industries, drawn up using Bureau van Dijk's AMADEUS database, valid to March 2010. In order to attain a greater level of robustness in the model and confirm measurement invariance and sameness of results both in the supply and the distribution channels, we divided the total sample in two approximately equal subsamples consisting of buyer and seller firms of machinery. The profile of contacted managers resulted from a respondent election criterion depending on the selection of a company acting as a buyer or a seller firm of machinery equipment or machinery parts. Respondents were asked to focus on a particular relationship with a selling (or buying) firm, preferably from a recent buying (or selling) operation, consisting of the transaction of a machine or a fixed asset which features some sort of innovation *due at least in part to the relationship with that particular client or supplier*. Table 1 describes the main features of the sample gathered as regards the relationship role (buyer or seller firm), country, years of relationship, and number of employees.

TABLE 1  
Descriptive values obtained from the sample

Variable		Result
<b>Relationship role</b>	As sellers	97
	As buyers	105
<b>Years of relationship</b>	Since 2008	5.0%
	Since 2006-2007	4.5%
	Since 2003-2005	11.3%
	Since 2000-2002	17.3%
	Since before 2000	61.9%
<b>Industries with which they are mainly involved</b>	Industrial equipment and machine industry in general	35.3%
	Motor and motor parts industry	11.3%
	Dies and moulds	6.0%
	Food industry	5.3%
	Textile industry	4.0%
	Aero-space construction	2.3%
	Wood	2.3%
	Plastic materials	1.3%
	Other	32.2%
<b>Country</b>	Germany	73

	UK	7
	Austria	5
	Finland	4
<b>Company size by No.of employees</b>	<i>Small</i> : Less than 100	95
	<i>Large</i> : Equal or more than 100	107

### 3.2. Preparation and testing of the questionnaire

<sup>1</sup> Regulation (EC) No 1893/2006 of the European Parliament and of the Council of 20 December 2006 establishing the statistical classification of economic activities NACE Revision 2 and amending Council Regulation (EEC) No 3037/90 as well as certain EC Regulations on specific statistical domains. Official Journal of the European Union, 30.12.2006.

In the case of *Product innovation performance*, we formed a scale based on Gemünden, Ritter and Heydebreck (1996), Ritter and Gemünden (2004) and Salomo, Weise and Gemünden (2007). For the case of *Knowledge-sharing routines*, we drew on the original ideas from Dyer and Singh (1998), Dyer and Nobeoka (2000) —although these two seminal works do not propose scales of measurement. We drew on Song et al.’s (2005) concept of *Knowledge application*. From this theoretical basis, we drew up an initial proposal of items, with the collaboration of a group of 26 teachers and PhD students. The improved proposals were then successively subjected to the judgment of two different research groups. This allowed us to improve and refine the initial list of items, leaving an initial number of 5 items.

To measure the *Trust* factor, we took the scale developed by Jap (1999), which she calls as *Beliefs in Interpersonal Trustworthiness*. For the case of the construct *Contracts*, we drew on Cannon et al. (2000)’s *Legal Bonds* factor. The measurement scales were devised in order to be interpreted correspondingly depending on whether the interviewed firm was the selling or the buying agent in a machine-tool selling operation. In each question, the alleged effects of the cited aspect focused either on the respondent’s own firm (i.e. the selling or buying part), or on the relationship as a whole.

### 3.3. Test of the measurement model

Table 2 shows the reliability measures of the items that were finally taken for the measurement model. Factor loadings, Cronbach’s Alpha, average variance extracted (AVE) and construct reliability measures are extracted with discrete to good values depending on the factor. For the case of the Knowledge-sharing factor, neither the Cronbach’s alpha minimum mark of 0.70, recommended by Nunnally and Bernstein (1994), nor Fornell and Larcker’s (1981) recommended minimum measurement of 0.50 for the average variances extracted (AVE), and of 0.70 for the composite reliability are reached. However, the Anderson and Gerbing’s (1988) Chi-square difference test result indicates that there is discriminant validity among the factors, as general convergence results obtained from setting the highest correlation to 1 give an adjusted result which is worse than that from the obtained correlation. Also, Anderson and Gerbing (1988) confidence interval test for the bivariate factor correlations do not include the value of 1 in any of their confidence intervals (Table 3, lower left part). Finally, the square roots from any AVE value obtained (Table 3, principal diagonal values) give values that are higher than any correlation from their corresponding row or column (Table 3, upper right part). Therefore, convergent and discriminant validity among the obtained factors is ascertained.

TABLE 2  
Adjustment results of factors used

	Standzd. Loadings	Cronbach’s alpha	AVE	Comp. reliability
<b>Innovation performance</b>				
<b>INP1:</b> Thanks to the innovations incorporated, the product sold to this customer/purchased from this supplier allows us to reach exceptional qualities or utilities in the sector.	0.723

Notes: \*p , 0.05; \*\*p , 0.01; \*\*\*p , 0.001. Diagonal represents the square root of the average variance extracted; above-diagonal values are factor correlations, and below diagonal values are the confidence intervals of factor correlations.

Our determination to obtain a robust resulting model led us to its application both in relationships with respect to suppliers, from a buying firm's point of view, and relationships with respect to buyers, from a seller firm's perspective. If a measurement scale is to be used in different subpopulations as is the case, it has to ensure that the observed variables or scales are invariant across populations (Mellenbergh 1989, Meredith 1993). There are three increasingly restrictive levels of measurement invariance, namely, weak measurement invariance, strong measurement invariance, and strict measurement invariance (Meredith 1993).

According to some references (Byrne, 1989; Byrne, 2006, p.241-246; Hair et al. 2006, p.823; Muthén & Christofferson 1981), weak measurement invariance is held if equality of factor loadings is ascertained for at least two items per factor. As regards the case of the used scales, the results of the incremental Chi-square values obtained ascertain the non-significance in the general adjustment Chi-square value due to the restriction of equal factor loadings between seller and buyer firms (Table 4). This means that weak measurement invariance between the buyer and the seller sub-samples is ascertained.

### 3.4. Results

We used structural equation modelling to test the hypotheses of the proposed model as set in Figure 1. The results of these contrasts are summarized in Table 5. Hypotheses H<sub>1</sub> to H<sub>2b</sub>, H<sub>3a</sub> to H<sub>3d</sub> and H<sub>4a</sub> to H<sub>4b</sub> are assessed by means of the decomposition of total effects into the direct effects of their respective antecedent over its consequent. Hypotheses H<sub>2c</sub>, H<sub>3e</sub> and H<sub>3f</sub>, and lines (1) to (3) contain all the possible indirect effects existing among the factors from the model<sup>2</sup>.

Overall, the obtained regression coefficients explaining the hypotheses do not vary from the total sample to the buying and the selling firm groups. Results in detail show, firstly, that there is a positive significant direct relation between the sharing of knowledge and innovation performance, supporting hypothesis H<sub>1</sub>. Also, there is a positive significant relation between knowledge sharing and mutual trust, meaning that hypothesis H<sub>2a</sub> is supported. Thirdly, we found that there is a significant positive relation between trust and innovation performance. Therefore, hypothesis H<sub>2b</sub> is also supported.

The proposed model also shows to full extent the mediation effects of both trust and the use of contracts in the relationship between knowledge exchange and innovation performance. An interesting interpretation of these relations is found analyzing the mediating role of trust, formalized in hypothesis H<sub>2c</sub>. In particular, for the cases of the total sample, and the selling companies subsample, this mediation effect is significantly positive<sup>3</sup>, meaning that interfirm trust accounts, albeit partially, for the positive relation existing between knowledge-sharing and innovation performance. This positive sign in the mediation effect is also ascertained for the case of buying firms, albeit it falls short of significance.

Contrary to the reasoning that we put forward in hypotheses H<sub>3c</sub> and H<sub>3d</sub>, in any case the use of contracts does not seem to have any significant effect, positive or negative, on innovation performance. Therefore, none of these two alternative hypotheses is supported. On the contrary, a more intensive level in the exchange of knowledge seems to be positively related to a higher level in the use of contracts, as posed in hypothesis H<sub>3a</sub>. This result holds only in the case of the whole sample, although it is also almost statistically significant at 5% in the cases of the buying and the selling sub-samples.

A more complete idea on this relation is given by the mediation role of contracts between knowledge sharing and trust, as seen in line (2). Again, the regression slope of this indirect effect is significantly positive in the case of the total sample, meaning that a significant amount in the positive effect of knowledge exchange on trust is due to the use of contracts. However, contracts seem to show a negative, albeit non-significant, mediating role in the relation between knowledge sharing and innovation performance. Along with the result from hypotheses H<sub>3c</sub> and H<sub>3d</sub>, and in combination with the results from its relation with trust, it seems that the role of contracts is a dual one, positively related with trust and the exchange of knowledge, on the one hand, but with a negative, although non-significant effect on innovation performance, on the other.

---

<sup>2</sup> Note: However, an important limitation of this procedure is that there could be non-linear effects among factors, such as the case of an inverted 'U'-shaped relation between the use of contracts and innovation performance, in which both too little or too detailed contractual terms correspond to low levels of innovation performance (Wang et al. 2011). The same could happen to the level of use in contracts with respect to knowledge sharing. In this respect, we have to mention that we have also examined the effect of any possible quadratic effect of factor contracts, or a non-linear relation of these with knowledge sharing or with trust, finding no significant effects. These results are not shown here for brevity reasons.

<sup>3</sup> In the case of buying companies, it is positive with a significance level of 8.1% .

## 4. Discussion

The obtained results do not seem to back the idea of contracts and trust as alternative customer-supplier relationship governance mechanisms. On the contrary, their relation seems to be in accordance with the literature linking both as complementary (Ring and van de Ben, 1994; Cannon et al, 2000; Poppo and Zenger, 2002; Luo, 2002; Reuer and Ariño, 2007; Liu et al. 2009; Carey et al. 2011). Both elements perform different roles under the general aim of achieving relationship governance. From these results, it is plausible to understand, on the one hand, that contracts are a necessary ingredient for the development of trust. But on the other hand, only trust does exert a positive influence on innovation performance. The specification of the relationship's mutual obligations under a contract favors mutual trust and relates positively with the exchange of knowledge between the parties, but is not on its own an antecedent factor contributing in a direct manner on innovation performance. For such an effect, it is necessary to bolster mutual trust in the relationship.

Secondly, it must be stated that the high level of correlation obtained between trust and contracts could lead us to suspect that there is a positive and significant interaction effect between both constructs in their mutual effect on innovation performance (Baron & Kenny, 1986, Hayes 2012). In particular, we must clear that this possibility was empirically checked and discarded<sup>4</sup>

## 5. Conclusions

Up to the present, the study of the roles of trust and party enforcement mechanisms (i.e., contracts) in relationship governance has brought interpretations of different sign. The here presented empirical analysis brings more clarity to the nature of the mutual relationship between these two factors and their individual and shared mediation effects on the causal link existing from knowledge sharing to innovation performance. A clear conclusion from these results lays in the fact that companies should propitiate both the use of contracts and mutual trust in the relation, and discard the idea that the use of one undermines the other.

Thus, the positive relation between these two factors is confirmed. Trust within the relation mediates partial but significantly in a positive in the linear effect from knowledge-sharing to innovation performance. Therefore, this means that a relationship based on trust is not simply necessary, but rather, inherent, for the exchange of relevant information and knowledge to take place.

It is not the same case for the use of contracts. Although the use of contracts seems to have a positive relation as a consequent factor of knowledge sharing and very specially, as an antecedent of trust, our results show that contracts by themselves do not act as a stimulus for innovation performance to take place. Rather, it is only trust the factor that seems to have a positive effect on it. Therefore, companies willing to improve their innovation capabilities from working out the relationship will have to, first, use contracts with the aim of providing guarantees for trust to develop, and second, cultivate trust within the relation in order to favor the positive effect that the exchange of valuable information and knowledge bring on innovation performance.

Last but not least, these conclusions are obtained from even more robust relations, with the evidence of sameness both in the case of buying firms with respect to their sellers, and in the case of selling firms. Traditionally, previous research has been solely based either from the perspective of the selling firms or from that of the buying ones. To our best knowledge there is no other empirical research in the literature confirming the hypothesized relations among the analyzed factors using simultaneously two subsamples with selling and buying firms.

---

<sup>4</sup> On this respect, see the second footnote.

## **6. Limitations and implications for future analysis**

This empirical study also has some limitations that is necessary to mention in order to advance in the future. Firstly, we have taken into our sample only companies belonging to the machine-tool and related industries. This industry is particularly characterized by relations of a very long term basis, between companies demanding or producing complex tailor-made products for which servicing becomes capital. Also, these relations tend to span through the producing life of the machine or installation. It is also a peculiar sector in terms of the web of relations in the form of weak ties (Granovetter 1973) downwards in the value-adding process, upwards along the supply chain, and horizontally with other sets of agents belonging to the industrial district in which the company is located (Marshall, 1890). In this context, not only trust but also other elements contributing to the government of the relationship, such as the reputation or the word-of-mouth, become also very relevant. Future studies comparatively incorporating these effects among different industries should be accomplished.

Another limitation that we faced in the empirical study was during the validation process of the measurement scales. The condition of weak measurement invariance across the two used populations (Mellenbergh 1989, Meredith 1993) compelled us to discard a number of items to a minimum of two for the case of the constructs of innovation performance and trust (Table 2).

Finally, it must be pointed out that the interrelations among the here analyzed factors and other ones that have been discarded, tend to evolve in a dynamic process usually spanning a number of years. A cross-sectional study as the one here explained can only show some of these relations in a very limited and static manner. It is necessary to point out the abovementioned fact that the order of causality in some of the relations set forward in the model is an important aspect that we think it cannot be fully ascertained in a cross-sectional empirical analysis for the case of long-standing buyer-seller relations. In particular, for our study, we assumed that after a long period of time, it becomes difficult to distinguish the direction of causality between knowledge-sharing and the use of contracts, or between the latter and trust. Nevertheless, we could obtain significant slopes, exclusively in the form of recursive effects. Maybe an empirical analysis on a lon-sectional basis could bring more light to the true relations among these factors.

## RESUMEN

*La capacidad de absorción constituye un concepto clave para la asimilación y explotación del conocimiento externo que los grupos de I+D y las empresas obtienen de su interacción mutua. En el tejido empresarial español, caracterizado por la fuerte presencia de pymes, se revela especialmente interesante esta colaboración interorganizativa para la generación y difusión de nuevo conocimiento. Este trabajo analiza empíricamente el efecto de la capacidad de absorción de los grupos de investigación sobre su capacidad para crear productos y generar conocimiento para la agricultura, a partir del establecimiento de proyectos de investigación con empresas privadas, moderado todo ello por el carácter tácito del conocimiento. El escenario empírico utilizado es el del clúster agroindustrial hortícola del sudeste español. Los resultados evidencian diferencias en cuanto al desempeño de los proyectos de investigación implementados para las empresas y los grupos de investigación participantes.*

## Palabras clave:

Transferencia de conocimiento, Capacidad de absorción, Carácter tácito, Clúster hortícola

---

## 1. Introducción

La innovación se concibe como el resultado de un complejo conjunto de relaciones entre los actores del sistema, que incluye las empresas, las universidades y los centros de investigación. En las economías actuales basadas en el conocimiento, el establecimiento de relaciones con la industria resultan esenciales para el desarrollo y el progreso económico (Ahrweiler et al., 2011).

La emergencia de los denominados clústeres de innovación regional (Yu y Jackson, 2011), pone de manifiesto que las industrias que participan en clústeres fuertes, alcanzan un mayor nivel de crecimiento, innovación y desarrollo (Delgado et al., 2012).

En particular, la intensidad de las interacciones entre las empresas privadas y las universidades y otras instituciones públicas de investigación, resulta particularmente importante para la eficiencia de la empresa (Fritsch y Slavtchev, 2011). Además, esta cooperación a menudo significa un importante beneficio para el entorno económico y tecnológico (Breznitz et al., 2008).

Normalmente, este tipo de actividad, cuando se encuentra localizada en un mismo área geográfica responde a lo que se denomina un clúster geográfico (Becattini, 1990). Este clúster resulta especialmente interesante en relación con la generación de conocimiento y el desarrollo de innovaciones en la industria agroalimentaria (Phillips et al., 2013). La creación de conocimiento constituye un factor clave para la innovación y el éxito en la industria agroalimentaria. Sin embargo, las pymes y las empresas de las industrias tradicionales disponen de bajos niveles de capacidad de absorción y necesitan ayuda externa en este sentido procedente de los centros de investigación (Spithoven et al., 2011). Los agricultores, las empresas productoras y las empresas de distribución minorista se benefician del establecimiento de relaciones de colaboración con organizaciones creadoras y difusoras de conocimiento, como los grupos de investigación. Esta estrategia es utilizada habitualmente por las pequeñas y medianas empresas (pymes) como la mejor manera de generar innovación y crecimiento económico, a través del desarrollo de vínculos sociales y de conocimiento (Rodríguez-Pose y Comptour, 2013).

Las redes de negocio y cooperación han sido destacadas por sus implicaciones para la innovación (Pitaway et al., 2004). Además, las perspectivas comportamentales proporcionan explicaciones útiles para la disposición de las empresas a innovar. A nivel empresarial, la teoría basada en los recursos (RBT) (Barney, 1991; Grant 1996) analiza cómo los recursos y capacidades de la empresa afectan al desarrollo de ventajas competitivas. En particular, la visión del conocimiento (KV) (Grant, 1996: 114) define el conocimiento como el recurso más significativo desde un punto de vista estratégico para la empresa. Este enfoque defiende que el conocimiento posee el mayor potencial con vistas a la generación de ventajas competitivas (Eisenhardt y Martin, 2000, Grant, 1996; Winter, 2000). Las capacidades están normalmente protegidas por distintos mecanismos de aislamiento que dificultan su imitación (Spender y Grant, 1996). Dado que la protección de las capacidades está determinada por la ambigüedad causal (Reed y DeFillipi, 1990), la transferencia entre los socios se ve afectada negativamente por el grado de ambigüedad del conocimiento (Simonin, 1999).

En este contexto, la capacidad de absorción (Cohen y Levinthal, 1990) constituye un concepto adecuado para identificar, asimilar y explotar el conocimiento externo que los grupos de I+D obtienen de las empresas agrícolas, incluyendo los vínculos entre la capacidad de absorción y el rendimiento (Lane et al., 2001). Sin embargo, la mera posesión del conocimiento por parte de los grupos de investigación y las empresas especializadas, no garantiza por sí misma que una empresa sea capaz de explotar las fuentes de esta ventaja. Así, Grant (1996: 114) sostiene que "si la mayoría del conocimiento relevante para la producción es tácito, la transferencia de conocimiento entre los miembros de la organización resulta excepcionalmente difícil".

Existen diferencias entre el conocimiento tácito y el explícito (Polanyi, 1966). El conocimiento explícito es codificable y transmisible, si bien la mayor parte del cuerpo del conocimiento se conforma a partir de conocimiento tácito. La literatura basada en el conocimiento llega a la conclusión de que el carácter tácito de tal conocimiento puede limitar el uso y el alcance de este conocimiento entre las empresas (Martin y Salomom, 2003).

Con estos antecedentes, en el tejido empresarial español, caracterizado por la fuerte presencia de pymes, se revela especialmente interesante la colaboración entre empresas. Este trabajo presta atención a las relaciones entre los grupos de investigación y las empresas miembros de un clúster agroindustrial. En particular, este estudio se centra en la industria auxiliar hortícola del sudeste español, considerado como un clúster industrial agroalimentario (Galdeano y Céspedes, 2008, Pallares-Barbera, 2002). Así, esta investigación analiza empíricamente el efecto de la capacidad de absorción de los grupos de investigación sobre su capacidad para crear productos y generar conocimiento para la agricultura, moderado todo ello por un mayor o menor carácter tácito del conocimiento.

El presente trabajo analiza los efectos de la capacidad de absorción del grupo de investigación sobre el desempeño del proyecto, tanto para el propio grupo como para la empresa contratante. Además de los efectos directos, nuestro objetivo es contrastar si la característica del conocimiento transferido (es decir, el carácter tácito) modera la influencia de la capacidad de absorción sobre los resultados del proyecto. Asimismo, pretendemos evaluar si existen diferencias entre ambas partes del intercambio.

## **2. Revisión de la literatura e hipótesis**

Según Carlsson et al. (2002), un sistema de innovación posee varias dimensiones, como la geográfica, sectorial, tecnológica o la temporal. Las relaciones, como uno de los componentes más importantes del sistema, implican la transferencia o adquisición de tecnología. Las industrias intensivas en conocimiento (Yam et al., 2011), la modularidad del producto o el conocimiento distribuido a lo largo de las organizaciones son determinantes externos de la necesidad de colaborar con otras empresas (Baldwin y Clark, 2003; Pittaway et al., 2004). Los descubrimientos y las innovaciones ya no se encuentran localizados en una empresa específica (Powell et al., 1996), por lo que la cooperación para innovar constituye en la actualidad una práctica habitual (Stremersch y Van Dyck, 2009).

La creación de conocimiento es un factor clave para la innovación y el éxito en la industria agroalimentaria. Con frecuencia, la actividad relacionada con la industria agroalimentaria se encuentra situada en una misma área geográfica, conocida como clúster geográfico o distrito industrial marshalliano (Becattini, 1990). Estos clústeres se consideran especialmente atractivos para generar conocimiento e innovación en general (Maskell, 2001; Maskell y Malmberg, 2007), y en la industria agroalimentaria en particular (Phillips et al., 2013). Los agricultores, las empresas de la industria auxiliar (semillas, maquinaria, etc.) y las de distribución detallista, se benefician todas ellas de la colaboración con organizaciones generadoras y difusoras de conocimiento, como son los grupos de investigación y desarrollo. Esta estructura territorial es generalmente adoptada por las pymes como la mejor manera de generar innovación y crecimiento económico a través de los vínculos sociales y el conocimiento (Molina-Morales y Martínez-Fernández, 2010; Rodríguez-Pose y Comptour, 2013).

La colaboración con centros e incluso individuos de investigación, de cualquier tamaño y tipo, se ha convertido en un patrón cada vez más utilizado para el fomento de las innovaciones (Huston y Sakkab, 2006). Las empresas pueden mejorar su rendimiento mediante la explotación de los conocimientos y tecnologías propiedad de la universidad (George et al., 2002). La cooperación entre empresas y universidades contribuye positivamente al éxito, y posee un alto impacto sobre la innovación en productos (Un et al., 2010). El sistema hortícola del sudeste español ofrece una alta concentración de invernaderos de horticultura y un sistema auxiliar notablemente destacado. Ambos factores definen un sistema de clúster hortícola complejo, con una continua transferencia de conocimiento y tecnología entre la industria y la academia (Pérez-Mesa y Galdeano-Gómez, 2010).

Los investigadores acumulan habilidades, conocimientos y relaciones para participar en futuros proyectos de investigación (Bozeman y Corley, 2004). Nuestro argumento es que esta acumulación de conocimiento inicialmente aumenta la capacidad de absorción del grupo de investigación, y es más probable conseguir un mejor rendimiento del proyecto de investigación. Sin embargo, los investigadores académicos con frecuencia son sometidos a una dependencia de su trayectoria histórica (i.e., "path dependence") que induce un desarrollo curricular particular (Ambos et al., 2008). Esto hace que los investigadores académicos se centren principalmente en los estudios con resultados

cuantitativos que pueden aportar más sobre cuestiones relativas al "cómo" y "por qué" de una teoría, y en las revistas de mejor ranking (Rothaermel et al., 2007).

De esta manera, la carrera académica se ve afectada por una dependencia de la trayectoria que refuerza la orientación y los patrones de publicación académicos (Ambos et al., 2008). Más aún, los investigadores más veteranos pueden preferir no modificar el "sistema" (Markides, 2007). Las evidencias sobre la comercialización del conocimiento académico muestran que los investigadores más académicos son menos propensos a formar parte de las actividades industriales y a obtener un resultado comercial del proyecto (Ambos et al. 2008). Además, en general, las ganancias no constituyen un incentivo válido para el emprendimiento universitario (Astebro et al., 2013).

La capacidad de absorción es la "habilidad de reconocer el valor de la información nueva, asimilarla y aplicarla a fines comerciales" (Cohen y Levinthal, 1990: 128). Una característica particular de la capacidad de absorción es la dependencia de la trayectoria que induce a través de la generación de nuevo conocimiento (Cohen y Levinthal, 1990: 136): "el conocimiento previo permite la asimilación y explotación de nuevos conocimientos". Los grupos de investigación que poseen conocimientos valiosos sobre ciertas tecnologías pueden generar nuevas ideas y productos. Los grupos de investigación con mayores niveles de capacidad de absorción tienen más probabilidades de aprovechar los conocimientos de otros campos. Deben tener la capacidad de absorber los inputs a fin de poder generar outputs (Tsai, 2001), siendo la ausencia de esta capacidad una de las principales barreras para la transferencia de conocimiento de una unidad a otra (Szulanski, 1996).

Puesto que una empresa puede perseguir diferentes objetivos simultánea o secuencialmente, las reacciones a la retroalimentación sobre el desempeño difieren dependiendo de la configuración de la capacidad de absorción (Be-Oz y Greve, 2012).

El carácter acumulativo del conocimiento permite a la organización predecir con mayor precisión los cambios en el entorno y, a su vez, influye su desempeño innovador. Como Cohen y Levinthal (1990: 137) defienden: "las empresas con mayores niveles de capacidad de absorción tenderán a ser más proactivas, explotando las oportunidades ofrecidas por el entorno, independientemente del actual desempeño".

*H<sub>1a</sub>: Existe una relación lineal positiva entre la capacidad de absorción y el desempeño de la empresa.*

*H<sub>1b</sub>: Existe una relación lineal positiva entre la capacidad de absorción y el desempeño del grupo de investigación.*

Aunque el conocimiento explícito es codificable y transmisible, representa sólo el "iceberg de todo el cuerpo de conocimiento" (Nonaka et al., 1994). Polanyi (1966) señala que la mayor parte del cuerpo de conocimiento se compone de conocimiento tácito. La literatura basada en el conocimiento postula que el carácter tácito de tal conocimiento puede limitar el uso y el alcance de este conocimiento entre las empresas (Martin y Salomom, 2003). Por lo tanto, este carácter tácito puede dificultar la transferencia de conocimiento entre las actividades de I+D y las empresas agroalimentarias. Proponemos en este sentido las siguientes hipótesis:

*H<sub>2a</sub>: Existe una relación lineal negativa entre el carácter tácito del conocimiento y el desempeño de la empresa.*

*H<sub>2b</sub>: Existe una relación lineal positiva entre el carácter tácito del conocimiento y el desempeño del grupo de investigación.*

A partir de los anteriores argumentos podemos postular también que si el carácter tácito del conocimiento es suficientemente elevado, los efectos positivos de la capacidad de absorción pueden verse compensados y neutralizados. Formulamos así las siguientes hipótesis:

*H<sub>3a</sub>: Cuando el carácter tácito del conocimiento a transferir es alto (bajo), se genera un efecto negativo (positivo) de la capacidad de absorción sobre el desempeño del proyecto para la empresa.*

*H<sub>3b</sub>: Cuando el carácter tácito del conocimiento a transferir es alto (bajo), se genera un*

*efecto negativo (positivo) de la capacidad de absorción sobre el desempeño del proyecto para el grupo de investigación.*

Una hipótesis alternativa sería que la capacidad de absorción y el desempeño tienen una relación no lineal. Uno de los problemas de la hipótesis H1 es que implica que el desempeño siempre aumentará con los niveles de capacidad de absorción más altos. Sin embargo, esta implicación puede dejar de reconocer que aunque aquellos grupos de investigación y empresas que colaboran en un proyecto de I+D deberían compartir los mismos objetivos sobre el proyecto, el grupo de investigación también puede tener otros objetivos relacionados con sus resultados de la investigación (Ambos et al., 2008). De hecho, la capacidad de absorción afecta la formación de expectativas, y estas condicionan el incentivo para invertir en la capacidad de absorción, generándose así un ciclo de auto-refuerzo (Cohen y Levinthal, 1990). Y la naturaleza de auto-refuerzo del aprendizaje vuelve atractiva para un individuo u organización el sostenimiento del enfoque actual. La mayor familiaridad con un dominio operativo existente aumenta la absorción organizativa y puede conducir a una "trampa de la familiaridad" que hace que la adopción de actividades diferentes resulte menos atractiva (Levinthal y March, 1993). En la interacción entre las trayectorias académica e industrial, los grupos de investigación pueden necesitar disminuir los esfuerzos en la investigación industrial/académica, en beneficio de los objetivos académicos/industriales. Este argumento ha sido considerado en la literatura sobre la orientación al mercado, prediciendo una relación en forma de U invertida con el desempeño (Atuahene-Gima et al., 2005).

El contexto académico y el industrial tienen diferentes ajustes preferenciales que les proporcionan un acceso diferente a los recursos e infraestructuras. Los investigadores académicos difieren de los investigadores de la industria en términos de su propensión hacia los incentivos, no resultando muy significativos para los grupos de investigación los incentivos económicos (Agarwal y Ohyama, 2012). Las tensiones emergen en relación con la difusión de los resultados, la propiedad del conocimiento (Clancy y Moschini, 2013) o los conflictos entre los fines comerciales de la empresa y los objetivos de publicación del grupo de investigación. Además, los problemas relativos a la percepción de equidad pueden impedir la cooperación entre los grupos de investigación y las empresas (Burg et al., 2013). Más aún, los investigadores académicos poseen una mayor "preferencia por los rendimientos no pecuniarios" (Agarwal y Ohyama, 2012). De hecho, no siempre el conocimiento científico conduce a una innovación y práctica de valor (Gittelman y Kogut, 2003).

Por lo tanto, aunque existe un efecto positivo de la capacidad de absorción sobre el desempeño, un sobre-exceso de la capacidad de absorción conduciría a un distanciamiento no deseado de los objetivos académicos. Proponemos así la existencia de una relación en forma de U invertida entre la capacidad de absorción y el desempeño de los objetivos de investigación de las empresas:

*H<sub>4a</sub>: Existe una relación curvilínea, cóncava y hacia abajo entre la capacidad de absorción y el desempeño del proyecto de investigación para la empresa*

*H<sub>4b</sub>: Existe una relación curvilínea, cóncava y hacia abajo entre la capacidad de absorción y el desempeño del proyecto para el grupo de investigación.*

### **3. Metodología**

#### **3.1. Datos y medida de las variables**

Para el contraste de las hipótesis planteadas, se ha seleccionado como escenario empírico de este trabajo el área del sudeste español (provincias de Almería y Murcia), que representan la mayor concentración de invernaderos a nivel mundial.

En la provincia de Almería la superficie bajo invernadero es de 28.576 hectáreas, lo que representa una producción total de 3.051.027 Tm (campaña 2012-2013). En Murcia existen 4.410 hectáreas de invernaderos, con una superficie total de horticuultura de regadío de 48.733 hectáreas, generando una producción total de 1.504.684 Tm (campaña 2010-2011) (Fundación Cajamar, 2012, 2013). Desde el punto de vista productivo, este área constituye un sistema agroalimentario industrial caracterizado por el uso intensivo de los recursos y el conocimiento (Aznar-Sánchez y Galdeano Gómez; Sánchez-Pérez

et al., 2001). Se trata de una industria altamente internacionalizada, que exporta la mayor parte de su producción a Europa.

Los datos han sido obtenidos a partir de 143 proyectos de I+D entre empresas agroalimentarias y grupos de investigación académicos. Los proyectos fueron previamente identificados a través de los registros de la Oficina de Transferencia de Resultados de Investigación de los centros de investigación de la zona, esto es, las universidades de Almería, Murcia, Politécnica de Cartagena y el IMIDA (Instituto Murciano de Investigación y Desarrollo Agrario y Alimentario). Con el fin de evaluar el desempeño de cada proyecto, se exigió que ninguno de los proyectos se encontrara en fase de ejecución, es decir, que todos ellos hubieran ya finalizado. Después de las correspondientes llamadas y reuniones con los investigadores principales de cada proyecto, se acordó que éstos rellenarían un cuestionario electrónico (publicado en una página web segura). La literatura académica ha empleado con anterioridad datos basados en proyectos financiados por el Consejo de Investigación, utilizando las percepciones de sus investigadores principales para contrastar la probabilidad de comercializar la investigación académica (Ambos et al., 2008).

Las escalas utilizadas para la medición de las distintas variables se detallan en el Anexo. La capacidad de absorción es una adaptación de la propuesta utilizada por Jiménez-Barrionuevo et al. (2011). El desempeño del proyecto se obtuvo a través de diferentes medidas para el grupo de investigación y la empresa. Para el caso de los resultados relativos al grupo de investigación, conscientes de la diversidad de dimensiones consideradas, se han utilizado escalas multi-ítem. Se espera que cada ítem mida una dimensión con niveles satisfactorios de validez predictiva (Bergkvist y Rossiter, 2007; Drolet y Morrison, 2001; Wanous et al., 1997). Los ítems se midieron con escalas que van de 0 (totalmente en desacuerdo) a 10 (totalmente de acuerdo). En el caso de las variables relativas al carácter tácito del conocimiento, se utilizó una escala de 7 puntos, donde 1 significaba "de forma escrita" (no tácito en absoluto) y 7 significaba "completamente tácito" para introducir variaciones en la dinámica potencial del entrevistado que podría conducir a un sesgo del método común (Podsakoff et al., 2003).

### 3.2. Análisis y resultados

Siguiendo la propuesta de Aiken y West (1991), las variables independientes fueron centradas con respecto a la media, para reducir al mínimo la amenaza de multicolinealidad en las ecuaciones donde introduzcamos los términos de interacción. La Tabla 1 muestra el resultado de la estimación realizada.

TABLA 1

**Análisis de regresión para los efectos de la capacidad de absorción y el carácter tácito del conocimiento sobre el desempeño de la empresa y del grupo de investigación, con efectos cuadráticos e interactivos**

Variable	Valores para la empresa		Valores para el grupo de investigación	
	Coefficiente no estandarizado	t-valor	Coefficiente no estandarizado	t-valor
Constante	0,106	1,002	0,168	1,393
Capacidad de absorción	0,293	4,040*	0,310	3,739*
Carácter tácito	-0,053	-1,114	-0,004	-0,073
Capacidad de absorción <sup>2</sup>	0,114	-1,499	0,068	-2,143**
Carác. Tácit. X Capac. Absorc.	-0,078	3,037*	-0,127	1,584
R <sup>2</sup> (adj. R <sup>2</sup> )	0,225 (0,202)		0,178 (0,154)	
F <sup>prob</sup>	10,001 <sup>0.000</sup>		7,478 <sup>0.000</sup>	

\* p<0,01; \*\*p<0,05

Los resultados confirman las hipótesis H<sub>1a</sub> y H<sub>1b</sub>, en la medida que la capacidad de absorción influye significativamente el desempeño derivado del proyecto para ambos socios (empresa y grupo de investigación) ( $\beta_{1r}=0,293$ ,  $p<0,01$ ;  $\beta_{1g}=0,310$ ,  $p<0,01$ ). Para el caso del carácter tácito del conocimiento, no es posible soportar desde un punto de vista empírico la existencia de efectos negativos, lo que nos lleva a rechazar las hipótesis H<sub>2a</sub> y H<sub>2b</sub>. En relación con la tercera de las hipótesis planteada, los resultados indican que mayores niveles de capacidad de absorción provocan que la relación entre la capacidad de absorción y el desempeño del grupo de investigación se vuelva negativa ( $\beta_{3g}=-0,173$ ,  $p<0,01$ ), lo que viene a confirmar H<sub>3b</sub>. Los resultados no permiten soportar la

existencia de esta relación para el caso del desempeño de la empresa (rechazándose así  $H_{3a}$ ). Por último,  $B_{4r}=0,114$  ( $p<0,05$ ) es significativo, pero con el signo contrario al esperado, lo que sugiere que los efectos negativos del carácter tácito del conocimiento no permiten compensar los efectos de absorción positivos sobre el desempeño del proyecto de I+D para la empresa. Por último, no existe ningún soporte para la hipótesis  $H_{4b}$ .

#### 4. Conclusiones

En primer lugar, los resultados muestran que los grupos de investigación pueden tener diferentes objetivos sobre el proyecto que las empresas agrícolas que demandaron acometer la investigación, si bien tales objetivos pueden ser también diferentes respecto a cuestiones como proporcionar conocimiento básico para el campo de la investigación, su propia valoración ó calificación científica, o la imagen de los investigadores. En particular, los resultados de la estimación realizada ponen de manifiesto el efecto positivo de la capacidad de absorción del grupo de investigación a la hora de obtener buenos resultados.

Se observan por otra parte diferencias en cuanto al desempeño de un proyecto de investigación para la empresa y para el grupo de investigación participantes, si bien en ambos casos la capacidad de absorción ejerce un efecto positivo sobre los resultados derivados del proyecto (es decir, tanto para la empresa como para el grupo de investigación). Por otra parte, los efectos del carácter tácito del conocimiento se ven contrarrestados con la capacidad de absorción de las empresas/grupos de investigación. La capacidad de absorción ejerce además un efecto en forma cóncava hacia abajo sobre el desempeño del proyecto para el grupo de investigación.

Se observa en general cómo los resultados difieren dependiendo de si se tienen en cuenta los beneficios para la empresa o para el grupo de investigación. Así, un resultado derivado de este trabajo alude al hecho de cómo los efectos positivos de la capacidad de absorción del grupo de investigación se vuelven negativos cuando tal capacidad alcanza niveles superiores. Sin embargo, los niveles elevados de capacidad de absorción pueden superar y compensar el efecto negativo asociado al carácter tácito del conocimiento.

## **Anexo. Escalas de medida**

### **A. Variables dependientes**

#### *Desempeño para la empresa*

---

1. Consecución del objetivo de investigación pretendido en la memoria del proyecto
2. Creación de un producto, proceso o tecnología que mejora la competitividad del sector agroalimentario

#### *Desempeño para el grupo de investigación*

---

1. Resultados económico-monetarios para los miembros del grupo de investigación
2. Resultados en patentes
3. Resultados aplicados exitosos en nuevos productos, procesos o empresas

### **B. Variables independientes**

#### *Capacidad de absorción*

---

##### • Adquisición

- |    |   |
|----|---|
| 1. | Se producía un intercambio continuo de información y conocimiento |
| 2. | Tenían interacciones personales continuas con la empresa          |
| 3. | Había una gran confianza mutua                                    |
| 4. | Había altos niveles de reciprocidad                               |

##### • Asimilación

- |    |   |
|----|---|
| 1. | Su grupo y la empresa "compartían el mismo lenguaje"                    |
| 2. | La empresa y su grupo tenían recursos y capacidades muy complementarios |
| 3. | La "cultura" de su grupo y la de la empresa eran altamente compatibles  |
| 4. | Los estilos de gestión de ambos eran muy compatibles                    |

##### • Transformación

- |    |  |
|----|--|
| 1. | Todo el grupo tenía acceso a la información de la empresa  |
| 2. | Se identificaba rápidamente la utilidad que el conocimiento nuevo procedente de la empresa aportaba al conocimiento previo del grupo     |
| 3. | Se analizaba sistemáticamente las consecuencias que el nuevo conocimiento procedente de la empresa tenía sobre la evolución del proyecto |

##### • Explotación

- |    |   |
|----|---|
| 1. | El proyecto se modificaba rápidamente a la luz de la información proveniente de la empresa                      |
| 2. | Existía en el grupo una gran habilidad para explotar la información y el conocimiento proveniente de la empresa |
| 3. | El conocimiento proveniente de la empresa se aplicó a nuevas ideas para este proyecto                           |
| 4. | El conocimiento proveniente de la empresa se ha aplicado en otros proyectos                                     |

## RESUMEN

*Actualmente existen ciertas tendencias en el contexto bancario centradas en la mejora de las relaciones con los clientes. Dichas tendencias se basan en el fortalecimiento de las relaciones con los clientes existentes a través de la excelencia en la calidad del servicio o el desarrollo del customer-centric banking, que anima a los bancos a ser más competitivos, especialmente desde el inicio de la crisis financiera actual. Por tanto, el presente trabajo pretende analizar los principales factores comportamentales y sociodemográficos que influyen en el proceso de elección de la cartera de productos del cliente bancario, con el objetivo de ofrecer una guía para optimizar el nivel de competitividad del banco ayudándole comprender a su cliente y de este modo, a satisfacer de una forma más adecuada las necesidades del mismo.*

## PALABRAS CLAVE

*Comportamiento del consumidor, Modelo de elección, Lealtad, Longitud de la Relación, RFM, Cross-buying, Nivel de uso de productos bancarios, Balance, Marketing sector bancario.*

## 1. Introducción

Este trabajo propone un análisis de los factores comportamentales relativos a la lealtad del cliente, a la compra cruzada (*cross-buying*) y factores socio-demográficos que afectan a la elección de la cartera de productos del cliente bancario. El interés de este estudio reside en que ofrece ideas sobre los factores que llevan al cliente bancario a elegir aquellos productos que configuran su cartera, de este modo se persigue ofrecer una guía que ayude en el fortalecimiento de las relaciones con los clientes existentes, por ejemplo a través de la excelencia en la calidad del servicio o el desarrollo del *customer-centric banking*. Todas estas herramientas favorecen el aumento de la competitividad de los bancos, la cual es fundamental para la supervivencia de las entidades bancarias especialmente desde el inicio de la crisis financiera actual.

Investigaciones previas sobre los factores que influyen en las elecciones del cliente se han centrado en otros sectores, como el consumo de aceite de oliva (Gázquez-Abad y Sánchez-Pérez, 2009), el consumo de lácteos (Barreiro *et al.*, 2004), la elección de la marca privada frente a la de fabricante respecto de la categoría de producto yogurt (Cuneo *et al.*, 2012) o el consumo de detergentes (Arindam, 2004), entre otros. Por su parte, es escasa la literatura que analiza los factores que influyen la elección de productos bancarios, en especial considerando la totalidad de productos que ofrece el banco y que configuran la cartera de productos que poseen los clientes, tal y como indica nuestra propuesta de análisis. A este respecto se ha detectado una línea de investigación muy concreta que analiza especialmente los determinantes relativos a características socio-demográficas de los clientes (e.g., nivel educativo, ingresos, ocupación, nacionalidad, religión) que afectan a la elección de determinados productos bancarios (centrándose especialmente o bien en productos de crédito, o bien en productos de ahorro) en países con ciertas dificultades de acceso a este tipo de productos, como es el caso de Ghana (Akpanjar *et al.*, 2013), Estonia (Kulikov *et al.*, 2007), Bosnia Herzegovina (Chen y Chivakul, 2008) o considerando conjuntamente varios países con economías en transición (Beck y Brown, 2011). En muchos de estos casos, la principal fuente de datos utilizada ha sido la encuesta. Aunque estos estudios son capaces de considerar una amplia variedad de antecedentes de la elección de la cartera de productos, tienen ciertas limitaciones (Xue *et al.*, 2011), en particular: (i) analizan un conjunto de datos de *cross-section* o de corte transversal, no pudiendo examinar factores o variables que varían con el tiempo, y (ii) se basan en percepciones de los clientes en lugar de en datos observados, hecho que introduce error de medida y limita los resultados del estudio a aquellos que son perceptibles por los clientes. En este sentido, el presente trabajo pretende ofrecer un diagnóstico completo, considerando la totalidad de productos que ofrece el banco al cliente no empresarial, de los factores comportamentales (obtenidos de una base de datos de la empresa) que llevan a los consumidores a realizar sus elecciones, así como las variables sociodemográficas que definen a los clientes que eligen uno u otro producto. De este modo, este trabajo contribuye a la literatura incipiente sobre el uso doméstico de los servicios bancarios formales.

El resto del trabajo se organiza como indicamos a continuación. En la sección 2 revisaremos la literatura más relevantes sobre los determinantes de la elección de la cartera de productos del cliente bancario y formularemos la hipótesis de investigación. A continuación, se describen los datos y la metodología propuesta. Finalmente, se hace una breve reseña de las principales conclusiones que se derivarán de este estudio.

## 2. Determinantes de la elección del *portfolio* del cliente bancario

### 2.1. Lealtad

Cuando un cliente es leal, este continuará comprando la misma marca, tenderá a comprar más y recomendará la marca a otros (Hepworth y Mateus, 1994). Desde las primeras investigaciones sobre lealtad del cliente, al menos tres han sido las perspectivas propuestas para definir y operar con el concepto, en particular se trata de: (i) el enfoque actitudinal, (ii) el enfoque comportamental y (iii) el enfoque compuesto (Jacoby y Chestnut, 1978). Para medir la lealtad es más adecuado trabajar con los datos de la base de datos de la empresa (Wong y Chung, 2008), como es nuestro caso con una base de datos de un banco, ya que los registros de compras e interacciones con el cliente grabados en este tipo de bases de datos recogen la lealtad comportamental real y observada de los mismos.

Para esta investigación hemos seleccionado tanto la longitud de la relación, como la triada RFM (R de recencia, o número de meses que transcurren entre una compra-cancelación y la siguiente; F de frecuencia en la adquisición de productos; y M de valor monetario del cliente) para medir la lealtad comportamental de una forma completa (Chang y Tsay, 2004; Kumar *et al.*, 2006; Li *et al.*, 2011) y comprobar si afectan al proceso de elección de la cartera de productos del cliente bancario.

Desde hace décadas muchas empresas perciben el tema de la lealtad y la retención de los clientes como algo central en su gestión y en sus decisiones de marketing, en especial en el contexto bancario (Van den Poel y Larivière, 2004). Este énfasis en la lealtad y la retención se basa en que existe una fuerte asociación entre la retención de los clientes y la rentabilidad de los mismos. Los clientes cuya relación con la empresa se ha desarrollado en el largo plazo compran más y son menos costosos de mantener (Ganesh *et al.*, 2000; Hwang *et al.*, 2004), mucho menos que los clientes nuevos. Tales clientes nuevos, por el contrario, son mucho más difíciles de conseguir y más costosos de mantener en el corto plazo (Colgate y Danaher, 2000), principalmente porque dichos clientes nuevos son más vulnerables a las acciones de la competencia, más sensibles al precio y tienen unos costes de cambio bajos. A este respecto algunos productos bancarios concretos, como los seguros de los depósitos, se han identificado como una herramienta para crear confianza (y por tanto, fuente potencial de lealtad de los clientes) en el sistema financiero, especialmente para los pequeños ahorradores (Beck y Brown, 2011). Del mismo modo, las mejoras en los sistemas de pago y un más amplio alcance físico de los bancos, por ejemplo a través de la puesta a disposición del cliente de los cajeros automáticos y las tarjetas de crédito y débito para operar a través de ellos, pueden reducir la barrera geográfica de los hogares para acceder a los servicios bancarios (Beck y Brown, 2011), lo cual puede ser también fuente de retención y lealtad de los clientes. Por tanto, analizaremos qué productos bancarios a los que puede acceder el cliente no empresarial se ven influenciados por la lealtad del mismo a la empresa.

**Hipótesis 1:** Una mayor longitud de la relación tiene un impacto positivo en la elección de productos bancarios.

Respecto de la famosa triada RFM, R de recencia, F de frecuencia en la adquisición de productos y M de valor monetario del cliente, los estudios que las utilizan ponen de relieve que son un importante conjunto de predictores que reflejan la repetición en las compras (Baesens *et al.*, 2002). En este sentido, Hughes (1996), y más recientemente Liang (2010), explican que los clientes que más recientemente han comprado de un vendedor (menor recencia), los que compran muchas veces de un vendedor (mayor frecuencia) y los que gastan más recursos monetarios con un vendedor (mayor valor monetario) suelen ser los clientes más valiosos para la empresa y por tanto, los mejores clientes a quienes ofrecerles nuevas ofertas. Por tanto,

**Hipótesis 2a:** Una mayor recencia en la compra tiene un impacto negativo en la elección de productos bancarios.

**Hipótesis 2b:** Una mayor recencia en la cancelación tiene un impacto negativo en la elección de productos bancarios.

**Hipótesis 3:** Una mayor frecuencia en la adquisición de productos bancarios tiene un impacto positivo en la elección de productos bancarios.

**Hipótesis 4:** Un mayor valor monetario del cliente tiene un impacto positivo en la elección de productos bancarios.

## 2.2. Cross-buying

Tanto el *cross-buying* (desde el punto de la demanda) como el *cross-selling* (desde el punto de vista de la oferta), persiguen conseguir la adquisición por parte de los clientes actuales de un mayor número de productos de la empresa procedentes de múltiples categorías (Gupta y Zeithaml, 2006). Mientras que el *cross-selling* es una acción de la empresa que se emplea para ampliar relaciones con los clientes, el *cross-buying* se refiere a la propensión de un cliente para hacer compras cruzadas (Reinartz y Venkatesan, 2008). El *cross-buying* o compra cruzada ha sido asociado con mayores niveles de retención de los clientes, mayores ingresos y lealtad. En particular, Donkers *et al.* (2003 p. 21) evidenció que los clientes eran más propensos a permanecer en la empresa cuando compraban más productos (en particular, más pólizas de seguro). Al examinar la relación ente el *cross-buying* y la

lealtad comportamental, Reinartz *et al.* (2008) descubrieron que el *cross-buying* es realmente una consecuencia y no un antecedente de la lealtad comportamental, ya que dicha lealtad impulsa tanto el número de categorías de las que una persona compra como el nivel de dispersión del gasto a través de esas categorías. Por lo tanto, los directivos cada vez más reconocen que la retención del cliente no es suficiente para tener éxito y muchos están tratando de mejorar el valor de sus clientes mediante la ampliación de la gama de productos y servicios que compran de la empresa (Blattberg y Deighton, 1996; Rust *et al.*, 2000 p.46). De esta forma, y siguiendo las sugerencias de Reinartz *et al.* (2008), para esta investigación hemos seleccionado tanto el nivel de uso de productos bancarios, como el balance en activos y pasivos para el medir el *cross-buying*. De esta forma se analiza si estos factores comportamentales afectan a la elección de productos bancarios. Por tanto,

**Hipótesis 5:** El uso de un mayor número de productos bancarios (histórico o anterior) tiene un impacto positivo en la elección de productos (futuros).

Haenlein *et al.* (2007) definen dos condiciones bajo las cuales un cliente se considera activo (o por el contrario inactivo) en un contexto bancario, en particular: (condición 1) todos los clientes que poseen un producto de ahorro, un producto de financiación de una vivienda, un préstamo o un seguro, se definen como activos debido a los flujos de ingresos regulares (e.g., ahorro, pago de intereses, cuotas de seguros) como resultado de cualquiera de estos productos; y (condición 2) todos los clientes que poseen cuentas corrientes y depósitos se definen como clientes activos cuando estas cuentas muestran un saldo positivo de un mínimo de 100 euros o al menos una transacción se ha realizado durante los tres últimos meses (en el caso de las cuentas corrientes) o últimos doce meses (en el caso de los depósitos). En este sentido, tanto el balance en productos de pasivo como el balance en producto de activo ofrecen información sobre el nivel de actividad de los clientes con la empresa (Haenlein *et al.*, 2007). Por tanto, si el cliente es un sujeto activo en su relación con la empresa, la elección de otros productos bancarios será más probable,

**Hipótesis 7a:** Un mayor balance en productos de activo (histórico) tiene un impacto positivo en la elección de productos bancarios (futuros).

**Hipótesis 7a:** Un mayor balance en productos de pasivo (histórico) tiene un impacto positivo en la elección de productos bancarios (futuros).

### 3. Metodología de la investigación

#### 3.1. Contexto de investigación

El contexto seleccionado para desarrollar esta investigación es un banco español que opera a nivel nacional. Hemos seleccionado este contexto ya que actualmente los mercados financieros se han vuelto mucho más competitivos entre otros motivos, por la madurez del sector (Prinzie y Van den Poel, 2006), la desregulación y la aparición de nuevos competidores procedentes de sectores tan diversos como los seguros y el sector del automóvil (Haenlein *et al.*, 2007). Como consecuencia, el número de nuevos participantes en el sector de la banca minorista ha aumentado, provocando la mercantilización de los productos bancarios básicos, tales como los depósitos, las hipotecas y las extensiones de crédito. Así mismo, esto ha generado cierta disminución de los márgenes de beneficio y una diferenciación en ocasiones borrosa entre bancos, aseguradoras y casas de bolsa (i.e., la banca universal). Por si esto no fuera poco, la situación del sector fue duramente dañada por la denominada *crisis subprime* (BusinessWorld, 2007; The Washington Post, 2007), lo que ha generado un entorno aún más crítico para los bancos. En este sentido, y con objeto de superar las dificultades a las que se enfrenta el sector en la actualidad, se hace necesaria cierta revisión del papel que juegan los clientes en las entidades. Por tanto, este trabajo pretende arrojar luz a los procesos de mejora de las relaciones con los clientes, en general en las empresas y en particular en el sector bancario, analizando los drivers que afectan a la elección de la cartera de productos.

#### 3.2. Datos

Como ya se ha indicado anteriormente, un banco español ha provisto la base de datos para realizar el presente estudio (véase Tabla 1). Originalmente la base de datos estaba compuesta por una muestra aleatoria de clientes del banco, con observaciones mensuales relativas a la propiedad y al uso de los

diferentes productos que ofrece el banco, así como determinadas variables sociodemográficas de los clientes. Se realizó una primera etapa de pre-procesamiento de datos, eliminando aquellos registros no necesarios para el presente estudio. Así mismo, se llevó a cabo un completo análisis de datos perdidos. En particular, se ha seleccionado la técnica de imputación múltiple (utilizando el software SPSS v.21) para imputar valores a aquellos registros que aparecían como perdidos. De esta forma se consiguió una muestra compuesta por un total de 2.187 clientes, con un total de 24 meses de información (en particular, el periodo de observación de datos comprende desde Diciembre de 2010 hasta Noviembre de 2012), obteniendo un total de 40.992 registros de datos. Todos los clientes empezaron su relación con el banco durante este periodo. En particular, nos centramos en la elección del productos bancarios llevada a cabo por la unidad decisora hogar, no incluyendo empresas en la muestra, de esta forma y a partir de los resultados obtenidos, comprenderemos qué factores afectan al cliente bancario cuando realizan sus elecciones, lo que ofrecerá información valiosa que ayudará al banco a comprender las elecciones realizadas por sus clientes, así como a detectar clientes prospecto para futuras promociones u ofertas de productos.

Tabla 1. Descripción de la base de datos

<b>Datos</b>	Panel
<b>Categorías de productos</b>	Participación en capital social del banco, Tarjeta de crédito, Tarjeta de débito, Seguro de ahorro, Seguro de hogar, Seguro de vida no vinculado (a hipoteca), Seguro de vida vinculado (a hipoteca), Otros seguros, Cuenta corriente, Cuenta vivienda, Depósito, Fondo de inversión, Plan de pensión, Valores, Préstamo consumo, Préstamo micro-consumo, Hipoteca, Crédito.
<b>Contexto</b>	Entidad bancaria que opera a nivel nacional.
<b>Periodo</b>	2 años: Diciembre 2010 - Noviembre 2012.
<b>Clientes</b>	Clientes no empresariales que empezaron su relación con el banco al comenzar el periodo de observación (Diciembre 2010).
<b>Tamaño</b>	2.187 clientes, 24 meses, 40.992 registros.

### 3.2. Modelo empírico

Para testear las hipótesis propuestas sobre los factores que influyen en la elección de la cartera de productos de los clientes bancarios, proponemos el uso de un modelo de elección multivariable (e.g., Barreiro *et al.*, 2004; Cuneo *et al.*, 2012; Gázquez-Abad y Sánchez-Pérez, 2007). Esta metodología relaciona a las variables explicativas (incluyendo variables individuales y *time-varying*) con la elección del producto, siendo la elección de cada uno de los productos la variable dependiente en el modelo medida como una variable binaria ( $Y_i = 1$  si el cliente elige el producto  $i$ , por el contrario  $Y_i = 0$  si el cliente no elige el producto  $i$ ).

En nuestro caso, siendo  $i$  cada uno de los productos considerados:

$$Y_i = L\beta_1 + PR\beta_2 + CR\beta_3 + F(cb)\beta_4 + M\beta_5 + AMA\beta_6 + AML\beta_7 + Q_{TOTAL}\beta_8 + AGE\beta_9 + GENDER\beta_{10} + INCOMI$$

Los dos modelos de elección binaria más comunes son el modelo Logit y el modelo Probit. La principal diferencia entre ellos es la función de distribución acumulativa que se asume, que asegura que las probabilidades de respuesta estimadas se mueven estrictamente entre cero y uno. En el modelo Logit, la función de distribución acumulativa es la función logística y en el modelo Probit, es la función de distribución normal estándar (Wooldridge, 2009). En la práctica, el modelo más utilizado es el Logit (Keane, 1992), sin embargo este modelo sufre de la propiedad denominada “*the independence of irrelevant alternatives*” (IIA), ignorando las similitudes entre las alternativas en conjunto de elección de un individuo, característica no realista en muchos contextos de comportamiento del consumidor (Chintagunta, 1992). Contrariamente al modelo Logit, el modelo Probit alivia el supuesto de IIA (Elrod y Keane, 1995) y en general, tiene mucho atractivo para la representación de los procesos de elección. Sin embargo, el modelo Probit se ha utilizado como modelo de elección en contadas ocasiones debido a la complejidad en su estimación como consecuencia de cálculo de múltiples integrales (Keane, 1992). Sin embargo, la evolución reciente de

los métodos de simulación, tales como SML (*simulated maximum likelihood*) o MSM (*method of simulated moments*), así como la estadística Bayesiana, han planteado un renovado interés en el modelo Probit como un modelo de elección (Chintagunta, 1992; Geweke *et al.*, 1994).

#### 4. Conclusiones

Este trabajo propone un análisis de los factores relativos a la lealtad y al *cross-buying* que influyen en la elección de la cartera de productos del cliente bancario. Para ello se propone utilizar una muestra de clientes bancarios españoles de los que se dispone de dos años de datos.

Las implicaciones para la gestión derivadas de este trabajo pueden ayudar a las empresas a conocer qué clientes son más propensos a elegir cada uno de los productos analizados, de esta forma y a partir de los resultados obtenidos, conoceremos qué factores afectan al cliente bancario a la hora de realizar sus elecciones, lo que ofrece información valiosa que ayuda al banco a comprender las elecciones realizadas por sus clientes, así como a detectar clientes prospecto para futuras promociones u ofertas de productos.

## RESUMEN

*Las redes sociales, tras surgir como una herramienta de comunicación, han alcanzado una elevada popularidad entre sus usuarios que ha llevado a las empresas a identificarlas como un medio para establecer y mantener relaciones con los clientes, definiendo nuevas estrategias de marketing que permiten influir en el proceso de toma de decisiones del cliente. En este estudio se pretende analizar el uso de páginas de marca en redes sociales como una herramienta a través de la cual los clientes pueden percibir beneficios, tanto por parte de la empresa como de la red social en sí misma. Para ello, se plantea una clasificación de dichos beneficios percibidos (utilitarios, simbólicos y hedónicos), así como los efectos que éstos generan en la intención de compra del cliente a través de la creación o mejora del conocimiento y del valor de marca.*

## PALABRAS CLAVE:

Beneficios Relacionales, Gratificaciones, Conocimiento de Marca, Valor de Marca, Intención de Compra, Redes Sociales

## **1. Introducción**

En los últimos años han surgido nuevas formas y tendencias de comunicación sociales que han modificado sustancialmente el modo en el que las personas se comunican. Entre los diferentes tipos de medios de comunicación sociales que existen destacan las redes sociales (RS), que se consideran aplicaciones que permiten a los usuarios conectarse entre sí mediante la creación de perfiles personales, invitar a amigos y compañeros a tener acceso a dichos perfiles, enviarles correos o mensajes instantáneos (Boyd y Ellison, 2008; Kaplan y Haenlein, 2010). Debido a la popularidad que las RS han alcanzado entre sus usuarios, han recibido una especial atención por parte de investigadores, docentes, profesionales y políticos (Boyd y Ellison, 2008) y las empresas han identificado la participación en las mismas como una oportunidad para establecer y mantener relaciones con los clientes, definiendo nuevas estrategias de marketing. Además, en el contexto de las RS, las actividades de marketing se asocian al uso de las denominadas páginas de marca (Zaglia, 2013), que son perfiles específicos de instituciones, empresas, marcas, personajes públicos o causas (Dholakia, Bagozzi y Pearo, 2004) a través de los cuales los clientes pueden construir y mantener relaciones entre ellos mismos y con las empresas (Hennig-Thurau y otros, 2010). De este modo, el denominado marketing de RS ofrece la posibilidad de conectar marcas y consumidores a través de un canal personalizado que se centra en el usuario y la interacción social (Chi, 2011). En este sentido, diferentes estudios han identificado la utilidad de las RS como herramienta de marketing (Moretti y Tuan, 2013). Sin embargo, teniendo en cuenta el rápido crecimiento que han experimentado las RS en el corto plazo junto al hecho de que su aparición no haya sido fruto de un proceso gradual, se considera necesario identificar cómo las empresas pueden gestionar sus páginas de marca en RS del modo más apropiado en función de sus objetivos una vez que han decidido participar en las mismas. Es por ello que en este trabajo planteamos un modelo para identificar qué efecto tienen los beneficios que el usuario de RS percibe de las páginas de marca sobre la intención de compra, a través del conocimiento y el valor de marca que dichos beneficios crean en el usuario.

## **2. Las páginas de marca en redes sociales: beneficios para el usuario**

Las páginas de marca en RS se consideran un medio de comunicación entre usuarios o entre empresas y clientes (Zaglia, 2013) que se utiliza por parte de las empresas como una herramienta de marketing relacional (Moretti y Tuan, 2013). Algunos estudios establecen que tanto los medios de comunicación (televisión, Internet, comunidades virtuales, etc.) como las herramientas de marketing relacional (programas de fidelización) proporcionan a sus usuarios una serie de beneficios (Dholakia y otros, 2004; Yi y Jeon, 2003). En base a ello en este trabajo consideramos que los usuarios de páginas de marca en RS pueden percibir principalmente dos tipos de beneficios, derivados de: 1) el uso de un medio de comunicación (la red social), denominados gratificaciones y 2) una herramienta de marketing relacional, denominados beneficios relacionales. A continuación, se exponen cada una de las categorías de beneficios.

### **2.1. Beneficios Relacionales**

Las páginas de marca son utilizadas por las empresas como herramienta de marketing relacional ya que, al igual que los programas de fidelización, su objetivo es establecer relaciones con sus clientes. Tradicionalmente, para cumplir su objetivo de desarrollar vínculos con los clientes, los programas de fidelización han ofrecido una serie de incentivos, recompensas o beneficios a los mismos (Yi y Jeon, 2003). Así, aunque existen diversas clasificaciones de los beneficios que se pueden ofrecer a través de un programa de fidelización, Mimouni y Volle (2010) establecieron que los clientes pueden percibir hasta tres tipos de beneficios de los programas de fidelización. En primer lugar, los beneficios utilitarios se basan en ventajas financieras, como el ahorro económico en forma de descuentos. En segundo lugar, los beneficios simbólicos son las ventajas en relación a las necesidades de expresión personal, la autoestima y la aprobación social; se relacionan con el reconocimiento cuando los clientes sienten que la empresa los trata mejor que a otros. Por último, los beneficios hedónicos se consideran no instrumentales, experienciales, emocionales y personalmente gratificantes, y se pueden conseguir mediante la exploración y el entretenimiento. Teniendo en cuenta lo anterior, planteamos que los usuarios de páginas de marca pueden percibir los tres tipos de beneficios relacionales que ofrece un programa de fidelización: utilitarios, simbólicos y hedónicos.

## **2.2. Gratificaciones de la red social**

Las RS se consideran herramientas de comunicación y, al igual que ocurre con otros medios de comunicación interactivos como las comunidades virtuales, la teoría de los usos y las gratificaciones puede explicar cuáles son las motivaciones de la gente a la hora de utilizar las RS (Katz y Foulkes, 1962). Así, según esta teoría, los usuarios de RS se exponen ante este medio con la motivación de obtener una gratificación –o beneficio- que satisfaga sus necesidades. Atendiendo a las distintas clasificaciones planteadas sobre los beneficios que proceden de los medios de comunicación (Flanagin y Metzger, 2001; Dholakia y otros, 2004) hemos establecido una clasificación con tres tipos de beneficios con una nomenclatura similar a la de los beneficios relacionales. Así, los beneficios utilitarios consisten en obtener, compartir y proporcionar información a otros, así como de persuadir para alcanzar un fin deseado; los beneficios simbólicos proporcionan identificación personal (conocerse mejor a uno mismo), integración social (mantener contacto con otras personas) y reconocimiento (conseguir la aprobación y la aceptación de otros) y los beneficios hedónicos se identifican con la diversión y relajación, a través de juegos e interacciones con otros individuos.

## **3. Efecto directo de los beneficios de las páginas de marca sobre el conocimiento y el valor de la marca**

Tanto las actividades de marketing relacional como las de marketing interactivo desempeñan diversas funciones para los clientes, permitiéndoles aprender sobre el producto, la empresa o sobre lo que la marca representa (Keller, 2009). Es por ello que las acciones de marketing se han asociado tradicionalmente con la creación de conocimiento de marca y con el valor de marca (Chang y Tseng, 2005; Keller, 2009). Así, mientras el conocimiento de la marca se define como el significado personal que tiene una marca en la memoria del consumidor (Keller, 2003), el valor de marca es la evaluación subjetiva e intangible de la marca por parte del cliente (Lemon y otros, 2001) y se considera la diferencia para el consumidor entre un producto de una marca conocida y un producto sin marca, teniendo ambos productos las mismas características (Yoo y otros, 2000). Por ello, en el ámbito de las RS las páginas de marca que ofrecen beneficios al usuario como herramienta de marketing pueden también tener efectos sobre ambas variables. Así, los beneficios utilitarios de la red social como medio de comunicación, que se identifican principalmente con la información suministrada a través de la página, pueden generar en el usuario un conocimiento sobre dicha marca, ya que los usuarios de medios interactivos buscan la información que les proporciona dicho medio para satisfacer sus necesidades de aprendizaje, aumentar su conocimiento (Stafford y otros, 2004; Chung y Kim, 2008) y llevar a cabo las decisiones de compra de productos (Stafford y otros, 2004). Por otro lado, al igual que las promociones de ventas tienen un efecto positivo sobre el conocimiento de la marca (Palazón y Delgado, 2005), los beneficios relacionales utilitarios, relacionados con ventajas económicas, también pueden tener un efecto en el conocimiento de la misma. Por tanto, planteamos:

*H1: Los beneficios utilitarios percibidos a través de las páginas de marca favorecerán la creación de conocimiento de marca en el usuario*

Además, tanto investigadores como profesionales han puesto de manifiesto la importancia del entretenimiento y la diversión en el proceso de aprendizaje (Waiguny y otros, 2012), así como la vinculación de las actividades de exploración con la búsqueda de un nuevo conocimiento, recursos y capacidades (Aspara y otros, 2011). Ello implica que cuando el usuario experimente un estado de entretenimiento o exploración en su relación con la marca, su conocimiento respecto a la misma pueda aumentar. Por ello, teniendo en cuenta que los beneficios relacionales hedónicos se asocian con experiencias placenteras de exploración y entretenimiento y que los beneficios hedónicos de la red social se asocian con la diversión que proporciona la página en sí misma, planteamos:

*H2: Los beneficios hedónicos percibidos a través de las páginas de marca favorecerán la creación de conocimiento de marca en el usuario*

Actividades de marketing tales como la creación de comunidades de marca y la realización de eventos se han asociado a la creación de valor de marca (Muniz y O'Guinn, 2001; Zarantonello y Schmitt, 2013), debido a que ofrecen a sus usuarios la posibilidad de conocer a otras personas con intereses hacia la misma marca. Los beneficios simbólicos procedentes de la red social se identifican con la

comunicación interpersonal, la identidad personal y el prestigio social. Por otro, aquellos que proceden de la empresa se asocian al reconocimiento por parte de ésta y la aprobación social que ello implica. Así, ambos beneficios se pueden identificar con las relaciones que se establecen entre el usuario y la empresa o entre los mismos usuarios. Por ello, podemos plantear la hipótesis:

*H3: Los beneficios simbólicos percibidos a través de las páginas de marca favorecerán la creación de valor de marca en el usuario.*

Existen diferentes estudios en los que se han relacionado las dimensiones del conocimiento de la marca con las del valor de marca; por lo que el valor de marca se deriva del conocimiento de la misma (Keller, 2003). Además, el modelo original de Keller, en el que se plantea que el conocimiento de la marca es un antecedente del valor de marca, ha sido ampliamente utilizado por diferentes autores para su aplicación en la investigación en marketing (Palazón y Delgado, 2005). Así, esperamos que el modelo creación de valor de marca se pueda aplicar al ámbito de las RS, planteando la hipótesis:

*H4: El conocimiento de la marca generado a través de las páginas de marca favorecerá la creación de valor de marca.*

#### 4. Efecto indirecto de las páginas de marca sobre la intención de compra

La intención de compra hace referencia al estado mental en el proceso de toma de decisiones en el que el consumidor ha desarrollado una intención real de adquirir un objeto o marca (Dodds y otros, 1991). De forma previa a la decisión de compra, es necesario que los clientes adquieran conocimiento sobre la marca (Yasin y otros, 2007). De hecho, varios estudios establecen que la intención de compra está positivamente influenciada por el conocimiento de la marca y el valor de marca (Broyles y otros, 2009; Dodds y otros, 1991; Yasin y otros, 2007). En base a lo anterior planteamos que:

*H5: El conocimiento de marca creado a través de las páginas de marca en redes sociales favorecerá la intención de compra del cliente.*

*H6: El valor de marca creado a través de las páginas de marca en redes sociales favorecerá la intención de compra del cliente.*

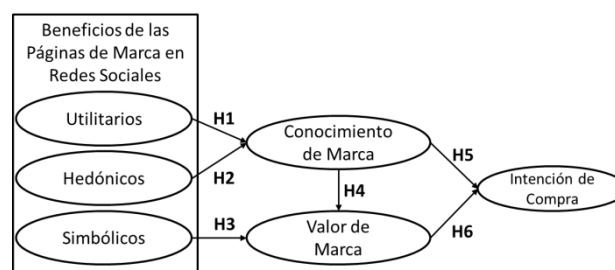

FIGURA 1

#### Modelo Propuesto

#### 5. Metodología y resultados esperados

La muestra objeto de estudio está compuesta por usuarios frecuentes de, al menos, una red social que, además, sean seguidores de una página de marca. Para asegurar que los participantes realmente sean usuarios de redes sociales, la metodología de investigación se desarrollará a través de un cuestionario online que será distribuido a través de redes sociales. Se solicitará que los participantes respondan el cuestionario basándose en su página de marca favorita. Por tanto, la primera pregunta requerirá que los participantes escriban el nombre de una empresa o marca de la que sean seguidores en redes sociales. La segunda pregunta hará referencia al nombre de la red social en la que está presente la empresa. En adelante, se solicitará a los participantes que respondan algunas preguntas relacionadas con los beneficios percibidos por el usuario como consecuencia de la participación de la empresa en la red social (utilitarios, simbólicos y hedónicos), el conocimiento y valor de marca generado en el usuario tras seguir a la empresa en la red social y la intención de comprar el producto que la empresa o marca comercializa. Para ello se utilizarán seis constructos que se medirán con escalas previamente validadas de la literatura. Además, se recogerán algunos datos demográficos como género y edad.

## 6. Conclusiones previsible

En este trabajo se propone que el uso de redes sociales como herramienta de marketing tiene efectos en la toma de decisiones del cliente, especialmente en la generación de intención de compra, a través de la percepción de beneficios y de la creación de conocimiento de marca y valor de marca. Sin embargo, tal y como se plantea en las hipótesis, se espera que el efecto sea diferente en función del tipo de beneficio. Se espera que el modelo propuesto ayude a las empresas a definir su actuación a través de las redes sociales, identificando qué efectos genera cada uno de los beneficios en el conocimiento y/o el valor de marca, y si los mismos repercuten en la intención de compra del cliente.
